Knee Replacement/Arthroplasty

CMM-311.1: Definition

- **Knee arthroplasty** is an orthopaedic surgical procedure during which the articular surface of the knee joint is replaced, remodeled or realigned.

- **Knee replacement** is a form of arthroplasty that includes the surgical replacement of the knee joint with a prosthesis.

- **Prosthesis** refers to an artificial device used to replace a structural element within a joint to improve and enhance function.

- **Total knee replacement** involves surgical reconstruction or replacement of the entire knee joint as a result of unicompartamental, bicompartamental, or tricompartmental involvement.

- **Partial knee replacement** involves surgical reconstruction or replacement of one joint surface of the knee joint as a result of unicompartamental (e.g., medial, lateral, or patellofemoral) involvement.

- **Revision of knee replacement (partial or total)** involves surgical reconstruction or replacement due to failure or complications of previous knee replacement.

- **The Modified Outerbridge Classification** is a system that has been developed for judging articular cartilage injury to the knee. This system allows delineation of varying areas of chondral pathology, based on the qualitative appearance of the cartilage surface, and can assist in identifying those injuries that are suitable for repair techniques. The characterization of cartilage in this system is as follows:
  - Grade I - Softening with swelling
  - Grade II - Fragmentation and fissuring less than one square centimeter (1 cm²)
  - Grade III - Fragmentation and fissuring greater than one square centimeter (1 cm²)
  - Grade IV - Subchondral bone exposed

- **The Kellgren-Lawrence Grading System** is a radiographic grading system that has been developed for describing osteoarthritic changes to the knee. When used, the radiographic findings are typically reported within one of the following categories:
  - Grade I – Doubtful narrowing of joint space and possible osteophytic lipping
  - Grade II – Definite osteophytes and possible narrowing of joint space
  - Grade III – Moderate multiple osteophytes, definite narrowing of joint space, some sclerosis, and possible deformity of bone contour
  - Grade IV – Large osteophytes, marked narrowing of joint space, severe sclerosis, and definite deformity of bone contour
Non-surgical management, with regard to the treatment of knee osteoarthritis, is defined as any provider-directed non-surgical treatment, which has been demonstrated in the scientific literature as efficacious and/or is considered reasonable care in the treatment of knee pain from osteoarthritis. The types of treatment involved can include, but are not limited to: relative rest/activity modification, weight loss, supervised physiotherapy modalities and therapeutic exercises, oral prescription and non-prescription medications, bracing and other assistive devices (e.g., cane, crutches, walker, wheelchair), and/or intra-articular injections (i.e., steroid and/or viscosupplementation).

CMM-311.2: General Guidelines

The determination of medical necessity for the performance of knee replacement (partial or total) is always made on a case-by-case basis.

CMM-311.3: Indications and Non-Indications

Partial Knee Replacement

Partial knee replacement (medial, lateral, or patellofemoral unicompartmental) is considered medically necessary when ALL of the following criteria have been met:

- Function-limiting pain at short distances (e.g., walking less than ¼ mile, limiting activity to two city blocks, the equivalent to walking the length of a shopping mall) for at least three (3) months duration
- Loss of knee function which interferes with the ability to carry out age appropriate activities of daily living and/or demands of employment
- Severe unicompartmental (medial, lateral, or patellofemoral) degenerative arthritis evidenced by EITHER of the following:
  - Large osteophytes, marked narrowing of joint space, severe sclerosis, and definite deformity of bone contour (i.e., Kellgren-Lawrence Grade IV radiographic findings)
  - Exposed subchondral bone (i.e., Modified Outerbridge Classification Grade IV arthroscopy findings)
- Intact, stable ligaments, in particular the anterior cruciate ligament
- Knee arc of motion (full extension to full flexion) greater than 90°
- Failure of at least three (3) months of provider-directed non-surgical management
  - For patients with BMI > 40, there must be failure of at least six (6) months of provider-directed non-surgical management
  - Provider-directed non-surgical management may be inappropriate. The medical record must clearly document why provider-directed non-surgical management is not appropriate.
Patellofemoral unicompartmental replacement to manage protracted anterior knee pain and/or mechanical symptoms attributed to the patellofemoral joint following a total knee replacement, during which patellar replacement was not performed at the time of the index knee replacement, is considered medically necessary when the above criteria are met for the performance of patellofemoral unicompartmental replacement, with the exception of radiographic criteria.

Partial knee replacement (medial, lateral, or patellofemoral unicompartmental) is considered not medically necessary for any other indication or condition, when ANY of the following criteria is present:

- Grade III or IV patellofemoral joint arthritis (when unicompartmental replacement is to be performed of the medial or lateral compartment) and Grade IV medial or lateral compartment degenerative changes (when unicompartmental replacement is to be performed of the patellofemoral compartment), evidenced by ANY of the following:
  - Large osteophytes, marked narrowing of joint space, severe sclerosis, and definite deformity of bone contour (i.e., Kellgren-Lawrence Grade IV radiographic findings)
  - Moderate multiple osteophytes, definite narrowing of joint space, some sclerosis, and possible deformity of bone contour (i.e., Kellgren-Lawrence Grade III radiographic findings)
  - Exposed subchondral bone (i.e., Modified Outerbridge Classification Grade IV arthroscopy findings)
- Tibial or femoral shaft deformity
- Radiographic evidence of medial or lateral subluxation
- Flexion contracture greater than 15°
- Varus deformity greater than 15°
- Valgus deformity greater than 20°
- Inflammatory arthropathy
- Active local or systemic infection
- Osseous abnormalities that cannot be optimally managed prior to surgery which would increase the likelihood of a poor surgical outcome (i.e., inadequate bone stock to support the implant)
- Severe lack of collateral ligament integrity leading to joint instability
- Charcot joint
- One or more uncontrolled or unstable medical conditions that would significantly increase the risk of morbidity (e.g., cardiac, pulmonary, liver, genitourinary, or metabolic disease; hypertension; abnormal serum electrolyte levels)
- Vascular insufficiency, significant muscular atrophy of the leg, or neuromuscular disease severe enough to compromise implant stability or post-operative recovery
- Severe immunocompromised state
Total Knee Replacement

Total Knee Replacement is considered medically necessary when ALL of the following criteria have been met:

- Function-limiting pain at short distances (e.g., walking less than ¼ mile, limiting activity to two city blocks, the equivalent to walking the length of a shopping mall) for at least three (3) months duration
- Loss of knee function which interferes with the ability to carry out age appropriate activities of daily living and/or demands of employment
- Severe bicompartamental, or tricompartmental degenerative arthritis evidenced by EITHER of the following:
  - Large osteophytes, marked narrowing of joint space, severe sclerosis, and definite deformity of bone contour (i.e., Kellgren-Lawrence Grade IV radiographic findings)
  - Exposed subchondral bone (i.e., Modified Outerbridge Classification Grade IV arthroscopy findings)
- The patient is not a candidate for partial (unicompartmental) knee replacement
- Failure of at least three (3) months of provider-directed non-surgical management
  - For patients with BMI > 40, there must be failure of at least six (6) months of provider-directed non-surgical management
  - Provider-directed non-surgical management may be inappropriate. The medical record must clearly document why provider-directed non-surgical management is not appropriate.

Total Knee Replacement is considered not medically necessary for any other indication or condition, including when ANY of the following criteria is present:

- Active local or systemic infection
- Osseous abnormalities that cannot be optimally managed prior to surgery and which would increase the likelihood of a poor surgical outcome (i.e., inadequate bone stock to support the implant)
- Joint instability due to a lack of collateral ligament integrity not amenable to surgical correction
- Greater than 30 degrees of fixed varus or valgus deformity not amenable to surgical correction.
- Charcot joint
- One or more uncontrolled or unstable medical conditions that would significantly increase the risk of morbidity (e.g., cardiac, pulmonary, liver, genitourinary, or metabolic disease; hypertension; abnormal serum electrolyte levels)
- Vascular insufficiency, significant muscular atrophy of the leg, or neuromuscular disease severe enough to compromise implant stability or post-operative recovery
- Severe immunocompromised state

Refer to MS-12: Osteoarthritis and MS-25: Knee for the advanced imaging indications prior to knee replacement surgery.
Revision of Knee Replacement – Partial or Total

Revision of Knee Replacement (including revision of a total knee replacement, revision of a medial, lateral, or patellofemoral unicompartmental replacement to another medial, lateral, or patellofemoral unicompartmental replacement, or revision of a medial, lateral, or patellofemoral unicompartmental replacement to a total knee replacement) is considered medically necessary for an individual who has previously undergone a partial or total knee replacement when ANY of the following criteria have been met:

- Presence of ANY of the following:
  - Fracture or dislocation of the patella
  - Instability of the components
  - Aseptic loosening
  - Periprosthetic infection
  - Periprosthetic fracture
- Unexplained function-limiting pain at short distances (e.g., walking less than ¼ mile, limiting activity to two city blocks, the equivalent to walking the length of a shopping mall) for greater than six (6) months unresponsive to provider-directed non-surgical management
- Kellgren-Lawrence Grade IV radiographic findings in the non-replaced medial, lateral, or patellofemoral compartments if revising from a partial (unicompartmental) knee replacement to a total joint replacement

Revision of knee replacement is considered not medically necessary for any other indication or condition, including Charcot joint.

Isolated polyethylene liner exchange (IPE) is considered medically necessary when ANY of the following criteria have been met:

- Wear and Osteolysis:
  - Symptomatic individual with progressive osteolysis noted on imaging studies which also confirm well-fixed implants in acceptable position
- Periprosthetic joint infection:
  - Individual is less than four (4) weeks from the index replacement procedure with well-fixed implants
- Stiffness following total knee replacement (flexion contracture of > 15 degrees with flexion limited to < 90 degrees):
  - Individual presents later than three (3) months from the index replacement procedure, after failure of physical therapy and manipulation under anesthesia with persistent restricted range-of-motion
- Instability:
  - Individual with mid-flexion instability without component malrotation or malalignment

Isolated polyethylene liner exchange (IPE) is considered not medically necessary for any other indication or condition.
Refer to **MS-16: Post-Operative Joint Replacement Surgery** and **MS-25: Knee** for advanced imaging indications following knee replacement surgery.

**Knee Arthroplasty**

Refer to **CMM-312.3: Procedures for Patellofemoral Conditions** for the indications and non-indications of trochleoplasty using CPT® 27442 for a hypoplastic trochlea in patients with recurrent patellar instability.

**Lysis of Adhesions/Manipulation Under Anesthesia (MUA)**

Refer to **CMM-312.3: Lysis of Adhesion/Manipulation Under Anesthesia (MUA)** for indications and non-indications of lysis of adhesions/manipulation under anesthesia (MUA).

**CMM-311.4 Experimental, Investigational, or Unproven**

Based on lack of scientific evidence of efficacy and safety, the following are considered **experimental, investigational, or unproven**:

- Bicompartmental knee arthroplasty
- Bi-unicompartmental knee arthroplasty
- Focal resurfacing of a single knee joint defect (e.g., Arthrosurface® femoral condyle implant)
- Unicompartmental free-floating (un-fixed) interpositional device (e.g., UniSpacer®)

The following CPT codes for arthroplasty of the patella, distal femur, or tibia are considered **experimental, investigational or unproven**:

- CPT® 27437 - Arthroplasty, patella; without prosthesis
- CPT® 27440 - Arthroplasty, knee, tibial plateau
- CPT® 27441 - Arthroplasty, knee, tibial plateau; with debridement and partial synovectomy
- CPT® 27443 - Arthroplasty, femoral condyles or tibial plateau(s), knee; with debridement and partial synovectomy
### CMM-311.5: Procedure (CPT®) Codes

This guideline relates to the CPT® code set below. Codes are displayed for informational purposes only. Any given code’s inclusion on this list does not necessarily indicate prior authorization is required.

<table>
