**Definition**

- **Shoulder arthroplasty** is an orthopaedic surgical procedure during which the articular surface of the shoulder joint is replaced, remodeled, or realigned.
- **Shoulder replacement** is a form of arthroplasty that includes the surgical replacement of the shoulder joint with a prosthesis.
- **Prosthesis** refers to an artificial device used to replace a structural element within a joint to improve and enhance function.
- **Hemi-arthroplasty (replacement)** is a surgical technique that involves replacing the humeral head and not replacing the glenoid (socket), which is typically the best option if the glenoid does not have any arthritis or if there is some concern that the glenoid component might fail if it is replaced.
- **Total shoulder arthroplasty (replacement)** is a surgical technique that involves replacing the humeral head and the glenoid. A total shoulder arthroplasty is typically the best option if the glenoid is damaged, but sufficient bone and rotator cuff remain to ensure that the glenoid component will last.
- **Reverse total shoulder arthroplasty (replacement)** is a surgical technique that involves replacing both the humeral head and the glenoid, but the ball and socket are reversed to improve muscle function. This allows the deltoide muscle, which has a longer moment arm, to generate greater force, allowing it to act in place of an inadequate functioning or torn rotator cuff.
- **Revision of shoulder arthroplasty (replacement)** is a surgical technique that involves surgical reconstruction or replacement due to failure or complication of previous shoulder arthroplasty.
- **Shoulder resurfacing** is a surgical technique that involves replacing the diseased part of the shoulder joint without replacing the humeral head. Resurfacing of the humeral head involves a prosthetic metal covering or cap to provide complete or partial coverage. It can be performed alone (hemi-resurfacing) or in combination with glenoid resurfacing (total or partial shoulder resurfacing).
- **Shoulder arthrodesis** is a surgical resection and fusion of the shoulder (glenohumeral) joint.
- **Rotator cuff tear arthropathy** is a condition that results from **ALL** of the following:
  - Rotator cuff insufficiency (e.g., secondary to irreparable massive rotator cuff tear)
  - Advanced glenohumeral arthritis
  - Radiographically diminished acromio-humeral distance
- **Non-surgical management**, with regard to the treatment of shoulder pain, is defined as any provider-directed non-surgical treatment that has been demonstrated in the scientific literature to be efficacious and/or is considered reasonable care in the treatment of shoulder pain. The types of treatment involved can include, but are not limited to: relative rest/activity modification, supervised physiotherapy modalities
and therapeutic exercises, oral prescription and non-prescription medications, assistive devices (e.g., sling, splint, brace), and/or injections (i.e., steroid).

**General Guidelines**

- The determination of medical necessity for the performance of shoulder surgery is always made on a case-by-case basis.
- Refer to MS-12: Osteoarthritis and MS-19: Shoulder for advanced imaging indications prior to shoulder arthroplasty/replacement surgery.
- Refer to MS-16: Post-Operative Joint Replacement Surgery and MS-19: Shoulder for advanced imaging indications following shoulder arthroplasty/replacement surgery.

**Indications and Non-Indications**

**Hemi-arthroplasty (Replacement)**

- **Hemi-arthroplasty (replacement)** is considered medically necessary when ALL of the following criteria have been met:
  - Function-limiting pain (e.g., loss of shoulder function which interferes with the ability to carry out age appropriate activities of daily living and/or demands of employment) for at least three (3) months
  - Failure of at least three (3) months of provider-directed non-surgical management
  - Radiographic imaging and/or an advanced diagnostic procedure (i.e., MRI, CT scan) is conclusive for the presence of ANY of the following and correlates with the individual’s reported symptoms and physical exam findings:
    - Arthritic conditions in which the glenoid bone stock is inadequate to support a glenoid prosthesis
    - Avascular necrosis without glenoid involvement

- **Hemi-arthroplasty** (replacement) is considered medically necessary when radiographic imaging and/or an advanced diagnostic study (i.e., MRI, CT scan) is conclusive for the presence of a proximal humerus fracture that is not amenable to internal fixation. Criteria for duration and severity of symptoms, physical examination findings, and provider-directed non-surgical management are not required to be met.

- **Hemi-arthroplasty** (replacement) is considered not medically necessary for any other indication or condition, including when ANY of the following criteria is present:
  - Active local or systemic infection
  - Paralytic disorder of the shoulder (e.g., flail shoulder due to irreversible brachial plexus palsy, spinal cord injury, or neuromuscular disease)
  - One or more uncontrolled or unstable medical conditions that would significantly increase the risk or morbidity (e.g., cardiac, pulmonary, liver, genitourinary, or metabolic disease; hypertension; abnormal serum electrolyte levels)
  - Charcot joint
Advanced destructive degenerative joint disease (i.e., rheumatoid arthritis or osteoarthritis) resulting in marked narrowing of the joint space
Rotator cuff tear arthropathy (i.e., severe rotator cuff tearing and end-stage arthritic disease)

Total Shoulder Arthroplasty (Replacement)

Total Shoulder Arthroplasty (Replacement) is considered medically necessary when ALL of the following criteria have been met:
- Function-limiting pain (e.g., loss of shoulder function which interferes with the ability to carry out age appropriate activities of daily living and/or demands of employment) for at least three (3) months
- Failure of at least three (3) months of provider-directed non-surgical management
- Radiographic imaging and/or an advanced diagnostic procedure (i.e., MRI, CT scan) is conclusive for the presence of advanced destructive degenerative joint disease (i.e., osteoarthritis, rheumatoid arthritis, avascular necrosis) that correlates with the individual's reported symptoms and physical exam findings including marked narrowing of the joint space and ONE OR MORE of the following:
  - Irregular joint surfaces
  - Glenoid sclerosis
  - Glenoid osteophyte changes
  - Flattened glenoid
  - Cystic changes in the humeral head

Total shoulder arthroplasty (replacement) is considered not medically necessary for any other indication or condition, including when ANY of the following criteria is present:
- Active local or systemic infection
- Paralytic disorder of the shoulder (e.g., flail shoulder due to irreversible brachial plexus palsy, spinal cord injury, or neuromuscular disease)
- One or more uncontrolled or unstable medical conditions that would significantly increase the risk or morbidity (e.g., cardiac, pulmonary, liver, genitourinary, or metabolic disease; hypertension; abnormal serum electrolyte levels)
- Charcot joint

Reverse Total Shoulder Arthroplasty (Replacement)

Reverse Total Shoulder Arthroplasty (Replacement) is considered medically necessary when ALL of the following criteria have been met:
- Function-limiting pain (e.g., loss of shoulder function which interferes with the ability to carry out age appropriate activities of daily living and/or demands of employment) for at least three (3) months duration
- The individual must possess functional use of the deltoid muscle
- At least 90° of passive shoulder range of motion (elevation/flexion)
Shoulder Arthroplasty

- Failure of at least three (3) months of provider-directed non-surgical management
- Presence of **ANY** of the following:
  - Deficient rotator cuff with severe glenohumeral arthropathy and limited ability to actively flex the upper extremity to 90° against gravity (i.e., rotator cuff tear arthropathy)
  - Pseudoparalysis from an irreparable rotator cuff tear (i.e., active forward flexion less than 90 degrees with full passive motion)
  - Failed hemi-arthroplasty or total shoulder replacement with a deficient rotator cuff that is non-repairable
  - Required reconstruction after a tumor resection

**Reverse total shoulder arthroplasty (replacement)** is considered **medically necessary** when radiographic imaging and/or an advanced diagnostic study (i.e., MRI, CT scan) is conclusive for the presence of a shoulder fracture that is not repairable or cannot be reconstructed with other techniques. Criteria for duration and severity of symptoms, physical examination findings, and provider-directed non-surgical management are not required to be met.

**Reverse total shoulder arthroplasty (replacement)** is considered **not medically necessary** for any other indication or condition, including when **ANY** of the following criteria is present:

- Active local or systemic infection
- Paralytic disorder of the shoulder (e.g., flail shoulder due to irreversible brachial plexus palsy, spinal cord injury, or neuromuscular disease)
- Deltoid deficiency (e.g., axillary nerve palsy)
- One or more uncontrolled or unstable medical conditions that would significantly increase the risk or morbidity (e.g., cardiac, pulmonary, liver, genitourinary, or metabolic disease; hypertension; abnormal serum electrolyte levels)
- Charcot joint

**Shoulder Resurfacing**

- Shoulder Resurfacing, including total, hemi or partial resurfacing, is considered experimental, investigational or unproven (EIU).

**Revision of Shoulder Arthroplasty (Replacement)**

**Revision of Shoulder Arthroplasty (Replacement)** is considered **medically necessary** for an individual who has previously undergone a hemi or total shoulder arthroplasty and when **ANY** of the following criteria have been met:

- Presence of **ANY** of the following:
  - Recurrent prosthetic dislocation not responsive to a reasonable course of non-surgical care
  - Instability of the components
  - Aseptic loosening
  - Periprosthetic infection
  - Periprosthetic fracture
Shoulder Arthroplasty

- Unexplained function-limiting pain (e.g., loss of shoulder function which interferes with the ability to carry out age appropriate activities of daily living and/or demands of employment) for greater than six (6) months unresponsive to provider-directed non-surgical management

- **Revision of shoulder arthroplasty (replacement)** is considered **not medically necessary** for the treatment of any other indication or condition, including Charcot joint.

Shoulder Arthrodesis

- **Shoulder Arthrodesis** is considered **medically necessary** when **ALL** of the following criteria have been met:
  - Function-limiting pain (e.g., loss of shoulder function which interferes with the ability to carry out age appropriate activities of daily living and/or demands of employment) for at least three (3) months duration
  - Failure of at least three (3) months of provider-directed non-surgical management and is not a candidate for alternative treatments
  - Radiographic imaging and/or advanced diagnostic procedure (i.e., MRI, CT scan, EMG/NCV, etc.) is conclusive for the presence of **ANY** of the following and correlates with the individual's reported symptoms and physical exam findings:
    - Irreparable deltoid and rotator cuff deficiency
    - Failed total shoulder arthroplasty
    - Joint infection
    - Reconstruction after tumor resection
    - Brachial plexus palsy
    - Recurrent shoulder instability, which has failed previous repair/reconstruction
    - Paralytic disorder in infancy

- **Shoulder Arthrodesis** is considered **not medically necessary** for any other indication or condition, including when **ANY** of the following criteria is present:
  - Deficient functional scapulothoracic motion
  - Paralysis of the trapezius, levator scapulae, and serratus anterior
  - Charcot joint
  - Ipsilateral elbow arthrodesis
  - Contralateral shoulder arthrodesis
### Procedure (CPT®) Codes

This guideline relates to the CPT® code set below. Codes are displayed for informational purposes only. Any given code’s inclusion on this list does not necessarily indicate prior authorization is required.
