Instructions for use
The following coverage policy applies to health benefit plans administered by Cigna. Coverage policies are intended to provide guidance in interpreting certain standard Cigna benefit plans and are used by medical directors and other health care professionals in making medical necessity and other coverage determinations. Please note the terms of a customer’s particular benefit plan document may differ significantly from the standard benefit plans upon which these coverage policies are based. For example, a customer’s benefit plan document may contain a specific exclusion related to a topic addressed in a coverage policy.

In the event of a conflict, a customer’s benefit plan document always supersedes the information in the coverage policy. In the absence of federal or state coverage mandates, benefits are ultimately determined by the terms of the applicable benefit plan document. Coverage determinations in each specific instance require consideration of:

1. The terms of the applicable benefit plan document in effect on the date of service
2. Any applicable laws and regulations
3. Any relevant collateral source materials including coverage policies
4. The specific facts of the particular situation

Coverage policies relate exclusively to the administration of health benefit plans. Coverage policies are not recommendations for treatment and should never be used as treatment guidelines.

This evidence-based medical coverage policy has been developed by eviCore, Inc. Some information in this coverage policy may not apply to all benefit plans administered by Cigna.

These guidelines include procedures eviCore does not review for Cigna. Please refer to the Cigna CPT code list for the current list of high-tech imaging procedures that eviCore reviews for Cigna.

PN-1: General Guidelines

A current clinical evaluation (within 60 days) is required before advanced imaging can be considered. The clinical evaluation may include a relevant history and physical examination, including a neurological examination, appropriate laboratory studies, non-advanced imaging modalities, electromyography and nerve conduction (EMG/NCV) studies. Other meaningful contact (telephone call, electronic mail or messaging) by an established individual can substitute for a face-to-face clinical evaluation.

If imaging of peripheral nerves is indicated, ultrasound is the preferred modality for superficial peripheral nerves. MRI may be used for imaging deep nerves such as the lumbosacral plexus or nerves obscured by overlying bone such as the brachial plexus or for surgical planning. CT is limited to cases in which MRI is contraindicated.

### PN-2: Focal Neuropathy

<table>
<thead>
<tr>
<th>Focal Disorder</th>
<th>EMG/NCV Initially?</th>
<th>Advanced Imaging</th>
</tr>
</thead>
</table>
| Carpal Tunnel Syndrome          | YES                | ▶ Ultrasound Wrist or MRI Wrist without contrast (CPT® 73321) to estimate size of the carpal tunnel and diameter of the median nerve may be helpful in the evaluation and confirmation of carpal tunnel syndrome pre-operatively when EMG findings are equivocal and clinical findings are uncertain.  
| Ulnar Neuropathy                | YES                | ▶ Ultrasound for evaluation when clinical findings and EMG/NCV findings are uncertain.  
▶ MRI Elbow without contrast (CPT® 73221) or MRI Upper Arm or Forearm without contrast (CPT® 73218) for ANY of the following:  
▶ Pre-operative  
▶ Complex cases when diagnosis remains uncertain after EMG and US |
| Radial Neuropathy               | YES                | ▶ MRI Upper Arm or Forearm without contrast (CPT® 73218) in severe cases when surgery is being considered.  
▶ MRI Upper Arm or Forearm without and with contrast (CPT® 73220) if there is a suspicion of a nerve tumor such as a neuroma. |

**Radial Neuropathy Notes:** Leads to wrist drop with common sites of entrapment the inferior aspect of the humerus (Saturday night palsy) or the forearm (Posterior Interosseus Syndrome).  
Trauma or fractures of the humerus, radius, or ulna can damage the radial nerve.

| Sciatic Neuropathy              | YES                | ▶ MRI Pelvis without contrast (CPT® 72195) may be performed in the evaluation of these entities.  
▶ CT Pelvis without contrast is not indicated due to lack of soft tissue contrast. It should only be performed in the rare circumstance of contrast allergy and contraindication to MRI such as pacemaking device. |
<table>
<thead>
<tr>
<th>Focal Disorder</th>
<th>EMG/NCV Initially?</th>
<th>Advanced Imaging</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Sciatic Neuropathy Notes:</strong> Trauma to the gluteal area with hematoma, injection palsy, hip or pelvic fractures, or hip replacement (arthroplasty) and rarely Piriformis Syndrome involves entrapment of the sciatic nerve at the sciatic notch in the pelvis by a tight piriformis muscle band.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Femoral Neuropathy</td>
<td>NO</td>
<td>MRI Pelvis without contrast (CPT® 72195) may be performed in the evaluation of these entities.</td>
</tr>
<tr>
<td><strong>Femoral Neuropathy Notes:</strong> May occur as a complication of pelvic surgery in women or those on anticoagulants with retroperitoneal bleeding, or as a mononeuropathy in diabetics.</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
| Meralgia Paresthetica      | NO                 | MRI Pelvis without contrast (CPT® 72195) may be performed for ANY of the following:  
  - Pre-operative  
  - Cases of diagnostic uncertainty  
  CT Pelvis without contrast is not indicated due to lack of soft tissue contrast. It should only be performed in the rare circumstance of contrast allergy and contraindication to MRI such as pacemaking device. |
| **Meralgia Paresthetica Notes:** Sensory loss in the lateral femoral cutaneous nerve as it exits the pelvis under the inguinal ligament (lateral thigh without extension into lower leg), and is usually easily diagnosed based on a careful history and physical exam. EMG/NCV testing is often technically difficult and not required. |
| Peroneal Neuropathy        | YES                | MRI Knee without contrast (CPT® 73721) or MRI Lower Extremity other than joint without contrast (CPT® 73718) in severe cases when surgery is considered. |
| Tarsal Tunnel Syndrome     | N/A                | See **MS-27: Foot (Tarsal Tunnel Syndrome)** in the Musculoskeletal Imaging Guidelines. |

References
PN-4: Brachial Plexus

- MRI Upper Extremity other than joint without or without and with contrast (CPT® 73218 or CPT® 73220), MRI Chest without or without and with contrast (CPT® 71550 or CPT® 71552) or MRI Neck without or without and with contrast (CPT® 70540 or CPT® 70543) (if upper trunk) after EMG/NCV examination for:
  - Malignant infiltration (EMG not required)
  - Radiation plexitis to rule out malignant infiltration
  - Brachial plexitis (Parsonage-Turner Syndrome or painful brachial amyotrophy).
    - Self-limited syndrome characterized by initial shoulder region pain followed by weakness of specific muscles in a pattern which does not conform to involvement of a single root or distal peripheral nerve
    - Consider MRI Cervical Spine if radiculopathy.
    - See SP-3: Neck (Cervical Spine) Pain Without/With Neurological Features (Including Stenosis) and Trauma in the Spine Imaging Guidelines
  - Traumatic injury
  - Neurogenic Thoracic Outlet Syndrome (TOS) failed a 2 to 3 month trial of conservative management and are being considered for surgical treatment.
  - See CH-31: Thoracic Outlet Syndrome (TOS) in the Chest Imaging Guidelines
  - Preoperative study which requires evaluation of the brachial plexus

References
PN-5: Lumbar and Lumbosacral Plexus

- MRI Pelvis without and with contrast with fat suppression imaging (CPT® 72197) OR MRI Abdomen and Pelvis without and with contrast with fat suppression imaging (CPT® 74183 and CPT® 72197) OR if MRI is not available, CT Pelvis with contrast (CPT® 72193) OR CT Abdomen and Pelvis with contrast (CPT® 74177) after EMG/NCV based on whether the upper lumbar plexus (abdominal retroperitoneal space) or the lumbosacral plexus (pelvis), respectively, is involved based on:
  - Malignant infiltration (EMG not required)
  - Radiation plexopathy to rule out malignant infiltration
  - Traumatic injury
  - Concern for retroperitoneal hematoma in individuals on anticoagulation or who have other thrombotic disorders (EMG/NCV not necessary)

## PN-6: Muscle Disorders

<table>
<thead>
<tr>
<th>Section</th>
<th>Page</th>
</tr>
</thead>
<tbody>
<tr>
<td>PN-6.1: Neuromuscular Disease</td>
<td>13</td>
</tr>
<tr>
<td>PN-6.2: Inflammatory Muscle Diseases</td>
<td>13</td>
</tr>
<tr>
<td>PN-6.3: Gaucher Disease (Storage Disorders)</td>
<td>13</td>
</tr>
</tbody>
</table>
PN-6.1: Neuromuscular Disease

- Myasthenia Gravis (MG) is associated with thymic disease and can undergo:
  - CT Chest with contrast (CPT® 71260) after an established diagnosis of MG.
    - Can be repeated if initial CT previously negative and now symptoms of chest mass, rising anti-striated muscle antibody titers, or need for preoperative evaluation (clinical presentation, electro-diagnostic studies, and antibody titers).
  - CT Chest without contrast (CPT® 71250) may be used if there is concern regarding adverse effects of contrast in individuals with MG.

- Lambert–Eaton myasthenic syndrome (LEMS) is associated with small cell lung cancer and can undergo:
  - CT Chest with contrast (CPT® 71260) with a suspected diagnosis (Chest x-ray, symptoms of lung mass, clinical presentation, electro-diagnostic studies, and antibody titers).
    - Can be repeated if initial CT previously negative after 3 months with persistent suspicion.

- Stiff man syndrome is associated with small cell lung cancer and breast cancer
  - CT Chest with contrast (CPT® 71260) if Stiff Man Syndrome is suspected based on clinical findings.

PN-6.2: Inflammatory Muscle Diseases

- MRI Lower Extremity other than joint without contrast (CPT® 73718) or MRI Lower Extremity other than joint without and with contrast (CPT® 73720) and/or MRI Upper Extremity other than joint without contrast (CPT® 73218) or MRI Upper Extremity other than joint without and with contrast (CPT® 73220), usually the most affected muscle is imaged (when criteria is met imaging can be approved for bilateral studies) for:
  - Additional evaluation of myopathy or myositis (based on clinical exam and adjunct testing with EMG/NCV and labs)
  - To plan muscle biopsy
  - See PEDMS-10.3: Inflammatory Muscle Diseases in the Pediatric Musculoskeletal Imaging Guidelines

- All cases with dermatomyositis and polymyositis can undergo search for occult neoplasm See ONC–30.3: Paraneoplastic Syndromes in the Oncology Imaging Guidelines

Background and Supporting Information

- MRI and ultrasound are increasingly being used in the evaluation of muscle disease. MRI may be helpful in demonstrating abnormalities in muscles that are difficult to examine or not clinically weak, and MRI can also help distinguish between different types of muscle disease. MRI is also useful in determining sites for muscle biopsy.

PN-6.3: Gaucher Disease (Storage Disorders)

- See AB-11: Gaucher Disease and Hemochromatosis in the Abdomen Imaging Guidelines.
See PEDPN-4: Gaucher Disease in the Pediatric Peripheral Nerve Disorders Imaging Guidelines.

References
PN-7: Magnetic Resonance Neurography (MRN)

Use limited to evaluation of complicated cases and diagnostic uncertainty when other studies (EMG/NCV, ultrasound) are equivocal or non-diagnostic and results will determine intervention and/or surgical planning for peripheral nerve surgery and repair.

Reference
PN-8: Amyotrophic Lateral Sclerosis (ALS)

- MRI Brain, Cervical, Thoracic, and Lumbar Spine most often without contrast, but may be without and with contrast with meningeal symptoms.
  - Can be considered when ALS is suspected (combination of upper and lower motor neuron findings) to establish a diagnosis.
  - Repeat imaging can be evaluated based on the appropriate Spine Imaging Guidelines.

References

PN-9: Peripheral Nerve Sheath Tumors (PNST)

- Tumors (Schwannomas or Neurofibromas) that arise from Schwann cells or other connective tissue of the nerve are located anywhere in the body and can undergo advanced imaging when suspected, which may include:
  - MRI Brain without and with contrast (CPT® 70553) (Vestibular Schwannomas. See HD-33.1: Acoustic Neuroma and Other Cerebellopontine Angle Tumors in the Head Imaging Guidelines).
  - MRI Cervical, Thoracic, and Lumbar Spine without and with contrast (CPT® 72156, CPT® 72157, and CPT® 72158) if paraspinal neurofibroma is found any spine level or multiple simplex perineural neurofibromas.
  - Follow-up imaging is not needed unless:
    - New symptoms or neurological findings develop.
    - Post operatively, at the discretion of the surgeon and to reestablish baseline if the tumor was not completely removed.
    - CT Chest and Abdomen with contrast (CPT® 71260 and CPT® 74160) if malignant transformation (5%) is known or suspected.

- See PEDONC-2.3: Neurofibromatosis 1 and 2 (NF1 and NF2) in the Pediatric Oncology Imaging Guidelines.
