Instructions for use
The following coverage policy applies to health benefit plans administered by Cigna. Coverage policies are intended to provide guidance in interpreting certain standard Cigna benefit plans and are used by medical directors and other health care professionals in making medical necessity and other coverage determinations. Please note the terms of a customer’s particular benefit plan document may differ significantly from the standard benefit plans upon which these coverage policies are based. For example, a customer’s benefit plan document may contain a specific exclusion related to a topic addressed in a coverage policy.

In the event of a conflict, a customer’s benefit plan document always supersedes the information in the coverage policy. In the absence of federal or state coverage mandates, benefits are ultimately determined by the terms of the applicable benefit plan document. Coverage determinations in each specific instance require consideration of:

1. The terms of the applicable benefit plan document in effect on the date of service
2. Any applicable laws and regulations
3. Any relevant collateral source materials including coverage policies
4. The specific facts of the particular situation

Coverage policies relate exclusively to the administration of health benefit plans. Coverage policies are not recommendations for treatment and should never be used as treatment guidelines.

This evidence-based medical coverage policy has been developed by eviCore, Inc. Some information in this coverage policy may not apply to all benefit plans administered by Cigna.

These guidelines include procedures eviCore does not review for Cigna. Please refer to the Cigna CPT code list for the current list of high-tech imaging procedures that eviCore reviews for Cigna.

CPT® (Current Procedural Terminology) is a registered trademark of the American Medical Association (AMA). CPT® five digit codes, nomenclature and other data are copyright 2017 American Medical Association. All Rights Reserved. No fee schedules, basic units, relative values or related listings are included in the CPT® book. AMA does not directly or indirectly practice medicine or dispense medical services. </tbody>
</table>
PVD-1.1: General Information

A current clinical evaluation (within 60 days), including medical treatments, are required prior to considering advanced imaging, which includes:

- Relevant history and physical examination including:
  - Palpation of pulses
  - Evaluation of lower extremities for presence of non-healing wounds or gangrene
  - Associated skin changes such as thickened nails, absence of hair in the feet or calves, cool extremities
  - Evaluation for the presence of arterial bruits
  - Appropriate laboratory studies
  - Non-advanced imaging modalities, such as recent ABIs (within 60 days) after symptoms started or worsened
- Other meaningful contact (telephone call, electronic mail or messaging) by an established individual can substitute for a face-to-face clinical evaluation.

Risk factors for vascular disease include:

- Diabetes
- Cigarette smoking
- Hypertension
- Hyperlipidemia
- Age >50, with at least one risk factor, are considered “at risk” for vascular disease.
- See PV-17: Impotence/Erectile Dysfunction in the Pelvis Imaging Guidelines.

Signs and symptoms of peripheral arterial disease:

- Claudication (Cramping pain in the legs, most notably back of the calves but can involve hips or thighs, after walking which is relieved with rest but recurs at a predictable distance)
  - Symptoms that are not consistent with claudication include:
    - Generalized leg pain
    - Nocturnal cramps
    - Pain that is not easily relieved after a few minutes of rest
    - Burning pain in feet
- Critical limb ischemia
  - Rest pain: Pain in the foot (not leg) at rest, particularly at night when the leg is elevated. Pain is relieved by dangling the leg off the bed or moving to an upright position
  - Non healing wounds. Wounds present for >2 weeks with little to no evidence of healing
- Erectile dysfunction can be associated with vascular disease

Claudication and critical limb ischemia have different natural histories. Claudication generally follows a benign indolent course. 70% of individuals with claudication will have the same symptoms after five years with no progression. Critical limb ischemia, on the other hand, is associated with a high rate of limb loss (25%) and death (35%) one year after presentation.
Simultaneous venous and arterial systems evaluation are unusual but are occasionally needed.

Post angioplasty/reconstruction: follow-up imaging is principally guided by symptoms. See
- PVD-6.8: Post Aortic Endovascular/Open Surgery Surveillance Studies
- PVD-7.3: Post-Procedure Surveillance Studies

### PVD-1.2: Procedure Coding

<table>
<thead>
<tr>
<th>Non-Invasive Physiologic Studies of Extremity Arteries</th>
<th>CPT®</th>
</tr>
</thead>
<tbody>
<tr>
<td>➢ Limited bilateral noninvasive physiologic studies of upper or lower extremity arteries.</td>
<td>93922</td>
</tr>
<tr>
<td>➢ Non-invasive physiologic studies of upper or lower extremity arteries, single level, bilateral (e.g., ankle/brachial indices, Doppler waveform analysis, volume plethysmography, transcutaneous oxygen tension measurement).</td>
<td></td>
</tr>
<tr>
<td>➢ Complete bilateral noninvasive physiologic studies of upper or lower extremity arteries, 3 or more levels.</td>
<td>93923</td>
</tr>
<tr>
<td>➢ Non-invasive physiologic studies of upper or lower extremity arteries, multiple levels or with provocative functional maneuvers, complete bilateral study (e.g., segmental blood pressure measurements, segmental Doppler waveform analysis, segmental volume plethysmography, segmental transcutaneous oxygen tension measurements, measurements with postural provocative tests, measurements with reactive hyperemia).</td>
<td></td>
</tr>
</tbody>
</table>

CPT® 93922 and CPT® 93923 can be requested and reported only once for the upper extremities and once for the lower extremities.

CPT® 93922 and CPT® 93923 should not be ordered on the same request nor billed together for the same date of service.

CPT® 93924 and CPT® 93922 and/or CPT® 93923 should not be ordered on the same request and should not be billed together for the same date of service.

ABI studies performed with handheld dopplers, where there is no hard copy output for evaluation of bidirectional blood flow, are not reportable by these codes.

</tbody>
</table>

### PVD-1.3: General Guidelines – Imaging

- ABI should be measured first:
  - If normal, then further vascular studies are generally not indicated.
  - If clinical suspicion for PAD remains high with normal ABI’s, exercise ABI’s (CPT® 93924) can be performed on a treadmill to elicit ischemia
  - The TBI (toe-brachial index) is used to establish the diagnosis of PAD in the setting of non-compressible arteries (ABI >1.40) and may also be used to assess perfusion in individuals with suspected CLI (rest pain and/or non-healing wound)

- Imaging Studies:
  - Carotid studies (MRA Neck or CTA Neck) capture the area from the top of the aortic arch (includes the origin of the innominate artery, common carotid artery, and subclavian artery, which gives off the vertebral artery) to the base of the skull.
  - CTA or MRA Abdomen (CPT® 74175 or CPT® 74185) images from the diaphragm to the umbilicus or iliac crest.
  - CTA or MRA Chest (CPT® 71275 or CPT® 71555) images from the base of the neck to the dome of the liver.
  - Runoff studies (CPT® 75635 for CTA or CPT® 74185, CPT® 73725, and CPT® 73725 for MRA) image from the umbilicus to the feet.
    - CTA Abdomen and lower extremities should be reported as CPT® 75635, rather than using the individual CPT® codes for the abdomen, pelvis, and legs
    - MRA Abdomen, MRA Pelvis and MRA Lower extremities should be reported as CPT® 74185, CPT® 73725, and CPT® 73725. The CPT® code for MRA Pelvis (CPT® 72198) should not be included in this circumstance.
  - If a prior imaging study (Ultrasound, MRA, CTA, Catheter angiogram, etc.) has been completed for a condition, a follow-up, additional, or repeat study for the same condition is generally not indicated unless there has been a change in the individual’s condition, previous imaging showed an indeterminate finding, or eviCore healthcare guidelines support routine follow-up imaging.

# PVD-2: Screening for Suspected Peripheral Artery Disease/Aneurysmal Disease

<table>
<thead>
<tr>
<th>Section</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PVD-2.1</td>
<td>Asymptomatic Screening</td>
</tr>
<tr>
<td>PVD-2.2</td>
<td>Screening for Vascular Related Genetic Connective Tissue Disorders (Familial Aneurysm Syndromes/Spontaneous Coronary Artery Dissection (SCAD)/Ehlers-Danlos/Marfan/Loeys-Dietz)</td>
</tr>
<tr>
<td>PVD-2.3</td>
<td>Screening for TAA in Individuals with Bicuspid Aortic Valves</td>
</tr>
</tbody>
</table>
**PVD-2.1: Asymptomatic Screening**

- Routine screening of asymptomatic individuals for PAD is not advised. Those with CVD risk factors should be placed on best medical management and should be questioned on symptoms of PAD at annual physicals.
- Resting ABI’s (CPT® 93922) may be appropriate in individuals with abnormal pulse exams.
- Currently, there is no evidence to demonstrate that screening all individuals with PAD for asymptomatic atherosclerosis in other arterial beds improves clinical outcome.

**PVD-2.2: Screening for Vascular Related Genetic Connective Tissue Disorders (Familial Aneurysm Syndromes/Spontaneous Coronary Artery Dissection (SCAD)/Ehlers-Danlos/Marfan/Loeys-Dietz)**

- Screening for Familial Syndromes in individuals with a positive family history (1st degree relative with dissection/TAA) but no known genetic syndrome/mutation, otherwise known as Suspected Familial Aneurysm syndrome.
  - ECHO (CPT® 93306, CPT® 93307, or CPT® 93308) and chest x-ray for all First-degree relatives (parents, siblings, children) of individuals with TAA and/or dissection.
    - Any imaging listed can be performed if these studies identify a TAA or are equivocal or do not visualize the ascending aorta adequately.
    - Studies can be repeated at 2 year intervals if negative.
- Follow-Up per TAA Follow-Up guidelines.
  - For individuals with documented Marfan/Loeys-Dietz/Ehlers-Danlos type IV on initial diagnosis full vascular imaging should be performed from head to pelvis with CTA Head, carotid duplex, CTA Chest or CT Chest with contrast, and abdominal duplex. If there are no identified aneurysms or dissections, repeat imaging can be obtained at 2 year intervals.
  - Imaging should be every 6 months once an aneurysm has been identified until a decision has been made to repair.
    - Intracranial aneurysm – CTA or MRA Head.
    - Aneurysm of a cervical artery – Carotid duplex or CTA Neck if unable to fully visualize with carotid duplex.
    - Thoracic aorta – CTA Chest or CT Chest with or without contrast.
    - Abdominal aneurysm – Abdominal duplex.
    - Visceral aneurysm – These can be difficult to visualize on duplex. If not visible on duplex, can obtain a CTA Abdomen.

**PVD-2.3: Screening for TAA in Individuals with Bicuspid Aortic Valves**

- Screening in individuals with bicuspid aortic valve:
  - Screening, any requested imaging from the “Table of Thoracic Aorta Imaging Options” in **PVD 6.2 Thoracic Aortic Aneurysm (TAA)** and/or ECHO (CPT® 93306, CPT® 93307, or CPT® 93308).
Additional imaging such as Cardiac MRI, Cardiac CT, or CCTA is NOT generally indicated
- There is no evidence-based data to support screening relatives of individuals with bicuspid aortic valve
  - Follow-up per TAA Follow-Up guidelines

If no dilatation of the aortic root or ascending thoracic aorta is found, there is no evidence-based data to support continued surveillance imaging

### PVD-3: Cerebrovascular and Carotid Disease

<table>
<thead>
<tr>
<th>Section</th>
<th>Page</th>
</tr>
</thead>
<tbody>
<tr>
<td>PVD-3.1: Initial Imaging</td>
<td>14</td>
</tr>
<tr>
<td>PVD-3.2: Surveillance Imaging with NO History of Carotid Surgery or Intervention</td>
<td>15</td>
</tr>
<tr>
<td>PVD-3.3: Surveillance Imaging WITH History of Carotid Surgery or Intervention</td>
<td>16</td>
</tr>
</tbody>
</table>
PVD-3.1: Initial Imaging

- Duplex ultrasound (CPT® 93880 bilateral or CPT® 93882 unilateral), prior to considering advanced imaging, should generally be used to evaluate possible carotid artery disease when ANY of the following apply:
  - Hemispheric neurologic symptoms including stroke, TIA, or amaurosis fugax
  - Known or suspected retinal arterial emboli or Hollenhorst plaque
  - Suspected carotid dissection
  - Pulsatile neck masses
  - Carotid or cervical bruit
  - Abnormal findings on physical exam of the carotid arteries (e.g. aneurysm or absent carotid pulses)
  - Preoperative evaluation of individuals with evidence of severe diffuse atherosclerosis, scheduled for major cardiovascular surgical procedures
  - Preoperative evaluation of individuals prior to elective coronary artery bypass graft (CABG) surgery in individuals older than 65 years of age and in those with peripheral artery disease, history of cigarette smoking, history of stroke or TIA, or carotid bruit
  - Suspected Subclavian Steal Syndrome
    - See CH-27: Subclavian Steal Syndrome in the Chest Imaging Guidelines
  - Blunt neck trauma
  - Neurologic complaints after chiropractic neck manipulation
  - Vasculitis potentially involving carotid arteries, i.e. Takayasu’s arteritis and fibromuscular dysplasia (FMD)

- Carotid ultrasound screening in asymptomatic individuals due only to risk factors is not indicated

- New signs and symptoms consistent with carotid artery disease (e.g. TIA, amaurosis fugax, change in nature of a carotid bruit) are an indication to re-image the cervical vessels (regardless of when the previous carotid imaging was performed) using ANY of the following:
  - Duplex ultrasound (CPT® 93880 bilateral study or CPT® 93882 unilateral study),
  - MRA Neck with contrast (CPT® 70548) or without and with contrast (CPT® 70549),
  - CTA Neck (CPT® 70498)

- For Typical Symptoms of TIA/Stroke or Carotid Dissection:
  - See HD-21: Stroke/TIA in the Head Imaging Guidelines

- For Suspected Vertebrobasilar Pathology:
  - Initial Imaging See HD-21: Stroke/TIA in the Head Imaging Guidelines
  - Surveillance Imaging
    - Asymptomatic or unchanged symptoms and known vertebrobasilar disease or post-stenting interval determined by Vascular Specialist

- After Intracranial Hemorrhage:
  - Initial Imaging See HD-13.1: Head Trauma in the Head Imaging Guidelines
  - Surveillance Imaging
    - Interval determined by neurosurgeon or neurologist
For Suspected Subclavian Steal Syndrome:
- Initial imaging should be a carotid duplex
  - If initial duplex demonstrates high grade stenosis or occlusion of the subclavian artery, advanced imaging is NOT indicated unless the individual is symptomatic with arm claudication or signs of hypo-perfusion of the vertebral artery with recurrent dizziness
- Surveillance of subclavian arterial disease is NOT indicated if there has not been any intervention such as a carotid-subclavian bypass or subclavian stent
- Advanced imaging See **CH-27: Subclavian Steal Syndrome** in the Chest Imaging

**PVD-3.2: Surveillance Imaging with NO History of Carotid Surgery or Intervention**

- Surveillance imaging once a year for individuals with fibromuscular dysplasia of the extracranial carotid arteries.
- Reporting standards for carotid stenosis varies widely. The most commonly used criteria, however, is noted in the chart below published by the Society of Radiology in 2003

<table>
<thead>
<tr>

</tbody>
</table>

- If normal study, no routine follow-up imaging is indicated
- If <50% carotid stenosis
  - Duplex ultrasound (CPT® 93880 bilateral or CPT® 93882 unilateral) can be performed every two years
- Between 50% and 70% carotid stenosis
  - Duplex ultrasound (CPT® 93880 bilateral or CPT® 93882 unilateral) can be performed annually
  - A repeat duplex (CPT® 93880 bilateral or CPT® 93882 unilateral) may be performed in three to six months until stability is reached when ONE of the following occurs:
    - Change in the character of the bruit
• Duplex demonstrates rapid progression, including:
  • Doubling of peak systolic velocities
  • Increase of the ICA/CCA ratio
  • Heavy calcification
  • Thrombus
  • Ulcerated plaque
  • Echolucent plaque

➤ Carotid stenosis ≥70% or ICA/CCA ratio >4
  • Duplex ultrasound (CPT® 93880 bilateral or CPT® 93882 unilateral) or MRA Neck with contrast (CPT® 70548) or CTA Neck (CPT® 70498) at the following intervals:
    • Every 6 months until ONE of the following occurs:
      • Intervention is performed
      • Decision is made to not intervene

➤ MRA Neck with contrast (CPT® 70548) or CTA Neck (CPT® 70498) if duplex ultrasound shows ≥70% occlusion/stenosis of the internal carotid artery OR the ICA/CCA ratio is >4.0 even with a lower percentage of stenosis
  • If carotid stent is planned
    • MRA Head (CPT® 70544) or CTA Head (CPT® 70496) can be added

PVD-3.3: Surveillance Imaging WITH History of Carotid Surgery or Intervention

➤ Duplex ultrasound (CPT® 93880 bilateral or CPT® 93882 unilateral) post carotid surgery or intervention at the following intervals:
  • 1 month after procedure
  • Every 6 months for 2 years after procedure
  • Then annually

➤ If ≥70% residual carotid stenosis is seen at 1 month after procedure
  • Duplex ultrasound (CPT® 93880 bilateral or CPT® 93882 unilateral) at the following intervals:
    • Every 3-6 months for one year
    • Then annually

Background and Supporting Information

• Carotid intima-media thickness using duplex ultrasound imaging (Category III code 0126T) is not recommended in clinical practice for risk assessment for a first ASCVD event. Although outcomes data are lacking, Texas has adopted this method in Texas Heart Attack Preventive Screening Bill (HR 1290).

• Texas Heart Attack Preventive Screening Law (HR 1290) mandates that insurers in Texas cover either a calcium scoring study (CPT® 75571 or HCPCS S8092) or a carotid intima-media thickness study (ultrasound—Category III code 0126T) every five years for certain populations. To qualify, the following must apply:
  • Must be a Texas resident
  • Must be a member of a fully-insured Texas health plan
  • Must be a man age 45 to 75 or a woman age 55 to 75
Must have either diabetes or a Framingham cardiac risk score of intermediate or higher
Must not have had a calcium scoring study or a carotid intima-media thickness study within the past 5 years

MRA Neck (CPT® 70548) or CTA Neck (CPT® 70498) may be indicated if ultrasound is technically difficult or confirmation of the degree of stenosis on ultrasound is needed because an interventional procedure is being considered.

PVD Imaging Guidelines

PVD-4.1: Upper Extremity PVD – Imaging

- For signs and symptoms of arterial insufficiency, appropriate studies include:
  - Arterial ultrasound upper extremities (CPT® 93930 or CPT® 93931), or
  - CTA Upper extremity (CPT® 73206) or MRA Upper extremity (CPT® 73225), and/or
  - CTA Chest (CPT® 71275) or MRA Chest (CPT® 71555).

- For suspected Fibromuscular Dysplasia of the brachial artery, appropriate studies include:
  - MRA Upper extremity (CPT® 73225).
  - CTA Upper extremity (CPT® 73206).
  - Arterial Ultrasound (CPT® 93930 bilateral study or CPT® 93931 unilateral study).

- Arterial Duplex (CPT® 93931) following upper extremity arterial revascularization at:
  - Baseline (within one month)
  - 6 months
  - Then annually if stable
  - Anytime for new or worsening symptoms

- For symptoms of venous insufficiency including but not limited to unilateral pain and swelling of the upper extremity:
  - Venous duplex upper extremities (CPT® 93930 or CPT® 93931) should be performed initially.
  - If duplex ultrasound is nondiagnostic:
    - MRV Upper extremity (CPT® 73225) and/or MRV Chest (CPT® 71555), or
    - CTV Upper extremity (CPT® 73206) and/or CTV Chest (CPT® 71275).
    - CTV Upper extremity (CPT® 73206) or MRV Upper extremity (CPT® 73225), and/or CTV Chest (CPT® 71275) or MRV Chest (CPT® 71555) if there is a history of exertion with the limb such as with weight lifting or in the presence of central venous access (port, PICC line, to name a few) with a negative venous duplex. See CH-31.1: Thoracic Outlet Syndrome in the Chest Imaging Guidelines.

- For Superior Vena Cava Syndrome (upper extremity and facial symptoms):
  - CT Chest with contrast (CPT® 71260).
  - MRV (CPT® 71555) or CTV (CPT® 71275) Chest may be considered when stenting of the SVC is being considered.

Background and Supporting Information

- Signs and symptoms of arterial insufficiency include but are not limited to:
  - Arm or hand claudication, cramping or fatigue of the unilateral extremity with use or with raising limb overhead that is relieved with rest and is reproducible. See CH 27. Subclavian Steal Syndrome in the Chest Imaging Guidelines.
  - Systolic blood pressure differential between arms of <15mmHg. See CH 27. Subclavian Steal Syndrome in the Chest Imaging Guidelines.
  - Bluish discoloration of the hand or fingers
  - Unilateral cold painful pulseless hand.
Non healing wound (>2 weeks with no healing or evidence of healing) or frank gangrene

References
PVD-5.1: Pulmonary Artery Hypertension – Imaging

- Pulmonary artery hypertension (PAH) comprises a spectrum of diseases which will need direct evaluation, including ECG (right ventricular hypertrophy with/without strain, right atrial dilatation); chest x-ray; arterial blood gas, PFT’s or V/Q scan. Imaging is based on suspected etiology.

- Transthoracic echocardiogram (TTE) (CPT® 93306) should be performed initially and may be accompanied by:
  - Pulmonary venous hypertension - Stress echocardiogram (CPT® 93350 or CPT® 93351) or left and/or right heart catheterization.
  - Pulmonary hypertension associated with hypoxemia - High resolution CT Chest (CPT® 71250) to rule out restrictive lung disorders such as idiopathic pulmonary fibrosis.

- Acute or chronic pulmonary embolism – CTA Chest (CPT® 71275)

- See specific subsections

- In clinical practice, CT, CTA, MRA are usually preferred to evaluate for stenosis of these vessels rather than ultrasound (Exception: Duplex ultrasound is appropriate to rule out testicular or ovarian torsion or to evaluate an abdominal bruit or a pulsatile abdominal mass).

- **Mesenteric Ischemia**
  - See **AB-6: Mesenteric/Colonic Ischemia** in the Abdomen Imaging Guidelines.

### References

PVD-6.2: Thoracic Aortic Aneurysm (TAA)

Advanced imaging with a CT or MR is preferred imaging for this diagnosis. Given the diversity of studies, pathology and provider preference, approved thoracic imaging for this indication can be ONE of the following studies listed in the table below:

<table>
<thead>
<tr>
<th>Table of Thoracic Aorta Imaging Options</th>
<th>CPT®</th>
</tr>
</thead>
<tbody>
<tr>
<td>CT Chest, and/or Abdomen, and/or Pelvis</td>
<td>71260, 74177, 74160, 72193</td>
</tr>
<tr>
<td>CTA Chest, and/or Abdomen, and/or Pelvis</td>
<td>71275, 74175, 72191, 74174</td>
</tr>
<tr>
<td>MRA Chest, and/or Abdomen, and/or Pelvis</td>
<td>71555, 74185, 72198</td>
</tr>
</tbody>
</table>

For suspected TAA, any requested imaging from the “Table of Thoracic Aorta Imaging Options” above:
- Abnormalities identified on chest x-ray (abnormality including widened mediastinum, suspicious calcifications) or other imaging studies (fluoroscopy, MRI Spine, etc.) abnormality.1,2,3,4,5

For known TAA accompanied with chest pain or back pain and suspicion of rupture, any requested imaging from the “Table of Thoracic Aorta Imaging Options” above.1,2,3,4,5

For planning for pre–thoracic endovascular repair (TEVAR) of thoracic aorta disease.9
- CTA Chest, and/or Abdomen, and/or Pelvis (CPT® 71275, CPT® 74175, CPT® 72191, CPT® 74174); or
- MRA Chest, and/or Abdomen, and/or Pelvis (CPT® 71555, CPT® 74185, CPT® 72198)

For follow-up of ascending aortic aneurysms
- Operative treatment is reasonable for asymptomatic individuals when the diameter of the arch exceeds 5.5 cm
- For individuals with isolated aortic arch aneurysms <4.0 cm in diameter
  - Repeat imaging annually
- For individuals with isolated aortic arch aneurysms ≥4.0 cm
  - Repeat imaging 6 months

For follow-up of descending aortic aneurysms, any requested imaging from the “Table of Thoracic Aorta Imaging Options” above for the following:4,5,7,9
- “Medically” treated/observation
  - 3.5 to 4.4 cm TAA can be followed annually
  - ≥4.5 cm TAA can be followed every 6 months
  - ≥3.0 cm TAA when there is concern for growth can have a one-time 3 month interval advanced imaging
Surgery or Stent treatment
- Preoperative open or endovascular (stent) repair imaging is appropriate
- Suspicion of endoleaks
- Open Repair imaging every 3 to 5 years
- Endovascular graft/stent
  - First year: 1 month, 6 months, 12 months, then annually

Screening in the presence of other aortic aneurysms
- In an individual with a known TAA, screening for AAA is appropriate with an abdominal duplex. See **PVD-6.3: Abdominal Aortic Aneurysm (AAA)**
- In an individual with a known AAA, screening for TAA is not supported by sufficient evidence

Screening in individuals with bicuspid aortic valve or familial TAA syndromes. See PVD-2.3: Screening for TAA in individuals with bicuspid aortic valve. See PVD-2.2: Screening for Vascular related genetic connective tissue Disorders (Familial Aneurysm Syndromes/Spontaneous Coronary Artery Dissection (SCAD)/Ehlers-Danlos/Marfan/Loeys-Dietz)

**Background and Supporting Information**

- The thoracic aorta is generally divided into two segments: the ascending aorta which includes the aortic root, aortic arch and ends just distal to the left subclavian artery and the descending aorta which starts just distal to the left subclavian artery to the level of the diaphragm

**References**

2. ACR Appropriateness Criteria® Nontraumatic Aortic Disease. American College of Radiology (ACR); 2013.
7. ACR Appropriateness Criteria® thoracic aorta interventional planning and follow-up. American College of Radiology (ACR); 2017.
PVD-6.3: Abdominal Aortic Aneurysm (AAA)

- Ultrasound Abdominal aorta (CPT® 76706) is the preferred initial imaging study to screen and retroperitoneal ultrasound (CPT® 76775) to survey for AAA or to evaluate a pulsatile abdominal mass.

- **Obese Individual (BMI ≥35):** CT Abdomen and Pelvis with contrast (CPT® 74177) or without contrast (CPT® 74176) can be substituted for US using the same timeline as a non-obese individual. Ultrasound abdominal aorta should ideally first be attempted to see if the image quality is adequate.

- **Screening**
  - One-time screening recommendations for AAA (Ultrasound CPT® 76706)
    - Men and women 65 to 75 years of age with a history of tobacco use
    - Men and women older than 75 years with a history of tobacco use and in otherwise good health who have not previously received a screening ultrasound examination
    - All first-degree relatives of individuals who present with an AAA and are between 65 and 75, or in those older than 75 in good health
  - Ultrasound (CPT® 76706) for AAA screening is reasonable if there is a documented thoracic aortic aneurysm; however, there is insufficient evidence to support the use of advanced imaging to screen for a thoracic aortic aneurysm in individuals with known abdominal aortic aneurysm.

- **Surveillance recommendations for AAA (CPT® 76775)**
  - >2.5 cm but <3.0 cm: 10 years
  - 3.0 cm to 3.9 cm: 3 year intervals
  - 4.0 cm to 4.9 cm: every 12 months
  - 5.0 cm to 5.4 cm: every 6 months
  - >5.4 cm or aortic diameter has increased in size by 0.7 cm in six months, or at least 1 cm in a year may undergo more frequent monitoring and should be evaluated by a Vascular Specialist.

- **Additional Imaging**
  - CT Abdomen and Pelvis with contrast (CPT® 74177), or CT Abdomen and Pelvis without and with contrast (CPT® 74178), or CTA Abdomen and Pelvis (CPT® 74174), or CTA Abdomen (CPT® 74175), or CTA Pelvis (CPT® 72191)
    - Individuals suspected to have AAA presenting with recent-onset abdominal or back pain, particularly in the presence of a pulsatile epigastric mass or significant risk factors for AAA
    - Pre-operative imaging for AAA repair
PVD-6.4: Iliac Artery Aneurysm (IAA)

- Ultrasound (CPT® 76882 or CPT® 93925) evaluation of a suspected IAA
  - CT Pelvis with contrast (CPT® 72193) if ultrasound is equivocal.
  - Follow-up imaging studies annually with an ultrasound if an aneurysm is >2cm

- Additional Imaging
  - CT Abdomen and Pelvis with contrast (CPT® 74177), CT Abdomen and Pelvis without and with contrast (CPT® 74178), or CTA Abdomen and Pelvis (CPT® 74174) for preoperative imaging if endovascular or open repair is being considered

Background and Supporting Information

- Isolated IAA’s are rare and are typically associated with AAA
- Approximately one third to one half of isolated IAA’s are bilateral at time of presentation.
- Abdominal Aortic aneurysm rupture usually occurs at a diameter of 5 cm or larger, whereas common iliac aneurysms that are less than 3 cm in diameter almost never rupture.
PVD-6.5: Visceral Artery Aneurysm

- Treatment is generally indicated for aneurysm >2cm
- Workup for suspected visceral artery aneurysm (spleen, kidney, liver or intestines) if calcifications seen on plain film imaging can include:
  - Ultrasound (CPT® 76700 or CPT® 76705), or
  - CTA Abdomen (CPT® 74175), or
  - CT Abdomen with contrast (CPT® 74160).

- Ultrasound (CPT® 76700 or CPT® 76705) or CTA Abdomen (CPT® 74175) or CT Abdomen with contrast (CPT® 74160) for further monitoring based on the intervals below or as determined by a vascular specialist:
  - Splenic artery aneurysms:
    - <20mm can be imaged every three years
    - If >25mm, they should be referred for treatment, either stent, excision or splenectomy
  - For all other visceral artery aneurysms:
    - Initial evaluation with six-month follow-up for one year
    - Further follow-up annually if no significant enlargement is seen

- CTA Abdomen (CPT® 74175), MRA Abdomen (CPT® 74185), or CT Abdomen (CPT® 74160) are indicated following stent placement at:
  - 1 month
  - 6 months
  - 12 months
  - Then every year

Background and Supporting Information

- Visceral Artery Aneurysms are defined by an increase of more than 50% of the original arterial diameter.
- Vascular specialty consultation is beneficial in order to determine the time frame to intervention.
- Splenic artery aneurysms, the most common (60%), tend to exhibit very slow rates of growth, while the other visceral artery aneurysms are more unpredictable in their rate of growth with a greater tendency to rupture

Reference
### PVD-6.6: Renovascular Hypertension/Renal Artery Stenosis

- MRA Abdomen without or with contrast (CPT® 74185) or CTA Abdomen with contrast (CPT® 74175) if:
  - The individual is adherent to full doses of three blood pressure medications (including a diuretic) yet has still not achieved goal.
  - Sudden and persistent worsening of previously controlled hypertension
  - Onset of hypertension younger than 30 years of age.
  - Malignant hypertension with coexistent evidence of acute end-organ damage (acute renal failure, new visual or neurological disturbance and/or advanced retinopathy) or flash pulmonary edema.
  - Women who develop hypertension (≥140/90) within the first 20 weeks of pregnancy, if hypertension persists >12 weeks post-partum.
  - New or worsening renal function/increasing creatinine (especially after the administration of an ACE inhibitor or with angiotensin receptor blocking agent).
  - Unexplained atrophic kidney or discrepancy in size between kidneys of greater than 1.5 cm.

- Gadolinium agents may be contraindicated in individuals with severe renal disease or on dialysis due to the risk of developing nephrogenic systemic sclerosis

- US kidney retroperitoneal (CPT® 76775) and/or Doppler (CPT® 93975 or CPT® 93976) if expertise is available

- Screening carotid duplex (CPT® 93880) is reasonable to assess for carotid involvement in individuals with documented or highly suspicious renal artery stenosis due to fibromuscular dysplasia (mostly women between 15 and 50 years of age). CTA Abdomen (CPT® 74175) or MRA Abdomen (CPT® 74185) to screen for renovascular fibromuscular dysplasia in hypertensive individuals with documented cervicocephalic fibromuscular dysplasia. The assessment of other vascular beds should be considered if supported by suggestive symptoms or medical history.

#### Background and Supporting Information

- Renal artery revascularization has NOT been shown to be more effective than medical therapy in most situations and should not be pursued except in extreme cases, or if there is concern for Takayasu arteritis or fibromuscular dysplasia

#### References

**PVD-6.7: Aortic Dissection and Other Aortic Conditions**

- CTA or MRA entire aorta (including arch branches) and extending through the femoral arteries for suspected aortic dissection.\(^1\),\(^2\),\(^3\),\(^4\),\(^5\)

- ANY of the following studies can be used if acute dissection is suspected:
  - CT Chest (CPT® 71260 or CPT® 71270) and/or CT Abdomen (CPT® 74160 or CPT® 74170) and/or CT Pelvis (CPT® 72193 or CPT® 72194) or
    - If CT Abdomen and Pelvis with or without is requested, codes: (CPT® 74177 or CPT® 74178) are appropriate.
  - CTA Chest (CPT® 71275) and/or CTA Abdomen and/or Pelvis (CPT® 74175 or CPT® 72191 or CPT® 74174), or
  - MRA Chest and/or Abdomen and/or Pelvis (CPT® 71555 and/or CPT® 74185 and/or CPT® 72198)

- Chronic Aortic Dissections
  - 1/3 of individuals with chronic type B dissections that were not treated via open or endovascular repair will go on to develop aneurysmal disease requiring subsequent intervention. Advanced imaging of the affected segment of the aorta can be performed as follows with any of the studies noted above:
    - In individuals with a persistent false lumen or initial aortic diameter of >4cm:
      - Every 6 months for two years until stability has been reached
      - Then annually
    - In individuals with initial aortic diameter of <4cm and/or a thrombosed false lumen:
      - Annually
    - Any time if the individual is symptomatic with chest pain, back pain or has any evidence of end organ ischemia: renal dysfunction, mesenteric ischemia or acute limb ischemia

- In individuals with Marfan syndrome/Loeys-Dietz/Ehlers-Danlos
  - As aneurysmal expansion within a dissection can occur rapidly, post-dissection imaging in these individuals is indicated as follows:
    - 1 month
    - 3 months
    - 6 months
    - 12 months
    - Yearly thereafter
  - Depending on the location of the dissection the following may be approved:
    - CTA or MRA Head
    - Carotid duplex or CTA Neck or MRA Neck
    - CTA or MRA Chest
    - CTA or MRA Abdomen and Pelvis or CTA or MRA Abdomen or CTA or MRA Pelvis
Background and Supporting Information

- Classic symptoms of sharp, severe acute onset of retrosternal or interscapular chest pain is seen in 96% and is best adapted to the emergent setting. Chest x-ray is imprecise; any suspicion should be considered since up to 10% of individuals with aortic dissection present without classic symptoms.

References

PVD-6.8: Post Aortic Endovascular/Open Surgery Surveillance Studies

- Aortic root/ascending aortic aneurysm repair post-operative echocardiography (TEE/TTE) can be obtained:
  - Every three months for the first year
  - Every six months year 2
  - Annually thereafter

PVD-6.8.1: Post-operative surveillance after TEVAR for any indication

<table>
<thead>
<tr>

- CT as per above coding as requested and color duplex ultrasound (CPT® 93975 or CPT® 93976) one month after EVAR
- If no endoleak, or sac enlargement, repeat **either** preferred CT or duplex ultrasound **(but not both)** at 12 months
- If a type II endoleak is observed 1 month after EVAR, may approve **BOTH at 6 months**:
  - ANY of the above CT with contrast
  - Color Duplex US
- If no endoleak or AAA enlargement is detected at 1 year after EVAR annual surveillance with:
  - Color duplex US
  - If DGUS is not available, ANY of the above CT can be performed
- If a type II endoleak is associated with an aneurysm sac that is shrinking or stable in size:
  - Continue surveillance with color duplex US every 6 months for 2 years
  - Annually thereafter
- If US detects a new endoleak, graft migration, or aneurysm sac growth >5mm:
  - ANY of the above CT scan as requested
  - Non-contrast CT entire aorta at 5-year intervals (CPT®74176)
- Open Aortic Aneurysm Repair
  - Non-contrast enhanced CT entire aorta at 5-year intervals (CPT®74176)
  - Imaging as requested to assess for suspected infection of the graft
## PVD-6.8.3: Endovascular (Stent) Iliac Repair

<table>
<thead>
<tr>
<th>Imaging for endovascular iliac repair (stent)</th>

<tr>
<td>MRA Pelvis</td>
<td>72198</td>
</tr>
</tbody>
</table>

- ONE of the above studies can be performed for endovascular iliac repair (stent)
- If performed in conjunction with EVAR, surveillance can follow the same schedule as EVAR.
- For isolated iliac artery aneurysm repair, surveillance can be performed with an arterial duplex (CPT® 93975 or CPT® 93976) or CT or MR as above if duplex unavailable:
  - Post-operatively within the first month
  - 6 months after endovascular treatment
  - Then annually

</tbody>
</table>
PVD-7.1: Claudication

Resting ABI for initial evaluation for suspected PAD. This can be accomplished at the bedside as part of the physical examination or requested as CPT® 93922 (limited Doppler ultrasound) or CPT® 93923 (multi-level complete Doppler ultrasound).

- CPT® 93923 may be performed once.
- Follow-up studies may be performed with CPT® 93922.
- Post-exercise ABI (CPT® 93924) can be performed if the resting ABI is >0.89 and PAD is still highly suspected clinically.

History and physical suggestive of PAD include:

- History
  - Claudication - reproducible calf or thigh cramping with exertion that is relieved completely with rest
  - Critical limb ischemia
  - Rest pain suggestive of ischemia - pain in the ball of foot when the leg is in an elevated position particularly at night
  - Distal non-healing wound or punched out ulcer with sharply demarcated edges present for >2 weeks with no evidence of healing, i.e. presence of granulation tissue

- Physical Examination
  - Abnormal lower extremity pulse examination
  - Vascular bruit
  - Non-healing lower extremity wound
  - Lower extremity gangrene
  - Other suggestive lower extremity physical findings (e.g., elevation pallor/dependent rubor)
  - Atrophic nails, hair loss, shiny skin

If resting ABI (CPT® 93922) is normal (0.9 to 1.3) and disease is still suspected:

- Differentiate from “pseudoclaudication” See **SP-9: Lumbar Spinal Stenosis** in the Spine Imaging Guidelines
- Re-measure ABI after exercise (CPT® 93924)
- A toe-brachial index may be used as further screening in individuals with ABI’s greater than 1.3
- Advanced imaging is necessary only if there is consideration for invasive therapy not to confirm diagnosis

Duplex ultrasound (CPT® 93925 bilateral study or CPT® 93926 unilateral study) and Doppler studies are adjuncts to abnormal ABI that may be used to identify location and extent of disease once there has been a decision for revascularization.

MRA Aorta and Pelvic vessels, and Lower extremities (CPT® 74185, CPT® 73725 and CPT® 73725), or CTA with run off (CPT® 75635) to further evaluate the lower extremity arteries for the purpose of preoperative planning for ANY of the following:

- Intermittent claudication (i.e. non-limb threatening ischemia) and either:
  - Failed 3 months conservative medical therapy (physician supervised walking/exercise program plus medical therapy), or
- Functional disability (e.g., exercise impairment sufficient to threaten the individual’s employment or to require significant alterations in the individual’s lifestyle)
  - Potentially limb-threatening vascular disease evidenced by:
    - Skin breakdown
    - Non-healing ischemic ulcers
    - Resting leg pain
    - Gangrene
  - Blue Toe Syndrome:
    - Emboli from aortic plaque or mural thrombus
    - Hyperviscosity syndrome
    - Hypercoagulable states
    - Vasculitis
  - Note: MRA Pelvis should not be requested/billed with CPT® 74185, CPT® 73725 and CPT® 73725.

**Background and Supporting Information**

Claudication symptoms usually remain stable (70% to 80% of individuals) and do not worsen or improve at rapid rates. Repeat studies to assess the efficacy of medical therapy are not indicated unless there is a negative change in clinical status for the purpose of preoperative planning for the purpose of preoperative planning such as worsening claudication or progression to critical limb ischemia.

**PVD-7.2: Popliteal Artery Entrapment Syndrome**

- Diagnosis of popliteal artery stenosis or occlusion due to compression by adjacent muscle and tendons seen in young men (ages 20 to 40).\(^{10}\)
  - Ultrasound (CPT® 93926 unilateral study), CTA Lower extremity (CPT® 73706), or MRA Lower extremity (CPT® 73725).
  - CT or MRI Lower Extremity (contrast as requested) if requested by the operating surgeon.

**PVD-7.3: Post-Procedure Surveillance Studies**

- Scheduled Interval
  - ABI (CPT® 93922) following any revascularization procedure.
    - ABI (CPT® 93922) or Duplex ultrasound (CPT® 93926 unilateral study) at each routine follow up is appropriate generally after a history/physical has been performed.
    - Further imaging studies such as CTA or MRA are indicated for worsening symptoms, an abnormal duplex or a significant reduction (>0.15) in the ABI

**PVD-7.3.1: For suprainguinal disease:**

- Arterial duplex (CPT® 93978 or CPT® 93979), or CTA Abdomen and Pelvis (CPT® 74174), or CT Abdomen and Pelvis with contrast (CPT® 74177), or CTA Aorta with lower extremity runoff (CPT® 75635), or MRI Abdomen and Pelvis, or MRA Abdomen and Pelvis, or MRA Aorta with Lower extremity runoff for:
  - Worsening signs or symptoms
  - Reduction of ABI >0.15
  - Peak systolic velocities or PSV ratio suggestive of high grade stenosis or in-stent re-stenosis
**PVD-7.3.2: For infraininguinal bypass:**

- CTA Lower extremity (CPT® 73706) or MRA Lower extremity for:
  - Worsening signs or symptoms
  - Reduction of ABI >0.15
  - Duplex suggestive of threatened graft

- If intervention was performed for a non-healing wound and wound has gone on to heal, no additional imaging is recommended for surveillance. Repeat arterial duplex imaging can be obtained for worsening clinical signs and symptoms such as the presence of a new wound or rest pain.

PVD-8: Imaging for Hemodialysis Access

PVD-8.1: Preoperative Arterial Evaluation and Venous Mapping Prior to AV Fistula Creation
PVD-8.1: Preoperative Arterial Evaluation and Venous Mapping Prior to AV Fistula Creation

- There is a Level II HCPCS code for vessel mapping prior to AV fistula creation that does not have a CPT® Level I equivalent, (HCPCS code G0365 [vessel mapping of vessels for hemodialysis access {services for preoperative vessel mapping prior to creation of hemodialysis access using an autogenous hemodialysis conduit, including arterial inflow and venous outflow}]). Therefore, CPT® codes for duplex venous and arterial are used for this purpose.

- In some instances, MRA Upper Extremity (CPT® 73225) may be needed if duplex imaging is equivocal.

- Arterial evaluation to assess arterial suitability (size, degree of stenosis and calcification) prior to AV fistula creation may be appropriate
  - CPT® 93930 or CPT® 93931 can be used to report upper extremity arterial evaluation
  - Venous mapping to assess venous suitability prior to AV fistula creation may be appropriate
    - CPT® 93970 or CPT® 93971 can be used to report venous mapping

- Indications for Duplex ultrasound (CPT® 93990) of hemodialysis access include but are not limited to:
  - Individuals with decreased flow rates during hemodialysis.
  - Development of arm swelling or discomfort after access placement surgery or a hemodialysis session.
  - Prolonged immaturity of a surgically created AV fistula.
  - Suspected pseudoaneurysm.
  - Suspected AV fistula or graft stenosis.
  - Known or suspected fluid collection adjacent to an AV fistula or graft.
  - Though it is, generally, not needed, one Duplex ultrasound (CPT® 93990) can be performed after a surgically created AV fistula for assessment.

PVD-11.2: Background Information

A current clinical evaluation (within 60 days), including medical treatments, are required prior to considering advanced imaging, which includes:

- Relevant history and physical examination including:
  - The affected limb(s), the extent of the edema (calf and/or thigh), pitting or non-pitting. With regard to venous insufficiency, presence or absence of hyperpigmentation or other skin changes, ulcerations if applicable, size of varicosities if present as well as distribution
  - Arterial examination to rule out phlegmasia alba/cerulea dolens which is comprised arterial flow secondary to extensive DVT if applicable
  - Appropriate laboratory studies, for example d-dimer, if applicable
  - Non-advanced imaging modalities, such as a venous duplex or venous valvular insufficiency study (VVI) after symptoms started or worsened
- Other meaningful contact (telephone call, electronic mail or messaging) by an established individual can substitute for a face-to-face clinical evaluation.

Venous disease can be classified into three categories:
- Veno-occlusive disease
- Venous insufficiency
- Venous malformations

Veno-occlusive disease

- Types of thrombotic disease:
  - Superficial venous thrombosis
  - Deep venous thrombosis
  - Iliac vein obstruction, unilateral or bilateral
  - May-Thurner’s syndrome

- Signs/Symptoms of veno-occlusive disease is generally sudden onset of pain and edema in the limb.

- Risk factors include age >40, obesity, pregnancy, prolonged immobility, post-surgery, and malignancy among others.

- Procedures related to veno-occlusive disease include:
  - Thrombolysis (CPT® 37799, CPT® 37212, CPT® 37213, CPT® 37214)
  - Thrombectomy (CPT® 37187)
  - Post Iliac vein angioplasty/stenting (CPT® 37205 and CPT® 75960)

Venous insufficiency

- Types of venous insufficiency:
  - Superficial and deep venous reflux
  - Varicose veins
  - Reticular and spider veins

- Signs/symptoms of venous insufficiency include:
  - Chronic swelling in the leg that is relieved with elevation
  - Chronic swelling in the leg that is worse in the evenings
- Aching or sense of heaviness in the leg
- Hyperpigmentation of the calf particularly around the ankle
- Itchy skin on legs and feet
- Leather appearance of the skin of the calves
- Skin ulcers in the calf particularly around the medial malleolus
- Varicose veins
- Spider veins/reticular veins/telangiectasias

Procedures related to the venous insufficiency include:
- Endovenous laser ablation utilizing either chemical, laser (CPT® 36478, CPT® 36479) or radio-frequency (CPT® 36475, CPT® 36476)
- Saphenous vein high ligation and stripping (CPT® 37720, CPT® 37730)
- Phlebectomy, stab (CPT® 37765, CPT® 37766) or powered (CPT® 37785)
- Sclerotherapy, liquid or foam (CPT® 36470, CPT® 36471)

Venous malformations

- Types of venous malformations include
  - Arterio-venous malformations which can occur throughout the body
  - See **CH-24.1: Pulmonary AVM** in the Chest Imaging Guidelines
  - See **HD-12: Aneurysm and AVM** in the Head Imaging Guidelines
  - See **PV-11: Pelvic Pain/Dyspareunia, Female** in the Pelvis Imaging Guidelines
  - Klippel-Trenaunay which affects primarily the lower extremity venous circulation and is characterized by varicose veins, limb size discrepancies, and port-wine stains.

- Treatment includes:
  - Primarily embolization (CPT® 37204 and CPT® 75894)
  - Sclerotherapy (CPT® 36470, CPT® 36471)
  - Klippel-Trenaunay: treatment can include phlebectomy (CPT® 37765, CPT® 37766) and sclerotherapy (CPT® 36470, CPT® 36471) of symptomatic varicose veins provided they meet the criteria for intervention.

- These codes are used to report studies of lower or upper extremity veins.
- A complete bilateral study of the lower extremity veins includes examination of the external iliac veins, common femoral, proximal deep femoral, great saphenous and popliteal veins. Calf veins may also be included.
- A complete bilateral study of upper extremity veins includes examination of the subclavian, jugular, axillary, brachial, basilic, and cephalic veins. Forearm veins may also be included.

| Duplex scan of aorta, inferior vena cava, iliac vasculature, or bypass grafts; complete study | 93978 |
| Duplex scan of extremity veins, including responses to compression and other maneuvers; unilateral or limited study. | 93979 |
PVD-11.4: General Guidelines – Imaging

Venous duplex (CPT® 93970, CPT® 93971) of the limb is the initial imaging of choice.

- Follow-up duplex imaging (CPT® 93970, CPT® 93971) is not generally indicated to document resolution and should only be obtained for new signs/symptoms or for concerns of propagation of thrombus when the treatment plan would change (Insertion of IVC filter, change of anticoagulation, etc.).

Imaging studies

- Venous duplex (CPT® 93970, CPT® 93971) should visualize the veins, with demonstration of the presence or absence of compressibility and venous flow.
- Venous valvular insufficiency studies (CPT® 93970, CPT® 93971) visualize the veins of the lower extremity, assess for reflux (reversal of venous antegrade flow after valve closure) and measure its duration.
- CTV or MRV Abdomen and Pelvis with contrast involves taking images from the diaphragm to just below the inguinal ligament after a delay of a few minutes after IV contrast is administered to optimize filling and therefore visualization of the venous vasculature.

## PVD-12: Acute Limb Swelling

<table>
<thead>
<tr>
<th>PVD-12.1: Superficial Venous Thrombosis (SVT)</th>
<th>53</th>
</tr>
</thead>
<tbody>
<tr>
<td>PVD-12.2: Acute Deep Venous Thrombosis (DVT)</td>
<td>53</td>
</tr>
<tr>
<td>PVD-12.3: Follow-up Imaging of Known DVT</td>
<td>54</td>
</tr>
<tr>
<td>PVD-12.4: Follow-up Imaging After Venous Surgery</td>
<td>54</td>
</tr>
</tbody>
</table>
PVD-12.1: Superficial Venous Thrombosis (SVT)

The diagnosis of superficial venous thrombosis is generally made on the basis of physical examination.

- Duplex ultrasound (CPT® 93970, CPT® 93971) is the initial imaging if the diagnosis is equivocal
- Follow-up duplex ultrasound (CPT® 93970, CPT® 93971) is indicated only if thrombus in the superficial systems is encroaching onto the deep venous system (saphenofemoral or saphenopopliteal junction)

**Background and Supporting Information**

Superficial venous thrombosis (SVT) refers to acute or chronic thrombosis of the superficial veins in both the upper (cephalic and basilic veins) and lower extremities (greater [great] saphenous vein, lesser [small] saphenous vein, gastrocnemius and soleal veins). Treatment: Elevation and warm compresses until pain and swelling subsides.

PVD-12.2: Acute Deep Venous Thrombosis (DVT)

- Duplex ultrasound (CPT® 93970 bilateral study or CPT® 93971 unilateral study) is the initial imaging study for any suspected DVT
- Deep venous thrombosis can present as:
  - Symptomatic
    - Swelling
    - Pain
    - Warmth
    - Erythema
    - Pain with dorsiflexion of the foot (Homan’s Sign)
    - Or with progression, such as phlegmasia cerulean dolens
- Risk factors for DVT include age >40, obesity, malignancy, prolonged immobilization, hypercoaguability as well as those outlined in CH-25: Pulmonary Embolism (PE) in Chest Imaging Guidelines.

- CTA/CTV Abdomen and Pelvis with contrast can be performed to rule out IVC thrombus secondary to the filter when there is acute bilateral lower extremity swelling in an individual with a history of an IVC filter in place.

- When there is concern for proximal DVT (iliofemoral):
  - Focused abdominal duplex can generally visualize the iliac veins and IVC to determine the absence or presence of iliac vein thrombus in an individual. If the results are equivocal or indeterminate:
    - CTV or MRV Abdomen and Pelvis with contrast can be performed.
  - For proximal DVT’s (iliac vein DVT’s or in cases of phlegmasia (extensive DVT compromising arterial inflow), thrombectomy (rarely performed) or thrombolysis can be performed.
  - If the cause of the DVT is found to be due to May-Thurner, iliac vein angioplasty followed by stenting of the left iliac vein is generally performed. See PVD-13.3 May-Thurner Syndrome
**Background and Supporting Information**

- Deep venous thrombosis is characterized by thrombosis of a deep vein in either the upper (brachial, axillary, subclavian veins) or the lower extremity (peroneal, posterior tibial, popliteal, femoral or iliac veins).

**PVD-12.3: Follow-up Imaging of Known DVT**

- Duplex ultrasound (CPT® 93970 bilateral study or CPT® 93971 unilateral study) can be repeated in order to rule out proximal extension of a calf vein DVT in those individuals who cannot be anticoagulated, most commonly after recent surgery.
- Time interval for follow-up study includes:
  - One week after the initial diagnosis.
  - Serial imaging (up to 3 studies) over the first three weeks if calf DVT is not treated.

- Imaging during or to terminate long-term anticoagulation therapy to determine venous recanalization is not supported by evidence. Repeat imaging to make decisions on whether or not to continue or terminate anticoagulation is not indicated.

**PVD-12.4: Follow-up Imaging after Venous Surgery**

- Venous duplex (CPT® 93971 unilateral study) can be obtained of the treated limb to rule out a DVT within seven days of endovenous ablation.
- Follow-up routine imaging is not indicated after other venous procedures including:
  - Saphenous vein ligation and stripping
  - Phlebectomy
  - Sclerotherapy

PVD-13: Chronic Limb Swelling Due to Chronic Deep Venous Thrombosis/May Thurner’s Syndrome

<table>
<thead>
<tr>
<th>Section</th>
<th>Page</th>
</tr>
</thead>
<tbody>
<tr>
<td>PVD-13.1: Chronic Deep Venous Thrombosis – General Information</td>
<td>56</td>
</tr>
<tr>
<td>PVD-13.2: Post Thrombotic Syndrome</td>
<td>56</td>
</tr>
<tr>
<td>PVD-13.3: May-Thurner’s Syndrome – General Information</td>
<td>56</td>
</tr>
</tbody>
</table>
PVD-13.1: Chronic Deep Venous Thrombosis – General Information

- In individuals with a history of proximal (iliofemoral) DVT who have subsequently developed post thrombotic syndrome, imaging can be performed to evaluate for iliac venous obstruction which can result from incompletely lysed thrombus.
  - Initial imaging should be Duplex (CPT® 93970 bilateral study or CPT® 93971 unilateral study) followed by either a CT or MR Venogram Abdomen and Pelvis or CT or MR Venogram Pelvis or Venography (CPT® 36005 and CPT® 75820) for treatment planning purposes.
  - Selected individuals may be a candidate for iliac vein angioplasty/stenting.

Background and Supporting Information

- Chronic deep venous thrombosis is defined as an acute DVT that is greater than 14 days old.
- Individual with incompletely lysed or residual DVT can develop post-thrombotic syndrome that can be characterized as chronic edema, venous stasis changes, pain and in advanced cases venous stasis ulceration.
  - Incompletely lysed DVT can cause luminal narrowing of the vein restricting venous outflow leading to stenosis or occlusion and /or can lead to valve dysfunction resulting in reflux of venous blood retrograde towards gravity. Both pathologies ultimately lead to chronic edema which can cause chronic pain and venous stasis disease.
    - Imaging for post-thrombotic syndrome is not indicated unless there are signs and symptoms suggestive of a new acute DVT or for preoperative planning for iliac vein/stenting for suspected iliac vein stenosis or occlusion.
    - The mainstay of treatment for chronic deep venous thrombosis is compression stockings.

PVD-13.2: Post Thrombotic Syndrome

- Imaging for post-thrombotic syndrome is indicated when:
  - There are signs and symptoms suggestive of a new acute DVT (NOT for chronic swelling that has not changed in severity or character)
  - For preoperative planning for iliac vein/stenting in the setting of known iliac

- See PVD-13.3: May-Thurner’s syndrome

PVD-13.3: May-Thurner’s Syndrome – General Information

- Duplex (CPT® 93970 bilateral study or CPT® 93971 unilateral study) will confirm the presence of a left common iliac vein DVT but diagnosis is made with advanced imaging such as CTV or MRV Abdomen and Pelvis, Venography (CPT® 36005 and CPT® 75820) or Peri-Procedural Intravascular ultrasound (CPT® 37252, CPT® 37253) demonstrating compression of the vein.
Treatment is with iliac vein angioplasty/stenting (CPT® 37205 and CPT® 75960) for both acute and chronic left-sided DVT

Prophylactic treatment of May-Thurner’s syndrome in the absence of acute or chronic DVT OR chronic left lower extremity edema and its sequelae such as varicose veins or venous stasis ulcers is NOT considered medically necessary.

**Background and Supporting Information**

In approximately 25% of people, the right iliac artery overlies the left iliac vein over the fifth lumbar vertebrae and its pulsations can compress the vein increasing the risk of DVT in the left extremity.

**References**

## PVD-14: Chronic Limb Swelling Due to Venous Insufficiency/Venous Stasis Changes/Varicose Veins

<table>
<thead>
<tr>
<th>Section</th>
<th>Page</th>
</tr>
</thead>
<tbody>
<tr>
<td>PVD-14.1: Venous Insufficiency – General Information</td>
<td>59</td>
</tr>
<tr>
<td>PVD-14.2: Venous Reflux</td>
<td>59</td>
</tr>
<tr>
<td>PVD-14.3: Varicose Veins</td>
<td>60</td>
</tr>
<tr>
<td>PVD-14.4: Spider Veins/Reticular Veins</td>
<td>60</td>
</tr>
</tbody>
</table>
PVD-14.1: Venous Insufficiency – General Information

- Venous insufficiency is characterized by failure of the venous blood to flow in its normal antegrade path of flow and instead reflux backwards by the force of gravity usually secondary to malfunction of the venous valves.
- Risk factors include previous DVT, obesity, female sex, hereditary, and environmental factors such as prolonged standing on a hard surface.
- Venous insufficiency loosely includes the diagnosis of venous reflux, varicose veins, venous stasis ulcers and spider/reticular veins.

PVD-14.2: Venous Reflux

- A duplex ultrasound (CPT® 93970 bilateral study or CPT® 93971 unilateral study) demonstrating the presence of pathologic reflux within the greater and lesser saphenous veins should be undertaken within the last six months. Vein size should be documented.
- Treatment of symptomatic superficial venous reflux is via endovenous laser (CPT® 36478, or CPT® 36479)/radiofrequency ablation (CPT® 36475, or CPT® 36476) of the greater or lesser saphenous vein resulting in closure of the vein allowing for venous blood to be rerouted to the deep venous system.
- Treatment of symptomatic superficial venous reflux can also be treated via saphenous vein ligation and stripping which has fallen out of favor but can be performed for a tortuous or enlarged (>15mm) greater or lesser saphenous vein. One complication of endovenous ablation is deep venous thrombosis.
- A post ablation venous ultrasound (CPT® 93970 bilateral study or CPT® 93971 unilateral study) is indicated within seven days post procedure. If thrombus is noted within the saphenofemoral junction, repeat imaging can be performed within seven days to assess for propagation into the deep system.
- Ultrasound mapping or monitoring techniques are considered medically necessary only to initially determine the extent and configuration of symptomatic varicosities or valvular insufficiency. Post procedure assessment by imaging techniques is inappropriate to confirm efficacy or outcome of the procedure.

Background and Supporting Information

- Diagnosis is made with a venous valvular insufficiency study (CPT® 93970 bilateral study or CPT® 93971 unilateral study) which documents the presence of reflux (>500ms) in the greater saphenous vein as well as the size of the refluxing vein (3-15mm).
- Symptoms of venous reflux include chronic edema, pain, and venous stasis ulcerations. Symptoms of venous reflux can be ameliorated with compression therapy with graded compression stockings, elevation, avoidance of prolonged standing and weight loss. Venous reflux can be seen in both the deep and superficial venous systems. Reflux within the deep system is not amenable to intervention.
Treatment of deep venous reflux is via active compression with compression stocks, pneumatic pumps or specialized dressings such as Unna boots.

Treatment of superficial venous reflux is amenable to intervention in selected individuals who are symptomatic and have failed conservative therapy.

### PVD-14.3: Varicose Veins

- If the varicosities remain symptomatic despite conservative therapy, varicose veins are treated with sclerotherapy (CPT® 36470, CPT® 36471) or phlebectomy (CPT® 37765, CPT® 37766, CPT® 37785) generally on the basis of size.

**Background and Supporting Information**

- Varicose veins are defined as enlarged, tortuous veins visible under the skin. Symptoms associated with varicose veins include achiness and heaviness of the legs and pain/discomfort over the varicosities. Varicose veins can exist both in the absence and presence of venous reflux.

- Treatment involves conservative therapy such as compression stockings, avoidance of prolonged standing, intermittent elevation, weight loss (if applicable) and exercise which relieves the distention of the varicose veins ameliorating the symptoms.

### PVD-14.4: Spider Veins/Reticular Veins

- Treatment of spider veins is generally cosmetic except in certain cases and can be treated with sclerotherapy (CPT® 36470, CPT® 36471)

**Background and Supporting Information**

- Spider veins are formed by the dilation of a cluster of blood vessels within the dermis – generally <3mm in diameter. Diagnosis is via physical examination. Spider veins are usually asymptomatic but can cause aching, burning and tenderness in the area overlying the abnormal veins. Spider veins can exist in the absence or presence of venous reflux. The presence of spider veins should not be an indication for treatment of venous reflux.

## PVD-15: Venous Stasis Ulceration

<table>
<thead>
<tr>
<th>Section</th>
<th>Title</th>
<th>Page</th>
</tr>
</thead>
<tbody>
<tr>
<td>PVD-15.1</td>
<td>Venous Stasis Ulcers – General Information</td>
<td>63</td>
</tr>
<tr>
<td>PVD-15.2</td>
<td>Venous Stasis Ulcers-Treatment</td>
<td>63</td>
</tr>
</tbody>
</table>
PVD-15.1: Venous Stasis Ulcers – General Information

- Venous stasis ulcers can arise from maceration of the skin in individuals with venous insufficiency often with minimal trauma. The area over the medial malleolus is usually the most commonly affected area. The presence of chronic edema from either venous reflux, post-thrombotic syndrome or either etiology predisposes to the formation of venous stasis ulcerations.

PVD-15.2: Venous Stasis Ulcers-Treatment

- In select individuals with venous stasis ulcers felt to be due to superficial venous reflux, incompetent perforators, and/or significant varicosities, the following may be indicated:
  - Endovenous ablation with RF or with laser for treatment of saphenous vein reflux and incompetent perforators
  - Saphenous vein ligation and stripping for treatment of saphenous vein reflux and varicose veins
  - Phlebectomy for treatment of varicose veins
  - Sclerotherapy for treatment of incompetent perforators and varicose veins

Background and Supporting Information

- The mainstay of treatment is a sterile dressing +/- adjunctive wound care salves coupled with compression with either stockings or wraps to reduce edema

PVD-16: IVC Filters

| PVD-16.1: IVC Filters – General Information | 65 |
| PVD-16.2: IVC Filters – Treatment          | 65 |
**PVD-16.1: IVC Filters – General Information**

- IVC filters are placed in individuals with known DVT that cannot be anti-coagulated, individuals with poor pulmonary reserve and high risk for DVT, or prophylaxis in trauma and surgical individuals.
- Most IVC filters inserted are retrievable and should be removed as soon as clinically feasible. After 12 months, removal of IVC filters can become technically more difficult.

**PVD-16.2: IVC Filters – Treatment**

- IVC filter insertion
  - An initial venous duplex can be performed to assess for the presence of thrombus in the femoral vein which would affect the approach (transjugular or transfemoral)
  - Advanced imaging is not indicated
- CT Abdomen and Pelvis (CPT® 74176) for ANY of the following:
  - KUB demonstrates tilting of the filter or malposition of one of the filter thongs
  - New **bilateral** lower extremity swelling (venous duplex should be performed first)
  - Filter present for >12 months, with documentation stating intent to remove
PVD-17.1: Post Iliac Vein Stenting/Angioplasty

- Iliac venous stents can be placed after thrombolysis for DVT associated with May-Thurner’s syndrome, DVT associated with extrinsic compression or for post thrombotic iliac obstruction.
  - Surveillance of iliac venous stents with an arterial duplex (CPT® 93975) can be obtained
  - For worsening signs or symptoms including increased edema when stent malfunction is suspected
  - Postoperatively within the first month, at six months, twelve months and then annually

- Advanced imaging CTV or MRV Abdomen and Pelvis can be obtained for an abnormal or indeterminate duplex
