eviCore healthcare Clinical Decision Support Tool Diagnostic Strategies: This tool addresses common symptoms and symptom complexes. Imaging requests for individuals with atypical symptoms or clinical presentations that are not specifically addressed will require physician review. Consultation with the referring physician, specialist and/or individual’s Primary Care Physician (PCP) may provide additional insight.

CMM-208.1 Definitions

Radiofrequency joint denervation/ablation (i.e., facet neurotomy, facet rhizotomy) refers to the insertion of a radiofrequency probe towards the median branch of the posterior primary rami, which supplies the innervation to the facet joints under fluoroscopic guidance. The radiofrequency electrode is then utilized to create a “continuous” heat lesion by coagulating the nerve supplying the joint with the intention of providing pain relief by denervating the painful facet joint.

CMM-208.2 General Guidelines

Radiofrequency joint denervations/ablations should be performed using fluoroscopy. Performance of radiofrequency joint denervation/ablations without the use of fluoroscopic guidance is considered not medically necessary.

CMM-208.3 Indications and Non-Indications

✓ A radiofrequency joint denervation/ablation is considered medically necessary for facet mediated pain resulting from disease, injury or surgery and confirmed by provocative testing when BOTH of the following criteria are met:
   o Failure of at least three (3) months of conservative care (e.g., exercise, physical methods including physical therapy, chiropractic care, NSAID’s and/or analgesics)
   o Two positive diagnostic medial branch block or facet joint injections using either a local anesthetic or a local anesthetic combined with corticosteroid as evidenced by EITHER of the following:
     ▪ A beneficial clinical response to an intra-articular facet injection or medial branch block performed with a local anesthetic with greater than 80% pain relief reported for the duration of the effect of the local anesthetic when no corticosteroids are added to the injectate
     ▪ A beneficial clinical response to an intra-articular facet joint injection or medial branch block performed with a local anesthetic and a corticosteroid with at least a 50% reduction in pain for at least one week.

✓ In the absence of two sequential positive diagnostic facet joint injections/medial branch blocks a radiofrequency joint denervation/ablation is considered not medically necessary.
A radiofrequency joint denervation/ablation should only be performed for neck pain or low back pain in the absence of an untreated radiculopathy. The performance of a radiofrequency joint denervation/ablation in an individual with an untreated radiculopathy is considered not medically necessary.

A repeat radiofrequency joint denervation/ablation is considered medically necessary when there is documented pain relief of at least 50% which has lasted for a minimum of 12 weeks. While repeat radiofrequency joint denervations/ablations may be required, they should not occur at an interval of less than six (6) months from the first procedure. No more than two (2) procedures at the same level(s) should be performed in a 12 month period.

When performing radiofrequency joint denervations/ablations, no more than three (3) levels should be performed during the same session/procedure. It is considered medically necessary to perform the procedure at the same level or levels bilaterally during the same session/procedure. The performance of the procedures on more than three (3) levels is considered not medically necessary.

A radiofrequency joint denervation/ablation is considered medically necessary when performed on an individual with previous spinal fusion only when performed at levels above or below the fusion.

Based on the lack of published peer-reviewed scientific literature on the efficacy of these methods of ablation, the following procedures are considered experimental, investigational, or unproven:

- Pulsed radiofrequency ablation for chronic pain syndromes
- Endoscopic radiofrequency denervation/endoscopic dorsal ramus rhizotomy
- Cryoablation/cryoneurolysis/cryodenervation
- Chemical ablation (e.g., alcohol, phenol, glycerol)
- Laser ablation
- Ablation by any method for sacroiliac (SI) joint pain
- Cooled radiofrequency ablation
