Instructions for use

The following coverage policy applies to health benefit plans administered by Cigna. Coverage policies are intended to provide guidance in interpreting certain standard Cigna benefit plans and are used by medical directors and other health care professionals in making medical necessity and other coverage determinations. Please note the terms of a customer’s particular benefit plan document may differ significantly from the standard benefit plans upon which these coverage policies are based. For example, a customer’s benefit plan document may contain a specific exclusion related to a topic addressed in a coverage policy.

In the event of a conflict, a customer’s benefit plan document always supersedes the information in the coverage policy. In the absence of federal or state coverage mandates, benefits are ultimately determined by the terms of the applicable benefit plan document. Coverage determinations in each specific instance require consideration of:

1. The terms of the applicable benefit plan document in effect on the date of service
2. Any applicable laws and regulations
3. Any relevant collateral source materials including coverage policies
4. The specific facts of the particular situation

Coverage policies relate exclusively to the administration of health benefit plans. Coverage policies are not recommendations for treatment and should never be used as treatment guidelines.

This evidence-based medical coverage policy has been developed by eviCore, Inc. Some information in this coverage policy may not apply to all benefit plans administered by Cigna.

CMM-203.1 Definitions

The presence of pain over the sacroiliac joint in the absence of radicular findings in and of itself does not substantiate the diagnosis of sacroiliac joint pain. There must also be clinical evidence as described below.

Intra-articular sacroiliac joint injection refers to the injection of contrast (absent allergy to contrast), followed by the introduction of a corticosteroid and/or a local anesthetic into the sacroiliac joint under fluoroscopic guidance.

Peri-articular injection refers to the introduction of a corticosteroid and/or a local anesthetic to one or more sections of the posterior ligamentous structures of the sacroiliac joint.

Sacroiliac joint pain is defined as pain originating from the sacroiliac joint and/or its supporting ligamentous structures as a result of injury, disease or surgery. Clinical components required to support the diagnosis of sacroiliac joint pain include all of the following:

- Pain primarily experienced between the upper level of the iliac crests and the gluteal fold (the pain can refer distally, even below the knee)
- A negative neurological examination for the presence of radicular symptoms/radiculopathy
- Reproduction of pain using at least three (3) of the following provocative tests:
  - Distraction or “Gapping” or FABER/Patrick’s Test
  - Thigh Thrust or Posterior Pelvic Pain Provocational Test
  - Gaenslen’s Test
  - Sacroiliac Joint Compression Test
  - Sacral Thrust or Yeoman’s Test.

CMM-203.2 General Guidelines

Intra-articular sacroiliac joint injections should be performed using fluoroscopy with injection of contrast (absent allergy to contrast) for guidance, as it is considered the standard of care.

Peri-articular sacroiliac joint injections may be performed with or without the use of fluoroscopic guidance.

When sacroiliac joint injections are performed (anesthetic only) for the purpose of diagnosing sacroiliac pain, a positive diagnostic response is defined as 50% pain relief for the duration of the local anesthetic.

Sacroiliac injections performed for the purpose of treating sacroiliac pain are termed therapeutic sacroiliac injections. When medical necessity criteria is met, a total of four therapeutic sacroiliac injections for the treatment of sacroiliac pain may be performed per joint during a 12 month period of time, with at minimum of two months duration between each injection, for the recurrence of pain.

The performance of interventional pain procedures such as a sacroiliac joint injection does not require the need for supplemental anesthesia in addition to local anesthesia.
CMM-203.3 Indications

The performance of a diagnostic sacroiliac joint injection for localized, sacroiliac joint pain resulting from disease, injury or surgery, is considered medical necessary when pain persists despite BOTH of the following:

- A minimum of four (4) weeks of noninvasive conservative therapy (e.g., exercise, physical therapy, chiropractic care, nonsteroidal anti-inflammatory drugs [NSAIDs], analgesics)
- Ongoing, active participation in a rehabilitative/therapeutic exercise program.

A therapeutic sacroiliac injection for the treatment of sacroiliac joint pain is considered medically necessary following a diagnostic injection when ALL of the following criteria are met:

- Any one of the following:
  - 50% reduction in the reported pain
  - Increase in the individual’s level of function (i.e., return to work)
  - Reduction in the use of pain medication and/or additional medical services such as physical therapy/chiropractic care for at least four (4) weeks.
- A minimum of two months since the prior injection
- No more than four injections per SI joint are performed within a 12 month period.

CMM 203.4 Non-Indications

Ultrasound guidance for a sacroiliac joint injection, for any indication, is considered experimental, investigational or unproven.

A sacroiliac joint injection is considered not medically necessary for ANY of the following:

- Sacroiliac joint injections performed without fluoroscopic or other alternative guidance, with the exception of ultrasound as noted above
- When performed on the same day of service as a facet joint block, epidural steroid injection, or lumbar sympathetic chain block
- When performed in isolation (i.e., without the individual participating in an active rehabilitation program, home exercise program, or functional restoration program)
- As a subsequent diagnostic block when the initial diagnostic block does not produce a positive response of 50% or more pain reduction
- Therapeutic sacroiliac joint injections performed at a frequency greater than once every two (2) months for the treatment of sacroiliac pain
- Therapeutic sacroiliac injections performed more than four (4) times per year for the treatment of sacroiliac pain.
**CMM-203.5 Procedure Codes**

This guideline relates to the CPT® code set below. Codes are displayed for informational purposes only. Any given code’s inclusion on this list does not necessarily indicate prior authorization is required.

<table>
<thead>
<tr>
<th>CPT®</th>
<th>Code Description/Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>27096</td>
<td>Injection procedure for sacroiliac joint, anesthetic/steroid, with image guidance (fluoroscopy or CT) including arthrography when performed</td>
</tr>
<tr>
<td>G0260</td>
<td>Injection procedure for sacroiliac joint; provision of anesthetic, steroid and/or other therapeutic agent, with or without arthrography</td>
</tr>
</tbody>
</table>

This list may not be all inclusive and is not intended to be used for coding/billing purposes. The final determination of reimbursement for services is the decision of the health plan and is based on the individual’s policy or benefit entitlement structure as well as claims processing rules.
