

Evidence Discussion –

Post-Transplant Lymphoproliferative Disorder (PTLD) (AB-42.4)

For suspected PTLD advanced imaging studies are extremely helpful. CT Chest/Abdomen/Pelvis with contrast are the mainstay for known or suspected PTLD. MRI could be a good alternative due to the lack of radiation exposure. PTLD generally is rapid growing and small ill –defined masses of lymphoid tissue cannot be initially identified on sonography. Since PTLD has the potential of being reversed by decreasing immunosuppression, early detection with more advanced imaging can very beneficial.
