Clinical Information to Establish Medical Necessity

eviCore applies an evidence-based approach to evaluate the most appropriate medically necessary care for each individual. This evaluation requires submission of legible medical records pertinent to the test or treatment being requested by the provider.

If the medical records provided do not provide sufficiently detailed information to understand the individual's current clinical status or cannot be read, then medical necessity for the request cannot be established and cannot be approved.

Specific elements of an individual's medical records commonly required to establish medical necessity include, but are not limited to:

- Recent virtual or in-person clinical evaluation which includes a detailed history and physical examination since the onset or change in symptoms
- Laboratory studies
- Imaging studies
- Pathology reports
- Procedure reports
- Reports from other providers participating in treatment of the relevant condition

Medicaid and Medicare Hierarchy and Application

CMS.AD.100.A
v2.0.2023

Medicaid

Medicaid Hierarchy

1. Medicaid state-specific policy
2. eviCore's evidence-based guidelines or the appropriate alternative guideline utilized by a program/health plan in place of eviCore's guidelines
3. Early and Periodic Screening, Diagnostic and Treatment (EPSDT) guidelines should also be reviewed for individuals under 21 years of age as applicable for coverage determination

Application of Medicaid Policy

The state Medicaid policy will be reviewed first to determine if the information provided is instructive to the clinical case at hand. For the purpose of this policy, sufficient clinical criteria to render a medical necessity decision is defined as the presence of a state Medicaid policy that addresses the service/procedure/test/equipment and the member condition (indication) and supplies sufficient clinically relevant detail to be instructive to the case. See the numbered items below for specific guidance:

1. State Medicaid policy addresses clinical scenario: (service/procedure/test/equipment AND member condition AND Medical Necessity criteria):
 - a. Medicaid policy will be utilized and cited for determining medical necessity
 - b. If specific medical necessity criteria are present in the state policy, but are limited or less detailed than eviCore or alternative guideline, the state policy would still be applied and cited, as this would be considered sufficient information to render a decision
2. State Medicaid policy addresses service/procedure/test/equipment, but does NOT cover member condition in question or provide specific medical necessity criteria for this indication and does not contain relevant clinical information to be instructive to the case/clinical scenario, eviCore guidelines or alternative guidelines, as appropriate, will be utilized and cited
3. State policy exists for service/procedure/test/equipment AND member condition but NO medical necessity criteria exist for this indication. The state policy would still be instructive to the case clinical scenario and Medicaid will be utilized and cited.

4. (Example: Service is requested to address a member condition and the state policy indicates that the service is indicated for this member condition without providing specific criteria regarding under which circumstances the service would be indicated for this condition. This is considered instructive, and the state policy would be applied/cited.)
5. If no clinical information is provided with a request, the above hierarchy is still applied. If there is an applicable state-specific Medicaid policy, the Medicaid policy would be utilized and cited to request clinical information/documentation. If there is no applicable state-specific Medicaid policy, eviCore guidelines or alternative guidelines, as appropriate, will be utilized and cited

Note The scope of this policy is to outline the default order in which policy sources will be used during a delegated medical necessity determination. The Medicaid hierarchy outlined here may be superseded by Plan- and State-specific Hierarchy policies, where applicable, based on eviCore client's contracts with a state Medicaid entity.

Application and citation of policy

Y	N	N	N	eviCore criteria applied and cited

Medicare Policy

CMS Coverage Hierarchy: Medicare Advantage Medical Policy Development and Application

Medicare Advantage medical policies identify the clinical criteria for determining when medical services are considered 'reasonable and necessary' (medically necessary). Medicare Advantage plans are required by CMS to provide the same medical benefits to Medicare Advantage members as original Medicare.

Medicare Advantage plans must comply with national coverage determinations (NCD), local coverage determinations (LCD), and general coverage and benefit conditions included in traditional Medicare laws. This includes criteria for determining whether an item or service is a benefit available under traditional Medicare. When coverage criteria are not fully established in Medicare statute, regulation, NCD, or LCD, Medicare Advantage organizations may create publicly accessible internal coverage criteria that are based on current evidence in widely used treatment guidelines or clinical literature.

If additional criteria are needed to interpret or supplement generalized provisions within an NCD, LCD or other Medicare coverage policy, or there is flexibility allowed in the NCD/LCD, or there is no applicable NCD, LCD, or LCA (used in concert with an LCD) available to determine medical necessity, then other evidence-based criteria may be applied.

Coverage criteria are not fully established when (42 CFR 422.101(6) (i) :

(i) Coverage criteria not fully established. Coverage criteria are not fully established when:

(A) Additional, unspecified criteria are needed to interpret or supplement general provisions in order to determine medical necessity consistently. The MA organization must demonstrate that the additional criteria provide clinical benefits that are highly likely to outweigh any clinical harms, including from delayed or decreased access to items or services;

(B) NCDs or LCDs include flexibility that explicitly allows for coverage in circumstances beyond the specific indications that are listed in an NCD or LCD; or

(C) There is an absence of any applicable Medicare statutes, regulations, NCDs or LCDs setting forth coverage criteria.

The following hierarchy is used to determine Medicare Advantage Medical Policy:

1. CMS Coverage Manuals or other CMS-Based Resource: Coverage provisions in interpretive manuals are instructions that are used to further define when and under what circumstances items or services may be covered (or not covered)
2. National Coverage Determinations (NCD)
 - a. Local Coverage Determinations (LCD)
 - b. Local Coverage Articles (LCA), when used on conjunction with LCD

3. eviCore's evidence-based guidelines or the appropriate alternative guideline utilized by a program/health plan in place of eviCore's guidelines.
 - a) Rationale supporting the adoption and use of internally developed coverage guidelines: When coverage criteria are not fully established (as defined in 42 CFR 422.101(6) (i)) in Medicare policy, an NCD, or an LCD, CMS allows a Medicare Advantage Organization (MAO) to create and use internally developed coverage criteria. See 'Coverage criteria are not fully established when (42 CFR 422.101(6) (i) above on page 3 for the full definition of 'not fully established'.
 - eviCore will exhaust all traditional Medicare policies, NCDs, and LCDs prior to using internal criteria policies. When an internally created coverage policy is utilized for a specific condition where a Medicare policy, an NCD, or LCD is not fully established, the general provisions supplemented by the internal criteria will include when the specific clinical presentation of the enrollee, for the request under review is not addressed in the Medicare coverage policy; or there are no specific coverage criteria included in a Medicare policy because the policy provides broad provisions, which may be instructive, but are not detailed enough to be used to determine the medical necessity of the request. Additionally, internal coverage policy may be used when Medicare policy includes statements within the policy that allow for coverage beyond what is written in the Medicare policy.
 - Under the guidance outlined above eviCore's evidence-based guidelines or the appropriate alternative guideline utilized by a program/health plan in place of eviCore's guidelines, eviCore may apply internally developed clinical coverage guidelines to the request under review. Each eviCore clinical coverage policy is developed following an objective, evidence-based process based on scientific evidence, generally accepted and current standards of medical practice, and authoritative clinical practice guidelines. Each coverage policy developed and used outlines clinical benefits, addresses any clinical harm, and access to services. In addition, each member's unique clinical situation is considered in conjunction with current CMS guidelines and eviCore clinical coverage policy, as applicable.

Note Where a Medicare Administrative Contractor (MAC) has adopted the Palmetto GBA MoIDX® Program's criteria for the LCDs governing molecular and genomic tests within their jurisdiction, eviCore's Laboratory Management program will follow the MoIDX criteria published by the MACs for those jurisdictions.

Medicare/Medicaid Dual Membership

Hierarchy and Application for dual eligible Medicare/Medicaid

Individuals enrolled in both Medicare and Medicaid are considered to be dually eligible. For individuals with both Medicare and Medicaid, the following hierarchy should be applied.

1. CMS Coverage Manuals

2. National Coverage Determinations (NCD)
3. Local Coverage Determinations (LCD)
4. Local Coverage Articles (LCA) – when used in conjunction with an LCD
5. Medicaid Coverage Policies (if Medicare/Medicaid (MMP) or Medicare/Medicaid Special Needs plans)
6. Evidence based clinical policies (eviCore) or the appropriate alternative guideline utilized by a program/health plan in place of eviCore's guidelines

eviCore Guideline Definitions

Definitions.A

v1.0.2024

Experimental, Investigational, or Unproven

Certain studies, treatments, procedures, or devices may be considered experimental, investigational, or unproven for **any** condition, illness, disease, injury being treated if one of the following is present:

- if there is a paucity of supporting evidence;
- if the evidence has not matured to exhibit improved health parameters;
- if clinical utility has not been demonstrated in any condition; OR
- the study, treatment, procedure, or device lacks a collective opinion of support.

Supporting evidence includes standards that are based on credible scientific evidence published in peer-reviewed medical literature (such as well conducted randomized clinical trials or cohort studies with a sample size of sufficient statistical power) generally recognized by the relevant medical community. Collective opinion of support includes physician specialty society recommendations and the views of physicians practicing in relevant clinical areas when physician specialty society recommendations are not available.

Medically Necessary

Healthcare services or supplies needed to diagnose, treat, or evaluate a condition or prevent an injury, illness, condition or disease that meets accepted standards of medicine based on evidenced-based clinical standards of care based on supporting evidence and/or collective opinion of support that is:

- Clinically appropriate in terms of type, frequency, extent, site, and duration, and considered effective for the individual's illness, injury or disease;
- Clinical utility of the technology, drug, device, treatment or procedure has been demonstrated for a diagnosis, treatment, evaluation or prevention of an illness, condition or disease based on evidence-based clinical standards of care;
- Not more costly than an alternative service or sequence of services that are at least as likely to produce equivalent therapeutic or diagnostic results as to the diagnosis or treatment of a condition;
- Not primarily for the convenience of the individual seeking medical services, health care provider, or other physicians or healthcare providers;
- Supporting evidence and/or collective opinion of support does not demonstrate that there is an alternative that is more appropriate/effective for diagnosis, treatment, or evaluation of a condition.

Supporting evidence includes standards that are based on credible scientific evidence published in peer-reviewed medical literature (such as well conducted randomized

clinical trials or cohort studies with a sample size of sufficient statistical power) generally recognized by the relevant medical community. Collective opinion of support includes physician specialty society recommendations and the views of physicians practicing in relevant clinical areas when physician specialty society recommendations are not available. Determination of medical necessity is based on specific clinical guidelines.

Not Medically Necessary

Certain studies, treatments, procedures, or devices may be considered not medically necessary if there is supporting evidence but one of the following is present:

- Not clinically appropriate in terms of type, frequency, extent, site, and duration, and/or not considered effective for the individual's illness, injury or disease;
- Clinical utility of the technology, drug, device, treatment or procedure has not been demonstrated for a diagnosis, treatment, evaluation or prevention of the specific illness, condition or disease based on evidence-based clinical standards of care;
- More costly than an alternative service or sequence of services that are at least as likely to produce equivalent therapeutic or diagnostic results as to the diagnosis or treatment of a condition;
- Primarily for the convenience of the individual seeking medical services, health care provider, or other physicians or healthcare providers;
- Supporting evidence and/or collective opinion of support demonstrates that there is an alternative that is more appropriate/effective for diagnosis, treatment, or evaluation of a condition

Supporting evidence includes standards that are based on credible scientific evidence published in peer-reviewed medical literature (such as well conducted randomized clinical trials or cohort studies with a sample size of sufficient statistical power) generally recognized by the relevant medical community. Collective opinion of support includes physician specialty society recommendations and the views of physicians practicing in relevant clinical areas when physician specialty society recommendations are not available. Determination of not medically necessary is based on specific clinical guidelines.

Special Considerations for Laboratory Testing

Laboratory-based testing is defined in terms of both the underlying technology used and, the indication for testing (i.e.: syndrome, condition, etc.). This is due to the ubiquitous use of specific technologies in laboratory medicine.

3. Per Compliance Internal policy: Clinical Certification of Services – Initial UM 0045:

- a. Experimental/Investigational: The use of a technology, drug, device, treatment, or procedure that has not been proven or recognized as having proven benefit in clinical medicine for any condition, illness, disease, or injury being treated.
- b. Medical Necessity: Refers to services or supplies for diagnosing, evaluating, treating or preventing an injury, illness, condition or disease, based on evidence-based clinical standards of care. Medically necessary services are accepted health care services and supplies provided by health care entities, appropriate to evaluation and treatment of a disease, condition, illness or injury and consistent with the applicable standard of care. Determination of medical necessity is based on specific clinical guidelines. (NCQA 2022 Standards; CMS; American College of Medical Quality)

v2.0.2024

- The eviCore healthcare (eviCore) evidence-based, proprietary clinical guidelines evaluate a range of advanced imaging and procedures, including NM, US, CT, MRI, PET, Radiation Oncology, Sleep Studies, Gastrointestinal Endoscopy, as well as Cardiac, musculoskeletal and Spine interventions.
- eviCore reserves the right to change and update the guidelines. The guidelines undergo a formal review annually. eviCore's guidelines are based on current evidence supported by major national and international association and society guidelines and criteria, peer-reviewed literature, major treatises as well as, input from health plans, and practicing academic and community-based physicians.
- These guidelines are not intended to supersede or replace sound medical judgment, but instead, should facilitate the identification of the most appropriate imaging or other designated procedure given the individual's clinical condition. These guidelines are written to cover medical conditions as experienced by the majority of individuals. However, these guidelines may not be applicable in certain clinical circumstances, and physician judgment can override the guidelines.
- These guidelines provide evidence-based, clinical benefits with a focus on health care quality and patient safety.
- Clinical decisions, including treatment decisions, are the responsibility of the individual and his/her provider. Clinicians are expected to use independent medical judgment, which takes into account the clinical circumstances to determine individual management decisions.
- eviCore supports the Choosing Wisely initiative (<https://www.choosingwisely.org/>) by the American Board of Internal Medicine (ABIM) Foundation and many national physician organizations, to reduce the overuse of diagnostic tests that are low value, no value, or whose risks are greater than the benefits.

Benefits, Coverage Policies, and Eligibility Issues (Preface-2.1)

PRF.BC.0002.1.U

v2.0.2024

Medicare Coverage Policies

- See eviCore's Medicaid and Medicare Hierarchy and Application

Investigational and Experimental Studies

- See eviCore's Guideline Definitions

Clinical and Research Trials

- Similar to investigational and experimental studies, clinical trial imaging requests will be considered to determine whether they meet Health Plan coverage and eviCore's evidence-based guidelines.
- Imaging studies which are inconsistent with established clinical standards, or are requested for data collection and not used in direct clinical management are not supported.³

Legislative Mandate

- State and federal legislations may need to be considered in the review of advanced imaging requests. For example:
 - Various State and Federal Breast Density Laws
 - Texas HB 1290 Coronary Calcium CT Law

v2.0.2024

Clinical Documentation and Age Considerations

- eviCore guidelines use an evidence-based approach to determine the most appropriate procedure for each individual, at the most appropriate time in the diagnostic and treatment cycle. eviCore guidelines are framed by:
 - Clinical presentation of the individual, rather than the studies requested
 - Adequate clinical information that must be submitted to eviCore in order to establish medical necessity for advanced imaging or other designated procedures includes, but is not limited to the following:
 - Pertinent clinical evaluation should include a recent detailed history, physical examination²⁰ since the onset or change in symptoms, and/or laboratory and prior imaging studies.
 - Condition-specific guideline sections may describe additional clinical information which is required for a pertinent clinical evaluation.
 - The Spine and Musculoskeletal guidelines require x-ray studies from when the current episode of symptoms has started or changed; x-ray imaging does not have to be within the past 60 days.
 - Advanced imaging or other designated procedures should not be ordered prior to clinical evaluation of an individual by the physician treating the individual. This may include referral to a consultant specialist who will make further treatment decisions.
 - Other meaningful technological contact (telehealth visit, telephone or video call, electronic mail or messaging) since the onset or change in symptoms by an established individual can serve as a pertinent clinical evaluation.
 - Some conditions may require a face-to-face evaluation as discussed in the applicable condition-specific guideline sections.
 - A recent clinical evaluation may be unnecessary if the individual is undergoing a guideline-supported, scheduled follow-up imaging or other designated procedural evaluation. Exceptions due to routine surveillance indications are addressed in the applicable condition-specific guideline sections.
 - eviCore's evidence-based approach to determine the most appropriate procedure for each individual requires submission of medical records pertinent to the requested imaging or other designated procedures.
- Many conditions affecting the pediatric population are different diagnoses than those occurring in the adult population. For those diseases which occur in both pediatric and adult populations, minor differences may exist in management due to individual age, comorbidities, and differences in disease natural history between children and adults.

- Individuals who are 18 years old or younger¹⁹ should be imaged according to the Pediatric Imaging Guidelines if discussed in the condition-specific guideline sections. Any conditions not specifically discussed in the Pediatric Imaging Guidelines should be imaged according to the General Imaging Guidelines. Individuals who are >18 years old should be imaged according to the General Imaging Guidelines, except where directed otherwise by a specific guideline section.
- The terms “male” and “female” used in these guidelines refer to anatomic-specific diseases and disease predispositions associated with the individual's sex assigned at birth rather than their gender identity. It should be noted that gender identity and anatomic-specific diseases as well as disease predispositions are not always linked. As such, these guidelines should be applied to the individual's corresponding known or suspected anatomic-specific disease or disease predisposition. At eviCore, we believe that it is important to understand how all individuals, including those who are gender-diverse, choose to identify themselves. To ensure that gender-diverse individuals are treated with respect and that decisions impacting their healthcare are made correctly and with sensitivity, eviCore recognizes all individuals with the following gender marker options: Male, Female, Transgender Male, Transgender Female, “X”, and “Not Specified.”

General Imaging Information

- “Standard” or “conventional” imaging is most often performed in the initial and subsequent evaluations of malignancy. Standard or conventional imaging includes plain film, CT, MRI, or US.
 - Often, further advanced imaging is needed when initial imaging, such as ultrasound, CT, or MRI does not answer the clinical question. Uncertain, indeterminate, inconclusive, or equivocal may describe these situations.
- Appropriate use of contrast is a very important component of evidence-based advanced imaging use.
 - The appropriate levels of contrast for an examination (i.e., without contrast, with contrast, without and with contrast) is determined by the evidence-based guidance reflected in the condition-specific guideline sections.
 - If, during the performance of a non-contrast imaging study, there is the unexpected need to use contrast in order to evaluate a possible abnormality, then that is appropriate.¹

Ultrasound

- Diagnostic ultrasound uses high-frequency sound waves to evaluate soft tissue structures and vascular structures utilizing grey scale and Doppler techniques.
- Ultrasound allows for dynamic real-time imaging at the bedside.
 - Ultrasound is limited in areas where there is dense bone or other calcification.
 - Ultrasound also has a relatively limited imaging window so may be of limited value in evaluating very large abnormalities.
 - In general, ultrasound is highly operator-dependent, and proper training and experience are required to perform consistent, high-quality evaluations.

- Indications for ultrasound may include, but are not limited to, the following:
 - Obstetric and gynecologic imaging
 - Soft tissue and visceral imaging of the chest, abdomen, pelvis, and extremities
 - Brain and spine imaging when not obscured by dense bony structures
 - Vascular imaging when not obscured by dense bony structures
 - Procedural guidance when not obscured by dense bony structures
 - Initial evaluation of ill-defined soft tissue masses or fullness and differentiating adenopathy from mass or cyst. Prior to advanced imaging, ultrasound can be very beneficial in selecting the proper modality, body area, image sequences, and contrast level that will provide the most definitive information for the individual.
- More specific guidance for ultrasound usage, including exceptions to this general guidance, can be found throughout the condition-specific guidelines.

Computed Tomography (CT)

- The AMA CPT® manual does not describe nor assign any minimum or maximum number of sequences for any CT study. CT imaging protocols are often influenced by the individual's clinical situation and additional sequences are not uncommon. There are numerous CT protocols that may be performed to evaluate specific clinical questions, and this technology is constantly undergoing development.
- CT utilizes ionizing radiation to create cross-sectional and volumetric images of the body.
 - Advantages over ultrasound include a much larger field of view and faster completion time in general. Disadvantages compared to ultrasound include lack of portability and exposure to ionizing radiation.
 - Advantages over MRI include faster imaging and a more spacious scanner area limiting claustrophobia. Disadvantages compared to MRI include decreased soft tissue definition, especially with non-contrast imaging, and exposure to ionizing radiation.
- CT can be performed without, with, or without and with intravenous (IV) contrast depending on the clinical indication and body area.
 - In general, non-contrast imaging is appropriate for evaluating structures with significant tissue density differences such as lung parenchyma and bony structures, or when there is a contraindication to contrast.
 - In general, CT with contrast is the most common level of contrast and can be used when there is need for improved vascular or soft tissue resolution, including better characterization of known or suspected malignancy as well as infectious and inflammatory conditions.
 - CT without and with contrast has a limited role as the risks of doubling the ionizing radiation exposure rarely outweigh the benefits of multiphasic imaging, though there are some exceptions which include, but are not limited to, the following:
 - Characterization of a mass
 - Characterization of arterial and venous anatomy

- CT with contrast may be used to better characterize findings on a very recent (within two weeks) inconclusive non-contrast CT where the guidelines would support CT without and with contrast.
- More specific guidance for CT contrast usage, including exceptions to this general guidance, can be found throughout the condition-specific guidelines.
- Shellfish allergy:
 - It is commonly assumed that an allergy to shellfish indicates iodine allergy, and that this implies an allergy to iodinated contrast media used with CT. However, this is NOT true. Shellfish allergy is due to tropomyosins. Iodine plays no role in these allergic reactions. Allergies to shellfish do not increase the risk of reaction to iodinated contrast media any more than that of other allergens.¹
- Enteric contrast (oral or rectal) is sometimes used in abdominal imaging. There is no specific CPT® code which refers to enteric contrast.
- The appropriate contrast level and anatomic region in CT imaging is specific to the clinical indication, as listed in the condition-specific guideline sections.
- CT should not be used to replace MRI in an attempt to avoid sedation unless it is listed as a recommended study the appropriate condition-specific guideline.
- There are significant potential adverse effects associated with the use of iodinated contrast media. These include hypersensitivity reactions, thyroid dysfunction, and contrast-induced nephropathy (CIN). Individuals with impaired renal function are at increased risk for CIN.²
- Both contrast CT and MRI may be considered to have the same risk profile with renal failure (GFR <30 mL/min).
- The use of CT contrast should proceed with caution in pregnant and breastfeeding individuals. There is a theoretical risk of contrast toxicity to the fetal and infant thyroid. The procedure can be performed if the specific need for that contrast-enhanced procedure outweighs risk to the fetus. Breastfeeding individuals may reduce this risk by choosing to pump and discard breast milk for 12-24 hours after the contrast injection.
- CT without contrast may be appropriate if clinical criteria for CT with contrast are met AND the individual has:
 - Elevated blood urea nitrogen (BUN) and/or creatinine
 - Renal insufficiency
 - Allergies to iodinated contrast
 - Thyroid disease which could be treated with I-131
 - Diabetes
 - Very elderly
 - Urgent or emergent settings due to availability
 - Trauma
- CT is superior to other imaging modalities in certain conditions including, but not limited to, the following:
 - Screening following trauma
 - Imaging pulmonary disease

- Imaging abdominal and pelvic viscera
- Imaging of complex fractures
- Evaluation of inconclusive findings on Ultrasound or MRI, or if there is a contraindication to MRI
- More specific guidance for CT usage, including exceptions to this general guidance, can be found throughout the condition-specific guidelines.

Magnetic Resonance Imaging (MRI)

- The AMA CPT® manual does not describe nor assign any minimum or maximum number of sequences for any MRI study. MRI protocols are often influenced by the individual's clinical situation and additional sequences are not uncommon. There are numerous MRI sequences that may be performed to evaluate specific clinical questions, and this technology is constantly undergoing development.
- Magnetic Resonance Imaging (MRI) utilizes the interaction between the intrinsic radiofrequency of certain Molecules in the body (hydrogen in most cases) and a strong external magnetic field.
 - MRI is often superior for advanced imaging of soft tissues and can also define physiological processes in some instances (e.g., edema, loss of circulation [AVN], and increased vascularity [tumors]).
 - MRI does not use ionizing radiation, and even non-contrast images have much higher soft tissue definition than CT or Ultrasound.
 - MRI typically takes much longer than either CT or Ultrasound, and for some individuals may require sedation. It is also much more sensitive to individual motion that can degrade image quality than either CT or Ultrasound.
- MRI Breast and MRI Chest are not interchangeable, as they focus detailed sequences on different adjacent body parts.
- MRI may be utilized either as the primary advanced imaging modality, or when further definition is needed based on CT or ultrasound imaging.
- Most orthopedic and dental implants are not magnetic. These include hip and knee replacements; plates, screws, and rods used to treat fractures; and cavity fillings. Yet, all of these metal implants can distort the MRI image if near the part of the body being scanned.
 - Other implants, however, may have contraindications to MRI. These include the following:
 - Pacemakers
 - ICD or heart valves
 - Metal implants in the brain
 - Metal implants in the eyes or ears
 - Infusion catheters and bullets or shrapnel
 - CT can therefore be an alternative study to MRI in these scenarios.
- The contrast level and anatomic region in MRI imaging is specific to the clinical indication, as listed in the specific guideline sections.

- MRI utilizing Xenon Xe 129 for contrast is considered investigational and experimental at this time. MRI with or with and without contrast in these guidelines refers to MRI utilizing gadolinium for contrast.
- MRI is commonly performed without, without and with contrast.
 - Non-contrast imaging offers excellent tissue definition.
 - Imaging without and with contrast is commonly used when needed to better characterize tissue perfusion and vascularization.
 - Most contrast is gadolinium based and causes T2 brightening of the vascular and extracellular spaces.
 - Some specialized gadolinium and non-gadolinium contrast agents are available, and most commonly used for characterizing liver lesions.
 - MRI with contrast only is rarely appropriate and is usually used to better characterize findings on a recent inconclusive non-contrast MRI, commonly called a completion study.
 - MRI contrast is contraindicated in pregnant individuals .
 - More specific guidance for MRI contrast usage, including exceptions to this general guidance, can be found throughout the condition-specific guidelines.
- MRI may be preferred in individuals with renal failure and in individuals allergic to intravenous CT contrast.
 - Both contrast CT and MRI may be considered to have the same risk profile with renal failure (GFR <30 mL/min).²
 - Gadolinium can cause Nephrogenic Systemic Fibrosis (NSF). The greater the exposure to gadolinium in individuals with a low GFR (especially if on dialysis), the greater the chance of individuals developing NSF.
 - Multiple studies have demonstrated potential for gadolinium deposition following the use of gadolinium-based contrast agents (GBCAs) for MRI studies.^{3,4,5,6,7} The U.S. Food and Drug Administration (FDA) has noted that there is currently no evidence to suggest that gadolinium retention in the brain is harmful and restricting gadolinium-based contrast agents (GBCAs) use is not warranted at this time. It has been recommended that GBCA use should be limited to circumstances in which additional information provided by the contrast agent is necessary and the necessity of repetitive MRIs with GBCAs should be assessed.⁸
- A CT may be approved in place of an MRI when clinical criteria are met for MRI AND there is a contraindication to having an MRI (pacemaker, ICD, insulin pump, neurostimulator, etc.).
 - When replacing MRI with CT, contrast level matching should occur as follows:
 - MRI without contrast → CT without contrast
 - MRI without and with contrast → CT with contrast or CT without and with contrast
- The following situations may impact the appropriateness for MRI and or MR contrast:
 - Caution should be taken in the use of gadolinium in individuals with renal failure.

- The use of gadolinium contrast agents is contraindicated during pregnancy unless the specific need for that procedure outweighs risk to the fetus.
- MRI can be performed for non-ferromagnetic body metals (i.e., titanium), although some imaging facilities will consider it contraindicated if recent surgery, regardless of the metal type.
- MRI should not be used as a replacement for CT for the sole reason of avoidance of ionizing radiation when MRI is not supported in the condition-based guidelines, since it does not solve the problem of overutilization.
- MRI is superior to other imaging modalities in certain conditions including, but not limited to, the following:
 - Imaging the brain and spinal cord
 - Characterizing visceral and musculoskeletal soft tissue masses
 - Evaluating musculoskeletal soft tissues including ligaments and tendons
 - Evaluating inconclusive findings on ultrasound or CT
 - Individuals who are pregnant or have high radiation sensitivity
 - Suspicion, diagnosis, or surveillance of infections
- More specific guidance for MRI usage, including exceptions to this general guidance, can be found throughout the condition-specific guidelines.

Positron Emission Tomography (PET)

- PET is a nuclear medicine study that uses a positron emitting radiotracer to create cross-sectional and volumetric images based on tissue metabolism.
- Conventional imaging (frequently CT, sometimes MRI or bone scan) of the affected area(s) drives much of initial and restaging and surveillance imaging for malignancy and other chronic conditions. PET is not indicated for surveillance imaging unless specifically stated in the condition-specific guideline sections.
- PET/MRI is generally not supported, see **PET-MRI (Preface-5.3)**.
- PET is rarely performed as a single modality, but is typically performed as a combined PET/CT.
 - The unbundling of PET/CT into separate PET and diagnostic CT CPT® codes is not supported, because PET/CT is done as a single study.
- PET/CT lacks the tissue definition of CT or MRI, but is fairly specific for metabolic activity based on the radiotracer used.
- Indications for PET/CT may include the following:
 - Oncologic Imaging for evaluation of tumor metabolic activity
 - Cardiac Imaging for evaluation of myocardial metabolic activity
 - Brain Imaging for evaluation of metabolic activity for procedural planning
- More specific guidance for PET usage, including exceptions to this general guidance, can be found throughout the condition-specific guidelines.

Overutilization of Advanced Imaging

- A number of recent reports describe overutilization in many areas of advanced imaging and other procedures, which may include the following:

- High-level testing without consideration of less invasive, lower cost options which may adequately address the clinical question at hand
- Excessive radiation and costs with unnecessary testing
- Defensive medical practice
- CT without and with contrast (so called “double contrast studies”) requests, which have few current indications
- MRI requested in place of CT to avoid radiation without considering the primary indication for imaging
- Adult CT settings and protocols used for smaller people and children
- Unnecessary imaging procedures when the same or similar studies have already been conducted
- A review of the imaging or other relevant procedural histories of all individuals presenting for studies has been recognized as one of the more important processes that can be significantly improved. By recognizing that a duplicate or questionably indicated examination has been ordered for individuals, it may be possible to avoid exposing them to unnecessary risks.^{9,10} To avoid these unnecessary risks, the precautions below should be considered:
 - The results of initial diagnostic tests or radiologic studies to narrow the differential diagnosis should be obtained prior to performing further tests or radiologic studies.
 - The clinical history should include a potential indication such as a known or suspected abnormality involving the body part for which the imaging study is being requested. These potential indications are addressed in greater detail within the applicable guidelines.
 - The results of the requested imaging procedures should be expected to have an impact on individual management or treatment decisions.
 - Repeat imaging studies are not generally necessary unless there is evidence of disease progression, recurrence of disease, and/or the repeat imaging will affect an individual’s clinical management.
- Pre-operative imaging/pre-surgical planning imaging/pre-procedure imaging is considered not medically necessary if the surgery/procedure is not considered medically necessary. Once the procedure has been approved or if the procedure does not require prior authorization, the appropriate pre-procedural imaging may be approved.

3D Rendering (Preface-4.1)

PRF.CD.0004.1.U

v2.0.2024

CPT® 76376 and CPT® 76377:

- Both codes require concurrent supervision of the image post-processing 3D manipulation of the volumetric data set and image rendering.
 - Concurrent supervision is defined as active physician participation in and monitoring of the reconstruction process including design of the anatomic region that is to be reconstructed; determination of the tissue types and actual structures to be displayed (e.g., bone, organs, and vessels); determination of the images or cine loops that are to be archived; and monitoring and adjustment of the 3D work product. The American College of Radiology (ACR) recommends that it is best to document the physician's supervision or participation in the 3D reconstruction of images.
- These two codes differ in the need for and use of an independent workstation for post-processing.
 - CPT® 76376 reports procedures not requiring image post-processing on an independent workstation.
 - CPT® 76377 reports procedures that require image post-processing on an independent workstation.
- These 3D rendering codes should not be used for 2D reformatting.
- Two-dimensional reconstruction (e.g., reformatting an axial scan into the coronal plane) is now included in all cross-sectional imaging base codes and is not separately reimbursable.
- The codes used to report 3D rendering for ultrasound and echocardiography are also used to report the 3D post processing work on CT, MRI, and other tomographic modalities.
- Providers may be required to obtain prior authorization on these 3D codes even if prior authorization is not required for the echocardiography and/or ultrasound procedure codes. It may appear that eviCore pre-authorizes echocardiography and/or ultrasound when, in fact, it may only be the 3D code that needs the prior authorization.
- CPT® codes for 3D rendering should not be billed in conjunction with computer-aided detection (CAD), MRA, CTA, nuclear medicine SPECT studies, PET, PET/CT, Mammogram, MRI Breast, US Breast, CT Colonography (virtual colonoscopy), Cardiac MRI, Cardiac CT, or Coronary CTA studies.
- CPT® 76377 (3D rendering requiring image post-processing on an independent workstation) or CPT® 76376 (3D rendering not requiring image post-processing on an independent workstation) can be considered in the following clinical scenarios:
 - Bony conditions:
 - Evaluation of congenital skull abnormalities in newborns, infants, and toddlers (usually for pre-operative planning)

- Complex fractures (comminuted or displaced)/dislocations of any joint (for pre-operative planning when conventional imaging is insufficient)
- Spine fractures, pelvic/acetabulum fractures, intra-articular fractures (for pre-operative planning when conventional imaging is insufficient)
- Pre-operative planning for other complex surgical cases
- Complex facial fractures
- Pre-operative planning for other complex surgical cases
- Cerebral angiography
- Pelvis conditions:
 - Uterine intra-cavitary lesion when initial US is equivocal: See **Abnormal Uterine Bleeding (AUB) (PV-2.1)** and **Leiomyoma/Uterine Fibroids (PV-12.1)** in the Pelvis Imaging Guidelines.
 - Hydrosalpinxes or peritoneal cysts when initial US is indeterminate: See **Complex Adnexal Masses (PV-5.3)** in the Pelvis Imaging Guidelines.
 - Lost IUD (inability to feel or see IUD string) with initial US: See **Intrauterine Device (PV-10.1)** in the Pelvis Imaging Guidelines.
 - Uterine anomalies with initial US: See **Uterine Anomalies (PV-14.1)** in the Pelvis Imaging Guidelines.
 - Infertility: See **Initial Infertility Evaluation, Female (PV-9.1)** in the Pelvis Imaging Guidelines.
- Abdomen conditions:
 - CT Urogram: See **Hematuria and Hydronephrosis (AB-39)** in the Abdomen Imaging Guidelines.
 - MRCP: See **MR Cholangiopancreatography (MRCP) (AB-27)** in the Abdomen Imaging Guidelines.

CT-, MR-, or Ultrasound-Guided Procedures (Preface-4.2)

PRF.CD.0004.2.A

v2.0.2024

- CT-, MR-, and Ultrasound-guidance procedure codes contain all of the imaging necessary to guide a needle or catheter. It is inappropriate to routinely bill a diagnostic procedure code in conjunction with a guidance procedure code.
- Imaging studies performed as part of a CT-, MR-, or Ultrasound-guided procedure should be reported using the CPT® codes in the following table:

TABLE: Imaging Guidance Procedure Codes

CPT®	Description
19085	Biopsy, breast, with placement of breast localization device(s), when performed, and imaging of the biopsy specimen, when performed, percutaneous; first lesion, including MR guidance
19086	Biopsy, breast, with placement of breast localization device(s), when performed, and imaging of the biopsy specimen, when performed, percutaneous; each additional lesion, including MR guidance
75989	Imaging guidance for percutaneous drainage with placement of catheter (all modalities)
76942	Ultrasonic guidance for needle placement
77011	CT guidance for stereotactic localization
77012	CT guidance for needle placement
77013	CT guidance for, and monitoring of parenchymal tissue ablation
77021	MR guidance for needle placement
77022	MR guidance for, and monitoring of parenchymal tissue ablation

CPT® 19085 and CPT® 19086

- The proper way to bill an MRI-guided breast biopsy is CPT® 19085 (Biopsy, breast, with placement of breast localization device(s), when performed, and imaging of the biopsy specimen, when performed, percutaneous; first lesion, including MR guidance). Additional lesions should be billed using CPT® 19086.
 - CPT® 77021** (MR guidance for needle placement) is not an appropriate code for a breast biopsy.

CPT® 75989

- This code is used to report imaging guidance for a percutaneous drainage procedure in which a catheter is left in place.

- This code can be used to report whether the drainage catheter is placed under fluoroscopy, Ultrasound-, CT-, or MR-guidance modality.

CPT® 77011

- A stereotactic CT localization scan is frequently obtained prior to sinus surgery. The dataset is then loaded into the navigational workstation in the operating room for use during the surgical procedure. The information provides exact positioning of surgical instruments with regard to the individual's 3D CT images.³
- In most cases, the pre-operative CT is a technical-only service that does not require interpretation by a radiologist.
 - The imaging facility should report CPT® 77011 when performing a scan not requiring interpretation by a radiologist.
 - If a diagnostic scan is performed and interpreted by a radiologist, the appropriate diagnostic CT code (e.g., CPT® 70486) should be used.
 - It is not appropriate to report both CPT® 70486 and CPT® 77011 for the same CT stereotactic localization imaging session.
 - 3D Rendering (CPT® 76376 or CPT® 76377) should not be reported in conjunction with CPT® 77011 (or CPT® 70486 if used). The procedure inherently generates a 3D dataset.

CPT® 77012 (CT) and CPT® 77021 (MR)

- These codes are used to report imaging guidance for needle placement during biopsy, aspiration, and other percutaneous procedures.
- They represent the radiological supervision and interpretation of the procedure and are often billed in conjunction with surgical procedure codes.
 - For example, CPT® 77012 is reported when CT guidance is used to place the needle for a conventional arthrogram.
 - Only codes representing percutaneous surgical procedures should be billed with CPT® 77012 and CPT® 77021. It is inappropriate to use with surgical codes for open, excisional, or incisional procedures.
 - **CPT® 77021** (MR guidance for needle placement) is not an appropriate code for breast biopsy.
 - CPT® 19085 would be appropriate for the first breast biopsy site and CPT® 19086 would be appropriate for additional concurrent biopsies.

CPT® 77013 (CT) and CPT® 77022 (MR)

- These codes include the initial guidance to direct a needle electrode to the tumor(s), monitoring for needle electrode repositioning within the lesion, and as necessary for multiple ablations to coagulate the lesion and confirmation of satisfactory coagulative necrosis of the lesion(s) and comparison to pre-ablation images.
 - **NOTE:** CPT® 77013 should only be used for non-bone ablation procedures.
 - CPT® 20982 includes CT guidance for bone tumor ablations.

- Only codes representing percutaneous surgical procedures should be billed with CPT® 77013 and CPT® 77022. It is inappropriate to use with surgical codes for open, excisional, or incisional procedures.
- CPT® 77012 and CPT® 77021 (as well as guidance codes CPT® 76942 [US] and CPT® 77002 - CPT® 77003 [fluoroscopy]) describe radiologic guidance by different modalities.
- Only one unit of any of these codes should be reported per individual encounter (date of service). The unit of service is considered to be the individual encounter, not the number of lesions, aspirations, biopsies, injections, or localizations.

Unlisted Procedures/Therapy Treatment Planning (Preface-4.3)

PRF.CD.0004.3.U

v2.0.2024

CPT ®	Description
78999	Unlisted procedure, diagnostic nuclear medicine
76498	Unlisted MR procedure (e.g., diagnostic or interventional)
76497	Unlisted CT procedure (e.g., diagnostic or interventional)

- These unlisted codes should be reported whenever a diagnostic or interventional CT or MR study is performed in which an appropriate anatomic site-specific code is not available.
 - A Category III code that describes the procedure performed must be reported rather than an unlisted code if one is available.
- CPT® 76497 or CPT® 76498 (Unlisted CT or MRI procedure) can be considered in the following clinical scenarios:
 - Studies done for navigation and planning for neurosurgical procedures (i.e. Stealth or Brain Lab Imaging)^{1,2}
 - Custom joint arthroplasty planning (not as an alternative recommendation): See **Osteoarthritis (MS-12.1)** in the Musculoskeletal Imaging Guidelines.
 - Any procedure/surgical planning if thinner cuts or different positional acquisition (than those on the completed diagnostic study) are needed. These could include navigational bronchoscopy. See **Navigational Bronchoscopy (CH-1.7)** in the Chest Imaging Guidelines

Therapy Treatment Planning

- Radiation Therapy Treatment Planning: See **Unlisted Procedure Codes in Oncology (ONC-1.5)** In the Oncology Imaging Guidelines

Unilateral Versus Bilateral Breast MRI (Preface-4.4)

PRF.CD.0004.4.A

v2.0.2024

- Diagnostic MRI of both breasts should be coded as CPT® 77049 regardless of whether both breasts are imaged simultaneously or whether unilateral breast MRI is performed in two separate imaging sessions.

CPT® 76380 Limited or Follow-up CT (Preface-4.5)

PRF.CD.0004.5.A

v2.0.2024

- CPT® 76380 describes a limited or follow-up CT scan. The code is used to report any CT scan, for any given area of the body, in which the work of a full diagnostic code is not performed.
- Common examples include, but are not limited to, the following:
 - Limited sinus CT imaging protocol
 - Limited or follow-up slices through a known pulmonary nodule
 - Limited slices to assess a non-healing fracture (such as the clavicle)
- Limited CT (CPT® 76380) is not indicated for treatment planning purposes. See **Unlisted Procedure Codes in Oncology (ONC-1.5)** in the Oncology Imaging Guidelines.
- It is inappropriate to report CPT® 76380, in conjunction with other diagnostic CT codes, to cover 'extra slices' in certain imaging protocols.
 - There is no specific number of sequences or slices defined in any CT CPT® code definition.
 - The AMA, in *CPT® 2019*, does not describe nor assign any minimum or maximum number of sequences or slices for any CT study.
 - A few additional slices or sequences are not uncommon.
 - CT imaging protocols are often influenced by the individual's clinical situation. Sometimes the protocols require more time and sometimes less.

SPECT/CT Imaging (Preface-4.6)

PRF.CD.0004.6.A

v2.0.2024

- SPECT/CT involves SPECT (Single Photon Emission Computed Tomography) nuclear medicine imaging and CT for optimizing location, accuracy, and attenuation correction and combines functional and anatomic information.
 - Common studies using this modality include ^{123}I - or ^{131}I -Metaiodobenzylguanidine (MIBG) and octreotide scintigraphy for neuroendocrine tumors.
- Hybrid Nuclear/CT scan can be reported as CPT[®] 78830 (single area and single day), CPT[®] 78831 (2 or more days), or CPT[®] 78832 (2 areas with one day and 2 day study).
- CPT[®] 78072 became effective January 1, 2013 for SPECT/CT parathyroid nuclear imaging.

CPT® 76140 Interpretation of an Outside Study (Preface-4.7)

PRF.CD.0004.7.U

v2.0.2024

- It is inappropriate to use diagnostic imaging codes for interpretation of a previously performed exam that was completed at another facility.
 - If the outside exam is being used for comparison with a current exam, the diagnostic code for the current examination includes comparison to the prior study.⁴
 - CPT® 76140 is the appropriate code to use for an exam which was completed elsewhere and a secondary interpretation of the images is requested.⁵
 - Medicare does not reimburse CPT® 76140 and their coverage policies take precedence over eviCore's guidelines.

Quantitative MR Analysis of Tissue Composition (Preface-4.8)

PRF.CD.0004.8.A

v2.0.2024

- Category III CPT® codes for quantitative analysis of multiparametric-MR (mp-MRI) data with and without an associated diagnostic MRI have been established. Quantitative mp-MRI uses software to analyze tissue physiology of visceral organs and other anatomic structures non-invasively. At present, these procedures are primarily being used in clinical trials and there is no widely recommended indications in clinical practice. As such, these procedures are considered to be investigational and experimental for coverage purposes.
 - CPT® 0648T (without diagnostic MRI) and CPT® 0649T (with diagnostic MRI) refer to data analysis with and without associate imaging of a single organ, with its most common use being LiverMultiScan (LMS).
 - See **Fatty Liver (AB-29.2)** in the Abdomen Imaging Guidelines.
 - CPT® 0697T (without diagnostic MRI) and CPT® 0698T (with diagnostic MRI) refer to data analysis with and without associate imaging of a multiple organs, with its most common use being CoverScan.

HCPCS Codes (Preface-4.9)

PRF.CD.0004.9.A

v2.0.2024

- Healthcare Common Procedure Coding System (HCPCS) codes are utilized by some hospitals in favor of the typical Level-III CPT® codes. These codes are typically 4 digits preceded by a C or S.⁶
 - Many of these codes have similar code descriptions to Level-III CPT® codes (i.e., C8931 – MRA with dye, Spinal Canal; and, CPT® 72159 – MRA Spinal Canal).
 - If cases are submitted with HCPCS codes with similar code descriptions to the typical Level-III CPT® codes, those procedures should be managed in the same manner as the typical CPT® codes.
 - Medicare does not support approval of "S" HCPCS codes.
 - HCPCS code management is discussed further in the applicable guideline sections.
- Requests for many Healthcare Common Procedure Coding System (HCPCS) codes, including non-specific codes such as S8042 (Magnetic resonance imaging [MRI], low-field), should be redirected to a more appropriate and specific CPT® code. Exceptions are noted in the applicable guideline sections.

Whole-Body Imaging (Preface-5)

Guideline

Whole Body CT Imaging (Preface-5.1)
Whole-Body MR Imaging (Preface-5.2)
PET-MRI (Preface-5.3)
References (Preface-5)

Whole Body CT Imaging (Preface-5.1)

PRF.WB.0005.1.U

v2.0.2024

- Whole-body CT or LifeScan (CT Brain, Chest, Abdomen, and Pelvis) for screening of asymptomatic individuals is not a covered benefit. The performance of whole-body screening CT examinations in healthy individuals does not meet any of the current validity criteria for screening studies and there is no clear documentation of benefit versus radiation risk.
- Whole-body low-dose CT is supported for oncologic staging in Multiple Myeloma. See **Multiple Myeloma and Plasmacytomas (ONC-25)** in the Oncology Imaging Guidelines.

Whole-Body MR Imaging (Preface-5.2)

PRF.WB.0005.2.A

v2.0.2024

- Whole-body MRI (WBMRI) is, with the exception of select cancer predisposition syndromes and autoimmune conditions discussed below, generally not supported at this time due to lack of standardization in imaging technique and lack of evidence that WBMRI improves outcome for any individual disease state.
 - While WBMRI has the benefit of whole-body imaging and lack of radiation exposure, substantial variation still exists in the number of images, type of sequences (STIR vs. diffusion weighting, for example), and contrast agent(s) used.
- Coding considerations:
 - There are no established CPT® or HCPCS codes for reporting WBMRI.
 - WBMRI is at present only reportable using CPT® 76498. All other methods of reporting whole-body MRI are inappropriate including the following:
 - Separate diagnostic MRI codes for multiple individual body parts
 - MRI Bone Marrow Supply (CPT® 77084)
- Disease-specific considerations:
 - Cancer screening:
 - Interval WBMRI is recommended for cancer screening in individuals with select cancer predisposition syndromes. Otherwise, WBMRI has not been shown to improve outcomes for cancer screening.
 - For additional information, see **Li-Fraumeni Syndrome (LFS) (PEDONC-2.2)**, **Hereditary Paraganglioma-Pheochromocytoma (HPP) Syndromes (PEDONC-2.13)**, or **Constitutional Mismatch Repair Deficiency (CMMRD or Turcot Syndrome) (PEDONC-2.15)** in the Pediatric Oncology Imaging Guidelines.
 - Cancer staging and restaging:
 - While the feasibility of WBMRI has been established, data remain conflicting on whether WBMRI is of equivalent diagnostic accuracy compared with standard imaging modalities such as CT, scintigraphy, and PET imaging. Evidence has not been published establishing WBMRI as a standard evaluation for any type of cancer.
 - Autoimmune disease:
 - WBMRI can be approved in some situations for individuals with chronic recurrent multifocal osteomyelitis.
 - For additional information, see **Chronic Recurrent Multifocal Osteomyelitis (PEDMS-10.2)** in the Pediatric Musculoskeletal Imaging Guidelines.

PET-MRI (Preface-5.3)

PRF.WB.0005.3.A

v2.0.2024

- PET-MRI is generally not supported for a vast majority of oncologic and neurologic conditions due to lack of standardization in imaging technique and interpretation. However, it may be appropriate in select circumstances when the following criteria are met:
 - The individual meets condition-specific guidelines for PET-MRI OR
 - The individual meets ALL of the following:
 - The individual is a pediatric patient or being treated under a pediatric guideline and treatment plan AND
 - The individual meets guideline criteria for PET-CT, AND
 - PET-CT is not available at the treating institution, AND
 - The provider requests PET-MRI in lieu of PET-CT
- When the above criteria are met, PET-MRI may be reported using the code combination of PET Whole-Body (CPT® 78813) and MRI Unlisted (CPT® 76498). All other methods of reporting PET-MRI are inappropriate.
 - When clinically appropriate, diagnostic MRI codes may be indicated at the same time as the PET-MRI code combination.
- For more information, see **PET Imaging in Pediatric Oncology (PEDONC-1.4)** in the Pediatric Oncology Imaging Guidelines, and **PET Brain Imaging (PEDHD-2.3)** and **Special Imaging Studies in Evaluation for Epilepsy Surgery (PEDHD-6.3)** in the Pediatric Head Imaging Guidelines.

Guideline

General Guidelines (AB-1)
Abdominal Pain (AB-2)
Abdominal Sepsis (Suspected Abdominal Abscess) (AB-3)
Flank Pain, Rule Out or Known Renal/Ureteral Stone (AB-4)
Gastroenteritis/Enterocolitis (AB-5)
Mesenteric/Colonic Ischemia (AB-6)
Post-Operative Pain Within 60 Days Following Abdominal Surgery – Abdominal Procedure (AB-7)
Abdominal Lymphadenopathy (AB-8)
Bariatric Surgery and Percutaneous Gastrostomy (AB-9)
Blunt Abdominal Trauma (AB-10)
Gaucher Disease and Hemochromatosis (AB-11)
Hernias (AB-12)
Abdominal Mass (AB-13)
Lower Extremity Edema (AB-14)
Zollinger-Ellison Syndrome (ZES-Gastrinoma) (AB-15)
Adrenal Cortical Lesions (AB-16)
Abdominal Aortic Aneurysm (AAA), Iliac Artery Aneurysm (IAA), and Visceral Artery Aneurysms Follow-Up of Known Aneurysms and Pre-Op Evaluation (AB-17)
Abdominal Aortic Aneurysm (AAA) and Iliac Artery Aneurysm (IAA)-Post Endovascular or Open Aortic Repair (AB-18)
Aortic Dissection and Imaging for Other Aortic Conditions (AB-19)
Bowel Obstruction, Gastroparesis, and Bloating (AB-20)
Diarrhea, Constipation, and Irritable Bowel (AB-21)
GI Bleeding (AB-22)
Inflammatory Bowel Disease (AB-23)
Celiac Disease (Sprue) (AB-24)
CT Colonography (CTC) (AB-25)
Cirrhosis and Liver Screening for Hepatocellular Carcinoma (HCC); Ascites and Portal Hypertension (AB-26)
MR Cholangiopancreatography (MRCP) (AB-27)
Gallbladder (AB-28)
Liver Lesion Characterization (AB-29)
Abnormal Liver Chemistries (AB-30)

Pancreatic Lesion (AB-31)
Pancreatic Pseudocysts (AB-32)
Pancreatitis (AB-33)
Spleen (AB-34)
Indeterminate Renal Lesion (AB-35)
Renal Failure (AB-36)
Renovascular Hypertension (AB-37)
Polycystic Kidney Disease (AB-38)
Hematuria and Hydronephrosis (AB-39)
Urinary Tract Infection (UTI) (AB-40)
Patent Urachus (AB-41)
Transplant (AB-42)
Hepatic and Abdominal Arteries (AB-43)
Suspected Neuroendocrine Tumors of the Abdomen (AB-44)
Liver Elastography (AB-45)
Hiccups (AB-46)
Retroperitoneal Fibrosis (AB-47)
Fistulae (AB-48)

Abbreviations for Abdomen Imaging Guidelines

AB.GG.Abbreviations.A

v1.0.2024

Abbreviations for Abdomen Imaging Guidelines	
AAA	abdominal aortic aneurysm
AASLD	American Association for the Study of Liver Diseases
ACE	angiotensin-converting enzyme
ACG	American College of Gastroenterology
ACR	American College of Radiology
ACTH	adrenocorticotrophic hormone
AFP	alpha-fetoprotein
AGA	American Gastroenterological Association
ALT	alanine aminotransferase
ASGE	American Society for Gastrointestinal Endoscopy
AST	aspartate aminotransferase
AUA	American Urological Association
BEIR	Biological Effects of Ionizing Radiation
BUN	blood urea nitrogen
CAG	Canadian Association of Gastroenterology
CNS	central nervous system
CT	computed tomography
CTA	computed tomography angiography
CTC	computed tomography colonography (aka: virtual colonoscopy)
DVT	deep vein thrombosis
ERCP	endoscopic retrograde cholangiopancreatography
EUS	endoscopic ultrasound
FNH	focal nodular hyperplasia
GFR	glomerular filtration rate

Abbreviations for Abdomen Imaging Guidelines	
GGT	gamma glutamyltransferase
GI	gastrointestinal
HCC	hepatocellular carcinoma
HCPCS	Healthcare Common Procedural Coding System (commonly pronounced: “hix pix”)
HU	Hounsfield units
IAA	iliac artery aneurysm
IV	intravenous
KUB	kidneys, ureters, bladder (plain frontal supine abdominal radiograph)
LFT	liver function tests
MRCP	magnetic resonance cholangiopancreatography
MRA	magnetic resonance angiography
MRI	magnetic resonance imaging
mSv	millisievert
NAFLD	nonalcoholic fatty liver disease
PA	posteroanterior projection
PET	positron emission tomography
RAS	renal artery stenosis
RBC	red blood cell
SBFT	small bowel follow through
SPECT	single photon emission computed tomography
VC	virtual colonoscopy (CT colonography)
PFT	pulmonary function tests
WBC	white blood cell
ZES	Zollinger-Ellison Syndrome

General Guidelines (AB-1.0)

AB.GG.0001.0.A

v1.0.2024

- A current clinical evaluation (within 60 days) is required before advanced imaging can be considered. The clinical evaluation must include a history relevant to the current complaint and physical examination, and may include appropriate laboratory studies, and non-advanced imaging modalities such as plain x-ray or ultrasound. Other meaningful contact (telephone call, electronic mail or messaging) by an established individual can substitute for a face-to-face clinical evaluation.

Red Flag Findings

- The following signs and symptoms can be indicative of more serious conditions. Documentation of abdominal pain along with ANY of the following warrants exclusion from prerequisites to advanced imaging:
 - History of malignancy with a likelihood or propensity to metastasize to abdomen
 - Fever (≥ 101 degrees Fahrenheit)
 - Elevated WBC $> 10,000$, or above the upper limit of normal for the particular lab reporting the result
 - Low WBC (absolute neutrophil count < 1000)
 - Palpable mass of clinical concern and/or without benign features
 - GI bleeding, overt or occult, not obviously hemorrhoidal
 - Abdominal tenderness documented as moderate or severe
 - Peritoneal signs, such as guarding or rebound tenderness
 - Suspected complication of bariatric surgery
 - Notation by the ordering provider that the individual has a "surgical abdomen"
 - Age ≥ 60 years with unintentional weight loss of ≥ 10 lbs. or $\geq 5\%$ of body weight over 6 months or less
- See the condition-specific sections for when the above list of exclusionary criteria apply and lead directly to advanced imaging.

Experimental, Investigational, and/or Unproven Techniques

- Certain studies, treatments, procedures, or devices may be considered experimental, investigational, or unproven for any condition, illness, disease, or injury being treated if one of the following is present:
 - If there is a paucity of supporting evidence;
 - If the evidence has not matured to exhibit improved health parameters;
 - If clinical utility has not been demonstrated in any condition OR
 - The study, treatment, procedure, or device lacks a collective opinion of support.

- Supporting evidence includes standards that are based on credible scientific evidence published in peer-reviewed medical literature (such as well conducted randomized clinical trials or cohort studies with a sample size of sufficient statistical power) generally recognized by the relevant medical community. Collective opinion of support includes physician specialty society recommendations and the views of physicians practicing in relevant clinical areas when physician specialty society recommendations are not available.

Imaging Recommended Per Drug Manufacturer

- When follow up imaging for the purposes of monitoring or screening is recommended in the package insert for a particular drug therapy or medication, that imaging may be indicated.

Complications Related to COVID-19

- Please refer to the appropriate condition-specific guideline relevant to the presenting signs or symptoms in individuals with potential sequelae of COVID-19.
 - Examples include:
 - For suspected acute mesenteric ischemia, see: **Mesenteric Ischemia (AB-6.1)**
 - For suspected renal failure, see: **Renal Failure (AB-36.1)**
 - For left upper quadrant pain and suspected infarct, see: **Left Upper Quadrant (LUQ) Pain (AB-2.4)**

Pre-operative Radiologic Imaging

- Please refer to the appropriate condition-specific guideline relevant to the clinical condition for pre-operative imaging indications (e.g., **Percutaneous Gastrostomy (AB-9.2)**)
- If imaging is requested by the operating surgeon to support planned surgery, the imaging may be approved.
- Radiologic therapeutic intervention is addressed elsewhere in this Guideline
 - Radiologic management of lower GI bleeding, see: **Small Bowel Bleeding Suspected (AB-22.2)**
 - Radiologic management of mesenteric ischemia, see: **Mesenteric/Colonic Ischemia (AB-6.1)**
 - Radiologic management of portal hypertension, see: **Portal Hypertension (AB-26.3)**

3D Rendering

- CPT® 76377 (3D rendering requiring image post-processing on an independent workstation) or CPT® 76376 (3D rendering not requiring image post-processing on an independent workstation) can be considered in the following clinical scenarios:
 - Preoperative planning for complex surgical cases
 - CT Urogram (See: **Hematuria and Hydronephrosis (AB-39)**)
 - MRCP (See: **MR Cholangiopancreatography (MRCP) (AB-27)**)
- CPT® codes for 3D rendering should not be billed in conjunction with computer-aided detection (CAD), MRA, CTA, nuclear medicine SPECT studies, PET, PET/CT, or CT Colonography (virtual colonoscopy).

Overview (AB-1.1)

AB.GG.0001.1.A
v1.0.2024

- GI Specialist evaluations can be helpful, particularly in determining mesenteric/colonic ischemia, diarrhea/constipation, irritable bowel syndrome (IBS), or need for MRCP.
- Abdominal imaging begins at the diaphragm and extends to the umbilicus or iliac crest.
- Pelvic imaging begins at the iliac crest and extends to the pubis.
- Clinical concerns at the dividing line can be providers' choice (abdomen and pelvis; abdomen or pelvis).

CT Imaging (AB-1.2)

AB.GG.0001.2.A

v1.0.2024

- CT imaging is a more generalized modality. CT Abdomen is usually performed with contrast (CPT® 74160):
 - Oral contrast has no relation to the IV contrast administered. Coding for contrast only refers to IV contrast. There is no coding for oral contrast.
 - Exceptions are noted in these guidelines, and include:
 - CT Abdomen with contrast (CPT® 74160) or without and with contrast (CPT® 74170) with suspicion of a solid organ lesion (liver, kidney, pancreas, spleen).
 - Please refer to the specific guideline for the lesion in question for specific guidance.
 - CT Abdomen without contrast (CPT® 74150) or CT Abdomen and Pelvis without contrast (CPT® 74176) if there is renal insufficiency/failure, or a documented allergy to contrast. It can also be considered for diabetics or the very elderly.
 - CT Abdomen and Pelvis without and with contrast (CPT® 74178 – CT Urogram) for certain urologic conditions (e.g. hematuria)
 - Shellfish allergy:
 - It is commonly assumed that an allergy to shellfish infers iodine allergy, and that this implies an allergy to CT iodinated contrast media. However, this is NOT true. Shellfish allergy is due to tropomyosins. Iodine plays no role in these allergic reactions. Allergies to shellfish do not increase the risk of reaction to IV contrast any more than that of other allergens.
 - CT Abdomen and Pelvis, usually with contrast (CPT® 74177), should be considered when signs or symptoms are generalized, or involve a lower quadrant of the abdomen.
 - CT Enterography (CPT® 74177) combines CT imaging with large volumes of ingested neutral bowel contrast material to allow visualization of the small bowel.
 - CT Enteroclysis
 - A tube is placed through the nose or mouth and advanced into the duodenum or jejunum. Bowel contrast material is infused through the tube and CT imaging is performed either with or without intravenous contrast.
 - CT Enteroclysis is used to allow visualization of the small bowel wall and lumen. CT Enteroclysis may allow better or more consistent distention of the small bowel than CT Enterography.
 - Report by assigning: CPT® 74176 or CPT® 74177
 - Triple-phase CT
 - 3 phases of a triple-phase CT are:

- 1) Hepatic arterial phase,
- 2) Portal venous phase, and
- 3) Washout or delayed acquisitions phase.
- It should be noted that, in general, a pre-contrast or non-contrast CT is usually not needed in a standard triple-phase CT, except in those individuals previously treated with locoregional embolic or ablative therapies. Other specific instances in which a prior noncontrast CT may be indicated for the evaluation of liver lesions are noted in **Liver Lesion Characterization (AB-29.1)**.
- CT Colonography (CTC)
 - There are 3 CPT® codes for CTC:
 - CPT® 74263: Screening CTC (only used for screening procedures)
 - CPT® 74261: CTC without contrast
 - CPT® 74262: CTC with contrast
 - See: **CT Colonography (CTC) (AB-25)** for further indications for these procedures

MR Imaging (AB-1.3)

AB.GG.0001.3.A

v1.0.2024

- MRI may be preferred as a more targeted study in cases of renal failure, in individuals allergic to intravenous CT contrast, and as noted in these guidelines.
 - MRI Abdomen with contrast only is essentially never performed. If contrast is indicated, MRI Abdomen without and with contrast (CPT® 74183) should be performed.
 - For pregnant women ultrasound or MRI without contrast should be used to avoid radiation exposure. The use of gadolinium contrast agents is limited during pregnancy, as gadolinium contrast agents cross the placenta and enter the amniotic fluid with unknown long-term effects on the fetus.
 - See: **Pregnancy Considerations for Imaging (AB-1.12)** for additional discussion of this issue
- MR Elastography (CPT® 76391) replaces MRI Abdomen (CPT® 74183 or CPT® 74181) for requests for MR Elastography liver (See: **Liver Elastography (AB-45)**)

MR Enterography and Enteroclysis

Coding Notes (AB-1.4)

AB.GG.0001.4.U

v1.0.2024

- MR Enterography or Enteroclysis is reported in one of two ways:
 - MRI Abdomen without and with contrast (CPT® 74183), or
 - MRI Abdomen without and with contrast (CPT® 74183) and MRI Pelvis with and without contrast (CPT® 72197)

Ultrasound (AB-1.5)

AB.GG.0001.5.A**v1.0.2024**

- Ultrasound, also called sonography, uses high frequency sounds waves to image body structures.
 - The routine use of 3D and 4D rendering, (post-processing), in conjunction with ultrasound is considered investigational.
 - All ultrasound studies require permanently recorded images either stored on film or in a Picture Archiving and Communication System (PACS).
 - The use of a hand-held or any Doppler device that does not create a hard-copy output is considered part of the physical examination and is not separately billable. This exclusion includes devices that produce a record that does not permit analysis of bi-directional vascular flow.
- Duplex scan describes an ultrasonic scanning procedure for characterizing the pattern and direction of blood flow in arteries and veins with the production of real-time images integrating B-mode 2D vascular structures, Doppler spectral analysis, and color flow Doppler imaging.
 - The minimal use of color Doppler alone, when performed for anatomical structure identification during a standard ultrasound procedure, is not separately reimbursable.

Abdominal Ultrasound (AB-1.6)

AB.GG.0001.6.A

v1.0.2024

- Complete abdominal ultrasound (CPT® 76700) includes all of the following required elements:
 - Liver, gallbladder, common bile duct, pancreas, spleen, kidneys, upper abdominal aorta, and inferior vena cava.
 - If a particular structure or organ cannot be visualized, the report should document the reason.
- Limited abdominal ultrasound (CPT® 76705) is without all of these required elements and can refer to a specific study of a single organ, a limited area of the abdomen, or a follow-up study.
 - Further, CPT® 76705 should:
 - Be assigned to report follow-up studies once a complete abdominal ultrasound (CPT® 76700) has been performed; and
 - Be assigned to report ultrasonic evaluation of diaphragmatic motion; and
 - Be reported only once per individual imaging session; and
 - Not be reported with CPT® 76700 for the same individual for the same imaging session.

Retroperitoneal Ultrasound (AB-1.7)

AB.GG.0001.7.A

v1.0.2024

- Complete retroperitoneal ultrasound (CPT® 76770) includes all of the following required elements:
 - Kidneys, lymph nodes, abdominal aorta, common iliac artery origins, inferior vena cava.
 - For urinary tract indications, a complete study can consist of kidneys and bladder.
- Limited retroperitoneal ultrasound (CPT® 76775) studies are without all of these required elements and can refer to a specific study of a single organ, a limited area of the abdomen, or a follow-up study.
 - Further, CPT® 76775 should:
 - Be assigned to report follow-up studies once a complete retroperitoneal ultrasound (CPT® 76770) has been performed; and
 - Be reported only once per individual imaging session; and
 - Not be reported with CPT® 76770 for the same individual for the same imaging session.

CT-, MR-, Ultrasound-guided Procedures (AB-1.8)

AB.GG.0001.8.A

v1.0.2024

See: **CT-, MR-, or Ultrasound-Guided Procedures (Preface-4.2)** in the Preface
Imaging Guidelines

Contrast-Enhanced Ultrasound (AB-1.9)

AB.GG.0001.9.A**v1.0.2024**

Ultrasound with contrast (CEUS, CPT® 76978, CPT® 76979) is an emerging technology that may be as good, if not better, than CT or MRI in certain circumstances. Abdominal Imaging Guidelines address its use as appropriate. CPT® 76978 refers to the initial imaging of the first lesion, and CPT® 76979 refers to additional lesions that are imaged subsequently.

Quantitative MRI (AB-1.10)

AB.GG.0001.10.A

v1.0.2024

- Quantitative MR analysis of tissue composition (CPT® 0648T, 0649T, 0697T and 0698T)
 - These CPT codes are investigational and experimental for coverage purposes.
 - See: **Quantitative MR Analysis of Tissue Composition (Preface-4.8)** and **Fatty Liver (AB-29.2)** for further discussion of these modalities.

RADCAT Grading System (AB-1.11)

AB.GG.0001.11.A**v1.0.2024**

- The RADCAT (Radiology Report Categorization) Grading System was developed in order to communicate to ordering physicians (most commonly in the ER setting), the relative urgency of a radiologic finding. It is not related to the LI-RADs reporting system, nor does it necessarily imply the need for follow-up imaging, as opposed to clinical follow-up. The rating system is as follows:
 - RADCAT 1: Normal Result
 - RADCAT 2: Routine Result
 - RADCAT 3: Result with recommendation for non-urgent routine follow-up
 - RADCAT 4: Priority Result
 - RADCAT 5: Critical Result

Pregnancy Considerations for Imaging (AB-1.12)

AB.GG.0001.12.A**v1.0.2024**

The American College of Obstetricians and Gynecologists has issued guidelines with regards to imaging during pregnancy and lactation. Their recommendations are as follows:¹⁵

- Ultrasonography and magnetic resonance imaging (MRI) are not associated with risk and are the imaging techniques of choice for the pregnant patient, but they should be used prudently and only when use is expected to answer a relevant clinical question or otherwise provide medical benefit to the patient.
- With few exceptions, radiation exposure through radiography, computed tomography (CT) scan, or nuclear medicine imaging techniques is at a dose much lower than the exposure associated with fetal harm.
 - If these techniques are necessary in addition to ultrasound or MRI or are more readily available for the diagnosis in question, they should not be withheld from a pregnant patient.
- The use of gadolinium contrast with MRI should be limited; it may be used as a contrast agent in a pregnant patient only if it significantly improves diagnostic performance and is expected to improve fetal or maternal outcome.
- With regards to iodinated IV contrast media, "it is generally recommended that contrast only be used if absolutely required to obtain additional diagnostic information that will affect the care of the fetus or woman during pregnancy".

Abdominal Pain (AB-2)

Guideline

Acute/Persistent (Non-Chronic) Lower Abdominal Pain (AB-2.2)

Right Upper Quadrant Pain Including Suspected Gallbladder Disease (AB-2.3)

Left Upper Quadrant (LUQ) Pain (AB-2.4)

Epigastric Pain and Dyspepsia (AB-2.5)

Chronic Abdominal Pain (AB-2.6)

Non-operative Treatment of Acute Appendicitis (AB-2.7)

Non-chronic Nonspecific Abdominal Pain with No Localizing Findings (AB-2.8)

References (AB-2)

Acute/Persistent (Non-Chronic) Lower Abdominal Pain (AB-2.2)

AB.AP.0002.2.A

v1.0.2024

- The presence of any red flag findings per **General Guidelines (AB-1.0)** precludes adjudication based on any other criteria.
- Left Lower Abdominal Pain (including suspected diverticulitis) <6 months duration
 - CT Abdomen and Pelvis with contrast is indicated if ANY of the following are present:
 - Age ≥65
 - The presence of LLQ tenderness specifically noted on physical examination, and diverticulitis is specified as a diagnostic consideration
 - Immunocompromised individual (e.g., on immunosuppressive therapy, history of HIV)
 - If prior abdominal and pelvic US has been performed and demonstrates a need for additional imaging OR if they do not explain the source of pain
 - CBC, Basic Metabolic Panel, C-Reactive Protein or other inflammatory marker, Pregnancy Test, and Urinalysis have been performed
 - Note: All the specific laboratory studies listed are not required, but there should be some studies performed relating to the current episode in order to help direct imaging appropriately.
 - For follow-up imaging of acute diverticulitis if symptoms or elevated WBC persists despite treatment
 - For follow-up of complicated diverticulitis, including confirmed abscess, fistulae, free fluid, or perforation (See: **Abdominal Sepsis/Suspected Abdominal Sepsis (AB-3)**).
 - For follow-up of diverticulitis treated with radiologic intervention (e.g. drainage procedure)
 - Note: Per ASCRS, colonic endoscopic evaluation is recommended to confirm the diagnosis after resolution of acute diverticulitis to exclude malignancy, especially when initial CT scan supports abscess, shouldering, or shelf-like appearance of a presumed inflammatory mass, obstruction, mesenteric or retroperitoneal adenopathy.
 - Pregnant individuals
 - US Abdomen and/or Pelvis should be considered initially to avoid ionizing radiation.
 - MRI Abdomen and MRI Pelvis without contrast if US is nondiagnostic. (See: **Pregnancy Considerations for Imaging (AB-1.12)**)
- Right Lower Abdominal Pain (including suspected appendicitis)
 - CT Abdomen and Pelvis with or without contrast is indicated if ANY of the following are present:

- Age ≥ 65
- For Alvarado Score of ≥ 4
- For AIR (Appendicitis Inflammatory Response Score) of ≥ 5
- Immunocompromised individual (e.g., on immunosuppressive therapy, history of HIV)
- US of the abdomen and pelvis has been performed and is nondiagnostic or negative or indicates a need for further advanced imaging
- CBC or CRP (or other inflammatory marker such as ESR or fecal calprotectin) have been performed related to this episode
- Pregnant individuals
 - Abdominal US and/or Pelvic US initial imaging
 - MRI Abdomen and Pelvis without contrast if initial US is nondiagnostic.
 - See above statement regarding CT and contrast during pregnancy.
- For Chronic lower abdominal pain (≥ 6 months), see: **Chronic Abdominal Pain (AB-2.6)**
- For follow-up imaging for conservatively treated acute appendicitis, see: **Non-Operative Treatment of Acute Appendicitis (AB-2.7)**.
- For Rectal Pain (Proctalgia) see: **Pelvic Pain/Dyspareunia (PV-11.1), Female, Proctalgia Syndromes and Male Pelvic Disorders, Proctalgia Syndromes (PV-19.1)**.
- For pain described as pelvic, see: **Pelvic Pain/Dyspareunia (PV-11.1)** or other appropriate sections based on likely etiology.

CPT® Codes for Acute/Persistent (Non-Chronic) Lower Abdominal Pain (AB-2.2)

CPT® 74150	CT Abdomen without contrast	CPT® 76700	Ultrasound, complete Abdomen
CPT® 74160	CT Abdomen with contrast	CPT® 76705	Ultrasound, limited Abdomen
CPT® 74176	CT Abdomen and Pelvis without contrast	CPT® 76830	Ultrasound, Transvaginal
CPT® 74177	CT Abdomen and Pelvis with contrast	CPT® 76856	Ultrasound, complete Pelvis
CPT® 74181	MRI Abdomen without contrast	CPT® 72195	MRI Pelvis without contrast
CPT® 74183	MRI Abdomen without and with contrast	CPT® 72197	MRI Pelvis without and with contrast

Background and Supporting Information

- The Alvarado Score for appendicitis risk is comprised of the following parameters with points assigned based on their presence, as follows:

Migration of pain	1 point
Anorexia	1 point
Nausea/vomiting	1 point
Right lower quadrant tenderness	2 points
Rebound pain	1 point
Temperature > 99.1	1 point
WBC > 10,000	2 points
PMNs ≥ 75%	1 point

- Low Risk: <4
 - Moderate Risk: 4-7
 - High Risk: ≥8
- Appendicitis Inflammatory Response Score (AIR)

Vomiting	1 point
Right iliac fossa pain	1 point
Rebound tenderness	Light – 1 point Medium – 2 points Strong – 3 points
Febrile (temperature ≥ 101.3)	1 point
PMNs	70-84% - 1 point ≥85% - 2 points
WBC	10-14.9 – 1 point ≥15 – 2 points
CRP	10-49 – 1 point >50 – 2 points

- Low Probability: 0-4
 - Mild Probability: 5-8
 - High Probability: 9-12

Right Upper Quadrant Pain Including Suspected Gallbladder Disease (AB-2.3)

AB.AP.0002.3.A
v1.0.2024

- The presence of any red flag findings per **General Guidelines (AB-1.0)** precludes adjudication based on any other criteria.
- For Pregnant Women, see: **Pregnancy Considerations for Imaging (AB-1.12)**
- For all others:
 - Abdominal ultrasound (complete or limited) is the initial diagnostic test
 - CT Abdomen with contrast, or MRCP/MRI (MRI Abdomen without or without and with contrast) if ultrasound is equivocal or nondiagnostic.
- Hepatobiliary System Imaging (HIDA) with OR without pharmacologic intervention (CPT® 78226 or CPT® 78227) can be considered:
 - If there is right upper quadrant pain or epigastric pain and there is a suspicion of gallbladder disease, with a normal, or equivocal or non-diagnostic recent ultrasound, CT, or MRI
 - NOTE: If findings on US suggest acute cholecystitis in a symptomatic individual (presence of gallstones with gallbladder wall thickening, Murphy's sign, and peri-cholecystic fluid) then a HIDA scan is generally not needed.
 - If the HIDA without pharmacologic intervention (CPT® 78226) is initially performed and is normal or inconclusive, the site can convert the study to HIDA with pharmacologic intervention (CPT® 78227). The member will not need to return for a second study with injection of a pharmaceutical.
 - Suspected bile leak after trauma or surgery
 - Monitoring of liver regeneration
 - Assessment of liver transplant
 - Assessment of choledochal cyst
 - Pre-operative assessment prior to partial hepatectomy
 - Chronic acalculous cholecystitis, biliary dyskinesia, functional gallbladder disease, or sphincter of Oddi dysfunction can be imaged with a HIDA with or without pharmacologic intervention (CPT® 78226 or CPT® 78227)

Left Upper Quadrant (LUQ) Pain (AB-2.4)

AB.AP.0002.4.A

v1.0.2024

- The presence of any red flag findings per **General Guidelines (AB-1.0)** precludes adjudication based on any other criteria.
- Most common causes which may be more specifically evaluated:
 - Splenic etiologies:
 - Suspected trauma, or splenomegaly
 - See: **Spleen (AB-34)**
 - Suspected infarct or abscess (severe pain and tenderness, fever, history of atrial fibrillation)
 - CT Abdomen without and with contrast or with contrast (CPT® 74170 or CPT® 74160)
 - Pancreatic etiologies:
 - Suspected pancreatitis
 - See: **Acute Pancreatitis (AB-33.1)**
 - Renal etiologies
 - Suspected nephrolithiasis
 - See: **Suspected Renal/Ureteral Stone (AB-4.1)**
 - Suspected pyelonephritis or abscess
 - See: **Upper (Pyelonephritis) (AB-40.1)**
 - Suspected small or large bowel etiologies (e.g., ischemia, obstruction, volvulus, diverticulitis)
 - CT Abdomen (CPT® 74160) or CT Abdomen and Pelvis (CPT® 74177)
 - Gastric etiologies
 - If there is concern for peptic ulcer disease, or if the complaint is dyspepsia, without any signs or symptoms suggesting possible perforation or penetration, endoscopy would be the best study for assessing these potential conditions. See: **EGD-1** in the EGD guidelines
 - If there is concern for a more urgent gastric problem, such as perforation, then a CT Abdomen (CPT® 74160) or CT Abdomen and Pelvis (CPT® 74177) can be approved.
 - Suspected aortic dissection
 - See: **Aortic Dissection and Other Aortic Conditions (PVD-6.7)** in the Peripheral Vascular Disease Imaging Guidelines
 - Unknown etiology, simply reported as LUQ pain

- Prior to advanced imaging, an adequate history and physical examination, with lab work to include: CBC, chemistry profile including electrolytes, BUN, creatinine, LFTs (ALT, AST, alkaline phosphatase and bilirubin) lipase, amylase, and urinalysis, should be performed with the intention of trying to establish a potential etiology.
 - All the specific laboratory studies listed are not required, but there should be some studies performed relating to the current episode in order to help direct imaging appropriately.
- CT Abdomen (CPT® 74160) or CT Abdomen and Pelvis (CPT® 74177) is indicated for ANY of the following:
 - History and physical examination and lab studies are negative or inconclusive for establishing a potential etiology

Background and Supporting Information

- LUQ pain is more difficult to categorize with regard to imaging as there are many potential etiologies, which might be better evaluated with different imaging procedures.

Epigastric Pain and Dyspepsia (AB-2.5)

AB.AP.0002.5.A

v1.0.2024

- The presence of any red flag findings per **General Guidelines (AB-1.0)** precludes adjudication based on any other criteria.

Epigastric Pain or Dyspepsia Without Additional Signs or Symptoms

- Epigastric pain or dyspepsia (dyspepsia is defined by the ACG and CAG as predominant epigastric pain lasting at least one month and can be associated with any upper gastrointestinal symptoms such as epigastric fullness, nausea, vomiting, or heartburn) without any red flag findings:
 - Ultrasound Abdomen (CPT® 76700 or CPT® 76705) to assess for biliary/pancreatic disease is the initial study
 - CT Abdomen (CPT® 74160) or MRI Abdomen (CPT® 74183), or MRCP (CPT® 74181 or CPT® 74183), may be appropriate to evaluate positive findings on ultrasound. The use of these advanced imaging procedures to evaluate the ultrasound findings may be specifically addressed in the dedicated guideline.
 - CT Abdomen (CPT® 74160), or MRI Abdomen (CPT® 74183) for persistent symptoms after a negative or inconclusive upper gastrointestinal endoscopy and ultrasound as well as ONE of the following:
 - Test and treat for *Helicobacter pylori* (*H. pylori*) and a trial of acid suppression with a proton pump inhibitor (PPI) for 4–8 weeks if eradication is successful, but symptoms do not resolve OR
 - An empiric trial of acid suppression with a PPI for 4–8 weeks.
- NOTE: See imaging for pregnant women **Pregnancy Considerations for Imaging (AB-1.12)**
- For suspicion of superior mesenteric artery syndrome, see: **Superior Mesenteric Artery (SMA) Syndrome (AB-20.4)**

Special Considerations for Suspicion of Pancreatic Cancer

- CT Abdomen with contrast (CPT® 74160), CT Abdomen and Pelvis with contrast (CPT® 74177), or MRI Abdomen without and with contrast (CPT® 74183) is appropriate for suspicion of pancreatic cancer in individuals aged ≥60 years with weight loss and any ONE of the following:
 - Diarrhea
 - Back pain
 - Abdominal pain
 - Nausea

- Vomiting
- Constipation
- New onset diabetes
- Abnormal lab results raising the possibility of pancreatic cancer (e.g., elevated CA-19-9, GGTP, alkaline phosphatase, or bilirubin)
- Nondiagnostic or negative prior US
- If none of the above signs or symptoms applies, follow criteria for epigastric pain and dyspepsia
- See also: **Pancreatic Cancer – Suspected/Diagnosis (ONC-13.2)** in the Oncology Imaging Guidelines

Chronic Abdominal Pain (AB-2.6)

AB.AP.0002.6.A

v1.0.2024

- The presence of any red flag findings per **General Guidelines (AB-1.0)** precludes adjudication based on any other criteria.
- Evaluation of Chronic Abdominal Pain (defined as continuous or intermittent symptoms >6 months)
 - Epigastric Pain and Dyspepsia
 - See: **Epigastric Pain and Dyspepsia (AB-2.5)**
 - Right Upper Quadrant Pain
 - See: **Right Upper Quadrant Pain Including Suspected Gallbladder Disease (AB-2.3)**
 - Left Upper Quadrant Pain
 - See: **Left Upper Quadrant (LUQ) Pain (AB-2.4)**
 - Nonspecific, generalized, or lower abdominal pain
 - CT Abdomen with contrast (CPT® 74160) or CT Abdomen and Pelvis with contrast (CPT® 74177) as requested (include pelvis for lower abdominal complaints or findings) for the following:
 - Initial laboratory assessment (see below) is negative or does not provide specific causes for more directed workup (for example, colonoscopy or EGD if iron deficiency anemia is found, or CT Urogram if urinalysis shows hematuria)
 - CBC with differential, chemistry profile including electrolytes, glucose, creatinine, BUN and liver chemistries, ESR, urinalysis, amylase and lipase (for generalized or upper abdominal complaints), thyroid function tests, and serology testing for celiac (if celiac is suspected)

Non-operative Treatment of Acute Appendicitis (AB-2.7)

AB.AP.0002.7.A**v1.0.2024**

- Recurrent symptoms or routine post-treatment follow-up, if requested:
 - One-time CT Abdomen and Pelvis with contrast (CPT® 74177)
(Note: Non-operative treatment of acute appendicitis is increasingly utilized. There is an approximately 2% chance of a pathologic finding not initially identified prior to treatment (e.g. Crohn's Disease or an appendiceal neoplasm such as a carcinoid). In view of this, some authors suggest a follow-up imaging study in asymptomatic patients, post-antibiotic treatment.)

Non-chronic Nonspecific Abdominal Pain with No Localizing Findings (AB-2.8)

AB.AP.0002.8.A

v1.0.2024

- The presence of any red flag findings per **General Guidelines (AB-1.0)** precludes adjudication based on any other criteria.
- Nonspecific abdominal pain can have multiple etiologies and be a diagnostic dilemma. Often, the history, physical examination, and laboratory data can guide subsequent workup in individuals presenting with abdominal pain (e.g. RUQ pain would lead to US for the evaluation of cholecystitis). If, despite an initial history and physical examination the clinical suspicion cannot be localized, and there is no specific indication of a significant concern for serious pathology, then further workup and appropriate imaging may be directed by the results of initial lab studies or the results of non-advanced imaging relevant to and ordered for the evaluation of the current complaint being investigated.
- When possible, please use the more specific guideline, depending on clinical presentation and the differential diagnosis offered by the provider:
 - **Right Upper Quadrant Pain including Suspected Gallbladder Disease (AB-2.3)**
 - **Left Upper Quadrant (LUQ) Pain (AB-2.4)**
 - **Epigastric Pain and Dyspepsia (AB-2.5)**
 - **Chronic Abdominal Pain (AB-2.6)**
 - **Flank Pain, Rule Out or Known Renal/Ureteral Stone (AB-4)**
 - **Gastroenteritis (AB-5.1)**
 - **Mesenteric Ischemia (AB-6.1)** and **Colonic Ischemia (AB-6.2)**
 - **Post-Operative Pain With-in 60 Days Following Abdominal Surgery – Abdominal Procedure (AB-7)**
 - **Bowel Obstruction (AB-20.1)** and **Gastroparesis (AB-20.2)**
 - **Diarrhea, Constipation, and Irritable Bowel (AB-21)**
 - **Inflammatory Bowel Disease Rule Out Crohn's Disease or Ulcerative Colitis (AB-23)**
 - **Pancreatitis (AB-33)**
- Evaluation of Nonspecific Abdominal Pain:
 - US Abdomen and/or Pelvis OR
 - CT Abdomen and Pelvis with contrast:
 - Preliminary labs such as CBC, electrolytes, lipase or amylase, urinalysis, ESR or CRP, or LFT's are unrevealing or do not point to a specific etiology

that would otherwise direct more appropriate imaging (such as findings suggestive of pancreatitis or biliary tract disease)

- Note: All the specific laboratory studies listed are not required, but there should be some studies performed relating to the current episode in order to help direct imaging appropriately. (Note: Pregnancy test should be performed prior to CT in all appropriate reproductive age females)
- If a prior US Abdomen and/or Pelvis performed for the current complaint is unrevealing or does not explain the pain
- Special Populations:
 - Pregnant women:
 - US Abdomen and/or Transvaginal and/or complete Pelvis as the initial study
 - MRI Abdomen and/or Pelvis without contrast if US is equivocal

Abdominal Sepsis (Suspected Abdominal Abscess) (AB-3)

Guideline

Abdominal Sepsis (AB-3.1)

Reference (AB-3)

Abdominal Sepsis (AB-3.1)

AB.AS.0003.1.A**v1.0.2024**

- CT Abdomen, or CT Pelvis, or CT Abdomen and Pelvis with contrast (CPT® 74160, or CPT® 72193, or CPT® 74177) for abdominal symptoms associated with fever and/or elevated white blood cell count.¹
- CT Abdomen and Pelvis with contrast (CPT® 74177) interval imaging as requested for intraperitoneal abscess.
- Serial Ultrasound (CPT® 76705) or CT Abdomen, CT Pelvis, or CT Abdomen and Pelvis with contrast (CPT® 74160, or CPT® 72193, or CPT® 74177) studies may be performed for follow-up of known abnormal fluid collections, especially following catheter drainage. The interval can be days, weeks, or months based on the clinical course of the individual.

Reference (AB-3)

v1.0.2024

Flank Pain, Rule Out or Known Renal/Ureteral Stone (AB-4)

Guideline

Ultrasound (AB-4.0)

Suspected Renal/Ureteral Stone(s) (AB-4.1)

Observation of Known Renal/Ureteral Stone(s) (AB-4.2)

Follow-Up of Treated Renal/Ureteral Stone (AB-4.3)

Annual Surveillance (AB-4.4)

Nuclear Kidney Imaging (AB-4.5)

References (AB-4)

Ultrasound (AB-4.0)

AB.US.0004.0.A

v1.0.2024

- Retroperitoneal ultrasound (CPT® 76770 or CPT® 76775) can be used in place of CT Abdomen and Pelvis at any of the initial or follow-up indications, if requested by Provider.

Suspected Renal/Ureteral Stone(s) (AB-4.1)

AB.US.0004.1.A

v1.0.2024

- CT Abdomen and Pelvis without contrast (CPT® 74176) is indicated for ANY of the following:
 - Suspected renal/ureteral stone with symptoms in non-pregnant adults (flank pain/renal colic)^{1,2}
 - Suspected staghorn calculi^{12,13,14}
- CT Abdomen and Pelvis without contrast (CPT® 74176) or CT Urogram (CPT® 74178) is indicated for the following:
 - Suspicion renal/ureteral stones (flank pain/renal colic) with hematuria
- Ultrasound (CPT® 76770 or CPT® 76775) or MRI Abdomen and Pelvis without contrast (CPT® 74181 and CPT® 72195) is indicated for the following:
 - Suspected renal/ureteral stone in pregnant women (flank pain/renal colic)^{3,4}
 - The use of gadolinium contrast agents is contraindicated during pregnancy unless the specific need for that procedure outweighs risk to the fetus.
- Suspected renal/ureteral stone in children (flank pain/renal colic)
 - See: **Flank Pain, Renal Stone (PEDAB-4)** in the Pediatric Abdomen Imaging Guidelines

Observation of Known Renal/Ureteral Stone(s) (AB-4.2)

AB.US.0004.2.A

v1.0.2024

- Radiopaque Stones
 - Initial follow-up imaging:
 - Retroperitoneal ultrasound (CPT® 76770 or CPT® 76775) and KUB X-ray
 - Subsequent follow-up imaging:
 - If initial follow-up ultrasound and KUB are negative, and there is no hematuria and individual is asymptomatic:
 - See: **Annual Surveillance (AB-4.4)**
 - If initial follow-up ultrasound and KUB demonstrates hydronephrosis, retained stone, or if the individual has persistent hematuria, or is symptomatic:
 - CT Abdomen and Pelvis without contrast (CPT® 74176)
- Non-radiopaque Stones (i.e. radiolucent)
 - Initial follow-up imaging:
 - CT Abdomen and Pelvis without contrast (CPT® 74176)
 - Subsequent follow-up imaging:
 - If CT is negative:
 - See: **Annual Surveillance (AB-4.4)**
 - If CT demonstrates a retained stone, hydronephrosis, or if the individual is being evaluated for surgery:
 - Further imaging can be considered on an individual basis
- ANY of the following are indicated for surgical/procedural evaluation of staghorn calculi:^{12,13,14}
 - CT Abdomen and Pelvis (contrast as requested)
 - 3-D reconstruction (CPT® 76377 or CPT® 76376)
 - Nuclear kidney imaging (CPT® 78707, CPT® 78708, or CPT® 78709) when there is concern for a poorly functioning kidney

Background and Supporting Information

- Radiopaque versus radiolucent stones on plain radiograph:
 - Radiopaque
 - Calcium-based stones (70-80%)
 - Struvite stones (triple phosphate) (usually opaque but variable – 15-20%)
 - Radiolucent
 - Uric acid (5-10%)

- Cystine (1-3%)
- Medication stones (e.g. indinavir) (1%)

Follow-Up of Treated Renal/Ureteral Stone (AB-4.3)

AB.US.0004.3.A

v1.0.2024

- Post-shock wave lithotripsy (SWL):
 - Retroperitoneal ultrasound (CPT® 76770 or CPT® 76775) is the appropriate initial follow-up imaging.
 - Retroperitoneal ultrasound (CPT® 76770 or CPT® 76775) and/or CT Abdomen and Pelvis (contrast as requested) may be indicated for:
 - Individuals who are symptomatic
 - Individuals with hydronephrosis
 - Individuals who have residual fragments
 - Individuals treated by SWL who have passed fragments, are asymptomatic and without hydronephrosis can be followed according to **Annual Surveillance (AB-4.4)**.
- Post-medical expulsive therapy (MET):
 - Retroperitoneal ultrasound for individuals treated by MET who have passed a stone and are symptomatic.
 - CT Abdomen and Pelvis (contrast as requested) if hydronephrosis is demonstrated with ultrasound.
 - Individuals treated by MET who have passed a stone and are asymptomatic can be followed according to **Annual Surveillance (AB-4.4)**.
- Post-ureteroscopic extraction with an intact stone:
 - Retroperitoneal ultrasound for individuals without symptoms
 - CT Abdomen and Pelvis with contrast (CPT® 74177) for individuals with symptoms or hydronephrosis demonstrated on ultrasound
 - Individuals without symptoms or without hydronephrosis demonstrated on ultrasound can be followed according to **Annual Surveillance (AB-4.4)**.
- Post-ureteroscopic extraction requiring fragmentation of the stone(s):
 - Retroperitoneal ultrasound for individuals without symptoms
 - CT Abdomen and Pelvis without contrast (CPT® 74176) for individuals without symptoms, but hydronephrosis demonstrated on ultrasound
 - Individuals without symptoms or without hydronephrosis demonstrated on ultrasound can be followed according to **Annual Surveillance (AB-4.4)**.
 - Retroperitoneal ultrasound and KUB for individuals with symptoms and a radiopaque stone
 - CT Abdomen and Pelvis without contrast (CPT® 74176) for individuals with symptoms and a non-radiopaque stone
- Post-surgical/procedural treatment of staghorn calculi:

- CT Abdomen and Pelvis without contrast (CPT® 74176)^{12,13,14}
- Retroperitoneal ultrasound and/or CT Abdomen and Pelvis (contrast as requested) may be indicated for individuals with persistent symptoms and/or hydronephrosis.

Annual Surveillance (AB-4.4)

AB.US.0004.4.A

v1.0.2024

- Annual surveillance for stable individuals who have a history of stones may be indicated to assess for stone growth or formation of new stones:
 - Plain X-ray (KUB) should be performed for individuals with radiopaque stones
 - Retroperitoneal ultrasound (CPT® 76770 or CPT® 76775) is the preferred modality for individuals with non-radiopaque stones

Nuclear Kidney Imaging (AB-4.5)

AB.US.0004.5.A

v1.0.2024

- Nuclear kidney imaging (CPT® 78707, CPT® 78708, or CPT® 78709) can be considered for evaluation of any of the following:^{5,6}
 - Recurrent flank pain when CT and ultrasound are non-diagnostic.
 - Prior imaging (CT or ultrasound) shows hydronephrosis and to determine if this truly obstructive in nature.

Gastroenteritis/ Enterocolitis (AB-5)

Guideline

Gastroenteritis/Enterocolitis (AB-5.1)

References (AB-5)

Gastroenteritis/Enterocolitis (AB-5.1)

AB.GE.0005.1.A

v1.0.2024

- The presence of any red flag findings per **General Guidelines (AB-1.0)** precludes adjudication based on any other criteria.
- CT Abdomen and Pelvis with contrast (CPT® 74177) if:
 - Acute abdomen suggesting bowel obstruction, toxic megacolon (abdominal swelling, fever, tachycardia, elevated white blood cell count), or perforation
 - Bloody stools
 - Immunocompromised
 - Previous gastric bypass
- For suspected ischemic enterocolitis, see: **Mesenteric Ischemia (AB-6.1)** or **Colonic Ischemia (Including Ischemic Colitis) (AB-6.2)**

Background and Supporting Information

Gastroenteritis is a nonspecific term which denotes a constellation of symptoms including, to a varying degree, nausea, vomiting, diarrhea, and abdominal pain. It is usually caused by infectious agents such as norovirus. The broad differential of such symptoms evades establishing a guideline to evaluate gastroenteritis, as a specific entity, from an imaging standpoint.

Mesenteric/Colonic Ischemia (AB-6)

Guideline

Mesenteric Ischemia (AB-6.1)

Colonic Ischemia (Including Ischemic Colitis) (AB-6.2)

References (AB-6)

Mesenteric Ischemia (AB-6.1)

AB.MI.0006.1.A

v1.0.2024

- Suspicion of acute mesenteric ischemia, ONE of the following:
 - CTA Abdominal and/or Pelvic (Mesenteric) (CPT® 74174, or CPT® 74175, or CPT® 72191) (preferable), **or**
 - MRA Abdominal and/or Pelvic (CPT® 72198 and/or CPT® 74185), **or**
 - CT Abdomen and Pelvis with contrast (CPT® 74177).
- Post-procedure surveillance imaging following invasive treatment for mesenteric ischemia (celiac, superior mesenteric, and inferior mesenteric angioplasty with or without stenting, or mesenteric artery bypass grafting):
 - Baseline Duplex ultrasound (CPT® 93975 or CPT® 93976) within 1 month of the procedure
 - Duplex ultrasound (CPT® 93975 or CPT® 93976) at 6 months, 12 months, 18 months, and then annually thereafter
 - CT Abdomen or Abdomen and Pelvis with contrast (CPT® 74160 and CPT® 74177) or CTA Abdomen or Abdomen and Pelvis (CPT® 74174 or CPT® 74175) or MRA Abdomen (CPT® 74185) and if requested, MRA Pelvis (CPT® 72198):
 - For symptoms suggesting recurrent ischemia OR
 - In the absence of symptoms, following a Duplex Ultrasound if, on the Duplex study:
 - Celiac axis:
 - PSV >370 cm/s or a substantial increase from the post-treatment baseline PSV (substantial increase has not been defined) or demonstration of restenosis ≥70%
 - Superior mesenteric artery:
 - PSV >420 cm/s, or a substantial increase from the post-treatment baseline PSV (substantial increase has not been defined) or demonstration of restenosis of ≥70%
 - Inferior mesenteric artery:
 - Substantial increase from the post treatment baseline PSV (substantial increase has not been defined).

Background and Supporting Information

- Typical presentation of mesenteric ischemia is based on severe abdominal pain out of proportion to findings on physical exam, usually in individuals with underlying risk factors including cardiovascular disease, atrial fibrillation, hypertension, etc.

Colonic Ischemia (Including Ischemic Colitis) (AB-6.2)

AB.MI.0006.2.A

v1.0.2024

- CT Abdomen and Pelvis with contrast (CPT® 74177) is considered the first imaging modality in order to assess the distribution and phase of the colitis, and it can be performed if abdominal pain **and**:
 - Rectal bleeding; **or**
 - Moderate or severe tenderness; **or**
 - Fever (≥ 101 degrees); **or**
 - Guarding, rebound tenderness, or other peritoneal signs; **or**
 - Elevated WBC as per the testing laboratory's range
- Repeat imaging for asymptomatic or improving individuals, including routine post-operative imaging, is generally not needed.
- CTA Abdomen (CPT® 74175) or CTA Abdomen and Pelvis (CPT® 74174) or MRA Abdomen (CPT® 74185) and if requested, MRA Pelvis (CPT® 72198) can be performed for suspicion of right sided or pancolonic ischemia (as suggested on the initial CT Abdomen and Pelvis or by history/physical examination)

Background and Supporting Information

- Suspicion of colonic ischemia based on sudden cramping abdominal pain accompanied by urgency to defecate and passage of bright red blood, maroon blood, or bloody diarrhea, with risk factors including cardiovascular disease, diabetes mellitus, kidney disease, previous abdominal surgery, use of constipating medications, COPD, and atrial fibrillation.
- As noted in the ACG Clinical Guideline:
 - "In contrast to AMI (*acute mesenteric ischemia*) in which conventional mesenteric angiography or CTA plays an essential role, vascular imaging studies are not indicated in most patients with suspected CI (*colonic ischemia*) because by the time of presentation, colon blood flow has usually returned to normal and the observed changes are not from ongoing ischemia but rather reflect the ischemic insult with or without reperfusion injury"

Abdominal Lymphadenopathy (AB-8)

Guideline

Abdominal Lymphadenopathy (AB-8.1)

Inguinal Lymphadenopathy (AB-8.2)

Sclerosing Mesenteritis and Mesenteric Panniculitis (AB-8.3)

References (AB-8)

Abdominal Lymphadenopathy (AB-8.1)

AB.AL.0008.1.A

v1.0.2024

- History of malignancy
 - Refer to oncology guidelines specific for that known malignancy
 - Biopsy may be considered
- Clinical or lab findings suggesting a lymphoproliferative disorder:
 - Biopsy
 - PET/CT (CPT® 78815) may be considered prior to biopsy in order to determine a more favorable site for biopsy, when a prior biopsy was nondiagnostic, or a relatively inaccessible site is contemplated which would require invasive surgical intervention for biopsy attempt.
Clinical note: Due to its relative lack of specificity as well as higher cost, PET is a less efficient alternative to biopsy.
- If clinical, laboratory findings, biopsy, or PET suggest benign etiology, and no history of malignancy:
 - CT Abdomen and Pelvis (CPT® 74177) at 3 months for follow-up.
 - If no changes at 3 months, 2 additional follow-up scans (at 6 months and one year) can be approved.
 - If no changes by one year, the finding can be considered benign. No further imaging.
- If a follow-up CT demonstrates a concerning change, biopsy should be performed. If biopsy is inconclusive, PET/CT (CPT® 78815) can be approved

Inguinal Lymphadenopathy (AB-8.2)

AB.AL.0008.2.A

v1.0.2024

There is no evidence-based support for advanced imaging of clinically evidenced inguinal lymphadenopathy without biopsy. Advanced imaging should be directed by results of biopsy. If biopsy results are negative or benign, then no advanced imaging is indicated.

If biopsy is positive for malignancy, advanced imaging is guided by sections specific to the histological diagnosis:

- High suspicion of lymphoma: See **Non-Hodgkin Lymphomas (ONC-27)** and **Hodgkin Lymphoma (ONC-28)** in the Oncology Imaging Guidelines
- Prior history of malignancy: See **Metastatic Cancer, Carcinoma of Unknown Primary Site, and Other Types of Cancer (ONC-31)** in the Oncology Imaging Guidelines

Background and Supporting Information

- Localized inguinal lymphadenopathy should prompt:
 - Search for adjacent extremity injury or infection
 - 3 to 4 weeks of observation if clinical picture is benign
 - Excisional or image guided core needle biopsy under ultrasound or CT guidance of most abnormal lymph node if condition persists or malignancy suspected
- Generalized inguinal lymphadenopathy should prompt:
 - Diagnostic work-up, including serological tests, for systemic diseases and
 - Excisional or image guided core needle biopsy under ultrasound or CT guidance of most abnormal lymph node if condition persists or malignancy suspected.

Sclerosing Mesenteritis and Mesenteric Panniculitis (AB-8.3)

AB.AL.0008.3.A

v1.0.2024

- For new or worsening clinical symptoms, or if not previously performed:
 - CT Abdomen and Pelvis without and with contrast (CPT® 74178)
- Requests for follow-up imaging in asymptomatic individuals or for sequential imaging to monitor for the development of malignancy:
 - Further imaging in these scenarios is not supported in the absence of worsening or new clinical symptoms.
- PET imaging is not indicated for the evaluation of Sclerosing Mesenteritis or Mesenteric Panniculitis

Background and Supporting Information

- Sclerosing mesenteritis and mesenteric panniculitis are rare, incompletely understood entities that are characterized by an idiopathic inflammatory condition of the mesentery, with radiologic findings including:
 - Fatty mass lesion in the small intestinal mesentery
 - “Halo” (fat ring) surrounding lymph nodes or vessels
 - Lymph nodes in the fatty mass
 - A “pseudocapsule”
 - “Misty” mesentery
 - Calcifications from fat necrosis
- Sclerosing mesenteritis may represent a spectrum of diseases (retractile mesenteritis, mesenteric panniculitis, and mesenteric lipodystrophy), or may be stages of one disease with progression.
- The chronic inflammation may result in fibrosis with a mass effect and can involve the gut (causing obstruction), the mesenteric vessels, and other intra-abdominal or retroperitoneal organs. The etiology is uncertain, but may be secondary to trauma (previous abdominal surgery), an autoimmune process, ischemia, infection, and possibly may represent a paraneoplastic syndrome secondary to a malignancy, though this is controversial.
- There is an increased prevalence of malignancy in individuals with sclerosing mesenteritis, and this has resulted in requests for sequential imaging in stable or asymptomatic individuals. In addition, requests may be made to assess the clinical response in those undergoing active treatment.
- However, studies have reported that the data on potentially developing a subsequent malignancy is inconclusive and thus “it does not seem justified to subject patients with MP, especially those in whom other associations such as abdomino-pelvic surgery may explain the MP findings, to multiple follow-up CT

scans with the aim of detecting a future malignancy”¹. This recommendation is supported by other authors.^{2,3,4,5}

- In addition, there is no correlation between radiologic and clinical findings, and management decisions are guided by the severity and type of symptoms. Thus, sequential radiologic imaging to assess treatment response is not recommended.²

Bariatric Surgery and Percutaneous Gastrostomy (AB-9)

Guideline

Bariatric Surgery (AB-9.1)

Percutaneous Gastrostomy (AB-9.2)

References (AB-9)

Bariatric Surgery (AB-9.1)

AB.BS.0009.1.A

v1.0.2024

- Pre-operative Assessment:
 - Abdominal ultrasound (CPT® 76700 or CPT® 76705) to assess the liver and gallbladder
- Post-operative complications:
 - CT Abdomen and Pelvis with contrast (CPT® 74177) or CT Abdomen with contrast (CPT® 74160) may be used for individuals who have had weight loss surgery and present with suspected complications including:
 - Weight loss failure
 - Heartburn
 - Nausea or vomiting
 - Abdominal pain
 - Fever
 - Abdominal distension
 - Suspected hernia
- Note: Internal hernias in patients who have had Roux-en-Y gastric bypasses may have intermittent and relatively mild abdominal symptoms which require immediate evaluation with CT imaging.
- See: **Post-Operative Pain Within 60 Days Following Abdominal Surgery – Abdominal Procedure (AB-7)**

Background and Supporting Information

- Bariatric procedures include gastric banding, gastric bypass, sleeve gastrectomy, and biliopancreatic diversion procedures.
- Though abdominal pain in post-operative bariatric patients may be gallbladder-induced and an ultrasound would be helpful for this diagnosis, the complications of bariatric surgery can become quickly life-threatening, and so any request for CT imaging in the post-operative bariatric individual should not be delayed with recommendations for ultrasound, even if the examination does not indicate any signs or symptoms of more serious or complicated disease.

Percutaneous Gastrostomy (AB-9.2)

AB.BS.0009.2.A

v1.0.2024

- Percutaneous Endoscopic Gastrostomy (PEG)
 - CT or MRI is generally not needed pre-operatively for PEG placement.
 - CT Abdomen with or without contrast (CPT® 74160 or 74150):
 - For pre-operative assessment in the presence of:
 - Abdominal wall defects such as an open abdomen
 - The presence of “ostomy” sites or drain tubes
 - Abdominal surgical scars or prior major abdominal surgery (e.g. laparotomy, laparoscopy)
 - Known situs inversus
 - Known paraesophageal hernia
 - Previous endoscopic attempt did not achieve adequate transillumination through the abdominal wall or compression and a suitable site for PEG placement could not be determined.
 - Percutaneous Gastrostomy via Interventional Radiologist using CT guidance
 - A pre-operative CT Abdomen with or without contrast (CPT® 74150, 74160) may be appropriate for complicated cases in which a safe window cannot be determined via fluoroscopy. See above indications for CT prior to endoscopic gastrostomy tube placement for pre-operative indications.
 - Suspected complication of an endoscopically or IR-placed gastrostomy or jejunostomy tube:
 - CT Abdomen with or without contrast (CPT® 74150, 74160) or CT Abdomen and Pelvis with or without contrast (CPT® 74176 or 74177)

Background and Supporting Information

- A percutaneous endoscopic gastrostomy utilizes endoscopic guidance in order to place the feeding tube.
- The optimal site for gastrostomy placement is determined by illuminating the abdominal wall from the stomach using the scope and simultaneously indenting the wall with the finger, and visualizing that indentation endoscopically.
 - Routine CT prior to this is generally not needed.
 - A recent study⁵ retrospectively compared complication rates between patients who underwent a pre-procedure CT vs. those that did not, and found no difference in the rate of bleeding events, need for operative intervention, and accidental tube dislodgement.
 - One patient in the non-CT group had an injury due to the tube being placed through the colon, but in that case there was failure of transillumination through the abdominal wall.

- The authors concluded, “routine CT to evaluate for unfavorable anatomy such as overlying liver or transverse colon prior to PEG tube placement does not result in a reduced complication rate. Safe site selection utilizing the correct technique of transillumination of the abdominal wall and visualization of the indentation of the operator’s finger is essential for safe PEG tube placement.”

Blunt Abdominal Trauma (AB-10)

Guideline

Blunt Abdominal Trauma (AB-10.1)

References (AB-10)

Blunt Abdominal Trauma (AB-10.1)

AB.BA.0010.1.A

v1.0.2024

- Abdominal and/or Pelvic ultrasound (CPT® 76700 and/or CPT® 76856) can be approved for the evaluation of blunt abdominal trauma when requested.
- CT Abdomen and/or Pelvis with contrast (CPT® 74160, or CPT® 72193, or CPT® 74177):
 - High probability intra-abdominal injury
 - Abdominal pain or tenderness
 - Pelvic or femur fracture
 - Lower rib fracture
 - Costal margin tenderness or evidence of thoracic wall trauma
 - Diminished breath sounds
 - Vomiting
 - Pneumothorax
 - Hematocrit <30%
 - Hematuria
 - Elevated AST
 - Non-examinable individual (intoxicated, less than fully conscious, Glasgow Coma Scale Score <13, etc.)
 - Evidence of abdominal wall trauma or seat-belt sign
 - If ultrasound demonstrates any definitive abnormalities or inconclusive results

Gaucher Disease and Hemochromatosis (AB-11)

Guideline

Gaucher Disease (AB-11.1)

Hereditary (Primary) Hemochromatosis (HH) and Other Iron Storage
Diseases (AB-11.2)

References (AB-11)

Gaucher Disease (AB-11.1)

AB.GD.0011.1.A

v1.0.2024

- See: **Gaucher Disease (Storage Disorders) (PN-6.3)** in the Peripheral Nerve Disorders (PND) Imaging Guidelines

Hereditary (Primary) Hemochromatosis (HH) and Other Iron Storage Diseases (AB-11.2)

AB.GD.0011.2.A

v1.0.2024

- MRI Abdomen without contrast (CPT® 74181) for iron quantification
 - If transferrin iron saturation (TS) $\geq 45\%$ OR Elevated serum ferritin (males >300 ng/ml, females >200 ng/ml)

AND

- Genetic studies for hemochromatosis have been performed and results are ANY of the following:
 - Negative for hemochromatosis
 - C282Y/H63D compound heterozygote
 - C282Y heterozygote
 - Non-C282Y homozygote

Note:

- For C282Y/C282Y homozygote, iron quantification generally not indicated. Workup is as follows:

- If serum ferritin >1000 ug/L or elevated liver enzymes:
- Liver biopsy for fibrosis staging and rule out concurrent liver disease
- If serum ferritin <1000 ug/L and normal liver enzymes:

Therapeutic phlebotomy

(Note: Studies indicate that measurements of hepatic iron concentration by MRI may be more useful in ruling out than diagnosing clinically significant iron overload. MRI can distinguish between primary and secondary iron overload based on iron uptake in the reticuloendothelial system.)

- For the evaluation of suspected hepatic iron overload in chronic transfusional states (e.g., sickle cell disease, thalassemia, oncology patients, bone marrow failure, and stem cell transplant individuals):
 - MRI Abdomen without contrast (CPT® 74181) for iron quantification can be performed annually
- See: **Transfusion-Associated (Secondary) Hemochromatosis (PEDAB-18.2)** in the Pediatric Abdomen Imaging Guidelines regarding transfusion-associated hepatic iron deposition.
- If clinical, biopsy, or radiological findings suggest advanced fibrosis or cirrhosis and HCC surveillance is requested, then follow HCC Screening Guidelines – See: **Chronic Liver Disease, Cirrhosis and Screening for HCC (AB-26.1)**.
- Role of MR Elastography (CPT® 76391):

- The role of MR Elastography to assess the degree of fibrosis in the setting of hemochromatosis is not yet clearly defined and thus not currently approvable.
- One of the main limitations of MR Elastography is that artifact from excess iron deposition degrades signal intensity in MRE sequences, leading to technical failure of elastography and a decrease in MRE's diagnostic reliability. The latest ACG Clinical Guideline (2019) indicates that MRI for the purpose of estimating hepatic iron concentration is appropriate in the circumstances described above. However, "if there is a concomitant need to stage hepatic fibrosis, then liver biopsy is the preferred method."¹⁴ The ACG diagnostic algorithm for the workup of hemochromatosis does not include MR Elastography at any stage, including the evaluation for the presence, absence, or degree of fibrosis.

Background and Supporting Information

- An elevated serum ferritin >1000 mcg/l is associated with an increased risk of cirrhosis and mortality in C282 homozygotes, while a serum ferritin <1000 mcg/l is associated with a very low likelihood of cirrhosis.
- The role of serial MRI for monitoring hepatic iron concentration in hemochromatosis has not been defined. Treatment is phlebotomy and results are monitored by serum ferritin.

Hernias (AB-12)

Guideline

Inguinal or Femoral Hernia, or Indeterminate Groin Pain (AB-12.1)

Spigelian, Ventral, Umbilical, or Incisional Hernia (AB-12.2)

Hiatal Hernia (AB-12.3)

References (AB-12)

Inguinal or Femoral Hernia, or Indeterminate Groin Pain (AB-12.1)

AB.IH.0012.1.A

v1.0.2024

- Clinical examination alone is usually sufficient for confirming the diagnosis of an evident groin hernia
- If musculoskeletal ailments such as osteitis pubis or athletic pubalgia are in the differential, see: **Pelvis (MS-23)** in the Musculoskeletal Imaging Guidelines.
- Ultrasound, pelvic limited (CPT® 76857) or pelvic complete (CPT® 76856) is the initial imaging study if:
 - Vague groin swelling with diagnostic uncertainty
 - Poor localization of swelling (as might be seen with a small hernia and prominent overlying fat)
 - Intermittent swelling not present on examination
 - Other/indeterminate groin complaints without swelling
- If ultrasound is indeterminate or non-diagnostic, ONE of the following:
 - CT Pelvis with contrast (CPT® 72193) or without contrast (CPT® 72192)
 - MRI Pelvis without contrast (CPT® 72195) or with and without contrast (CPT® 72197)
- For suspected incarceration or strangulation (initial ultrasound is not required):
 - CT Pelvis with contrast (CPT® 72193) or without contrast (CPT® 72192)
- For chronic post-surgical groin pain (after hernia repair):
 - Pelvic ultrasound (CPT® 76856 or CPT® 76857) or US-guided nerve block
 - CT Pelvis with contrast (CPT® 72193) or without contrast (CPT® 72192) or MRI Pelvis without contrast (CPT® 72195) or without and with contrast (CPT® 72197) can be approved if either ultrasound or ultrasound-guided nerve block is indeterminate or non-diagnostic, to assess for other, non-neuropathic causes.

Spigelian, Ventral, Umbilical, or Incisional Hernia (AB-12.2)

AB.IH.0012.2.A

v1.0.2024

- Known or suspected primary or recurrent Spigelian hernia (anterior abdominal wall hernia through the semilunar line), ventral hernia, umbilical, or incisional hernia:
 - CT Abdomen without or with contrast (if at or above the umbilicus) (CPT® 74150 or CPT® 74160) **or**
 - CT Pelvis without or with contrast (if below the umbilicus) (CPT® 72192 or CPT® 72193) **or**
 - CT Abdomen and Pelvis without or with contrast (if above and below the umbilicus, or indeterminate) (CPT® 74176 or CPT® 74177)

Hiatal Hernia (AB-12.3)

AB.IH.0012.3.A

v1.0.2024

- CT Chest and/or Abdomen with contrast (CPT® 71260 and/or CPT® 74160) to evaluate ANY of the following:
 - GI specialist or surgeon or any provider in consultation with one of these specialists request for treatment/pre-operative planning.
 - Suspected complication of primary disease or surgery.

Background and Supporting Information

- Some complications might include suspicion of a gastric volvulus (torsion) within the chest cavity, vomiting, chest pain, and difficulty in swallowing

Abdominal Mass (AB-13)

Guideline

Abdominal Wall Mass (AB-13.1)

Indeterminate Intra-Abdominal Mass (AB-13.2)

Abnormal Findings on Endoscopy/Colonoscopy (AB-13.3)

References (AB-13)

Abdominal Wall Mass (AB-13.1)

AB.AM.0013.1.A

v1.0.2024

- Abdominal ultrasound and/or Pelvic ultrasound (CPT® 76700 or CPT® 76705 and/or CPT® 76856) is the initial imaging study to assess an abdominal wall or subcutaneous mass.
- MRI Abdomen without and with contrast (CPT® 74183) or CT Abdomen with contrast (CPT® 74160) to assess a suspected malignant or indeterminate mass detected on ultrasound (Pelvic imaging can be included depending on the location of the mass).

Indeterminate Intra-Abdominal Mass (AB-13.2)

AB.AM.0013.2.A

v1.0.2024

- Palpable abdominal mass on physical examination:
 - CT Abdomen with contrast (CPT® 74160) if above the umbilicus
 - CT Abdomen and Pelvis with contrast (CPT® 74177) if extending below the umbilicus
 - CT Pelvis with contrast (CPT® 72193) if involving the pelvis
 - Abdominal ultrasound (CPT® 76700) and/or Pelvis ultrasound (CPT® 76856) may be approved in lieu of CT, if requested
- Indeterminate findings on a prior CT or ultrasound:
 - MRI Abdomen without and with contrast (CPT® 74183)
 - MRI Pelvis without and with contrast (CPT® 72197) may be approved to evaluate if the mass extends below the umbilicus or involves the pelvis
 - Specific lesions mentioned within the Abdomen Imaging Guidelines should be imaged according to those specific sections (e.g., liver lesion, pancreatic cyst, etc.)
- For a pulsatile abdominal mass, suspected aortic aneurysm: See: **Abdominal Aortic Aneurysm (AAA) (PVD-6.3)** in the Peripheral Vascular Disease (PVD) Imaging Guidelines
- For females with a suspected adnexal mass or fibroid: See: **Adnexal Mass/Ovarian Cysts (PV-5)** or **Leiomyomata/Uterine Fibroids (PV-12)** in the Pelvis Imaging Guidelines.
- Pregnant individual:
 - Abdominal and/or Pelvic and/or Transvaginal ultrasound (CPT® 76700 and/or CPT® 76856 and/or CPT® 76830) is appropriate for initial imaging.

Abnormal Findings on Endoscopy/Colonoscopy (AB-13.3)

AB.AM.0013.3.A

v1.0.2024

- Submucosal colonic lesions above the rectum or unexplained colonic extrinsic compression above the rectum:
 - CT Abdomen and Pelvis with contrast (CPT® 74177)
- Colonic Mucosal Mass or Polypoid Lesion above the rectum:
 - If pathology shows invasive cancer OR if colonoscopic findings describe a fungating, ulcerated, bleeding, irregular, circumferential (partial or complete) mass (i.e., findings that suggest a colonic malignancy based on the endoscopic appearance):
 - CT Abdomen and Pelvis with contrast (CPT® 74177), and if requested, CT Chest with contrast (CPT® 71260) (See: **Colorectal Cancer – Initial Work-up/Staging (ONC-16.2)** in the Oncology Imaging Guidelines)
 - If the lesion is in the distal sigmoid:
 - MRI Pelvis without and with contrast (CPT® 72197) if requested can also be performed
 - Pre-operative planning for the surgical (not endoscopic) removal of a polypoid lesion:
 - CT Abdomen and Pelvis with contrast (CPT® 74177)
- Submucosal gastric lesions:
 - CT Abdomen with contrast (CPT® 74160) or CT Abdomen and Pelvis with contrast (CPT® 74177)
 - If endoscopic ultrasound with or without fine-needle aspiration (which is the preferred initial imaging modality to further characterize a gastric submucosal lesion detected on endoscopy) cannot be performed, is indeterminate, or if the findings of the endoscopic ultrasound indicate a need for further imaging.
- Gastric extrinsic compression:
 - CT Abdomen with contrast (CPT® 74160) or CT Abdomen and Pelvis with contrast (CPT® 74177)
- Submucosal rectal lesions or unexplained extrinsic compression in the rectum:
 - MRI Pelvis without and with contrast (CPT® 72197), or, if requested, MRI Pelvis without contrast (CPT® 72195)
 - If rectal endoscopic ultrasound, which is the preferred initial imaging study, cannot be performed (e.g. anal stricture, or severe inflammatory process prohibiting passage of probe, etc.), is indeterminate, or, if based on endoscopic ultrasound findings, additional imaging is needed for further characterization
- Rectal Mucosal Mass or Polypoid Lesion:

- If pathology shows invasive cancer OR if colonoscopic findings describe a fungating, ulcerated, bleeding, irregular, circumferential (partial or complete) mass (i.e., findings that suggest a colonic malignancy based on the endoscopic appearance):
 - CT Abdomen and Pelvis with contrast (CPT® 74177) and if requested, CT Chest with contrast (CPT® 71260)
 - MRI Pelvis without and with contrast (CPT® 72197) or without contrast (CPT® 72195) in addition to the above
- Pre-operative planning for the surgical (not endoscopic) removal of a polypoid lesion:
 - CT Abdomen and Pelvis with contrast (CPT® 74177)
- For further imaging of a documented colonic or rectal malignancy: See **Colorectal Cancer – Initial Work-up/Staging (ONC-16.2)** in the Oncology Imaging Guidelines
- For further imaging of a suspected Gastrointestinal Stromal Tumor (GIST): See **Gastrointestinal Stromal Tumor (GIST) (ONC-12.5)** in the Oncology Imaging Guidelines
- For further imaging of gastric cancer: See **Gastric Cancer - Initial Work-up/Staging (ONC-14.9)** in the Oncology Imaging Guidelines

Asymptomatic Adrenal Cortical Lesions (AB-16.1)

AB.AC.0016.1.A

v1.0.2024

Overall Considerations

- US is not a prerequisite study for advanced imaging in the evaluation of any adrenal abnormality
- The following recommendations are for asymptomatic individuals
 - Symptomatic refers to signs or symptoms of hormonal excess or abnormal adrenal hormone levels.
 - For symptomatic individuals, see: **Symptomatic Adrenal Cortical Lesions (AB-16.2)**
- Abdominal pain may be present in large or rapidly expanding adrenal tumors due to mass effect or hemorrhage.
 - If the source of abdominal pain is suspected to be an incidental adrenal mass and initial imaging was indeterminate, immediate reimaging with a dedicated adrenal protocol study (see 3 imaging modalities below) is reasonable irrespective of the size of the mass.
 - See: **Abdominal Pain (AB-2)** in the Abdomen Imaging Guidelines for imaging recommendations if abdominal pain is unrelated to the adrenal mass
- The three imaging modalities that can be used for definitive benign characterization of an adrenal mass are:
 - CT Abdomen without contrast (CPT® 74150)
 - CT Abdomen without and with contrast (CPT® 74170)
 - CS-MRI (chemical shift MRI, CPT® 74181)
- The following list represents definitively benign characteristics of the adrenal gland. This list applies wherever "benign characteristics" are mentioned in the table below:
 - ≤ 10 HFU on CT
 - $\geq 60\%$ absolute washout or $\geq 40\%$ relative washout on CT abdomen without and with contrast with calculated washout (adrenal protocol CT, CPT® 74170)
 - An important exception to the washout rule: Non-adenomatous adrenal masses that may show elevated washout on adrenal protocol CT but are not benign include:
 - Adrenal metastasis from hypervascular tumors (e.g. RCC and HCC)
 - Pheochromocytoma
 - Adrenocortical carcinoma
 - Clinical suspicion should be used in these cases to guide further investigation

- Decreased signal on Chemical Shift MRI (CS-MRI, CPT® 74181)
- Cyst (if imaging was completed with and without contrast and "no enhancement"-defined as <10HFU change between unenhanced and enhanced/contrasted CT)
- Adrenal myelolipoma (macroscopic fat)
- If definitively benign diagnosis cannot be made during follow up imaging using dedicated CT adrenal protocol (If <60% absolute washout or <40% relative washout) or lack of signal drop out on MRI chemical shift:
 - Additional imaging is indicated at 6-12 months from initial follow up OR
 - Consider resection for possible primary adrenocortical carcinoma after biochemical evaluation and exclusion of pheochromocytoma.
 - For individuals who are poor surgical candidates, if ordered by or in consultation with an endocrinologist, endocrine surgeon, or urologist:
 - Imaging as requested
- CT Abdomen without and with contrast (CPT® 74170) may be approved in place of any below recommended CT Abdomen without contrast for the following:
 - Facility protocol is to cease imaging if adrenal mass is found to have HFU<10 on initial non-contrasted images
- MRI Abdomen without contrast (CPT® 74181) is indicated in place of CT for the following:
 - Clips that cause artifacts when using CT
 - Allergy to CT contrast
 - Individuals in whom radiation exposure should be limited (children, pregnant individuals, individuals with known germline mutations, and individuals with recent excessive radiation exposure)
- CS MRI may not detect the intracellular lipid in an adrenal mass if HFU is 30 HU or more on CT without contrast. CS MRI is less effective than CT without and with contrast with calculated washout for adenomas with unenhanced attenuation of more than 20 HU
- Below imaging can be applied to bilateral adrenal masses, with each lesion addressed separately.

Mass Characteristics and Appropriate Imaging

Mass Details	Imaging Study
<ul style="list-style-type: none"> Asymptomatic AND Incidentally found on US, CT, or MRI of area OTHER than the abdomen or if seen only on US of the abdomen AND Any size AND No history of cancer 	<ul style="list-style-type: none"> CT Abdomen without contrast (CPT® 74150)
<ul style="list-style-type: none"> Asymptomatic AND Incidentally found on CT Chest without contrast, entirely imaged, and fully characterized as indeterminate by HFU score AND >2 cm AND No history of cancer 	<ul style="list-style-type: none"> CT Abdomen without and with contrast (CPT® 74170) in lieu of above recommended CT Abdomen without contrast

Background and Supporting Information

Benign Adenoma Imaging Characteristics		
	Findings consistent with Adenoma:	Indeterminate for Adenoma:
CT Abdomen without contrast	≤10 Hounsfield Units	>10 Hounsfield Units
CT Abdomen WWO with calculated washout	≥60% absolute washout or ≥40% relative washout	<60% absolute washout <40% relative washout
Chemical Shift MRI	Signal drop out	Lack of signal drop out

- Endocrine guidelines recommend biochemical evaluation in all incidental adrenal lesions (with the exception of myelolipomas and cysts), however laboratory results are NOT required for imaging in an asymptomatic individual.
- Most benign adenomas, which account for up to 75% of adrenal incidentalomas, are lipid rich and thus easily characterized because they measure 10HFU or less on CT without contrast. CT Abdomen without and with contrast with calculated washout and chemical shift MRI help identify lipid poor adenomas which are the next most common group. Masses which remain indeterminate include pheochromocytomas (up to 7%) and primary adrenal cancers or metastases to the adrenal glands (approximately 4%).
- Adrenal masses are often found incidentally on CT scans performed WITH contrast to evaluate abdominal symptoms. While CT scans performed with contrast only may report the HFU of an adrenal mass, most benign adenomas are labeled

"indeterminate" originally because non-contrasted HFU and HFU after washout cannot be measured or calculated.

- An "Adrenal Protocol CT" measures pre-contrast HFU of an adrenal mass as well as the HFU during "wash out" of contrast medium after 60 to 90 seconds [early] and 10 to 15 minutes [delayed]. Benign adenomas show more rapid and efficient contrast washout as compared to malignant adrenal masses.
- When an adrenal mass shows avid enhancement on CT scan ($>110 - 120$ HU), a pheochromocytoma should be considered.
- In addition to the imaging features in the grid which are considered "diagnostic" of a benign adrenal mass, other radiographic characteristics "suggestive" of a benignity include: smooth/round shape, homogeneous content, lack of calcification/hemorrhage/necrosis, growth rate $<1\text{cm/year}$, lack of FDG avidity on PET, $<4\text{cm}$
- Radiographic characteristics "suggestive" of malignancy include: irregular margins/shape, heterogeneous content, presence of calcification/hemorrhage/necrosis, growth rate $>1\text{cm/year}$, presence of FDG avidity on PET, $>4\text{-}6\text{cm}$
- Malignancies most likely to metastasize to the adrenal glands include lung cancer, gastrointestinal cancer, melanoma, and renal-cell carcinoma.

Adrenal Hormone Excess/Symptomatic Adrenal Lesions (AB-16.2)

AB.AC.0016.2.A
v1.0.2024

Overall Considerations

- Prior to advanced imaging, adrenal hormone excess must be clinically suspected, and then biochemically confirmed via testing listed in the table below
 - The following imaging recommendations can also be followed in asymptomatic individuals with an adrenal incidentaloma who are found to have abnormalities at initial hormonal evaluation.
- For severe hormone elevation or rapidly progressing symptoms for which adrenocortical carcinoma is suspected, see: **Adrenocortical Carcinoma (ONC-15.13)** in the Oncology Imaging Guidelines.

Background and Supporting Information

- Surgery is the management of choice for patients with virilizing adrenal tumors, feminizing adrenal tumors, pheochromocytoma/PGL and suspected adrenocortical carcinoma due to an increased risk of malignancy and/or comorbidity. Adrenal masses that secrete excess cortisol (adrenal Cushing's syndrome) or aldosterone (primary hyperaldosteronism/Conn's syndrome) are rarely malignant; however, surgery is also definitive management.

Suspected cortisol excess (adrenal Cushing's syndrome)

- Low or suppressed ACTH levels (<10 pg/mL) are consistent with an adrenal source.
- DHEAS levels are also low in adrenal Cushing's syndrome.
- The diagnosis of Cushing's syndrome can be delayed for years due to the insidious nature of clinical presentation and the complexity of diagnostic testing.

Suspected adrenal hyperandrogenism/virilizing adrenal tumor

- Testosterone is produced by both the ovary (primary source) and adrenal gland while DHEA and DHEAS are produced almost exclusively by the adrenal gland.

- The magnitude of the androgen level is of poor predictive value for tumors, although a very high testosterone (adult-male range) or DHEAS level (>700 $\mu\text{g/dL}$) is suggestive.

Suspected feminizing adrenal tumor

- Adrenal tumors, mainly carcinomas (extremely rare, 0.5–2.0 per million), can secrete both estrogens and high amounts of adrenal androgens, which aromatize to estrogens. In this case, gynecomastia is usually of recent onset, progresses rapidly and testicular atrophy can also be seen.
- Common causes of excessive endogenous estrogens should be excluded prior to adrenal imaging. These include increased secretion from testis (Leydig cell or Sertoli cell tumors, stimulation of normal Leydig cells by LH or hCG) and increased aromatization of androgens to estrogens (aging, obesity, alcoholic cirrhosis, hyperthyroidism, drugs, hCG-secreting tumors, aromatase excess syndrome).

Suspected primary aldosteronism (Conn's syndrome)

- A positive screen for primary aldosteronism is an aldosterone level >15 – 20 ng/dL in the setting of suppressed renin* (plasma renin activity <0.6 – 1.0 ng/mL/hour or plasma renin concentration <5 – 8.2 mU/L) and spontaneous hypokalemia ($K < 3.5$ mEq/L).
- The most common dynamic confirmatory tests include the oral sodium suppression test, the seated intravenous saline suppression test, the fludrocortisone suppression test, and the captopril challenge test and results that indicate a "positive" result are unique to the each test. For example, if oral sodium loading is used, a 24-hour urine aldosterone excretion of more than 12 mg in the setting of 24-hour urine sodium excretion of more than 200 mEq is diagnostic of primary aldosteronism (and values of more than 10 mg/24 hours are strongly suggestive).
- Primary hyperaldosteronism may be managed medically with mineralocorticoid receptor antagonists (spironolactone and eplerenone) in cases of bilateral adrenal disease or poor surgical candidacy. If there has been no recent adrenal imaging, reimaging can be considered in cases of diagnostic uncertainty or poor response to medical therapy.

Suspected pheochromocytoma/paraganglioma

- A pheochromocytoma (85% of chromaffin tumors) arises from the chromaffin cells in the adrenal medulla and commonly produces one or more of the following catecholamines: epinephrine, norepinephrine and dopamine.
- A paraganglioma (15–20% of chromaffin tumors) arises from the extra-adrenal chromaffin cells of the sympathetic paravertebral ganglia of the thorax, abdomen and pelvis (catecholamine producing) or the parasympathetic ganglia along the

glossopharyngeal and vagal nerves in the neck and base of skull (not catecholamine producing).

- Cases of pheochromocytoma/paraganglioma can be sporadic but 1/3 are hereditary and due to germ-line mutations that may increase malignant potential.

Suspected adrenocortical carcinoma

- Adrenocortical carcinoma may be suspected radiographically or clinically. Approximately 60% of patients present with evidence of adrenal steroid hormone excess, with or without virilization. Hormonally inactive ACCs typically produce symptoms related to tumor burden, including abdominal pain, back pain, early satiety, and weight loss.
- See: **Adrenocortical Carcinoma (ONC-15.13)**

Adrenal Insufficiency (AB-16.3)

AB.AC.0016.3.A

v1.0.2024

- CT Abdomen (contrast as requested), or MRI Abdomen (contrast as requested) if CT is contraindicated, if the cause of primary adrenal insufficiency is unclear.
- Imaging is NOT indicated if clinical presentation and labs are consistent with any of the following:
 - Primary autoimmune destruction of the adrenal cortex (Addison's disease)
 - Congenital adrenal hyperplasia
 - Adrenoleukodystrophy

Background and Supporting Information

- Imaging can detect infiltrative disease, adrenal hemorrhage, infections, and malignant tumors which may be the cause of adrenal dysfunction

References (AB-16.3)

v1.0.2024

1. Bornstein SR, Allolio B, Arit W, et al. Diagnosis and Treatment of Primary Adrenal Insufficiency: An Endocrine Society Clinical Practice Guideline. *J Clin Endocrinol Metab*. 2016;101(2):364-389.

Adrenal Nuclear Imaging (AB-16.4)

AB.AC.0016.4.A

v1.0.2024

Nuclear medicine imaging can assist in the evaluation of adrenal masses not adequately characterized by CT or MRI.

- Evaluation of SUSPECTED pheochromocytoma or paraganglioma:
 - MIBG (Any ONE of the following codes can be approved: CPT® 78801, CPT® 78802, or CPT® 78804
 - Any ONE of the following codes may also be approved, individual or in combination with CPT® 78801, 78802, 78804: SPECT studies (CPT® 78803 or CPT® 78831), or hybrid SPECT/CT studies (CPT® 78830 or CPT® 78832)
 - Octreotide scans can be approved in place of MIBG scans (with the same CPT codes) as requested in rare clinical circumstances including head and neck paragangliomas
- For PET/CT indications and for cases of KNOWN pheochromocytoma or paraganglioma, see: **Adrenal Tumors (ONC-15.10-15.12)** in the Oncology Imaging Guidelines
- Evaluation of SUSPECTED neuroblastoma, ganglioneuroblastoma, or ganglioneuromas:
 - MIBG (Any ONE of the following codes can be approved: CPT® 78801, CPT® 78802, or CPT® 78804)
 - Any ONE of the following codes may also be approved, individual or in combination with CPT® 78801, 78802, 78804: SPECT studies (CPT® 78803 or CPT® 78831), or hybrid SPECT/CT studies (CPT® 78830 or CPT® 78832)
- For KNOWN neuroblastoma, ganglioneuroblastoma, or ganglioneuroma, see **Neuroblastoma (PEDONC-6)** in the Pediatric and Special Populations Oncology Imaging Guidelines
- Adrenal Nuclear Imaging of the cortex and/or medulla (single site, planar imaging of the adrenal gland only) (CPT® 78075) includes the adrenal scintigraphy scans for 131I-iodocholesterol (NP-59) as well as MIBG (Iodine i-123 iobenguane and Iodine i-131 iobenguane sulfate) scans
 - 131I-iodocholesterol (NP-59) scans for adrenal cortex imaging can be useful in cases of suspected hyperaldosteronism and adrenal Cushing's, however NP-59 is not readily available for use in the United States
 - MIBG (Iodine i-123 iobenguane and Iodine i-131 iobenguane sulfate) scans for adrenal medulla imaging can be helpful in cases of known pheochromocytoma or neuroblastoma
 - CPT® 78075 is insufficient for the initial evaluation of a suspected pheochromocytoma, paraganglioma or neuroblastoma as this study does not evaluate extra-adrenal sites of disease, but can be considered in rare circumstances

- SPECT and SPECT/CT codes as listed above for MIBG can be added to CPT® 78075 as requested
- History of multiple endocrine neoplasia syndromes: See **Multiple Endocrine Neoplasias (MEN) (PEDONC-2.8)** in the Pediatric and Special Populations Oncology Imaging Guidelines.
- History of Neurofibromatosis: there is insufficient evidence to support routine imaging of adult patients with Neurofibromatosis in asymptomatic patients. See: **Adrenal Hormone Excess/Symptomatic Adrenal Lesions (AB-16.2)** if there is concern for pheochromocytoma. Labs would be required before imaging as stated in guideline.
- History of von Hippel-Lindau disease: See **Von Hippel-Lindau Syndrome (VHL) (PEDONC-2.10)** in the Pediatric and Special Populations Oncology Imaging Guidelines.

v1.0.2024

- Suspected bowel obstruction:
 - CT Abdomen and Pelvis with contrast (CPT® 74177)
 - Pediatric individuals:
 - MRI Abdomen and Pelvis without and with contrast (CPT® 74183 and CPT® 72197) can be approved if requested
 - Pregnant individuals:
 - MRI Abdomen and Pelvis without contrast (CPT® 74181 and CPT® 72195)
 - If the etiology or level of suspected intermittent or low-grade small bowel obstruction remains undetermined and additional imaging is needed after CT Abdomen and Pelvis:
 - CT Enteroclysis (CPT® 74176 or CPT® 74177) or
 - CT Enterography (CPT® 74177) or
 - MR Enteroclysis (CPT® 74183 and CPT® 72197) or
 - MR Enterography (CPT® 74183 and CPT® 72197)
- If there is a suspected small bowel tumor as a cause of the small bowel obstruction (including a history of no prior abdominal or pelvic surgery, no known hernia and/or concomitant obscure GI bleeding):
 - CT Enterography (CPT® 74177)
- Small bowel obstruction suspected to be secondary to Crohn's Disease:
 - See: **IBD (Crohn's Disease or Ulcerative Colitis) (AB-23.1)** and **Known IBD (AB-23.2)**
- Bariatric surgery patients, see: **Bariatric Surgery (AB-9.1)**

Background and Supporting Information

- Complete or high-grade obstruction can be defined as no fluid or gas passing beyond the site of obstruction. In incomplete or partial obstruction (low-grade), some fluid or gas passes beyond the point of obstruction. However, a plain film is not required prior to advanced imaging for suspicion of either high- or low- grade obstruction.

Gastroparesis and Dumping Syndrome (AB-20.2)

AB.BO.0020.2.A

v1.0.2024

Gastroparesis

- Gastric Emptying Study (CPT® 78264) for suspicion of delayed gastric emptying and ONE of the following:
 - Nausea, or vomiting of old food ingested several hours earlier
 - Bloating
 - Early satiety, or postprandial fullness
 - Recurrent aspiration
 - Unexplained poor glucose control in diabetes
 - Gastroesophageal reflux refractory to medical management
 - Non-ulcer dyspepsia
 - Retained gastric contents on endoscopy
- Gastric emptying study with small bowel transit (CPT® 78265) can be used in the evaluation of suspected abnormalities in both total and regional times for gastrointestinal transit in small bowel.
- Gastric emptying study with small bowel and colon transit (CPT® 78266) can be used in the evaluation of suspected abnormalities in both total and regional time for gastrointestinal transit to the colon.

Dumping Syndrome

- Gastric Emptying Study (CPT® 78264) to evaluate signs or symptoms of dumping syndrome is not indicated
- Dumping syndrome is a common complication of gastric and bariatric surgery in which changes in anatomy and innervation promote a rapid emptying of gastric contents into the small bowel. This triggers a series of physiologic responses. “Early dumping”, occurring within the first hour after a meal is characterized by abdominal pain, bloating, gassiness, nausea, vomiting, and diarrhea as well as vasomotor symptoms such as flushing, sweatiness, tachycardia, and hypotension). “Late dumping” symptoms occurring between 1 and 3 hours after meals are usually related to hypoglycemia (e.g., weakness, confusion, syncope).
- Dumping syndrome is usually a clinical diagnosis and the recommended diagnostic testing is an oral glucose tolerance test.
- Evidence-based guidelines have recently concluded that gastric emptying tests have low sensitivity and specificity for dumping syndrome, and that a gastric emptying test showing rapid emptying rate would not be used to confirm a diagnosis of dumping syndrome. Rapid emptying can occur in other conditions, and it has been demonstrated that the initial rapid emptying in dumping may produce symptoms such as nausea, which then delays gastric emptying, such that the

results of a gastric emptying study are in the normal range. Because of these limitations, recent guidelines have concluded that "...gastric emptying testing seems to be of low utility in diagnosing dumping syndrome".¹⁸

Note: If both a solid-phase and a liquid-phase gastric emptying imaging study are performed on the same day by any protocol, CPT® 78264 may not be reported with two units, only 1 unit. However, if a solid-phase study is performed, and then on a later date a liquid-phase study is performed, one unit of CPT® 78264 may be reported for each date of service. This occurrence should be rare, however, as there are dual-phase imaging protocols that should be employed if both are known to be needed prior to the start of the first study.

Nausea and Vomiting as the Primary Symptom (AB-20.3)

AB.BO.0020.3.A

v1.0.2024

- The presence of any red flag findings per **General Guidelines (AB-1.0)** precludes adjudication based on any other criteria
- Nausea and vomiting as the Primary Symptom
 - An initial assessment should be performed prior to imaging requests. The initial assessment should include a history with a delineation of the duration, frequency, and severity of symptoms, including a description of their characteristics and any associated symptoms. The purpose of the initial assessment is to define whether the symptom complex suggests a central (neurologic), endocrine (e.g. pregnancy, thyroid disorder), iatrogenic (chemotherapy/medication-induced), obstructive (e.g., low-grade small bowel obstruction), or a mucosal (gastritis, peptic ulcer disease) etiology. Diagnostic testing for nausea and vomiting should be targeted at finding the etiology suggested by a thorough history and physical examination. In the absence of more complicated or serious disease, if the cause is not obvious or suggestive from the history and physical, laboratory data including a CBC, chemistry profile, and, in a reproductive-age female, pregnancy testing, should be performed prior to advanced radiographic imaging. Imaging is based on the findings of the initial evaluation as follows:
 - CT Abdomen and Pelvis with contrast (CPT® 74177) for ANY of the following:
 - If the initial assessment does not suggest a specific cause
 - If the evaluation proves unproductive
 - Symptoms suggesting mucosal disease (e.g. GERD, suspicion of ulcer disease):
 - EGD prior to advanced imaging
 - If nausea and vomiting remains unexplained despite workup and CT Abdomen and Pelvis is negative:
 - Gastric emptying study (CPT® 78264)
 - Symptoms suggesting an intracranial etiology (vertigo/nystagmus, associated headache, or neurogenic vomiting suggested by a positional nature and/or associated with other neurologic signs and symptoms):
 - See: **Headache (HD-11)** , **Dizziness, Vertigo and Syncope (HD-23)** , or other Head Imaging Guidelines depending on the predominant neurologic presentation
 - See: **General Guidelines – Other Imaging Situations (HD-1.7)** in the Head Imaging Guidelines for persistent, unexplained nausea and vomiting, when GI evaluation is negative.

- Nausea and vomiting associated with RUQ pain and suspicion of gallbladder disease, see: **Right Upper Quadrant Pain including Suspected Gallbladder Disease (AB-2.3)**
- Nausea and vomiting associated with dyspeptic symptoms, or epigastric pain, see: **Epigastric Pain and Dyspepsia (AB-2.5)**

Superior Mesenteric Artery (SMA) Syndrome (AB-20.4)

AB.BO.0020.4.A

v1.0.2024

- CTA Abdomen (CPT® 74175) or MRA Abdomen (CPT® 74185) are indicated for clinical suspicion of SMA syndrome and ANY of the following:
 - Risk factors or radiographic/EGD findings as noted below:
 - Recent significant weight loss which leads to a loss of retroperitoneal fat
 - Presence of a severe debilitating illness such as malignancy, malabsorption syndromes, AIDS, trauma, and burns.
 - History of corrective spine surgery for scoliosis
 - Anorexia Nervosa
 - Abdominal surgery
 - Congenital short ligament of Treitz
 - Radiologic findings or history suggestive of duodenal obstruction
 - Failure to diagnose either persistent nausea and vomiting despite the workup outlined in **Nausea and Vomiting as the Primary Symptom (AB-20.3)**

Background and Supporting Information

- SMA syndrome is a rare cause of duodenal obstruction in which there is a decrease in the aortomesenteric angle with resulting compression of the duodenum by the SMA.
- The typical clinical scenario includes an episode of weight loss followed by chronic food intolerance with nausea and vomiting, further weight loss, and epigastric pain, and can be relieved by lying prone or in the left lateral decubitus position.
- The diagnosis can be suspected with barium studies demonstrating delayed passage of contrast beyond the duodenum, dilatation of the first and second portions of the duodenum, anti-peristaltic flow of barium proximal to the obstruction, and relief of obstruction when placed in the prone, knee-chest, or left lateral position, or with an upper endoscopy revealing pulsatile extrinsic compression of the duodenum, or plain films suggesting duodenal obstruction.

Bloating, Gas, and Distention (AB-20.5)

AB.BO.0020.5.A

v1.0.2024

- For bloating as the primary symptom, present for at least 3 months, see: **Irritable Bowel Syndrome (AB-21.4)**
- For documented suspicion of bowel obstruction (e.g., patients with prior abdominal surgery, previous history of SBO, known adhesions, history of Crohn's Disease, etc.) see: **Bowel Obstruction (AB-20.1)**.
- If associated with constipation, see: **Constipation (AB-21.3)**
- If associated with dyspeptic symptoms, see: **Epigastric Pain/Dyspepsia (AB-2.5)**
- CT Abdomen and Pelvis with contrast (CPT® 74177) if any of the following is present:
 - History of malignancy with a likelihood or propensity to metastasize to abdomen
 - Fever (≥ 101 degrees Fahrenheit)
 - Elevated WBC $>10,000$, or above the upper limit of normal for the particular lab reporting the result
 - Low WBC (absolute neutrophil count <1000)
 - Palpable mass of clinical concern and/or without benign features
 - GI bleeding, overt or occult, not obviously hemorrhoidal
 - Abdominal tenderness documented as moderate or severe
 - Peritoneal signs, such as guarding or rebound tenderness
 - Suspected complication of bariatric surgery
 - Notation by the ordering provider that the patient has a "surgical abdomen"
 - Age >60 years with unintentional weight loss of ≥ 10 lbs. or $\geq 5\%$ of body weight over 6 months or less, without an identifiable reason

Background and Supporting Information

Bloating and distension are among the most common gastrointestinal complaints, and appears in 96% of patients with IBS, and 20-30% of the general population. Bloating is the subjective perception of increased abdominal pressure. Distension is the objective finding of increased abdominal girth.

Diarrhea, Constipation, and Irritable Bowel (AB-21)

Guideline

Acute and Persistent Diarrhea (Up to 30 Days) (AB-21.1)

Chronic Diarrhea (More than 30 Days) (AB-21.2)

Constipation (AB-21.3)

Irritable Bowel Syndrome (AB-21.4)

References (AB-21)

Acute and Persistent Diarrhea (Up to 30 Days) (AB-21.1)

AB.DC.0021.1.A

v1.0.2024

- The presence of any red flag findings per **General Guidelines (AB-1.0)** precludes adjudication based on any other criteria.
- Routine advanced imaging is not supported for acute, or persistent (up to 30 days) uncomplicated, including infectious diarrhea.
- Travel and dysenteric (including bloody) diarrhea should undergo biological assessment and antimicrobial treatment.^{9,10,11}
- CT Abdomen and Pelvis with contrast (CPT® 74177) can be used if:
 - Suspected ischemia (See: **Mesenteric Ischemia (AB-6.1)** and **Colonic Ischemia (AB-6.2)**)
 - Older (>50) individuals with significant abdominal pain
 - Previous gastric bypass
 - Immunocompromised
 - Obstruction, toxic megacolon, or perforation suspected

Chronic Diarrhea (More than 30 Days) (AB-21.2)

AB.DC.0021.2.A

v1.0.2024

- Basic lab work including routine CBC, chemistries, as well as stool tests for pathogens.
- CT Abdomen with contrast (CPT® 74160), CT Abdomen and Pelvis with contrast (CPT® 74177), CT Enterography (CPT® 74177), or MR Enterography (CPT® 74183 or CPT® 74183 and CPT® 72197), can be approved if all of the following have been performed:
 - Colonoscopy has been performed and is nondiagnostic or suggestive of inflammatory bowel disease
 - Fecal calprotectin or fecal lactoferrin
 - Testing for giardia antigen or PCR for giardia
 - Testing for celiac disease with serum IgA tissue transglutaminase (tTG)
- See: **IBD (Crohn's Disease or Ulcerative Colitis) (AB-23.1)** for concerns regarding inflammatory bowel disease.

Constipation (AB-21.3)

AB.DC.0021.3.U

v1.0.2024

- The presence of any red flag findings per **General Guidelines (AB-1.0)** precludes adjudication based on any other criteria
- CT Abdomen and Pelvis with contrast (CPT® 74177) if:
 - Concern for obstruction
- MRI (MRI Pelvis without contrast CPT® 72195) for Defecography is considered investigational/experimental by UHC.

Background and Supporting Information

- The work-up and treatment of constipation usually proceeds with a history and physical followed by empiric medication or dietary trials.
 - In general, a colonoscopy is performed prior to advanced imaging in an individual presenting with chronic constipation if the alarm symptoms of blood in the stool, anemia, or weight loss are present.

Irritable Bowel Syndrome (AB-21.4)

AB.DC.0021.4.A

v1.0.2024

- The presence of any red flag findings per **General Guidelines (AB-1.0)** precludes adjudication based on any other criteria.
- Advanced imaging in the absence of alarm symptoms has a very low yield, but can be considered in the following circumstances:
 - CT Abdomen (CPT® 74160) or CT Abdomen and Pelvis (CPT® 74177) can be considered in the following circumstances:
 - Presence of any of the following alarm symptoms:
 - Weight loss
 - Frequent nocturnal awakenings due to gastrointestinal symptoms
 - Fever
 - Blood in the stool or iron deficiency anemia (See: **GI Bleeding (AB-22)** for appropriateness of imaging in this circumstance)
 - New onset and progressive symptoms
 - Onset of symptoms after age 50
 - Family history of colon cancer or inflammatory bowel disease
 - Findings of an abdominal mass
 - Presence of lymphadenopathy
 - Fecal calprotectin $\geq 50\text{ug/g}$ or fecal lactoferrin $\geq 4.0\text{ug/g}$ or CRP >0.5 in individuals with diarrhea-predominance
 - Celiac testing should also be performed in individuals with diarrhea-predominance IBS, and if positive see: **Celiac Disease (AB-24.1)** for imaging guidance. (See background and supporting information in **IBD (Crohn's Disease or Ulcerative Colitis) (AB-23.1)**)

Background and Supporting Information

- Irritable bowel syndrome is characterized by abdominal pain associated with altered bowel habits, abdominal distention, and bloating. It is important to understand that IBS is a positive diagnosis, not a diagnosis of exclusion. ACG guidelines (2021) strongly suggest that IBS be assessed with a “positive diagnostic strategy as compared to a diagnostic strategy of exclusion”. Subtypes include IBS-C (constipation-predominant), IBS-D (diarrhea-predominant), IBS-M (mixed), and unclassified IBS. Rome IV Criteria for the diagnosis of irritable bowel syndrome are:
 - Recurrent abdominal pain, on average ≥ 1 d/wk in the past 3 months, related to ≥ 2 of the following:
 - Defecation
 - Change in stool frequency
 - Change in stool appearance (form)

GI Bleeding (AB-22)

Guideline

GI Bleeding (AB-22.1)

Small Bowel Bleeding Suspected (AB-22.2)

References (AB-22)

GI Bleeding (AB-22.1)

AB.GI.0022.1.A

v1.0.2024

- Endoscopy for upper GI bleeding as initial evaluation
- Colonoscopy for lower GI bleeding as initial evaluation
- CTA Abdomen (CPT® 74175) or CTA Abdomen and Pelvis (CPT® 74174) or CT Abdomen and Pelvis with contrast (CPT® 74177):
 - If colonoscopy cannot be performed in an individual with GI bleeding
 - Active bleeding and if endoscopy is negative
 - If conventional angiography is being considered
 - If surgery is being considered
 - GI bleeding and moderate to severe abdominal pain and/or tenderness
 - GI bleeding and hemodynamic instability (shock)
 - If there is concern for an aorto-enteric fistula (known or suspected aortic aneurysm, history of any type of aortic aneurysm repair).
- Meckel's scan (CPT® 78290) can be approved if bleeding is suspected from a Meckel's diverticulum.
- Gastrointestinal Bleeding Scintigraphy (CPT® 78278) can be considered if there is brisk active bleeding with negative endoscopy
- For TIPS placement, see: **Portal Hypertension (AB-26.3)**

Small Bowel Bleeding Suspected (AB-22.2)

AB.GI.0022.2.A

v1.0.2024

- If small bowel bleeding is suspected as the source of bleeding, and if upper and lower endoscopies are negative:
 - Video capsule endoscopy (VCE) is performed prior to advanced imaging.
 - VCE is not required prior to advanced imaging if small bowel obstruction or stricture of the gastrointestinal tract is suspected, if there is dysphagia, or in individuals with implantable devices such as pacemakers or defibrillators.
 - CT Enterography (CPT® 74177) if upper and lower endoscopy are negative and if VCE is negative. If there is a contraindication to CT Enterography, MR Enterography (CPT® 74183 or CPT® 74183 and CPT® 72197) may be performed.
 - Note: Providers occasionally request a CT or MR Enterography prior to the administration of a VCE, in order to assess whether there is pathology that might impede passage of the capsule and cause retention. This is not supported as a routine procedure prior to VCE. It should be noted that a patency capsule is available, and that this may identify patients at higher risk of retention. However, guidance from the consensus group of the American College of Gastroenterology recommends that in individuals with obstructive symptomatology, imaging (MR Enterography or CT Enterography) should be performed prior to VCE. This group would also include high risk individuals with a known history of Crohn's Disease, known history of strictures or other obstruction, history of previous pelvic or abdominal radiation, or suspected tumor.
- Iron Deficiency Anemia
 - If the bleeding is determined to be non-gastrointestinal (e.g. hematuria or vaginal bleeding), refer to the appropriate guideline for these conditions.
 - If the source is determined to be gastrointestinal:
 - Upper endoscopy and colonoscopy should be performed, unless contraindicated.
 - Small bowel video capsule endoscopy is next, if endoscopies are negative (unless contraindicated).
 - CT Abdomen and Pelvis with contrast (CPT® 74177), CT Enterography (CPT® 74177), or MR Enterography (CPT® 74183 or CPT® 74183 and CPT® 72197) (if CT Enterography is contraindicated) can be performed, if small bowel video capsule endoscopy is negative, or for further evaluation of abnormal video capsule findings. CT Enterography should be considered the test of choice given the lack of motion artifact and its superior spatial resolution.

Inflammatory Bowel Disease (AB-23)

Guideline

IBD (Crohn's Disease or Ulcerative Colitis) (AB-23.1)

Known IBD (AB-23.2)

Perirectal/Perianal Disease (AB-23.3)

Primary Sclerosing Cholangitis (PSC) (AB-23.4)

References (AB-23)

IBD (Crohn's Disease or Ulcerative Colitis) (AB-23.1)

AB.IB.0023.1.A

v1.0.2024

- Suspected Crohn's Disease or Ulcerative Colitis
 - CT Abdomen and Pelvis with contrast (CPT® 74177) or CT Enterography (CPT® 74177) or MR Enterography (CPT® 74183 or CPT® 74183 and CPT® 72197) for ANY of the following:
 - History of malignancy with a likelihood or propensity to metastasize to abdomen
 - Fever (≥ 101 degrees Fahrenheit)
 - Elevated WBC $>10,000$, or above the upper limit of normal for the particular lab reporting the result
 - Palpable mass of clinical concern and/or without benign features
 - GI bleeding, overt or occult, not obviously hemorrhoidal
 - Abdominal tenderness documented as moderate or severe
 - Peritoneal signs, such as guarding or rebound tenderness
 - Suspected complication of bariatric surgery
 - Notation by the ordering provider that the patient has a "surgical abdomen"
 - Age >60 years with unintentional weight loss of ≥ 10 lbs. or $\geq 5\%$ of body weight over 6 months or less, without an identifiable reason
 - Chronic diarrhea without the above signs or symptoms, see: **Diarrhea, Constipation, and Irritable Bowel (AB-21)**
 - CT Enterography (CPT® 74177) or MR Enterography (CPT® 74183 or CPT® 74183 and CPT® 72197) if none of the above signs or symptoms are present and request is for the evaluation of chronic abdominal pain associated with diarrhea due to a concern for inflammatory bowel disease if:
 - There is a positive family history of inflammatory bowel disease, **OR**
 - There are endoscopy or colonoscopy findings suggestive of inflammatory bowel disease, **OR**
 - Elevated inflammatory markers (fecal lactoferrin ≥ 4.0 ug/g, CRP >0.5 mg/dL, or fecal calprotectin ≥ 50 ug/g), **OR**
 - Diagnosis is still in doubt after colonoscopy and evaluation of inflammatory markers, and Crohn's disease is suspected
 - CT Abdomen and Pelvis with or without contrast (CPT® 74177 or CPT® 74176) can be performed prior to endoscopy if requested by or in consultation with the provider who will be performing the endoscopy.
- NOTE: Serologic markers

Serologic and genetic markers are currently under investigation with regards to their value in diagnosing inflammatory bowel disease, and are sometimes used as a

screening test for IBD in which other examinations are negative. At the current time they are not considered suitable as a screening test for inflammatory bowel disease in patients with GI symptoms, and the routine use of serologic or genetic markers for the diagnosis of IBD is not indicated. Thus, an isolated positive marker result in a patient without any other findings to suggest IBD, especially in the presence of negative inflammatory markers and endoscopic examinations, is not, in and of itself, an indication for advanced imaging.

- Note: Serologic markers include anti-glycan antibodies, such as ASCA, ACCA, ALCA, AMCA, Anti-L, Anti-C, Anti-OmpC, Anti-Is, Anti-Cbir, pANCA, PAB, GAB

Background and Supporting Information

Studies have demonstrated the negative predictive value of a low fecal calprotectin and CRP with regards to inflammatory bowel disease. Chey, et al. in a meta-analysis demonstrated that a fecal calprotectin <40mcg/g or a CRP ≤0.5 mg/dl effectively excludes inflammatory bowel disease in patients with IBS. Katsinelos, et al. reviewed wireless capsule endoscopy results in patients with abdominal pain and diarrhea. The diagnostic yield of capsule endoscopy in patients with abdominal pain and diarrhea with positive inflammatory markers was 90.1%, and 0% in patients with abdominal pain and diarrhea with negative inflammatory markers. This led the Canadian Association of Gastroenterology to recommend against the use of capsule endoscopy in persons with chronic abdominal pain or diarrhea as their only symptoms and no evidence of biomarkers associated with Crohn's Disease, stating "CE (capsule endoscopy) is not warranted in most patients who present with chronic abdominal pain in the absence of positive tests for inflammatory markers or abnormal findings on endoscopy or imaging".

Known IBD (AB-23.2)

AB.IB.0023.2.A

v1.0.2024

- CT Abdomen and Pelvis (CPT® 74177), CT Enterography (CPT® 74177), or MR Enterography (CPT® 74183 or CPT® 74183 and CPT® 72197) for known Crohn's Disease or Ulcerative Colitis and ANY of the following:
 - Suspected complications including abscess, perforation, fistula, or obstruction
 - Monitoring response to therapy
 - To determine change in treatment
- MR Enterography is the test of choice for the follow up of young patients with IBD given the lack of ionizing radiation and the need for lifetime follow up in many patients.

Perirectal/Perianal Disease (AB-23.3)

AB.IB.0023.3.A

v1.0.2024

This section is applicable to individuals with Crohn's disease. See: **Fistula in Ano (PV-21.1)** and **Perirectal Abscess (PV-21.2)** in the Pelvis Imaging Guidelines for non-Crohn's related perirectal and/or perianal fistulae

- Perirectal/Perianal Fistula:
 - MRI Pelvis without and with contrast (CPT® 72197)
 - Endoscopic ultrasound is preferential to CT in this setting
 - CT Pelvis with contrast (CPT® 72193) is an inferior study in this setting, and should be used when MRI or Endoscopic ultrasound cannot be performed.
- Perirectal/Perianal Abscess:
 - MRI Pelvis without and with contrast (CPT® 72197)
 - CT Pelvis with contrast (CPT® 72193) is inferior but can be approved as an alternative if desired.

Primary Sclerosing Cholangitis (PSC) (AB-23.4)

AB.IB.0023.4.A

v1.0.2024

- Primary Sclerosing Cholangitis:
 - MRCP can be considered to assess for PSC in those:
 - With IBD and any elevated liver study (including alkaline phosphatase, GGTP, bilirubin, AST, or ALT).
 - Without IBD, but with persistent cholestatic liver tests. (See: **Abnormal Liver Chemistries (AB-30)**)
 - Ultrasound or MRI/MRCP can be done as surveillance for cholangiocarcinoma in individuals with PSC every 6 months.

Background and Supporting Information

Primary sclerosing cholangitis (PSC) is a chronic liver and biliary tract disease that can result in stricturing and fibrosis of the intra- and extra- hepatic biliary ducts, as well as end-stage liver disease. It is most often associated with inflammatory bowel disease. Biliary obstruction can occur anywhere along the biliary tree, resulting in cholangitis, and there is a high risk of the development of cholangiocarcinoma, which must be strongly considered in individuals with PSC and a dominant stricture, as well as an increased risk of gallbladder polyps and other malignancies. As such, imaging plays an important role in the diagnosis and follow-up of PSC.^{6,7,8}

See: **Chronic Liver Disease, Cirrhosis and Screening for HCC (AB-26.1)**

Background and Supporting Information PSC (Primary Sclerosing Cholangitis) vs PBC (Primary Biliary Cholangitis)

Celiac Disease (Sprue) (AB-24)

Guideline

Celiac Disease (AB-24.1)

References (AB-24)

Celiac Disease (AB-24.1)

AB.CD.0024.1.A

v1.0.2024

- CT Abdomen and Pelvis with contrast (CPT® 74177), CT Enteroclysis (CPT® 74176 or CPT® 74177), or CT Enterography (CPT® 74177) is appropriate for:
 - One time study after initial, confirmed diagnosis of celiac disease.
 - Confirmed celiac disease and new or continued symptoms (e.g., bloating, diarrhea, abdominal pain, weight loss, distention, evidence of malabsorption, anemia) despite adherence to 6 months of a gluten free diet

Background and Supporting Information

- Celiac is an autoimmune disease in which the villi of the small intestine are damaged from eating gluten (found in wheat, barley, and rye).
- Complications of celiac disease include ulcerative jejunitis, lymphoma, and small intestinal adenocarcinoma.
- Diagnosis is made by blood testing¹:
 - Anti-tissue transglutaminase antibody [anti-tTG], anti-endomysium antibody (EMA), total IgA count, CBC to detect anemia, ESR, C-reactive protein, complete metabolic panel, vitamin D, E, B12 levels.
- Endoscopy with biopsy of the small bowel is performed to confirm the diagnosis of celiac disease if anti-tTG and/or EMA tests are positive.
- Capsule endoscopy may be used to confirm diagnosis of celiac disease in individuals with positive serology and negative biopsy, or when there is contraindication to biopsy or EGD. See: **Celiac Disease (CAPEND-2)** in the Capsule Endoscopy guidelines.

CT Colonography (CTC) (AB-25)

Guideline

CTC (AB-25.1)

References (AB-25)

CTC (AB-25.1)

AB.CT.0025.1.U

v1.0.2024

Note: A screening CTC (CPT® 74263) can ONLY be used for an individual who is a candidate for average risk screening as defined below. It cannot be used for any other indication. If the request for a CTC is for any other reason than average risk screening, please refer to diagnostic CTC indications. A diagnostic CTC would be the appropriate code, if approvable, for any other reason than average risk screening. This would include surveillance for a history of colon polyps, the evaluation of a change in bowel habits, abdominal pain, bleeding, etc. Please refer to the definition below of an average-risk individual, as well as the circumstances for which a diagnostic CTC is appropriate.

- Screening CTC (CPT® 74263) for colorectal cancer is NOT indicated if:
 - FIT-DNA (multi-targeted stool DNA test) within the last 3 years, OR
 - Colonoscopy within the last 10 years
- Screening CTC (CPT® 74263) can be approved every 5 years for colorectal cancer^{1,2,3} for:
 - Average-risk individuals ages 45 to 75
 - Average risk is defined as:
 - No previously diagnosed colorectal cancer, or colonic adenomas, or inflammatory bowel disease involving the colon
 - Individuals between 76 to 85 if there is no history of a previously negative colonoscopy or CTC, or, if in the opinion of the provider, the benefits of screening outweigh the risks.
 - Individuals with a SINGLE first-degree relative diagnosed at age >60 years with colorectal cancer or an advanced adenoma can be screened with CTC beginning at age 40.
 - If there are 2 or more first degree relatives at any age with CRC or an advanced adenoma, or a first degree relative <60, the individual should be screened via colonoscopy, not CTC.
- Diagnostic CTC without contrast (CPT® 74261) can be approved for:
 - Failed conventional colonoscopy (e.g. due to a known colonic lesion, structural abnormality, or technical difficulty), and/or
 - Conventional colonoscopy is medically contraindicated. Contraindications may include:⁴
 - Coagulopathy
 - Intolerance to sedation
 - Elderly ≥80 years of age
 - Recent (within the last 60 days) myocardial infarction (MI)
- Diagnostic CTC with contrast (CPT® 74262) can be approved if:

- There is a known obstructing colorectal malignancy so that staging prior to surgery can be performed, if desired.
- There is a clearly stated indication for IV contrast to evaluate extra-colonic organs. When performed in this setting, a CTC with contrast will substitute for a CT Abdomen and Pelvis such that an additional CT Abdomen and Pelvis would generally not be needed.
- MRI Colonography: Currently, no published society-endorsed guideline with respect to colorectal cancer screening lists MRI Colonography as an alternative screening study. As such, requests for MRI Colonography would be considered investigational at this time. There is no specific CPT assigned for this procedure. It is sometimes requested as an MRI Abdomen and MRI Pelvis.

Background and Supporting Information

CT Colonography is routinely performed without contrast, and IV contrast is not needed in most cases

Cirrhosis and Liver Screening for Hepatocellular Carcinoma (HCC); Ascites and Portal Hypertension (AB-26)

Guideline

Chronic Liver Disease, Cirrhosis and Screening for HCC (AB-26.1)

Ascites (AB-26.2)

Portal Hypertension (AB-26.3)

Monitoring After Fontan Procedure (AB-26.4)

References (AB-26)

Chronic Liver Disease, Cirrhosis and Screening for HCC (AB-26.1)

AB.CL.0026.1.A

v1.0.2024

- Note: for HCC surveillance in Budd-Chiari Syndrome/Hepatic Vein Thrombosis, see: **Hepatic Arteries and Veins (AB-43.1)**
- Ultrasound (CPT® 76700 or CPT® 76705) every 6 months for HCC screening is appropriate in the following circumstances:
 - All individuals, regardless of etiology, with cirrhosis or advanced fibrosis (e.g., Fibrosis Score F3 or greater on an elastography study, or results of a lab study such as FIB-4 or a biopsy indicative of severe activity or advanced fibrosis). See below for any exceptions.
 - All individuals with Hepatitis B, regardless of the presence of cirrhosis or advanced fibrosis.
 - See: **Hepatic Arteries and Veins (AB-43.1)** for individuals with Chronic Budd-Chiari Syndrome (BCS).
 - See: **Monitoring After Fontan Procedure (AB-26.4)** for individuals who have undergone the FONTAN procedure.
 - The presence of liver disease in the absence of advanced fibrosis or cirrhosis, with the exception for those circumstances indicated above, is not an indication for screening. This would include, for example, NAFLD (Non-alcoholic fatty liver disease), the presence of which is not an indication for screening in the absence of either advanced fibrosis or cirrhosis.
 - HCC screening may also be indicated in the use of medications or treatments which increase risk of HCC. See: **General Guidelines (AB-1.0)** for additional information.
- If liver nodule is identified on screening:
 - Less than 1cm
 - Repeat US in 3 months, then every 3 to 6 months.
 - If stable for 2 years, then return to US every 6 months
 - Greater than or equal to 1cm
 - Multiphase CT Liver (either CPT® 74160 or CPT® 74170) or MRI Abdomen (CPT® 74183) should be performed.
 - If negative, return to routine surveillance via US in 6 months.
 - If Li-RADS NC (non-categorizable): repeat the same study or an alternative diagnostic imaging ≤3 months. (Note: non-categorizable refers to a technical problem with the study, such as image omission or severe degradation)
 - If Li-RADS 1 (definitely benign): Return to routine surveillance via US in 6 months.

- If Li-RADS 2 (probably benign): CT or MRI in 6 months can be approved (US requests are approvable if desired). If unchanged, return to routine surveillance via US.
- If Li-RADS 3 (intermediate): CT or MRI in 3-6 months, and can be repeated every 6 months 2 more times, for a total of 18 months from the initial finding. If no change by 18 months, return to US surveillance every 6 months.
- If Li-RADS 4 (probable HCC): Repeat or alternative imaging in ≤ 3 months. If HCC confirmed: See: **Upper GI Cancers (ONC-14)** in the Oncology Imaging Guidelines.
- If Li-RADS 5 (HCC confirmed): See: **Upper GI Cancers (ONC-14)** in the Oncology Imaging Guidelines.
- If Li-RADS M (Malignant, not definitely HCC): Repeat or alternative imaging in ≤ 3 months, and follow appropriate Oncology guidelines upon diagnosis.
- Exceptions to the above algorithms:
 - Advanced imaging for surveillance may be substituted for US in the following circumstances:
 - Obesity (BMI >35)
 - Marked parenchymal heterogeneity noted on US.
 - Other specifically noted technical limitations of US such as obscuration by intestinal gas, chest wall deformity, etc.
 - For individuals on the Liver Transplant list: See: **Liver Transplant, Pre-Transplant (AB-42.1)**
- Alpha-fetoprotein ≥ 20 ng/mL: Multiphasic CT or MRI Abdomen:
 - Further imaging should follow the above algorithm, depending on the findings of the CT or MRI.
 - If the initial CT or MRI does not reveal a lesion, but the AFP increases on subsequent testing, additional advanced imaging by CT or MRI may be approved.
- Contrast-Enhanced Ultrasound (CEUS)
 - Further studies are needed to assess the value of CEUS in this setting, and it should be considered investigational and experimental at this time.

Background and Supporting Information

When performed for liver lesion evaluation, a multiphase CT protocol may include non-contrast imaging as well as arterial, portal venous, and delayed-phase post-contrast imaging. However, these protocols do not always require non-contrast imaging which may not provide additional information in many scenarios. Therefore, a multiphase CT for liver lesion evaluation can be requested as CPT® 74160 (CT Abdomen with contrast) or CPT® 74170 (CT Abdomen without and with contrast).

The American Association for the Study of Liver Diseases (AASLD) revised its guidelines with respect to surveillance for HCC in patients with cirrhosis in 2018. The recommended algorithm now includes either US alone or US with serum AFP every 6 months. It should be noted that “modification of this surveillance strategy based on the etiology of liver diseases or risk stratification models cannot be recommended at this time.”¹

In addition, the AASLD also issued a subsequent Practice Guidance in 2018 and this document forms the basis of eviCore’s guidelines. The AASLD has adopted the Li-RADS classification of liver lesions with respect to HCC surveillance imaging for patients with advanced liver disease, and follow-up imaging protocols are based on this system. In view of this, the Li-RADS classification now informs imaging protocols used by eviCore.

Note: PSC (Primary Sclerosing Cholangitis) vs. PBC (Primary Biliary Cholangitis)

These 2 entities sound similar, and both are cholestatic, but they are different diseases, and as such have different monitoring requirements.

PSC is an idiopathic cholestatic disease characterized by chronic inflammation, progressive fibrosis, and stricturing of the *medium and large-sized* extra-hepatic or intra-hepatic bile ducts. Segmental bile duct dilation proximal to areas of stricturing creates the characteristic beaded appearance on a cholangiogram, such as MRCP. This may progress and eventually lead to cirrhosis as well. It is most commonly associated with inflammatory bowel disease. From a surveillance standpoint, PSC may be complicated by disease-associated malignancies, including cholangiocarcinoma, hepatocellular carcinoma, and pancreatic cancer. Thus, follow-up imaging in this setting is generally via MRCP +/- MRI Abdomen (CPT® 74181 or CPT® 74183) – See: **Primary Sclerosing Cholangitis (PSC) (AB-23.4)**.

PBC is a complex, chronic, and slowly progressive autoimmune liver disease that predominately affects women, and is characterized by cholestatic liver biochemistries as well as the presence of AMA (Anti-Mitochondrial Antibodies), and results in T-lymphocyte-mediated destruction of *small* intrahepatic bile ducts. This may ultimately lead to cirrhosis, and thus an increased risk of hepatocellular carcinoma. Because of this, surveillance via US screening protocols for HCC are followed in PBC.

It may be necessary, when the diagnosis of PBC is uncertain, for an MRCP to be performed in order to distinguish between PBC and PSC. However, MRI or MRCP is not used for serial monitoring for PBC, once the diagnosis is established. This is in contradistinction to PSC, in which MRCP is used to surveil for cholangiocarcinoma, as discussed above.

Ascites (AB-26.2)

AB.CL.0026.2.A

v1.0.2024

- Abdominal ultrasound (CPT® 76700 or CPT® 76705) and/or Doppler (CPT® 93975) with diagnostic paracentesis required for all initial evaluations of ascites to determine the need for further or advanced imaging.
- Further advanced imaging is determined by the nature of etiology of the ascites (e.g., portal hypertension secondary to cirrhosis, malignancy such as ovarian or pancreatic, heart failure, etc.).
- Peritoneal-venous shunt patency study (CPT® 78291) is considered for evaluation of shunt patency and function in an individual with ascites

Background and Supporting Information

- Guidance from the American Association for the Study of Liver Diseases (2021) indicates that the initial evaluation of patients with ascites should include a medical history, physical examination, abdominal US with Doppler, lab studies including CBC, Liver function tests, serum and urine electrolytes and paracentesis with ascitic fluid analysis, which then guides further management. They specifically note that "A diagnostic paracentesis should be performed in all patients with new-onset ascites that is accessible for sampling".

Portal Hypertension (AB-26.3)

AB.CL.0026.3.A

v1.0.2024

- For noninvasive abdominal imaging:
 - Abdominal US (CPT® 76700 or CPT® 76705) (including Duplex Doppler US [CPT® 93975] of the liver and upper abdomen) is required for all initial evaluations to assist in determining the cause (pre-hepatic [e.g. portal vein thrombosis, extrinsic compression from a tumor], intrahepatic [e.g. cirrhosis], and post-hepatic [e.g. hepatic vein thrombosis]). US is very accurate for detecting portal vein or hepatic vein thrombosis.
- For additional imaging indications, see: **Hepatic Arteries and Veins (AB-43.1)**
- TIPS (transjugular intrahepatic portosystemic shunt)
 - See: **Hepatic Arteries and Veins (AB-43.1)**
- Certain requests are made for advanced imaging to evaluate an individual with cirrhosis for the presence of esophageal varices. In general, and in the absence of a contraindication, endoscopy should be performed in individuals to assess for the presence of varices.

Background and Supporting Information

- Most cases of portal hypertension are caused by cirrhosis, and the most feared complication is that of esophageal variceal hemorrhage. Causes of portal hypertension can be divided into prehepatic (e.g. portal vein thrombosis, extrinsic compression from a tumor), intrahepatic (e.g. cirrhosis) and post-hepatic (e.g. hepatic vein thrombosis) causes. The differentiation of some of these causes may require work-up which includes measurement of the hepatic venous pressure gradient (HVPG) which is considered the gold standard for the evaluation of portal hypertension.
- The gold standard for the assessment of portal hypertension is the Hepatic Venous Pressure Gradient (HPVG [pressure gradient between portal vein and the inferior vena cava]), which is an invasive test.

Monitoring After Fontan Procedure (AB-26.4)

AB.CL.0026.4.A

v1.0.2024

- Abdominal ultrasound (CPT® 76700 or CPT® 76705) and Doppler (CPT® 93975) every 6 months or per institution protocol
- MR Elastography (CPT® 76391) every 6 months
- If any sized lesions are detected on ultrasound:
 - MRI Abdomen without contrast, or without and with contrast (CPT® 74181 or CPT® 74183) with follow-up timeframes as requested
- If advanced fibrosis or cirrhosis is detected on any imaging modality:
 - HCC monitoring every 6 months after advanced fibrosis or cirrhosis is detected with MRI Abdomen without contrast, or without and with contrast (CPT® 74181 or CPT® 74183) is indicated
- CT Abdomen and Pelvis with contrast, CT Abdomen with contrast, or other elastography techniques (i.e., Fibroscan) can be used to assess and monitor individuals with contraindications to MRI (e.g., pacemaker devices, etc.)

Background and Supporting Information

- Individuals with single-ventricle physiology who have undergone the Fontan Procedure which redirects venous blood flow to the pulmonary circulation invariably develop liver complications, which can include the development of nodules and cirrhosis secondary to the altered vascular anatomy, and thus are at risk for hepatocellular carcinoma. In addition, the congestive hepatopathy associated with the Fontan procedure makes differentiation of focal liver lesions from congestive changes more challenging than other cirrhotic conditions. Thus, most institutions use MRI rather than US for monitoring in the setting of cirrhosis. In addition, the evaluation for HCC is challenging due to the vascular changes associated with the Fontan procedure, because the typical HCC pattern of delayed venous-phase contrast washout may not be appreciated within the background congestive hepatopathy. Thus, biopsy is usually required. Also, distinguishing dysplastic lesions from true HCC based on LiRADS criteria is very challenging as well. There are no current society endorsed guidelines, and institutions may vary in the monitoring of chronic liver disease in this patient population. The above algorithm represents an accepted approach and is consistent with the consensus from the Fontan-Associated Liver Disease proceedings from the American College of Cardiology Shareholders Meeting (2015) as well as the consensus of a multidisciplinary group of American Society of Transplantation members (2020).

MR

Cholangiopancreatography

(MRCP) (AB-27)

Guideline

MRCP (AB-27.1)

References (AB-27)

MRCP (AB-27.1)

AB.MR.0027.1.A

v1.0.2024

- MRCP (Magnetic Resonance Cholangio Pancreatography) is a non-invasive imaging procedure, which is used to visualize the biliary and pancreatic ductal system. It is used most often in the following circumstances:
 - Suspected gallstone pancreatitis (See: **Pancreatitis (AB-33)**)
 - Suspected biliary pain (See: **Right Upper Quadrant Pain (AB-2.3)** including Suspected Gallbladder Disease and **Epigastric Pain and Dyspepsia (AB-2.5)**)
 - Pancreatic cyst and pseudocyst evaluation (See: **Pancreatic Lesion (AB-31)**, and **Pancreatitis (AB-33)**)
 - Evaluation of abnormal liver chemistries (See: **Abnormal Liver Chemistries (AB-30.1)**)
 - Evaluation of the pancreas secondary to abdominal trauma with suspected duct injury or pseudocyst
 - Recurrent pancreatitis of unknown etiology (See: **Pancreatitis (AB-33)**)
 - Evaluation and follow-up of Primary Sclerosing Cholangitis (See: **Primary Sclerosing Cholangitis (PSC) (AB-23.4)**)
 - Evaluation of jaundice (See: **Abnormal Liver Chemistries (AB-30.1)**)
 - Evaluation of congenital anomalies of the cystic and hepatic ducts
 - Post-surgical biliary anatomy and complications (See: **Liver Transplant, Post-Transplant Imaging (AB-42.3)**)
 - For the further evaluation of abnormal ultrasound or CT findings of dilated pancreatic duct, enlargement, or fullness of the pancreas.
- Code assignment for MRCP
 - In general, there is no specific CPT code to describe MRCP. To report an MRCP, one of the MRI Abdomen codes should be selected, depending on contrast needs (CPT® 74181, CPT® 74182, or CPT® 74183).
 - There is a Level II HCPCS code for MRCP, S8037, used by some insurers. However this code (and any other code beginning with the letter “S”) is not payable by Medicare.
 - Reporting or billing a *second* MRI code to represent the “MRCP portion” of the study is not supported. When this occurs, it is usually seen as two simultaneous MRI requests, an MRI Abdomen without and with contrast (CPT® 74183) AND an additional MRI Abdomen without contrast (CPT® 74181). This second MRI code, as noted, is not supported. Both the primary MRI Abdomen AND the MRCP portion of the study are covered by the single MRI Abdomen code (CPT® 74183).
 - Requests for 3D rendering (either CPT® 76376 or CPT® 76377) are approvable, if requested, in addition to the primary MRI Abdomen code (CPT® 74181, CPT® 74182, or CPT® 74183).

Gallbladder (AB-28)

Guideline

Gallbladder (AB-28.1)

References (AB-28)

Gallbladder (AB-28.1)

AB.GP.0028.1.A

v1.0.2024

- Findings on ultrasound or EUS suspicious for malignancy:
 - CT Abdomen with or without and with contrast (CPT® 74160 or CPT® 74170)
- Findings on ultrasound inconclusive for adenomyomatosis:
 - Contrast-Enhanced US (CEUS, CPT® 76978, CPT® 76979)
 - If US and CEUS are inconclusive for adenomyomatosis:
 - MRI Abdomen without and with contrast (CPT® 74183)
- For confirmed gallbladder malignancy:
 - See **Gallbladder and Biliary Tumors - Initial Work-up/Staging (ONC-14.6)** in the Oncology Imaging Guidelines

Gallbladder Polyps

- Individuals at increased risk for gallbladder malignancy (if surgery not chosen):
 - Age >50
 - Primary Sclerosing Cholangitis
 - Indian ethnicity
 - Sessile polyp or gallbladder wall thickening >4mm
- Increased risk for gallbladder malignancy:
 - Polyp <6 mm
 - Ultrasound at 6 months, then yearly for 5 years
 - Polyp 6-9 mm (If cholecystectomy is not chosen)
 - Ultrasound at 6 months, then yearly for 5 years
- No increased risk for gallbladder malignancy:
 - Polyp <6 mm
 - Ultrasound at 1, 3, and 5 years
 - Polyp 6-9 mm
 - Ultrasound at 6 months, and then yearly for 5 years
- Gallbladder polyp ≥10 mm:
 - Surgery recommended. If surgery not performed, follow guidelines for increased risk of gallbladder malignancy as noted above.
- Alternative Imaging:
 - Endoscopic ultrasound (EUS) may provide additional information in the diagnosis of gallbladder polyps. There is insufficient data that advanced imaging (CT or MRI) should be used ahead of conventional ultrasound in the investigation of gallbladder polyps.¹

Liver Lesion Characterization (AB-29)

Guideline

Liver Lesion Characterization (AB-29.1)

Fatty Liver (Non-Alcoholic Fatty Liver Disease – NAFLD) (AB-29.2)

Polycystic Liver Disease (AB-29.3)

Isolated or Incidental Hepatomegaly (AB-29.4)

References (AB-29)

Liver Lesion Characterization (AB-29.1)

AB.LL.0029.1.A

v1.0.2024

Note: Advanced imaging approvals in this section refers to MRI Abdomen without and with contrast (CPT® 74183), CT Abdomen with contrast (CPT® 74160), CT Abdomen without and with contrast (CPT® 74170) and Contrast-Enhanced Ultrasound (CPT® 76978-initial lesion, CPT® 76979-additional lesions). In the following section, if only CT Abdomen with contrast (CPT® 74160) is noted as the appropriate study, it is because the American College of Radiology has determined that a prior without contrast study does not provide any added benefit. It should also be noted that a standard “triple-phase CT” liver does not involve a prior without contrast study (See: [CT Imaging \(AB-1.2\)](#))

- **Low-risk** individuals defined as:
 - No known primary malignancy
 - No hepatic dysfunction (abnormal liver tests)
 - No known underlying chronic liver disease
 - No history of alcoholism, sclerosing cholangitis, choledochal cysts, hemochromatosis, or anabolic steroid use²
- High-risk individual would have one or more of the above conditions.
- Liver Lesion discovered on US:
 - Indeterminate Liver Lesion ≥1cm on initial imaging
 - No suspicion or evidence of extrahepatic malignancy or underlying liver disease
 - MRI Abdomen without and with contrast (CPT® 74183) or CT Abdomen with contrast (CPT® 74160) or Contrast-Enhanced US (CEUS, CPT® 76978, CPT® 76979)
 - Known history of an extrahepatic malignancy:
 - MRI Abdomen without and with contrast (CPT® 74183) or CT Abdomen with contrast or without and with contrast (CPT® 74160 or CPT® 74170)
 - Known history of chronic liver disease:
 - See: [Chronic Liver Disease, Cirrhosis, and Screening for HCC \(AB-26.1\)](#)
 - Indeterminate Liver Lesion <1cm on initial imaging
 - Known underlying chronic liver disease
 - See: [Chronic Liver Disease, Cirrhosis, and Screening for HCC \(AB-26.1\)](#)
 - Known history of an extrahepatic malignancy:

- MRI Abdomen without and with contrast (CPT® 74183) is the preferred study
- Contrast-Enhanced US (CPT® 76978, CPT® 76979) is appropriate
- CT Abdomen is generally not the appropriate study in this scenario. In most circumstances, the resolution of CT does not allow for definitive characterization of lesions <1cm.
- Liver Lesion discovered on CT (non-contrast or single-contrast) or non-contrast MRI
 - Indeterminate, ≥1cm on initial imaging:
 - No suspicion or evidence of extrahepatic malignancy or underlying liver disease
 - Multiphase CT Abdomen with contrast (CPT® 74160), MRI Abdomen without and with contrast (CPT® 74183), or CEUS (CPT® 76978 and/or CPT® 76979)
 - Known history of an extrahepatic malignancy:
 - MRI Abdomen without and with contrast (CPT® 74183), CT Abdomen with contrast or without and with contrast (CPT® 74160 or CPT® 74170), or CEUS (CPT® 76978 or CPT® 76979)
 - Known chronic liver disease:
 - See: **Chronic Liver Disease, Cirrhosis, and Screening for HCC (AB-26.1)**
 - Indeterminate liver lesion <1cm on initial imaging:
 - Known history of an extrahepatic malignancy:
 - MRI Abdomen without and with contrast (CPT® 74183), Multiphase CT Abdomen (CPT® 74160), or CEUS (CPT® 76978 and/or CPT® 76979)
 - Known chronic liver disease:
 - See: **Chronic Liver Disease, Cirrhosis, and Screening for HCC (AB-26.1)**
- Additional scenarios and follow-up imaging for an Indeterminate lesion²:
 - Indeterminate lesion <1cm on US, CT, or MRI, **low-risk** individual (See above “Low-Risk individuals”) and no suspicious imaging features noted on the study
 - No further imaging
 - Indeterminate lesion <1cm in high-risk individuals on US, CT, or unenhanced MRI (See above “High Risk”) not specifically dealt with in the above guidelines:
 - MRI Abdomen without and with contrast (CPT® 74183)
 - If, after MRI, the lesion remains indeterminate or not fully characterized
 - See: **Liver Metastases (ONC-31.2)** or malignancy-specific guidelines in the Oncology Imaging Guidelines
 - If **biopsy cannot be performed**, follow-up MRI can be obtained in 3-6 months. Additional imaging in this setting can be considered on an individual basis. This timeframe would also apply if the lesion is

indeterminate and an MRI with Eovist is requested for further evaluation in this setting.

- Most lesions $\geq 1\text{cm}$ can be categorized by MRI or histology. For lesions which have been categorized, regardless of size, see below.
- For the imaging of specific focal liver lesions:
 - Suspected hepatic adenoma³:
 - MRI is considered the best technique for characterization. Follow-up imaging can be CT Abdomen (CPT® 74160 or CPT® 74170) or MRI Abdomen (CPT® 74183) every 6 months for 2 years, and then annually, to establish any growth patterns and assess for malignant transformation.
 - Hepatic Hemangioma (if not completely characterized on initial CT without a liver protocol):³
 - Multiphase CT Abdomen (CPT® 74160 or CPT® 74170) or MRI Abdomen (CPT® 74183)
 - Additional follow-up imaging is not required if the advanced imaging study demonstrates classic features of hemangioma with the following exception:
 - Giant hemangiomas ($>4\text{cm}$) can be followed by limited abdominal US in 6-12 months. If no change in size, no further follow-up is indicated, unless it becomes symptomatic.
 - See below for pre-operative considerations
 - Focal Nodular Hyperplasia (FNH)³:
 - MRI Abdomen (CPT® 74183) or CT Abdomen (CPT® 74160 or CPT® 74170) to confirm a diagnosis of FNH. The use of Eovist contrast is often diagnostic in differentiating FNH from other lesions seen on MRI or CT.
 - Additional follow-up is annual US for 2 to 3 years in women diagnosed with FNH who are continuing to use oral contraceptives. Follow-up with CT (CPT® 74160 or CPT® 74170) or MRI (CPT® 74183) can be done if the lesion is not adequately visualized on US.
 - Hepatic cysts³:
 - Asymptomatic, simple cysts do not require additional follow-up.
 - For complicated cysts (US shows internal septations, fenestrations, calcifications, irregular walls, as well as the presence of daughter cysts):
 - CT Abdomen (CPT® 74160 or CPT® 74170) or MRI Abdomen (CPT® 74183) can be performed
- Additional indications for advanced imaging (MRI Abdomen or CT Abdomen):
 - If documented that a percutaneous liver biopsy is to be considered if imaging is atypical or inconclusive.¹
 - Fatty liver on US with a focal liver lesion.
 - **If there is a technical limitation to US (e.g. marked heterogeneity, or other specifically noted technical limitations of US such as obscuration by intestinal gas, chest wall deformity, etc.)⁵

- For suspected liver metastases, see: **Liver Metastases (ONC-31.2)** in the Oncology Imaging Guidelines
- Preoperative studies for individuals with large hemangiomas or adenomas considered for resection:
 - MRA Abdomen (CPT® 74185) or CTA Abdomen (CPT® 74175) can be considered
- For Indeterminate Lesions ≥1cm in categories for which defined guidelines do not exist (i.e., underlying chronic liver disease, **Chronic Liver Disease, Cirrhosis, and Screening for HCC (AB-26.1)**, underlying malignancy, **Liver Metastases (ONC-31.2)** or the specific malignancy in the Oncology Imaging Guidelines, hepatic adenoma, etc.) a biopsy should be considered when the findings from advanced imaging are inconclusive. In clinical situations when a biopsy cannot be performed (such as a medical contraindication or a liver transplant candidate due to the risk of needle-tract seeding), or is inconclusive, a short-term surveillance MRI can be performed in 3-4 months to monitor lesion stability.
- This can be repeated every 6 months, as necessary in this scenario.¹ This timeframe would also apply if an MRI with Eovist is requested for short-term follow-up of an indeterminate lesion imaged on MRI Abdomen without and with contrast performed with other contrast, such as gadolinium. An exception would be if the differential is between FNH vs. hepatic adenoma or other benign lesions. FNH follow-up is yearly, and hepatic adenoma would require a 6 month follow-up study; if the differential of the lesion is between FNH and hepatic adenoma, then the follow-up study should be 6 months.
- Nuclear Medicine imaging of the Liver (CPT® 78201, CPT® 78202, CPT® 78803, CPT® 78215, CPT® 78216, or CPT® 78830) are rarely performed, but can be considered when US, CT, and MRI are unavailable or contraindicated for:
 - Evaluation of liver mass, trauma, or suspected focal nodular hyperplasia (FNH)
 - Differentiation of hepatic hemangioma from FNH
 - Diffuse hepatic disease or elevated liver function tests

Fatty Liver (Non-Alcoholic Fatty Liver Disease – NAFLD) (AB-29.2)

AB.LL.0029.2.A

v1.0.2024

- Non-Alcoholic Fatty Liver Disease
 - Fatty liver incidentally discovered on imaging (US/CT/MRI) or suspected:
 - Magnetic Resonance Elastography (MRE) (CPT® 76391)
 - See: **Liver Elastography (AB-45)** for MRE indications
 - Magnetic Resonance-Protein Density Fat Fraction (MRI-PDFF, usually requested as CPT® 74181 or 74183), MR Spectroscopy (MR-S, CPT® 76390), and the multiparametric MRI referred to as Liver Multiscan (LMS, Category III CPT® code 0648T or 0649T) for evaluation of fatty liver disease:
 - With regards to the above procedures, their main current utility is in assessing response to therapy in clinical trials. Their role in clinical practice, or with what frequency one would image, has not been defined. In view of this, they are considered investigational at this time.
 - HCC Screening for Fatty Liver with cirrhosis or advanced fibrosis:
 - See: **Chronic Liver Disease, Cirrhosis, and Screening for HCC AB-26.1)**
 - MRI or CT for the further evaluation of incidentally discovered fatty liver on US, in the absence of a specific finding needing further characterization such as a nodule, is generally not indicated. See: **Liver Lesion Characterization and Additional Indications for Advanced Imaging AB-29.1**. In addition, the finding of fatty liver alone on CT with contrast does not require MRI for confirmation.
 - Requests for imaging studies to screen individuals at high-risk for NAFLD (e.g., diabetes or obesity) or for screening family members of individuals with NAFLD is not approvable at this time.⁴

Polycystic Liver Disease (AB-29.3)

AB.LL.0029.3.A

v1.0.2024

- Polycystic Liver Disease
 - Defined as >20 cysts, or the presence of cysts occupying $\frac{1}{2}$ the volume of the hepatic parenchyma
 - Most commonly seen as an extra-renal manifestation of Autosomal Dominant Polycystic Kidney Disease, though may occur as Autosomal Dominant Polycystic Liver Disease.
 - Imaging:
 - For prognostication purposes MRI Abdomen (CPT® 74183) or CT Abdomen (CPT® 74160 or CPT® 74170) can be performed initially to assess liver volume.
 - At this time, there is no evidence that the asymptomatic patient requires surveillance imaging or monitoring.
 - Suspected complications such as cyst rupture or hemorrhage (manifested by acute pain in the upper abdomen):
 - MRI Abdomen (CPT® 74183) or CT Abdomen (CPT® 74160 or CPT® 74170)

Isolated or Incidental Hepatomegaly (AB-29.4)

AB.LL.0029.4.A

v1.0.2024

- Initial imaging of hepatomegaly discovered or suspected on physical examination:
 - US Abdomen (CPT® 76700 or CPT® 76705) and Duplex (CPT® 93975 or CPT® 93976)
- Further evaluation of abnormalities on initial ultrasound that require further characterization:
 - Refer to specific guidelines for the abnormality detected on US
 - Fatty liver, see: **Fatty Liver (Non-Alcoholic Fatty Liver Disease - NAFLD) (AB-29.2)**
 - Hepatic lesion, see: **Liver Lesion Characterization (AB-29.1)**
- Hepatomegaly discovered on ultrasound and no indeterminate abnormalities:
 - Medical workup, including lab studies such as liver tests, and history and physical should be performed to assess for suspected underlying disease (e.g. infiltrative disease such as amyloid, lymphoma, etc.)
 - Lab abnormalities and/or symptoms of a specific disease process should follow imaging studies outlined in the guideline for that disease process
 - Advanced imaging in the absence of symptoms or lab abnormalities indicative of an underlying disorder is not indicated

Background and Supporting Information

As noted by the AASLD "...imaging tests, such as ultrasound, computed tomography (CT), and MR, do not reliably reflect the spectrum of liver histology in patients with NAFLD." In addition, "MR imaging, either by spectroscopy or by proton density fat fraction is an excellent noninvasive modality for quantifying hepatic fat and is being widely used in NAFLD clinical trials.....However, the utility of noninvasively quantifying HS (hepatic steatosis) in patients with NAFLD in routine clinical care is limited".⁴

- Hints for liver lesion imaging:
 - Imaging accuracy:
 - A non-contrast CT is less sensitive than ultrasound
 - A non-contrast MRI is better than a non-contrast CT, but inadequate to define the etiology of a lesion
 - Triple-phase scanning is essential in characterizing a liver lesion
- How to interpret the radiologist's descriptors:
 - Hemangioma:
 - Hyperechoic
 - Peripheral nodular enhancement

- Fills in from the periphery (nodular centripetal fill-in on venous and delayed phases)
- Focal nodular hyperplasia:
 - Homogenous enhancement
 - Washout. No delayed rim enhancement
 - Central scar (with fibrous-appearing septae radiating from the scar)
 - MRI specifics:
 - Homogenous on T1
 - Scar hyperintense on T2
 - Uniformly hyperintense with contrast
- Hepatic adenoma:
 - Irregular enhancement
 - Fat-containing
 - Washout
 - Central hemorrhage
 - No rim enhancement
 - No central scar
 - MRI specifics: Hyperintense signal on T1 and T2-weighted imaging with intra-lesional lipid
- Hepatocellular carcinoma:
 - HCC's are hypervascular and receive 100% of their blood supply from the hepatic artery, whereas the liver parenchyma receives 30% from the hepatic artery and 70% from the portal vein, and this discrepancy can be exploited during imaging.
 - Dynamic imaging via MRI and CT follows tumor density with time after IV contrast bolus.
 - During the early arterial phase: HCC appears brighter than surrounding liver (hyperintense) due to hepatic arterial supply.
 - May have a necrotic central region
 - Washes out rapidly
 - Delayed post-contrast phase: rim enhancement (a "tumor capsule")
- Focal fat (pseudo-mass)
 - Area with sharply demarcated borders
 - Absence of mass effect of surrounding architecture
 - Vessels can course through the region
 - No rim enhancement
 - No central scar

Abnormal Liver Chemistries (AB-30)

Guideline

Abnormal Liver Chemistries (AB-30.1)

References (AB-30)

Abnormal Liver Chemistries (AB-30.1)

AB.LC.0030.1.A

v1.0.2024

- The major patterns of elevation which affect work-up are:
 - Hepatocellular (AST and ALT disproportionately elevated to ALKP)
 - Cholestatic (ALKP elevated disproportionately to AST and ALT)
 - Mixed pattern (ALKP, AST, and ALT all elevated)
 - Isolated hyperbilirubinemia (elevated bilirubin and normal ALKP, ALT and AST)
 - “R” Ratio
 - “R” Ratio: The so-called “R” ratio can be used to determine whether a pattern of multiple elevated liver chemistries is predominately cholestatic or hepatocellular in origin
 - $R = (\text{ALT} / \text{Upper limit of normal (ULN)}) / (\text{ALKP} / \text{ULN ALKP})$
 - If the “R” ratio:
 - >5 = hepatocellular
 - <2 = cholestatic
 - $2-5$ = mixed pattern
 - For hepatocellular, use AST or ALT elevation guidelines
 - For cholestatic, use ALKP elevation guidelines
 - Use ULN for ALT as noted below, and ULN for alkphos based on the individual lab report
- For elevated AST and/or ALT (>33 IU/l for males, >25 IU/l for females) and other LFTs are normal:
 - $<2X$ normal:
 - Repeat lab after 3 weeks and discontinuation of medications associated with elevated LFTs (such as statins, niacin, sulfa, rifampin, tetracycline, estrogen) if applicable.
 - If LFTs remain elevated: Abdominal US (CPT® 76700 or CPT® 76705)
 - 2 to 15X normal:
 - Abdominal US (CPT® 76700 or CPT® 76705)
 - $>15X$ normal:
 - Abdominal US with Doppler (CPT® 76700 or CPT® 76705 and CPT® 93975)
- CT Abdomen with contrast (CPT® 74160) may be approved if the above studies do not explain the cause of the elevated transaminases AND the following labs have been performed and are inconclusive:
 - HAV IgG, HBsAg, HBcAb, HBsAb, HCV Ab, iron panel (may include ferritin, serum iron, iron-binding capacity, or transferrin saturation).

- Additional labs, which may be useful, but not required, are: serum ceruloplasmin, anti-nuclear antibody (ANA), anti-smooth muscle antibody (ASMA), lipid profile, prothrombin time, creatine kinase (CK)
- If the findings suggest chronic liver disease, see: **Chronic Liver Disease, Cirrhosis and Screening for HCC (AB-26.1)**
- If the findings suggest hemochromatosis, see: **Hereditary (Primary) Hemochromatosis (HH) and Other Iron Storage Diseases (AB-11.2)**
- Elevated alkaline phosphatase level (or GGT), and other LFTs are normal
 - Etiology of elevated ALKP should be determined prior to imaging.
 - If isolated ALKP elevation, GGT should be obtained for confirmation of hepatic etiology, prior to imaging. If ALKP is elevated with other LFTs, no confirmatory test is necessary.
 - For confirmed hepatic etiology of elevated ALKP, Abdominal or RUQ ultrasound (CPT® 76700 or CPT® 76705)
 - If dilated biliary ducts on US: MRCP
 - If no dilated biliary ducts: anti-mitochondrial antibody (AMA) should be checked prior to advanced imaging.
 - If AMA is negative, and ALKP >2X ULN: MRCP
 - If AMA is negative, and ALKP 1 to 2X ULN: observe for 6 months, if ALKP remains elevated: MRCP
 - CT Abdomen with contrast (CPT® 74160) if the above studies are unrevealing or individual cannot undergo MRCP.
- Isolated elevated bilirubin (no other LFTs elevated).
 - An isolated elevated bilirubin should be fractionated into direct (conjugated) and indirect (unconjugated) levels.
 - No advanced imaging if elevation is unconjugated, and no other LFT elevations
 - RUQ ultrasound if elevation is conjugated
 - MRCP if biliary ducts dilated
 - Check AMA prior to advanced imaging if biliary ducts not dilated
 - MRCP or liver biopsy can be considered if negative and elevation persists or is unexplained
 - CT Abdomen with contrast (CPT® 74160) if the above studies are unremarkable or the individual cannot undergo MRCP.
- For individuals with elevated LFTs and suspicion of sclerosing cholangitis, such as those with IBD, see: **Primary Sclerosing Cholangitis (PSC) (AB-23.4)**.
- For individuals with elevated LFTs and history of underlying malignancy, please refer to the specific oncology guidelines, when appropriate.
- Requests for additional advanced imaging (CT, MRI, etc.) are based on the prior imaging results, as appropriate to the finding (for example, if a lesion is identified that needs further characterization, refer to liver lesion imaging as per **Liver Lesion Characterization (AB-29.1)**).

- Clinical jaundice, no known predisposing condition
 - Abdominal ultrasound (CPT® 76700 or CPT® 76705)
 - For further imaging, follow guideline for elevated bilirubin
- Clinical jaundice, suspected mechanical obstruction based on clinical condition or laboratory values (e.g., known choledocholithiasis, acute and chronic pancreatitis, suspected stricture from a recent invasive procedure, previous biliary surgery, suspected tumor), or US findings suggesting mechanical biliary obstruction, non-diagnostic or technically limited US (e.g., large amounts of intestinal gas, obesity with BMI >35):
 - CT Abdomen with contrast (CPT® 74160) or
 - MRI and/or MRCP (CPT® 74183 or CPT® 74181)

Background and Supporting Information

- The standard laboratory tests commonly referred to as “LFTs” include bilirubin, alkaline phosphatase (alkphos or ALKP), aspartate transaminase (AST), alanine transaminase (ALT), and gamma-glutamyl transferase (GGT).

Pancreatic Lesion (AB-31)

Guideline

Pancreatic Cystic Lesions (AB-31.1)

Incidental Pancreatic Mass or Suspected Metastatic Disease to Pancreas
(AB-31.2)

References (AB-31)

Pancreatic Cystic Lesions (AB-31.1)

AB.PC.0031.1.A

v1.0.2024

Screening studies for pancreatic cancer can be considered in those who are considered high risk in the following guideline: **Pancreatic Cancer (ONC-13)** in the Oncology Imaging Guidelines.

- Note:
 - Individuals who are not medically fit for surgery should not undergo further surveillance of incidentally found pancreatic cysts, irrespective of size.
 - Surveillance should be discontinued if an individual is no longer a surgical candidate. However, follow-up imaging can be performed if requested for a symptomatic cyst (such as the development of jaundice secondary to cyst), in which palliative treatment might be available.
- This guideline applies to the following pancreatic cystic lesions:
 - Intraductal papillary mucinous neoplasms (IPMN)
 - Mucinous cystic neoplasms (MCN)
 - Serous Cystadenomas (SCA)
 - Solid-pseudopapillary neoplasms (SPN)
- Pancreatic Cyst seen on Imaging-Initial Management:
 - MRI Abdomen (CPT® 74183) and/or MRCP are the tests of choice for initial evaluation.
 - Both MRI Abdomen and MRCP may be performed, but only one CPT® 74183 should be used, not two.
 - CT Pancreatic protocol (CPT® 74160) or EUS are alternatives in patients who are unable to undergo MRI.
 - Indeterminate cysts may benefit from a second imaging modality or EUS prior to proceeding with surveillance. MRI/MRCP can be approved to better characterize the lesion, without reference to the timeframe for follow-up imaging, if a previous US or CT Abdomen has been performed.
 - Radiographic diagnosis of a non-neoplastic cyst or classic features of a serous cystadenoma
 - No further imaging
 - If any of the following are present the individual should proceed to EUS + FNA and depending on findings, surgical consultation:
 - Main duct >5mm
 - Cyst ≥3cm
 - Change in main duct caliber with upstream atrophy
 - If EUS does not reveal findings of main duct involvement, patulous ampulla, cytology with high-grade dysplasia or pancreatic malignancy, or a mural nodule, then follow up MRI should be performed in 6 months.

- Pancreatic Cyst Follow up Imaging
 - If high risk features (See below High Risk Considerations and Features) are not present, then the next follow-up imaging proceeds as follows:
 - Cyst <1cm: MRI in 2 years
 - Cyst 1-<2cm: MRI in 1 year
 - Cyst 2-3cm: if cyst is not clearly an IPMN or MCN then proceed with EUS. If it is an IPMN or MCN, then MRI at 6-12 months.
 - If the cyst is determined to be a serous cystadenoma, then no further evaluation unless symptomatic.
 - Additional Surveillance for a presumed IPMN or MCN (imaging from time of presentation):
 - (Note: MRCP or MRI/MRCP is the preferred modality for surveillance due to non-invasiveness, lack of radiation, and improved delineation of the main pancreatic duct. In addition, since the timeframes for surveillance imaging are based on the size of the cyst as well as characteristics such as the presence or absence of high-risk features, it is necessary to have an adequate description of these findings from the previous imaging study, either by inclusion of the previous imaging report, or an adequate description of the findings. Finally, the date of the previous study is needed so that the appropriate timing for the next study can be determined.)
 - Cyst <1cm
 - MRI every 2 years for 4 years.
 - If stable after 4 years consider lengthening of interval imaging.
 - If increase in cyst size, then MRI or EUS in 6 months.
 - If stable, repeat again in 1 year and if stable return to MRI every 2 years.
 - Cyst 1-<2cm
 - MRI yearly for 3 years
 - If stable for 3 years, then change to MRI every 2 years for 4 years
 - If stable after the additional 4 years, consider lengthening of interval for surveillance.
 - If increase in cyst size, repeat MRI in 6 months. If stable, repeat MRI in 1 year and if remains stable, resume original surveillance schedule.
 - Cyst 2-<3cm
 - MRI every 6-12 months for 3 years
 - If stable after 3 years, change to MRI every year for 4 years
 - If remains stable, consider lengthening of surveillance interval
 - Cyst ≥3cm
 - MRI alternating with EUS every 6 months for 3 years
 - If stable for 3 years, increase interval to MRI alternating with EUS yearly for 4 years.
 - If remains stable, consider lengthening of surveillance interval.
 - If increase in cyst size, EUS + FNA

- Additional considerations
 - Individuals with asymptomatic cysts that are diagnosed as pseudocysts on initial imaging and clinical history, or are determined to be serous cystadenomas, do not require further evaluation.
 - High-Risk Considerations and Features
 - Individuals with IPMNs or MCNs with new onset or worsening diabetes
 - Rapid increase in cyst size (>3mm/year) during surveillance may have an increased risk of malignancy and should undergo a short-interval MRI or EUS.
 - Additional high-risk features which may prompt early evaluation are:
 - Jaundice secondary to the cyst
 - Acute pancreatitis secondary to the cyst
 - Significantly elevated CA 19-9
 - Presence of a mural nodule or solid component either within the cyst or in the pancreatic parenchyma
 - Dilation of the main pancreatic duct >5mm
 - Focal dilation of the pancreatic duct concerning for main duct IPMN or an obstructing lesion
 - IPMNs or MCNs measuring ≥3cm in diameter
 - Presence of high-grade dysplasia or pancreatic cancer on cytology. In this circumstance, imaging should be at the discretion of the provider.
- Post-op surveillance
 - Surgically resected serous cystadenomas, pseudocyst, or other benign cyst:
 - No additional imaging after resection
 - Surgically resected mucinous cystic neoplasms (MCNs) without an associated pancreatic malignancy (can have low, intermediate, or high-grade dysplasia):
 - No additional post-op surveillance
 - Surgically resected MCNs with invasive cancer:
 - Standard surveillance-based pancreatic cancer guidelines (See: **Pancreatic Cancer-Surveillance/Follow-up (ONC-13.5)** in the Oncology Imaging Guidelines) for 5 years. No surveillance required after 5 years.
 - Surgically resected IPMNs
 - IPMN with cancer
 - Pancreatic cancer surveillance guidelines (See: **Pancreatic Cancer-Surveillance/Follow-up (ONC-13.5)** in the Oncology Imaging Guidelines)
 - IPMN with high-grade dysplasia
 - MRI Abdomen (CPT® 74183) or EUS every 6 months
 - IPMN with low- or intermediate-grade dysplasia
 - MRI Abdomen (CPT® 74183) every 2 years

- Surgically resected solid-pseudopapillary neoplasm with negative margins:
 - MRI Abdomen (CPT® 74183) yearly for 5 years.
- See: **MR Cholangiopancreatography (MRCP) (AB-27)** for coding guidelines for MRCP.

Incidental Pancreatic Mass or Suspected Metastatic Disease to Pancreas (AB-31.2)

AB.PC.0031.2.A

v1.0.2024

- CT Abdomen with contrast with dual phase imaging (CPT® 74160), or MRI Abdomen without and with contrast (CPT® 74183).
- Note: A pancreatic protocol CT involves scan acquisition during a parenchymal and portal venous phase, each of which are post-contrast administration.

Acute Pancreatitis (AB-33.1)

AB.PX.0033.1.A

v1.0.2024

- Knowledge base:
 - Acute pancreatitis (2 of 3 of the following criteria):
 - Characteristic abdominal pain (typically epigastric or left upper quadrant pain with radiation to the back, chest, or flank)
 - Amylase or lipase >3 times the upper limit of normal
 - Radiographic evidence of pancreatitis on cross-sectional imaging
 - Early Phase takes place in the first week
 - Goals of imaging:¹
 - Establish the correct diagnosis or provide an alternative diagnosis
 - Establish the etiology
 - Stage the morphologic severity
 - Assess for complications in patients who deteriorate or fail to improve
 - Late phase can last weeks to months thereafter
 - Goals of imaging:¹
 - Monitor established pancreatic collections
 - Delineate the presence of symptomatic and asymptomatic complications
 - Guide interventional procedures
 - Etiologies of pancreatitis:
 - Gallstones and alcohol account for 75-80% of all causes¹
 - Hypercalcemia, hypertriglyceridemia, medications, a benign or malignant obstruction, pancreatic mass, genetic causes (hereditary pancreatitis), autoimmune pancreatitis (IgG4), infectious etiologies, ischemia secondary to vascular disease, anatomic abnormalities (e.g., pancreas divisum), physiologic abnormalities (Sphincter of Oddi dysfunction), idiopathic causes.
 - Complications:
 - Early Phase:²
 - Generally manifests as a systemic inflammatory response
 - In the first week, imaging findings correlate poorly with clinical severity¹
 - Advanced imaging is most useful when performed 5-7 days after admission, when local complications have developed and pancreatic necrosis can be clearly defined.
 - IEP = acute interstitial edematous pancreatitis
 - Necrotizing Pancreatitis
 - Late Phase:²
 - APFC (Acute peripancreatic fluid collection) occurs during the first 4 weeks. If it does not resolve within 4 weeks, it can become organized and

- develop into a pseudocyst, which contains only fluid with no nonliquefied components
- Walled-off necrosis (sequelae of necrotizing pancreatitis): inhomogenous nonliquefied components, encapsulated with a wall
- Note: Most cases of pancreatitis are mild. More severe cases are usually hospitalized and imaging performed in that setting is generally not managed by eviCore. The majority of imaging requests are for the initial evaluation of suspected pancreatitis in individuals with epigastric pain, and then the follow-up imaging of discharged individuals with respect to complications experienced during the hospitalization, to further elucidate the etiology of the pancreatitis if this was not previously established, or to evaluate continued post-discharge symptoms.
- The presence of any red flag findings per **General Guidelines (AB-1.0)** precludes adjudication based on any other criteria.
- Imaging:
 - Initial imaging for suspicion of pancreatitis (typical symptoms, <48 to 72 hours, first-time presentation)³
 - Abdominal ultrasound (CPT® 76700 or CPT® 76705)
 - Purpose is to establish the presence/absence of gallstones and biliary ductal dilation.
 - Doppler ultrasound (CPT® 93975) can be approved to assess vasculature, if requested
 - If ultrasound or CT is performed and is nondiagnostic due to technical limitation (obesity, overlying gas, etc.):
 - MRI/MRCP (CPT® 74183 or CPT® 74181)
 - CT Abdomen and Pelvis with contrast (CPT® 74177) or CT Abdomen with contrast (CPT® 74160) if ultrasound is nondiagnostic and MRI/MRCP cannot be performed.
 - In suspected acute biliary pancreatitis and/or cholangitis (dilated ducts or choledocholithiasis on ultrasound, elevated liver chemistries with a negative ultrasound, suspicion of cholangitis (classic triad is RUQ pain, fever, and jaundice))⁴
 - MRI/MRCP (CPT® 74183 or CPT® 74181)
 - Initial imaging with atypical signs and symptoms when diagnoses other than pancreatitis are being considered (e.g., bowel perforation, bowel ischemia):
 - CT Abdomen and Pelvis with contrast (CPT® 74177) or CT Abdomen with contrast (CPT® 74160)
 - MRI/MRCP* (CPT® 74181 or CPT® 74183) can be considered for pregnant patients (non-contrast), or those with renal insufficiency (without or without and with depending on request)
 - Follow-up imaging (late phase and thereafter):
 - Continued or worsening symptoms:

- CT Abdomen and Pelvis with contrast (CPT® 74177), CT Abdomen with contrast (CPT® 74160) or MRI and/or MRCP (CPT® 74183 or CPT® 74181)
- Follow-up of known pancreatic or peri-pancreatic fluid collections (including pseudocysts), to follow-up symptomatic collections, or for interventional planning:
 - MRI/MRCP (CPT® 74183 or CPT® 74181) or CT Abdomen and Pelvis (CPT® 74177)
 - Note: If requested, CT Abdomen with contrast (CPT® 74160) or Abdominal ultrasound (CPT® 76705 or CPT® 76700) can be approved (Note: Frequency or intervals for additional follow-up is not defined and depends on clinical circumstances, response to therapy, etc.)
- If, despite initial imaging, the etiology of the pancreatitis is still in doubt:
 - MRI/MRCP (CPT® 74183 or CPT® 74181) or CT Abdomen and Pelvis with (CPT® 74177)
 - Note: If requested, CT Abdomen with contrast (CPT® 74160) can be approved.
- Acute recurrent pancreatitis
 - Abdominal ultrasound (CPT® 76705 or CPT® 76700)
 - MRI/MRCP (CPT® 74183 or CPT® 74181)
 - CT Abdomen and Pelvis with contrast (CPT® 74177)
 - See: **Chronic Pancreatitis (AB-33.2)**

Background and Supporting Information

- *NOTE: While MRI/MRCP will give better evaluation of the pancreatic parenchyma as well as biliary and pancreatic ducts, it does NOT provide coverage and adequate evaluation of the bowel to assess alternative diagnoses such as bowel ischemia or perforation.

Chronic Pancreatitis (AB-33.2)

AB.PX.0033.2.A

v1.0.2024

- If chronic pancreatitis is suspected:
 - Initial imaging:
 - CT Abdomen with contrast or without and with contrast (CPT® 74160 or CPT® 74170) or MRI Abdomen without and with contrast (CPT® 74183)
 - If diagnostic criteria are met (pancreatic calcification in combination with pancreatic atrophy and/or dilated pancreatic duct):
 - No further imaging indicated (See below regarding worsening symptoms)
 - If initial CT is inconclusive or nondiagnostic of chronic pancreatitis:
 - MRI/MRCP with secretin enhancement (CPT® 74183 or CPT® 74181)
 - If MRI/MRCP are inconclusive or nondiagnostic of chronic pancreatitis:
 - Endoscopic ultrasound (EUS) is the appropriate next imaging study
 - If EUS is inconclusive, pancreatic function testing and/or ERCP can be performed
 - Note: If abdominal ultrasound is requested at any stage for evaluation of chronic pancreatitis, this can be approved in lieu of advanced imaging
 - If initial imaging fails to confirm chronic pancreatitis, but the clinical suspicion remains, the above testing can be repeated in 6 months.
- Known chronic pancreatitis with worsening symptoms or pain
 - CT Abdomen with or without and with contrast (CPT® 74160 or CPT® 74170), MRI/MRCP (CPT® 74183 or CPT® 74181) or Abdominal ultrasound (CPT® 76700 or CPT® 76705) can be approved
 - Note: Possible etiologies of worsening pain include:
 - Peptic ulcer disease
 - GI cancers
 - Pseudocysts
 - Duodenal or common bile duct obstruction
 - Pancreatic duct stone or strictures
 - Inflammatory masses at the head of the pancreas
- For pre-surgical planning or post-surgical evaluation for treatment of complications of chronic pancreatitis
 - CT Abdomen with or without and with contrast (CPT® 74160 or CPT® 74170), or MRI/MRCP (CPT® 74183 or CPT® 74181) or Abdominal ultrasound (CPT® 76700 or CPT® 76705)
- Routine screening for pancreatic cancer in chronic pancreatitis
 - As noted in the American College of Gastroenterology Clinical Guideline for Chronic Pancreatitis (2020)¹⁴ “There is a lack of evidence to suggest that

performing screening examinations on patients with CP (chronic pancreatitis) to detect malignancy is beneficial.....Although the overall prevalence of pancreatic malignancy is increased in patients with CP, there are no RCTs (randomized controlled trials), systematic reviews, or meta-analyses to support screening this patient population for pancreatic malignancy.” As such, the ACG Guideline concludes “At this time there is no definitive benefit to screen patients with CP for pancreatic ductal adenocarcinoma. This is based on the invasive and costly nature of testing, the inherent difficulty in screening given the structural changes of CP, and the inability to alter in many cases the natural history of the disease even if malignancy is detected at an early stage.”

- Therefore, routine surveillance to monitor for the occurrence of pancreatic cancer in individuals with chronic pancreatitis is not supported at this time. For other indications for imaging in chronic pancreatitis, see the above. For pancreatic cancer screening guidelines in inherited syndromes, including hereditary pancreatitis, see: **Screening Studies for Pancreatic Cancer (ONC-13.1)** in the Oncology Imaging Guidelines

Background and Supporting Information

- Clinical signs of chronic pancreatitis include history of alcohol use, abdominal pain, weight loss, steatorrhea, malabsorption, recurrent pancreatitis, fatty food intolerance, low fecal elastase.

Exocrine Pancreatic Insufficiency (AB-33.3)

AB.PX.0033.3.A

v1.0.2024

- The presence of any red flag findings per **General Guidelines (AB-1.0)** precludes adjudication based on any other criteria.
- Pancreatic Insufficiency
 - The initial evaluation for pancreatic insufficiency should include one of the following laboratory results:
 - Elevation in fecal fat
 - Fecal elastase <200 mcg/g
 - Serum trypsinogen <20ng/mL
 - CT Abdomen with (CPT® 74160) or without and with contrast (CPT® 74170) or MRI/MRCP (CPT® 74183 or 74181) for the evaluation of suspected pancreatic insufficiency:
 - For suspected pancreatic insufficiency with any one of the above laboratory findings
 - For suspected pancreatic insufficiency due to known chronic pancreatitis, see: **Chronic Pancreatitis (AB-33.2)**
 - For suspected pancreatic insufficiency due to known cystic fibrosis, see: **(PEDAB-16)** and **(PEDCH-5.1)**
 - For suspected pancreatic cancer, see: **Pancreatic Cancer – Suspected/Diagnosis (ONC-13.2)**

Background and Supporting Information

- Exocrine pancreatic insufficiency (EPI) reflects reduced pancreatic enzymes with resulting maldigestion/malabsorption. When intraduodenal levels of lipase fall below 5-10% of normal output, individuals may manifest with abdominal pain, bloating/cramping, flatulence, and progressive steatorrhea.

Asymptomatic Elevation of Pancreatic Enzymes (AB-33.4)

AB.PX.0033.4.A

v1.0.2024

- If there is the incidental elevation of amylase or lipase:
 - If isolated amylase elevation, prior to imaging, the source of the elevation should be confirmed as pancreatic by the performance of amylase isoenzymes demonstrating that the source is not salivary, or the absence of macroamylase should be ascertained by blood test.
 - If the lipase is elevated alone or in combination with an elevated amylase, or If the amylase is confirmed as pancreatic in origin:
 - Abdominal Ultrasound can be performed initially
 - If US is inconclusive, nondiagnostic, or the elevated pancreatic enzymes persist:
 - MRI/MRCP can be performed (CPT® 74183). Note: It is best performed as a secretin-stimulation test in this setting.
 - Note: CT Abdomen (pancreatic protocol, CPT® 74160) can be performed if there is a contraindication to MRI.
 - If the pancreatic enzyme elevation persists at one year, either of the above studies can be repeated

Spleen (AB-34)

Guideline

Spleen (AB-34.1)

Trauma – Spleen (AB-34.2)

References (AB-34)

Spleen (AB-34.1)

AB.SP.0034.1.A

v1.0.2024

- Incidental splenic findings on US:
 - CT Abdomen (CPT® 74170) or MRI Abdomen (CPT® 74183) can be obtained.
- Incidental splenic findings on CT or MRI:
 - Imaging is diagnostic of a benign lesion (simple cyst, hemangioma) or characteristics are benign-appearing (homogeneous, low attenuation, no enhancement, smooth margins):
 - No follow-up imaging.
 - Imaging characteristics are not diagnostic:
 - Prior imaging available:
 - One year stability: no follow up imaging
 - Lack of stability: consider MRI if not done, biopsy, or PET/CT (CPT® 78815).
 - No prior imaging:
 - No known malignancy:
 - Suspicious imaging features: (suggesting possible malignancy)
 - MRI Abdomen (CPT® 74183) if not already done or biopsy
 - If MRI still inconclusive and biopsy is not feasible then PET/CT (CPT® 78815) can be considered
 - Indeterminate imaging features: (equivocal but not suspicious for malignancy)
 - Follow up MRI Abdomen (CPT® 74183) in 6 and 12 months.
 - Known malignancy:
 - <1 cm: follow up MRI Abdomen (CPT® 74183) in 6 and 12 months.
 - ≥1 cm: consider MRI Abdomen (CPT® 74183) if not done, biopsy
 - If MRI still inconclusive and biopsy is not feasible then PET/CT (CPT® 78815) can be considered
 - (See diagnosis-specific in the **Oncology Imaging Guidelines**).
 - Clinically detected splenomegaly
 - Abdominal US (CPT® 76700 or CPT® 76705) should be the first imaging study to evaluate splenic size.
 - If splenomegaly is confirmed, the following evaluation is indicated prior to advanced imaging:
 - CBC, evaluation of the peripheral blood smear, LFTs, UA, chest x-ray, HIV testing.

- CT Abdomen without and with contrast or with (CPT® 74170 or CPT® 74160) can be performed if the etiology of the splenomegaly remains unexplained.
- MRI Abdomen (CPT® 74183) can be considered for pregnant patients, or individuals with iodinated contrast allergy.
- Nuclear medicine imaging of the liver/spleen (CPT® 78201, CPT® 78202, CPT® 78803, CPT® 78215, CPT® 78216, or CPT® 78830) is rarely performed, but can be considered if CT and MRI are contraindicated, as well as for evaluation of an accessory spleen.

Background and Supporting Information

Our current guidelines are consistent with ACR recommendations for the follow-up of incidental splenic masses. It is noteworthy, however, that a recent study from Beth Israel Deaconess Medical Center in which the authors retrospectively reviewed 379 patients who were found to have an incidental splenic mass on CT found that in patients without a history of malignancy, constitutional symptoms of fever or weight loss, or left upper quadrant or epigastric pain (205/379) there were 2 incidences of malignancy. However, in both of these cases the splenic masses were neither isolated nor indeterminate findings as the CTs demonstrated disease in other locations. An isolated splenic malignancy (which can occur but is very rare) was found only in 2 patients and both of these had constitutional symptoms. Thus, the authors claim that “the isolated and incidentally found splenic mass is of unlikely clinical significance, regardless of its appearance”, They concluded that “in patients with an incidental splenic mass identified at imaging and with the absence of a history of malignancy, fever, weight loss, or pain in the left upper quadrant or epigastrium, such masses are highly likely to be benign regardless of their appearance. Additional imaging or follow-up is not warranted, even if the mass does not show the appearance of simple cyst. Further work-up is only needed if the splenic mass is seen in conjunction with other findings worrisome for malignancy”. These authors challenge the use of the ACR guidelines.

Trauma – Spleen (AB-34.2)

AB.SP.0034.2.A

v1.0.2024

- Ultrasound Abdomen (CPT® 76700 or CPT® 76705) and Pelvis (CPT® 76856 or CPT® 76857) or CT^{3,4,5} Abdomen and Pelvis without and with contrast (CPT® 74178) or with contrast (CPT® 74177) for ANY of the following:
 - Blunt abdominal trauma with suspected splenic rupture, or
 - Suspected post-procedural injury, or
 - Individuals with penetrating trauma to the left upper quadrant. See: **Blunt Abdominal Trauma (AB-10)**

Background and Supporting Information

Splenomegaly is usually the result of systemic disease, and diagnostic studies are directed toward identifying the causative disease. Complete blood count with differential, LFT's, and peripheral blood smear examination are often performed prior to considering advanced imaging. There is no evidence-based data to support performing serial CT or MRI to follow individuals with incidental splenic lesions.

AB.RL.0035.0.A

v1.0.2024

For acute flank pain, rule out renal stone, see: **Flank Pain, Rule Out or Known Renal/Ureteral Stone (AB-4)**

Indeterminate Renal Lesion (AB-35.1)

RL.AB.0035.1.A

v1.0.2024

- Incidental Renal Mass on Ultrasound
 - If categorized as simple cyst or Bosniak I or II, no further imaging
 - Otherwise, CT Abdomen without and with contrast (CPT® 74170), MRI Abdomen without and with contrast (CPT® 74183), or Contrast-Enhanced Ultrasound (CPT® 76978 for one lesion, and CPT® 76979 if there are additional lesions).
- CT Abdomen without and with contrast (CPT® 74170) or MRI Abdomen without and with contrast (CPT® 74183) can be approved for further characterization if the original study reveals incomplete visualization of a renal lesion (for example, if only partially visualized on a CT Chest).
- Incidental Renal Mass on Non-Contrast CT
 - If characterized as heterogeneous (thick or irregular wall, mural nodule, septa or calcification):
 - Considered indeterminate. MRI Abdomen without and with contrast (CPT® 74183) or CT Abdomen without and with contrast (CPT® 74170)
 - If characterized as homogeneous (thin or imperceptible wall, NO mural nodule, septa or calcification):
 - 10 to 20 HU (Hounsfield units)
 - Likely benign, not fully characterized: no further work-up
 - 21 to 69 HU
 - Indeterminate: MRI or CT Abdomen without and with contrast (CPT® 74183 or CPT® 74170)
 - ≥70 HU
 - Hemorrhagic or proteinaceous cyst, unlikely to be neoplastic: no further work-up
 - If characterized as TSTC (too small to characterize) and homogeneous:
 - If labelled likely benign cyst, not fully characterized:
 - No further work-up
 - If labelled inconclusive based on subjective evaluation:
 - Considered indeterminate. MRI Abdomen without and with contrast (CPT® 74183) (preferred) or CT Abdomen without and with contrast (CPT® 74170) within 6-12 months
- Incidental Renal Mass on Contrast-Enhanced CT
 - If characterized as heterogeneous: thick or irregular wall, mural nodule, septa or calcification:
 - Considered indeterminate. MRI Abdomen without and with contrast (CPT® 74183) or CT Abdomen without and with contrast (CPT® 74170)

- If characterized as homogeneous: thin or imperceptible wall, NO mural nodule, septa or calcification:
 - 10 to 20 HU
 - No further work-up
 - >20 HU (solid or complicated cystic mass)
 - Considered indeterminate. MRI Abdomen without and with contrast (CPT® 74183) or CT Abdomen without and with contrast (CPT® 74170)
- If characterized as TSTC, homogeneous:
 - If labelled likely benign cyst, not fully characterized:
 - No further work-up
 - If labelled inconclusive based on subjective evaluation:
 - Considered indeterminate. MRI Abdomen without and with contrast (CPT® 74183) (preferred), or CT Abdomen without and with contrast (CPT® 74170) within 6-12 months
- Incidental cystic renal mass on CT or MRI without and with contrast (completely characterized, and does NOT contain fat)
 - Bosniak I (benign simple) or II (minimally complicated)
 - No further work-up
 - Bosniak IIF
 - CT Abdomen without and with contrast (CPT® 74170) or MRI Abdomen without and with contrast (CPT® 74183) at 6 and 12 months, then yearly for 5 years
 - If no changes for 5 years, cyst is considered benign and of no clinical significance
 - Bosniak III or IV should be referred for additional management or if chosen, active surveillance see: **Surveillance (ONC-17.4)** in the Oncology Imaging Guidelines
- Incidental solid renal mass or incidental mass too small to characterize evaluated on CT or MRI without and with contrast and does NOT contain fat
 - TSTC
 - If labelled likely benign cyst:
 - No further work-up
 - If labelled inconclusive based on subjective evaluation:
 - MRI Abdomen without and with contrast (CPT® 74183) (preferred), or CT Abdomen without and with contrast (CPT® 74170) within 6 months
 - If solid mass <1.0cm
 - MRI Abdomen without and with contrast (CPT® 74183) (preferred), or CT Abdomen without and with contrast (CPT® 74170) beginning at 6-12 months, then yearly for 5 years
 - If stable at 5 years (average growth ≤3mm per year): No further work-up

- If mass shows growth (≥ 4 mm per year) or morphologic change: refer for management, consider renal biopsy. If biopsy is technically challenging or relatively contraindicated, a T2 weighted image MRI Abdomen without and with contrast (CPT® 74183) can be performed
- Solid mass 1.0-4.0cm:
 - Considered a small renal neoplasm: refer for management, consider biopsy. If biopsy is technically challenging or relatively contraindicated, a T2 weighted imaging MRI Abdomen without and with contrast (CPT® 74183) can be performed. If active surveillance chosen due to limited life expectancy or co-morbidities, see: **Surveillance (ONC-17.4)** in the Oncology Imaging Guidelines
- Solid renal mass >4.0 cm
 - Considered a renal neoplasm: refer for management, or biopsy. If biopsy is technically challenging or relatively contraindicated, a T2 weighted image MRI Abdomen without and with contrast (CPT® 74183) can be performed. If active surveillance chosen due to limited life expectancy or co-morbidities, see: **Surveillance (ONC-17.4)** in the Oncology Imaging Guidelines
- Incidental renal mass containing fat (contains a region of interest measuring <-10 HU on CT)
 - No calcification angiomyolipoma (AML)
 - Solitary and without documentation of growth:
 - <4 cm: no further work-up
 - If no prior imaging study for comparison, one follow-up MRI Abdomen (CPT® 74183) or CT Abdomen (CPT® 74170) can be repeated in 6-12 months to assess for any growth.
 - ≥ 4 cm, and considered an AML with potential for clinical symptoms: refer for management.
 - Multiple lesions or growth documented based on old studies:
 - Refer for management. If active surveillance chosen due to limited life expectancy or co-morbidities, see: **Surveillance (ONC-17.4)** in the Oncology Imaging Guidelines.
 - With calcification (suspected renal cell carcinoma):
 - CT Abdomen without and with contrast (CPT® 74170) or MRI Abdomen without and with contrast (CPT® 74183) if only a non-contrast CT has been performed. If active surveillance chosen due to limited life expectancy or co-morbidities, see: **Surveillance (ONC-17.4)** in the Oncology Imaging Guidelines.
- Active Surveillance: For all Active Surveillance indications, see: **Surveillance (ONC-17.4)** in the Oncology Imaging Guidelines

NOTE: PET/CT or PET/MRI are not recommended because their role evaluating the incidental renal mass is limited.¹

Bosniak Classification:

I- Benign simple cyst with a hairline thin wall without septa, calcification, or solid component. Homogeneous near-water attenuation density (10 to 20 HU) without enhancement.

II- Benign minimally complicated cyst that may contain a few hairline thin septa that may have “perceived” but not measurable enhancement. Fine calcification or a segment of slightly thickened calcification may be present in the wall or septa. Also, a well-marginated nonenhancing homogeneous mass <3cm with density above simple fluid attenuation (hyperdense cyst).

IIF- Usually benign complicated renal cyst with multiple hairline thin septa or minimal smooth thickening of the wall or septa. Wall or septa may contain thick and nodular calcification and may have “perceived” but not measurable enhancement. Also, a well-marginated intrarenal nonenhancing mass >3cm with density above simple fluid.

III -Indeterminate complicated cystic renal mass with thickened irregular walls or septa that have measurable enhancement.

IV-Malignant cystic renal mass with enhancing soft tissue components (cystic renal cell carcinoma).

From the Journal of the American College of Radiology¹

Pre-operative Assessment (AB-35.2)

RL.AB.0035.2.A

v1.0.2024

- Pre-operative assessment for robotic kidney surgery
 - If not previously performed:
 - CT Abdomen without and with contrast (CPT® 74170) OR
 - MRI Abdomen without and with contrast (CPT® 74183)
 - CTA Abdomen (CPT® 74175) or CTA Abdomen and Pelvis (CPT® 74174) OR
 - MRA Abdomen (CPT® 74185), or MRA Abdomen and Pelvis (CPT® 74185 and CPT® 72198)

AB.RF.0036.1.A

v1.0.2024

- Ultrasound kidney and bladder (CPT® 76770 or CPT® 76775), preferably with Doppler (CPT® 93975 or CPT® 93976), is the preferred imaging study for the evaluation of acute or chronic renal failure¹.
- MRA Abdomen (CPT® 74185) can be utilized when there is suspected¹:
 - Renal vein/caval thrombosis
 - Renal artery stenosis as cause of renal failure
 - MRA with contrast may be contraindicated in severe renal failure or patients on dialysis due to the risk of gadolinium agents in causing nephrogenic systemic sclerosis.
- CT Abdomen without contrast (CPT® 74150) is not needed except to rule out ureteral obstruction or retroperitoneal mass.¹
- Nuclear renal imaging (CPT® 78701, CPT® 78707, CPT® 78708, CPT® 78709) can be considered for ANY of the following:^{3,4}
 - Renal transplant follow-up
 - Kidney salvage vs. nephrectomy surgical decisions
 - Acute renal failure with no evidence of obstruction on recent ultrasound.
 - Chronic renal failure to estimate prognosis for recovery.
- Nuclear medicine studies of the kidney (CPT® 78700 or CPT® 78701) can be considered for evaluation of the following anatomic renal anomalies:³
 - Suspected horseshoe kidney
 - Suspected solitary or ectopic kidney

Polycystic Kidney Disease (AB-38)

Guideline

Polycystic Kidney Disease (AB-38.1)

References (AB-38)

Polycystic Kidney Disease (AB-38.1)

AB.PK.0038.1.A

v1.0.2024

- Retroperitoneal ultrasound¹ (CPT® 76770 or CPT® 76775) can be performed for:
 - Suspected polycystic kidney disease
 - Screening individuals at risk for autosomal dominant polycystic disease (ADPKD)
 - In the absence of any clinical change, follow-up screening is not indicated if a screening ultrasound was performed at age 40 or later and was negative for any cysts (The negative predictive value of an ultrasound in this age group is 100% for both PKD1 and PKD2, if no cysts are identified.).
 - If an initial ultrasound is negative for any cysts, a follow-up ultrasound can be performed at the discretion of the ordering provider for individuals <40 years of age.
- MRI Abdomen without contrast (CPT® 74181) can be performed:
 - If a cystic renal lesion is detected in an individual at-risk of PKD, for prognostic purposes
 - For volume averaging (Total Kidney Volume – TKV) prior to treatment for PKD (Jynarque, tolvaptan)
 - Optimal follow-up imaging intervals in this setting have not yet been established. Requests for follow-up imaging can be considered on a case-by-case basis.

Background and Supporting Information

- Ultrasound is very effective in establishing a diagnosis of ADPKD, though may miss early small cysts. However, the negative predictive value in the various age groups of a negative ultrasound is as follows:
 - ≥40: 100% for PKD1 and PKD2
 - 30-39: 100% for PKD1 and 96.8% for PKD2
 - 5-29: 99.1% for PKD1 and 83.5% for PKD2
- In addition, the preferable advanced imaging study is MRI Abdomen without contrast (CPT® 74181). This is because of the increased risk of gadolinium-induced nephrogenic fibrosis in individuals with PKD.

Hematuria and Hydronephrosis (AB-39)

Guideline

Hematuria with Urinary Tract Infection (UTI) (AB-39.1)

Asymptomatic Hematuria (AB-39.2)

Hematuria and Flank Pain (Suspicion for Renal/ureteral Stones) (AB-39.3)

Hydronephrosis of Unexplained or Indeterminate Cause (AB-39.4)

References (AB-39)

Hematuria with Urinary Tract Infection (UTI) (AB-39.1)

AB.HH.0039.1.A

v1.0.2024

- Individuals suspected to have a UTI as the etiology of microscopic hematuria should be treated for the UTI and should then undergo repeat urinalysis to confirm resolution of the hematuria. If the hematuria persists following treatment, proceed with the risk-based evaluation as per **Asymptomatic Hematuria (AB-39.2)**.
- Also see: **Urinary Tract Infection (UTI) (AB-40)** for additional imaging considerations

Background and Supporting Information

- Signs and symptoms of UTI: urinary frequency, burning on urination, urgency, dysuria, positive urine leukocyte esterase, presence of WBCs in the urine, fever, elevated WBC as per the testing laboratory's range

Asymptomatic Hematuria (AB-39.2)

AB.HH.0039.2.A

v1.0.2024

- Microscopic hematuria is defined as ≥ 3 red blood cells per high power field. Hematuria is NOT defined as a positive dipstick. A positive dipstick should prompt a microscopic examination. A positive dipstick is not considered as defining microhematuria.
- Prior to imaging, individuals should be stratified into low, intermediate, or high risk, based on the following criteria⁷
 - Low risk (individual meets ALL criteria listed)
 - Women <50 years of age or Men <40 years of age
 - Never smoker or <10 pack years
 - 3-10 RBC/HPF on a single urinalysis
 - No additional risk factors for urothelial cancer:
 - Irritative lower urinary tract symptoms
 - Prior pelvic radiation therapy
 - Prior cyclophosphamide/ifosfamide chemotherapy
 - Family history of urothelial cancer or Lynch Syndrome
 - Occupational exposures to benzene chemicals or aromatic amines (e.g. rubber, petrochemicals, dyes)
 - Chronic indwelling foreign body in the urinary tract
 - Intermediate risk (individual meets any one of these criteria)
 - Women age 50-59 years, Men age 40-59 years
 - 10-30 pack years of smoking
 - 11-25 RBC/HPF on a single urinalysis
 - Low-risk individual with no prior evaluation and 3-10 RBC/HPF on repeat urinalysis
 - Any one of the Additional risk factors for urothelial cancer (see above)
 - High-risk (individual meets any one of these criteria)
 - Women or Men ≥ 60 years
 - >30 pack-years of smoking
 - >25 RBC/HPF on a single urinalysis
 - History of gross hematuria
- Low- or intermediate-risk individuals:
 - Renal ultrasound (combined with cystoscopy)
 - Note: Low-risk individuals may opt for observation with repeat urinalysis within 6 months. If no imaging was performed initially, and follow-up urinalysis reveals persistent hematuria with 3-10 RBC/HPF the individual may be imaged according to Intermediate-Risk criteria. If >10 RBC/HPF, they should be imaged according to High-risk guidelines.

- High-risk individuals
 - CT Urogram (CPT® 74178) (3D imaging is appropriate if requested)
 - If CT is contraindicated, MR Urography may be performed (CPT® 74183 and 72197)
 - If both CT and MR are contraindicated due to contrast, non-contrast CT urography or renal ultrasound should be performed. See also:
Pregnancy Considerations for Imaging (AB-1.12).
- Persistent microscopic hematuria if previously evaluated by renal ultrasound
 - Imaging as per High-risk individuals above
- Hematuria in individuals with inherited risk factors for renal cortical tumors
 - Renal ultrasound or
 - CT Abdomen without and with contrast (CPT® 74170) or
 - MRI Abdomen without and with contrast (CPT® 74183)
 - Note: Inherited risk factors include:
 - Von-Hippel-Lindau
 - Birt-Hogg-Dube
 - Hereditary Papillary RCC
 - Hereditary Leiomyomatosis Renal Cell Cancer
 - Tuberous Sclerosis
- Follow-up
 - Individuals with a negative hematuria evaluation who undergo repeat urinalysis
 - If repeat urinalysis is negative:
 - No further workup
 - If repeat urinalysis demonstrates persistent hematuria
 - Repeat imaging as requested (Renal Ultrasound or CT urography)
- NOTE: 3-D Reconstruction enhances a CT Urogram. Requests for 3-D reconstruction (CPT® 76377 or 76376) for a CT Urogram can be approved.

Hematuria and Flank Pain (Suspicion for Renal/ureteral Stones) (AB-39.3)

AB.HH.0039.3.A

v1.0.2024

- CT Abdomen and Pelvis without contrast (CPT® 74176) or CT Urogram (CPT® 74178)
- NOTE:
 - 3-D Reconstruction enhances a CT Urogram. Requests for 3-D reconstruction (CPT® 76377 or CPT® 76376) for a CT Urogram can be approved.
 - US abdomen or retroperitoneum can be performed in lieu of a CT for any of the above indications

Hydronephrosis of Unexplained or Indeterminate Cause^{3, 4} (AB-39.4)

AB.HH.0039.4.A

v1.0.2024

- CT Urogram (CPT® 74178)
- NOTE:
 - 3-D Reconstruction enhances a CT Urogram. Requests for 3-D reconstruction (CPT® 76377 or CPT® 76376) for a CT Urogram can be approved.
 - US abdomen or retroperitoneum can be performed in lieu of a CT for any of the above indications
- Patients with known uncomplicated hydronephrosis, neurogenic bladder, myelomeningocele (open spinal dysraphism), or spina bifida can have follow-up/surveillance imaging with Retroperitoneal Ultrasound (CPT® 76770) every 6 to 12 months

Upper (Pyelonephritis) (AB-40.1)

AB.UT.0040.1.A

v1.0.2024

- CT Abdomen and Pelvis without and with contrast (CPT® 74178) or CT Abdomen and Pelvis with contrast (CPT® 74177) if¹:
 - Suspected complicated: diabetes, immune-compromised, history of stones, prior renal surgery, or fever ≥ 101 F (≥ 38.5 C).
 - Not responding to therapy after 3 days.
 - Recurrent pyelonephritis (at least 1 prior pyelonephritis).
 - Males with first time UTI, or recurrent UTI without etiology.
- MRI Abdomen without or with and without contrast (CPT® 74181 or CPT® 74183)
 - Elevated creatinine
- Pregnant women should be evaluated initially by renal ultrasound² (CPT® 76770 or CPT® 76775) and if further imaging is necessary, MRI Abdomen and Pelvis³ without contrast (CPT® 74181 and CPT® 72195).

Lower (AB-40.2)

AB.UT.0040.2.A

v1.0.2024

- CT Abdomen and Pelvis without and with contrast (CPT® 74178) if³:
 - Suspected complicated: diabetes or immunocompromised or history of stones or prior renal surgery, or fever ≥ 101 F (≥ 38.5 C).
 - Not responding to therapy after 3 days.
 - Males with first time UTI or recurrent UTI without etiology.
 - Recurrent UTI ≥ 3 per year.
 - Recommendation by or in consultation with a urologist or specialist.
- MRI Abdomen and MRI Pelvis without or with and without contrast (CPT® 74181 and CPT® 72195 or CPT® 74183 and CPT® 72197) can be approved if requested when ALL of the following apply:
 - Criteria (as above) for CT Abdomen and Pelvis without and with contrast are met and
 - Elevated creatinine
- See: **Periurethral Cysts and Urethral Diverticula (PV-13)** in the Pelvis Imaging Guidelines

Liver Transplant, Living Donor Pre-Transplant Imaging (Donor Imaging) (AB-42.2)

AB.TX.0042.2.A

v1.0.2024

- CT Abdomen or MRI Abdomen (CPT® 74160, or CPT® 74170, or CPT® 74183) to assess liver anatomy and volumetrics.
- MRCP to assess biliary anatomy (See: **MRCP (AB-27.1)** for proper coding)
- CTA or MRA Abdomen (CPT® 74175 or CPT® 74185) to assess vascular anatomy

Liver Transplant, Post-Transplant Imaging (AB-42.3)

AB.TX.0042.3.A

v1.0.2024

- Cardiac Imaging:
 - See: **Transplant Patients (CD-1.6)** in the Cardiac Imaging Guidelines
- Suspected post-operative complications:
 - Vascular thrombosis (suspected hepatic artery thrombosis)
 - Doppler ultrasound (CPT® 93975)
 - CTA or MRA Abdomen (CPT® 74175 or CPT® 74185)
 - Suspicion of biliary anastomotic strictures:
 - MRCP (See: **MRCP (AB-27.1)** for appropriate CPT codes)
 - Vascular imaging as above for vascular thrombosis may also be requested and approved for this indication
 - Other suspected post-operative complications (e.g., infection, etc.)
 - Imaging as requested by the transplant institution or team
- Transplant individuals without prior HCC or cholangiocarcinoma:
 - Routine post-transplant imaging is not indicated.
 - If cirrhosis develops post-transplant:
 - See: **Cirrhosis and Liver Screening for Hepatocellular Carcinoma (HCC) (AB-26.1)**, **Ascites (AB-26.2)**, and **Portal Hypertension (AB-26.3)** for HCC screening guidelines.
 - Fibrosis assessment post-liver transplant:
 - Transient elastography (CPT® 91200), which is the most studied modality in this setting.
- Surveillance after transplant for HCC:
 - Based on RETREAT score
 - 0 points: No additional screening needed
 - 1-3 points: CT or MRI Abdomen (CPT® 74160, or CPT® 74170, or CPT® 74183) and CT Chest (CPT® 71260 or CPT® 71250) every 6 months for 2 years.
 - 4 points: CT or MRI Abdomen (CPT® 74160, or CPT® 74170, or CPT® 74183) and CT Chest (CPT® 71260 or CPT® 71250) every 6 months for 5 years
 - ≥5 points: CT or MRI Abdomen (CPT® 74160, or CPT® 74170, or CPT® 74183) and CT Chest (CPT® 71260 or CPT® 71250) every 3 months for 2 years, then every 6 months between the 2nd and 5th years.
- If there is a suspicion of recurrent tumor based on clinical findings and/or sequentially increasing AFP:

- CT Abdomen (CPT® 74160 or CPT® 74170) or MRI Abdomen (CPT® 74183)
- Imaging after transplant for primary sclerosing cholangitis (PSC):
 - Suspected recurrence of PSC;
 - MRCP (See: **MRCP (AB-27.1)** for proper coding)
- Imaging after transplant for cholangiocarcinoma:
 - Liver ultrasound (CPT® 76705 or CPT® 76700) or MRI Abdomen and MRCP (CPT® 74183) every 6 months for 5 years post-transplantation.
 - CT Chest (CPT® 71250 or CPT® 71260) every 6 months for 5 years post-transplantation

Background and Supporting Information

Consensus guidelines regarding post-transplant surveillance imaging have not yet been established. There have been recent attempts to establish evidence-based guidelines, including the development of the RETREAT score, validated recently in a study conducted at University of California, San Francisco, Mayo Clinic-Rochester, and Mayo Clinic-Jacksonville. This scoring system has been adopted for use by UCSF and guides post-transplant imaging for individuals who have undergone transplant for HCC.

The RETREAT score is a protocol used to estimate the risk of tumor recurrence after liver transplantation in patients who have been transplanted for the treatment of hepatocellular carcinoma. It is comprised of three factors which are assessed before and after transplant. Points are assigned based on criteria which include the alpha-fetoprotein level before liver transplantation, the presence or absence of microvascular invasion, and the sum of the diameter of the largest viable tumor and the number of viable nodules on pathologic examination of the explant liver. The RETREAT score is calculated as follows:

Risk Factor	Score
Alpha-fetoprotein level before LT	
0-20	0
21-99	1
100-999	2
≥1000	3
Microvascular invasion present	2
Sum of the diameter of the largest viable tumor and the number of viable nodules	
0	0

Risk Factor	Score
1.1-4.9	1
5.0-9.9	2
≥10	3

Post-Transplant Lymphoproliferative Disorder (PTLD) (AB-42.4)

AB.TX.0042.4.A

v1.0.2024

- CT Chest/Abdomen/Pelvis with contrast (CPT® 71260 and CPT® 74177) for known or suspected PTLD.
- Additional evaluation of suspected PTLD is the same as the evaluation of lymphoma. See: **Diffuse Large B Cell Lymphoma (DLBCL) (ONC-27.2)** in the Oncology Imaging Guidelines for further recommendations
- There is insufficient evidence to support the routine use of imaging to screen for PTLD.

Background and Supporting Information

- Post-transplant lymphoproliferative disease (PTLD) is a major complication of solid organ transplantation and the spectrum ranges from benign hyperplasia to malignant lymphoma. It has an incidence of 1-20%, and is usually related to Epstein-Barr virus infection in the setting of immunosuppression.

Kidney Transplant, Pre-Transplant Imaging Studies (AB-42.5)

AB.TX.0042.5.A
v1.0.2024

Pre-Transplant Evaluation (Per Institution Protocol)

- Individuals referred to a transplant center for kidney or kidney-pancreas transplant evaluation can undergo advanced imaging as follows:
 - Per the transplant institution's protocol, OR
 - Per the studies and intervals listed below:

Imaging Study	Interval	Comments
ONE of the following abdomen/pelvis imaging studies: <ul style="list-style-type: none">• CT Abdomen and Pelvis without contrast (CPT® 74176)• CT Abdomen and Pelvis with contrast (CPT® 74177)• CTA Abdomen (CPT® 74175)• CTA Abdomen and Pelvis (CPT® 74174)• CTA Pelvis (CPT® 72191)	One-time	
ONE of the following echocardiography studies: <ul style="list-style-type: none">• CPT® 93306 (preferred)• CPT® 93307• CPT® 93308	Annual	See also: <u>Transthoracic Echocardiography (TTE) - Indications/initial evaluation (CD-2.2)</u> for descriptions of CPTs or further indications

Imaging Study	Interval	Comments
<p>ONE of the following stress imaging studies:</p> <ul style="list-style-type: none"> • CPT® 93350 • CPT® 93351 • CPT® 78452 • CPT® 75563 • CPT® 78492 • CPT® 78431 	Annual	<p>See also: <u>Transplant (CD-1.6)</u>, <u>Stress Echocardiography (Stress Echo) (CD-2.7)</u>, <u>Myocardial Perfusion Imaging (MPI) - Coding (CD-3.1)</u>, <u>Cardiac MRI - Coding (CD-5.1)</u>, <u>Cardiac PET - Coding (CD-6.1)</u>, <u>Cardiac PET - Perfusion - Indications (CD-6.2)</u> for descriptions of CPTs or further indications</p>

Additional Pre-Transplant Evaluation (Per Indication)

Individuals referred to a transplant center for kidney or kidney-pancreas transplant evaluation can undergo the following additional advanced imaging when the listed indications are met:

Indication	Imaging Study	Interval	Comments
<ul style="list-style-type: none"> 20 pack-year history of smoking 	ONE of the following: <ul style="list-style-type: none"> CT Chest without contrast (CPT® 71250) CT Chest with contrast (CPT® 71260) 	One-time	For lung cancer screening with Low Dose Computed Tomography (LDCT), see: <u>U.S. Preventative Services Task Force: Lung Cancer Screening (Commercial and Medicaid) (CH-33.1)</u> or <u>National Coverage Determination (NCD) for Lung Cancer Screening with Low Dose Computed Tomography (LDCT) (210.14) (CH-33.2)</u> for Low-Dose CT Chest without contrast
<ul style="list-style-type: none"> Autosomal dominant polycystic kidney disease 	ONE of the following: <ul style="list-style-type: none"> MRA Head (CPT® 70544, 70545, or 70546) CTA Head (CPT® 70496) 	One-time	Repeat imaging as per <u>Intracranial Aneurysms (HD-12.1)</u>
<ul style="list-style-type: none"> History of stroke, or History of TIA, or Carotid bruit on exam 	ONE of the following: <ul style="list-style-type: none"> Carotid duplex bilateral study (CPT® 93880 or CPT® 73882) 	One-time	Repeat imaging as per <u>Initial Imaging (PVD-3.1)</u>

Indication	Imaging Study	Interval	Comments
<ul style="list-style-type: none"> Presence of systemic amyloidosis 	ONE of the following cardiac MRI studies: <ul style="list-style-type: none"> CPT® 75557 CPT® 75561 	One-time	See also: <u>Cardiac MRI - Coding (CD-5.1)</u> , <u>Cardiac MRI - Indications (excluding Stress MRI) (CD-5.2)</u> for descriptions of CPTs or further indications
BOTH of the following: <ul style="list-style-type: none"> Presence of systemic amyloidosis AND Cardiac MRI is either contraindicated or indeterminate 	ONE of the following nuclear medicine studies: <ul style="list-style-type: none"> CPT® 78803 CPT® 78830 	One-time	See also: <u>Myocardial Tc-99m Pyrophosphate Imaging (CD-3.7)</u> , <u>Cardiac Amyloidosis (CD-3.8)</u> or descriptions of CPTs or further indications
<ul style="list-style-type: none"> In place of stress imaging for initial pre-transplant evaluation, or Stress imaging is positive for ischemia 	ONE of the following heart catheterization: <ul style="list-style-type: none"> CPT® 93458 CPT® 93454 If prior CABG: <ul style="list-style-type: none"> CPT® 93459 CPT® 93455 	One-time	Repeat imaging as per <u>Diagnostic Heart Catheterization - Code Sets (CD-7.1)</u> and <u>Evaluation of structural heart disease (CD-7.3.5)</u>

Kidney Donor Nephrectomy or Pre-Transplant Nephrectomy

Indication	Imaging Study	Comments
<ul style="list-style-type: none"> Individuals being evaluated for living kidney donation, or Individual is planning removal of one or both kidneys 	ONE of the following: <ul style="list-style-type: none"> CTA Abdomen (CPT® 74175) MRA Abdomen (CPT® 74185) MRI Abdomen without and with contrast (CPT® 74183) 	For CTA and MRA, 3D rendering is included with the original study

Kidney Transplant, Post-Transplant (AB-42.6)

AB.TX.0042.6.A

v1.0.2024

- Ultrasound of transplanted kidney:
 - Current ultrasound imaging protocols of the transplanted kidney commonly include a Doppler study and are coded as CPT® 76776.
 - Do not report non-invasive vascular codes CPT® 93975 and CPT® 93976 in conjunction with CPT® 76776.
 - Ultrasound of the transplanted kidney performed without duplex Doppler should be reported as a limited retroperitoneal ultrasound (CPT® 76775).

Heart Transplant (AB-42.7)

AB.TX.0042.7.A

v1.0.2024

- See: **Transplant Patients (CD-1.6)** in the Cardiac Imaging Guidelines

Hepatic and Abdominal Arteries (AB-43)

Guideline

Hepatic Arteries and Veins (AB-43.1)

Abdominal Veins Other than Hepatic and Portal Veins (AB-43.2)

Renal Vein Thrombosis (AB-43.3)

References (AB-43)

Hepatic Arteries and Veins (AB-43.1)

AB.HA.0043.1.A

v1.0.2024

- Portal Vein Thrombosis (PVT):
 - Doppler US (CPT® 93975) is the initial noninvasive modality for the diagnosis of Portal Vein Thrombosis
 - CT Abdomen with contrast (CPT® 74160 or 74170 – 4 phase CT), MRI Abdomen without and with contrast (CPT® 74183) or CTA Abdomen (CPT® 74175)
 - To assess the extension of thrombus into the mesenteric veins when Doppler US (or other imaging, such as abdominal US) is positive for PVT
 - To exclude tumor thrombus among individuals with cirrhosis who develop new portal and/or mesenteric vein thrombosis
 - For continued concern for PVT (for example in an individual with a hypercoagulable state or abdominal malignancy) if Doppler US is negative or inconclusive
 - To assess for development of intestinal ischemia among individuals with known portal and/or mesenteric vein thrombosis (MVT) (e.g., development of fever, rebound, leukocytosis, elevated serum lactate levels):
 - In lieu of the above imaging modalities, if requested: CT Abdomen and Pelvis with contrast (CPT® 74177)
 - For suspicion of portal hypertensive or portal cavernoma cholangiopathy in individuals with known PVT or MVT (cholestatic liver chemistry profile (See **Abnormal Liver Chemistries (AB-30.1)**), known portal cavernoma, extrahepatic biliary abnormalities on imaging):
 - MRCP (CPT® 74183 or CPT® 74181)

(Note: Portosystemic collaterals in the region surrounding the common bile duct in individuals with chronic PVT can be associated with common bile duct obstruction.)

- For routine follow-up of PVT:
 - US/Doppler every 6 months. If these are reported as not providing adequate visualization, CT Abdomen (CPT® 74160), MRI Abdomen (CPT® 74183), or CTA Abdomen (CPT® 74175), can be performed.
- For follow-up of PVT being treated with anticoagulation:
 - US/Doppler, CT Abdomen (CPT® 74160), MRI Abdomen (CPT® 74183), or CTA Abdomen (CPT® 74175) in 3-6 months.
 - Further follow-up every 6 months with US/Doppler unless these are reported as not providing adequate visualization, in which case any of the above studies can be approved.
- TIPS (transjugular intrahepatic portosystemic shunt)
 - Pre-procedure evaluation:

- Abdominal US, including Doppler (CPT® 76700 and/or CPT® 93975), Multiphase CT Abdomen (CPT® 74160 or CPT® 74170), Multiphase CTA Abdomen (CPT® 74175), Multiphase MRA Abdomen (CPT® 74185), or MRI Abdomen liver protocol (CPT® 74183)
- Echocardiogram (CPT® 93306) (see: **Transthoracic Echocardiography (TTE) – Indications/Initial Evaluation (CD-2.2)**)
- For routine follow-up to monitor stent patency:
 - US with Doppler (CPT® 93975) 7-14 days after shunt creation, and then at 3 months, 6 months, and then every 6 months thereafter.
 - Note: If requested earlier than the above intervals because of a clinical deterioration or suspicion of stent occlusion, the Doppler can be approved.
- If Doppler imaging is indeterminate or if there is a negative Doppler with clinical signs of worsening portal hypertension:
 - Multiphase CT Abdomen (CPT® 74160 or CPT® 74170), Multiphase CTA Abdomen (CPT® 74175), Multiphase MRA Abdomen (CPT® 74185), or MRI Abdomen liver protocol (CPT® 74183)
- Echocardiogram (CPT® 93306) is indicated for the following:
 - One time post-procedure for routine follow up
 - Any time post-procedure:
 - For new signs or symptoms
 - For concern for new or worsening pulmonary hypertension
 - See also: **Frequency of Echocardiography Testing (CD-2.3)** in the Cardiac Imaging Guidelines
- Budd-Chiari Syndrome
 - Primary Budd-Chiari Syndrome (BCS) is due to thrombotic obstruction of the hepatic venous outflow tract, and Secondary BCS is caused by malignant tumors or extrinsic compression of the hepatic vein. Guidelines refer to Primary BCS.
 - LI-RADS assessment should not be applied to individuals <18 years old or those with cirrhosis from congenital hepatic fibrosis or secondary to vascular disorders (e.g., Budd-Chiari syndrome, chronic portal vein occlusion, cardiac congestion, hereditary hemorrhagic telangiectasia).
 - Doppler US (CPT® 93975) is the initial diagnostic test for the evaluation of BCS.
 - CT Abdomen with contrast (CPT® 74160), or MRI Abdomen without and with contrast (CPT® 74183) or CTA Abdomen (CPT® 74175)
 - To assess thrombus extension
 - Rule out tumor thrombus
 - Assess response to anticoagulation therapy
 - If there is high suspicion of BCS despite a negative or inconclusive Doppler US

- To additionally assess indeterminate hepatic nodules detected on the prior US (any of the above studies or CT Abdomen without and with contrast CPT® 74170)
- For pre-operative evaluation of anticipated interventional vascular therapies or TIPS:
 - Abdominal US, including Doppler (CPT® 76700 and/or CPT® 93975), Multiphase CT Abdomen (CPT® 74160 or CPT® 74170), Multiphase CTA Abdomen (CPT® 74175), Multiphase MRA Abdomen (CPT® 74185), or MRI Abdomen liver protocol (CPT® 74183)
- For HCC Surveillance in patients with chronic BCS:
 - Abdominal US (CPT® 76700 or CPT® 76705) and serum alpha-fetoprotein every 6 months
 - Triphasic CT Abdomen (CPT® 74160 or CPT® 74170), or MRI Abdomen (CPT® 74183) for the evaluation of hepatic nodules seen on US or AFP ≥15 ng/ml.
 - The LiRADS reporting system does not apply to HCC surveillance in this population, due to the vascular origin of many of the hepatic imaging abnormalities.
- Hereditary Hemorrhagic Telangiectasia (HHT)
 - Note: The liver may be involved in individuals with HHT, and artery-to-vein or vein-to-vein shunting may occur resulting in liver vascular malformations (LVMs).
 - Screening the liver for LVMs is not indicated. As per recent ACG Guidelines⁶ “There is no evidence to suggest that making a diagnosis in an asymptomatic patient has clinical benefits or prevents death”.
 - For symptoms suggestive of LVMs (including an audible bruit or palpable thrill over the hepatic region on physical examination, abnormal liver tests) or for the development of signs or symptoms of heart failure, biliary ischemia, hepatic encephalopathy, mesenteric ischemia, or portal hypertension:
 - CT Abdomen (CPT® 74160), CTA Abdomen (CPT® 74175), MRI Abdomen with and without (CPT® 74183), MRCP (CPT® 74183), or MRA Abdomen (CPT® 74185)
- CTA Abdomen and Pelvis (CPT® 74174), or CTA Abdomen (CPT® 74175) or MRA Abdomen (CPT® 74185) additional indications:
 - Evaluation of portal and hepatic veins prior to or following surgical intervention for the treatment of portal hypertension (See: **Portal Hypertension (AB-26.3)**)
 - Evaluation of hepatic vasculature prior to and following embolization procedure (See: **Hepatocellular Carcinoma (HCC) – Restaging/Recurrence (ONC-14.4)** and **Hepatocellular Carcinoma (HCC) – Surveillance/Follow-up (ONC-14.5)** and **Liver Metastases (ONC-31.2)** in the Oncology Imaging Guideline)
 - Evaluation of hepatic vasculature prior to planned hepatectomy (See: **Liver Transplant, Pre-Transplant (AB-42.1)**)

- Evaluation of liver donor (See: Liver Transplant, **Living Donor Pre-Transplant Imaging (Donor Imaging) (AB-42.2)** for specific guidance)
- Hepatic arterial aneurysms:
 - See: **Visceral Artery Aneurysm (PVD-6.5)** in the Peripheral Vascular Disease Imaging Guidelines

Background and Supporting Information

Primary Budd-Chiari Syndrome is due to thrombotic occlusion of the hepatic venous outflow tract. Most individuals have an underlying prothrombotic condition such as a myeloproliferative disease, an inherited thrombophilia (e.g. Factor V Leiden), a systemic disease such as vasculitis, or hormonal factors, such as recent oral contraceptive use. Secondary Budd-Chiari Syndrome is caused by malignant tumors or extrinsic compression of the hepatic veins.

Abdominal Veins Other than Hepatic and Portal Veins (AB-43.2)

AB.HA.0043.2.A

v1.0.2024

- CTA Abdomen and Pelvis (CPT® 74174), or CTA Abdomen (CPT® 74175) or MRA Abdomen (CPT® 74185) if ONE of the following:
 - Nephrotic syndrome
 - Renal vein thrombosis
 - Mesenteric vein thrombosis
- Suspicion of iliac vein thrombus when a lower extremity duplex or abdominal duplex is inconclusive or equivocal, see: **Acute Deep Venous Thrombosis (DVT) (PVD 12.2)**
- Suspicion of inferior vena cava thrombus when a lower extremity duplex or abdominal duplex is inconclusive or equivocal, see: **Acute Deep Venous Thrombosis (DVT) (PVD 12.2)**

Renal Vein Thrombosis (AB-43.3)

AB.HA.0043.3.A

v1.0.2024

- MRA Abdomen (CPT® 74185) if ONE of the following:
 - Nephrotic syndrome
 - Proteinuria – 3 grams or more in 24 hours
 - Lupus nephritis
 - Hypercoagulable state, ONE of the following:
 - Antiphospholipid antibodies
 - Behçet's syndrome
 - Protein C deficiency
 - Protein S deficiency

Suspected Neuroendocrine Tumors of the Abdomen (AB-44)

Guideline

Suspected Neuroendocrine Tumors of the Abdomen (AB-44)

Suspected Neuroendocrine Tumors of the Abdomen (AB-44)

AB.44.A

v1.0.2024

For the evaluation of a suspected neuroendocrine tumor of the abdomen: See **Gastrointestinal/Pancreatic Neuroendocrine Cancers - Suspected/Diagnosis (ONC-15.2)** in the Oncology Imaging Guidelines.

Liver Elastography (AB-45)

Guideline

Liver Elastography (AB-45)

References (AB-45)

Liver Elastography (AB-45)

AB.LE.0045.A

v1.0.2024

- Initial staging of liver fibrosis in suspected non-alcoholic fatty liver disease (NAFLD):
 - Transient Elastography or Vibration-Controlled Transient Elastography (VCTE, e.g. Fibroscan) (CPT® 91200) is the initial imaging modality
 - Typically repeated within a 3-year period. If repeat transient elastography fails, see MRE criteria below²³
 - Magnetic Resonance Elastography (MRE, CPT® 76391) can be approved for ANY of the following:
 - Transient Elastography failure despite use of an XL-probe, OR BMI ≥ 35
 - Conflict between clinical picture and transient elastography results (e.g., individual with portal hypertension but VCTE suggests no fibrosis)
 - VCTE liver stiffness measurement of ≥ 8 kPa
 - FIB 4 score of > 2.67
 - Liver biopsy demonstrates fibrosis stage F2-F4
- Special considerations for MRE:
 - For MRE requests in the setting of hemochromatosis, see: **Hereditary (Primary) Hemochromatosis (HH) and Other Iron Storage Diseases (AB-11.2)**
 - Note: The correct CPT code for MR Elastography is CPT® 76391. It is a stand-alone code and it does not require an additional CPT code such as MRI Abdomen (CPT® 74183).
 - An additional MRI Abdomen code should only be approved if there is another appropriate indication for it, other than the Elastography study (for example, MRE for fibrosis scoring in NAFLD due to a BMI ≥ 35 , AND further evaluation of an indeterminate hepatic lesion).
- The use of other ultrasound elastographic techniques (CPT® 76981, CPT® 76982, and CPT® 76983), including but not limited to acoustic radiation force impulse imaging or real-time tissue elastography for any indication is considered experimental or investigational at this time.

Background and Supporting Information

- For the assessment of cirrhosis in individuals with hepatitis C, the AGA noted that MRE has little to no increase in identifying cirrhosis, but had poorer specificity and thus higher false-positive rates than VCTE. In view of this, the AGA concluded that MRE has a poorer diagnostic performance in this setting, compared to VCTE. In their recommendations for the assessment of fibrosis in chronic liver disease, VCTE was recommended over MRE with the exception of NAFLD in high risk populations, in which MRE resulted in a lower rate of false positives compared to VCTE. This was considered a conditional recommendation with a low quality of evidence.

- Transient Elastography (VCTE) is the most studied elastography technique and informs multiple evidence-based guidelines with respect to fibrosis scoring. No national evidence-based guideline recommends the use of either ARFI or real-time tissue elastography (RTTE) over the use of VCTE for any clinical protocol, nor is there direct evidence that ARFI or RTTE improves health outcomes over and above VCTE.
- Vibration-Controlled Transient Elastography (VCTE) (e.g. Fibroscan, CPT® 91200) may be considered appropriate to assess for advanced fibrosis and cirrhosis in the following conditions: (Note: eviCore does not currently review for this procedure code and providers should contact the insurer directly for any pre-authorization requirements.)
 - Hepatitis C
 - Hepatitis B
 - Chronic alcoholic liver disease
 - All other chronic liver diseases
- FIB-4 index is calculated as follows²²:
 - $$\text{FIB-4} = (\text{Age in years} \times \text{AST level}) / (\text{Platelet count} \times \sqrt{\text{ALT}})$$

Hiccups (AB-46)

Guideline

Hiccups (AB-46.0)

References (AB-46)

Hiccups (AB-46.0)

AB.HI.0046.0.A

v1.0.2024

- Note: Hiccups may be associated with cerebrovascular disease, brain tumors, and intracranial injury, though it would be very rare for hiccups to be the only presenting symptom of serious neurologic disease. If concern is expressed for neurologic involvement, please see the appropriate guideline in HD imaging (e.g., **Neuromyelitis Optica and NMO Spectrum Disorders (HD-16.2)** and **Anti-MOG syndromes (HD-16.3)**)
- Hiccups <48 hours without any localizing or specific symptoms:
 - No advanced imaging
- Hiccups ≥48 hours:
 - History and physical examination, laboratory and CMP and baseline chest x-ray
 - Abnormal or negative chest x-ray with symptoms referable to the chest:
 - CT Chest with contrast (CPT® 71260)
 - Lab or history/physical findings suggest a gastrointestinal etiology:
 - CT Abdomen with contrast (CPT® 74160)

References (AB-46)

Retroperitoneal Fibrosis (AB-47)

Guideline

Retroperitoneal Fibrosis (AB-47.0)

References (AB-47)

Retroperitoneal Fibrosis (AB-47.0)

AB.RP.0047.0.A

v1.0.2024

- Individuals diagnosed with retroperitoneal fibrosis:
 - ONE of the following every 3 months until stability demonstrated:
 - CT Abdomen and Pelvis with contrast (CPT® 74177)
 - MRI Abdomen and Pelvis without contrast (CPT® 74181 and CPT® 72195)
 - MRI Abdomen and Pelvis with and without contrast (CPT® 74183 and CPT® 72197)
 - Retroperitoneal or Abdominal ultrasound (CPT® 76770 or CPT® 76700) can be approved if requested.
 - After stability established repeat imaging can be approved every 6 months.
 - Requests for non-contrasted studies in individuals with renal insufficiency is appropriate. Gadolinium may induce nephrogenic systemic fibrosis in individuals with moderate or severe renal insufficiency, especially if the GFR is <30 ml/min.
 - Additional imaging:
 - CT Chest (CPT® 71260) can also be performed upon initial diagnosis if requested, to further evaluate for the possibility of malignancy as an underlying etiology.
- PET/CT (CPT® 78815)
 - Can be considered initially, after diagnosis, to establish avidity patterns to assess for the likelihood of malignancy and for stratification for the likelihood of response to steroids.
 - Follow-up can be considered if there is documentation of an anticipated therapeutic change based on the results (such as a change in immunosuppression therapy or stent removal).
- Methysergide-induced retroperitoneal fibrosis:
 - Methysergide for migraine treatment is generally no longer available but is rarely being used at some centers. It has a known complication of retroperitoneal fibrosis.
 - Individuals can be screened at baseline and then every 6 months with ONE of the following:
 - CT Abdomen and Pelvis with contrast (CPT® 74177)
 - CT Abdomen and Pelvis without contrast (CPT® 74176)
 - MRI Abdomen and Pelvis without and with contrast (CPT® 74183 and CPT® 72197)
 - MRI Abdomen and Pelvis without contrast (CPT® 74181 and CPT® 72195)
 - Retroperitoneal ultrasound (CPT® 76770 or CPT® 76775)

Background and Supporting Information

Retroperitoneal fibrosis is a rare disease, and may be idiopathic (IgG4 or non-IgG-4 related) or secondary. Secondary causes include malignancy, infections, previous radiation therapy, previous abdominal surgery, drugs such as methysergide, and biologic agents.

Fistulae (AB-48)

Guideline

Fistulae (AB-48)

References (AB-48)

Fistulae (AB-48)

AB.FD.0048.A

v1.0.2024

- Suspected enteric fistulae
 - CT Abdomen and Pelvis with contrast (CPT® 74177)
- Suspected colovesical fistulae
 - CT Abdomen and Pelvis without contrast (CPT® 74176)
- Enterocutaneous fistulae
 - Suspected enterocutaneous fistulae:
 - CT Abdomen and Pelvis with contrast (CPT® 74177)
 - MRI Abdomen and Pelvis without and with contrast (CPT® 74183) is appropriate to substitute if there is a contraindication to CT
 - Surgical planning of known complex fistulae:
 - MRI Abdomen and Pelvis without and with contrast (CPT® 74183) if not already performed
- Complicated diverticulitis with fistula, see: **Acute/Persistent (Non-Chronic) Lower Abdominal Pain (AB-2.2)**
- Perianal/perirectal fistulae and abscess related to Crohn's disease, see: **Perirectal/Perianal Disease (AB-23.3)**
- Other fistulae related to Crohn's disease, see: **Known IBD (AB-23.2)**
- Perianal/perirectal fistulae NOT related to Crohn's disease, see: **Fistula in Ano (PV-21.1)** in the Pelvis Imaging Guidelines
- For colovaginal, rectovesicular, rectovaginal, or urinary-vaginal communicating fistulae, see: **Pelvic Fistula (PV-21.3)** in the Pelvis Imaging Guidelines
- For pilonidal cyst, see: **Pilonidal Cyst (PV-21.4)** in the Pelvis Imaging Guidelines

Background and Supporting Information

- Examples of gastrointestinal fistulae include tracheo- and broncho-esophageal, entero-cutaneous, entero-enteric, entero-colic, entero-vesical, colo-vesical, recto-vaginal, perianal, and aorto-enteric.
- Etiologies of fistulae include: complication of inflammatory disease (e.g., Diverticulitis, Crohn's disease), complication of surgical procedures (which are the most common cause of intestinal fistula, comprising more than half of all fistulae), obstetric injury (e.g., recto-vaginal, ano-vaginal), malignancy, radiation, non-surgical injuries, and foreign bodies.

General Guidelines (BR-Preface 1.0)

BR.GG.0001.0.A

v2.0.2024

- A current clinical evaluation since the onset or change in symptoms is usually required prior to considering advanced imaging.
 - A clinical evaluation should include the following:
 - A relevant history and physical examination since the onset or change in symptoms
 - Appropriate laboratory studies and non-advanced imaging modalities, such as mammogram and/or ultrasound
 - Other meaningful contact (telephone call, electronic mail or messaging) since the onset or change in symptoms by an established individual can substitute for a face-to-face clinical evaluation
- Current clinical evaluation is not required prior to screening studies.
- Throughout this guideline, when MRI Breast is indicated any **ONE** of the following codes is supported:
 - CPT® 77049 MRI Breast Bilateral, including CAD, with and without contrast
 - HCPCS C8908 MRI Breast Bilateral, with and without contrast
- If the individual has breast implants, the following code is supported when MRI Breast is requested to assess integrity of breast implants **AND** is also indicated in the guidelines:
 - CPT® 77047 MRI Breast Bilateral, without contrast

BI-RADS™ Categories Chart (BR-Preface 1.1)

BR.GG.0001.1.A
v2.0.2024

BI-RADS™ Categories Chart	
Category	Description
Category 0: Incomplete	Need additional imaging evaluation or prior mammograms for comparison. Category 0 classification requires that additional imaging study be specified, e.g., ultrasound, additional mammogram view, MRI.
Category 1: Negative	There is nothing to comment on. The breasts are symmetrical and no masses, architectural disturbances, or suspicious calcifications are present.
Category 2: Benign Finding	This is also a negative mammogram, but the interpreter may wish to describe a finding. Involuting, calcified fibroadenomas, multiple secretory calcifications, fat-containing lesions (such as oil cysts, lipomas, galactoceles, and mixed density hamartomas) all have characteristic appearances, and may be labeled with confidence. The interpreter might wish to describe intramammary lymph nodes, implants, etc. while still concluding that there is no mammographic evidence of malignancy.

BI-RADS™ Categories Chart	
Category	Description
<i>Category 3: Probably Benign Finding – Short Interval Follow-up Suggested</i>	A finding placed in this category should have a very high probability of being benign. It is not expected to change over the follow-up interval, but the radiologist would prefer to establish its stability. Data is becoming available that sheds light on the efficacy of short interval follow-up. At the present time, most approaches are intuitive. These will likely undergo future modification as more data accrue as to the validity of an approach, the interval required, and the type of findings that should be followed.
<i>Category 4: Suspicious Abnormality – Biopsy Should Be Considered</i>	There are lesions that do not have the characteristic morphologies of breast cancer but have a definite probability of being malignant. The radiologist has sufficient concern to urge a biopsy. If possible, the relevant possibilities should be cited so that the individual and her physician can make the decision on the ultimate course of action.
<i>Category 5: Highly Suggestive of Malignancy – Appropriate Action Should Be Taken</i>	These lesions have a high probability of being cancer and should be biopsied or treated surgically.
<i>Category 6: Known Biopsy-Proven Malignancy – Appropriate Action Should Be Taken</i>	These lesions have been biopsied and are known to be malignant.

BI-RADS™ Breast Density Categories (BR-Preface 1.2)

BR.GG.0001.2.A
v2.0.2024

BI-RADS™ Breast Density Categories
<i>Category A: Almost entire fatty</i>
<i>Category B: Scattered fibroglandular densities</i>
<i>Category C: Heterogeneously dense</i>
<i>Category D: Extremely dense</i>

Breast Ultrasound (BR-1)

Guideline

Breast Ultrasound (BR-1.1)

Breast Ultrasound (BR-1.1)

BR.US.0001.1.A

v2.0.2024

- Routine performance of breast ultrasound as stand-alone screening or with screening mammography is inappropriate.
 - Breast ultrasound is a supplemental screening alternative for high-risk females (as described in **MRI Breast Indications [BR-5]**) with dense breasts on mammography, when MRI Breast without and with contrast cannot be performed. The inability to perform MRI Breast may be because it cannot be tolerated (i.e., insurmountable claustrophobia or body habitus), or there exists a contraindication (i.e., non-MRI compatible implantable devices or an inability to receive MRI contrast). When a MRI Breast has not been performed in the past year for high-risk screening, then a bilateral breast ultrasound requested for supplemental screening in high-risk females with dense breasts on mammography is supported.
 - Equivocal or Occult Findings:
 - Breast ultrasound (CPT® 76641 or CPT® 76642): Radiologist Report recommendation **and** inconclusive or conflicting findings on mammography or MRI Breast
- Breast ultrasound (CPT® 76641: unilateral, complete; or, CPT® 76642: unilateral, limited) can be used to further evaluate abnormalities found on mammogram, especially in differentiating cysts from solid lesions.
 - A clinical office visit is not necessary prior to breast ultrasound when an abnormality has been identified on recent (within the last 60 days) mammogram.
- BI-RADS™ Cat 3 ultrasound follow-up imaging for stable findings at 6 months:
 - If repeat imaging remains BI-RADS™ 3, repeat at 12 months, 18 months, and 24 months from the date of the initial imaging.
 - After 2 years of stability, the finding should be assessed as benign (Cat 2).
 - If repeat imaging is BI-RADS™ 1 or 2, then imaging reverts to routine per individual's risk profile.
- Mammography and breast ultrasound, in any order, regardless of age for palpable breast masses or other clinical abnormalities (such as skin change, pain, nipple inversion). Ultrasound can enhance biopsy.
- If recent clinical examination is equivocal for rupture of breast implants (saline or silicone), initial imaging is indicated as below:

Evaluation of Suspected Rupture of Breast Implants

Age	Saline Breast Implant	Silicone Breast Implant
<30	Breast Ultrasound	Breast Ultrasound or MRI Breast without contrast (CPT® 77047)

Evaluation of Suspected Rupture of Breast Implants		
Age	Saline Breast Implant	Silicone Breast Implant
30-39	Breast Ultrasound or mammography/Digital breast tomosynthesis (DBT)	Breast Ultrasound, mammography/Digital breast tomosynthesis (DBT) or MRI Breast without contrast (CPT® 77047)
≥40	Mammography/Digital breast tomosynthesis (DBT)	Mammography/Digital breast tomosynthesis (DBT) or MRI Breast without contrast (CPT® 77047)

- Axilla ultrasound (CPT® 76882)
 - For females with clinically suspicious lymph nodes, pre-operative axillary ultrasound with a FNA or biopsy can help identify individuals who have positive nodes.
 - See **Axillary Lymphadenopathy (and Mass) (CH-2.2)** in the Chest Imaging Guidelines.
 - Bilateral should be coded CPT® 76882 x 2.
- US-guided breast biopsy (CPT® 19083) includes the imaging component.
 - Additional lesions should be billed using CPT® 19084.
- Ultrasound Breast can be repeated at least 6 months after an US-directed breast biopsy to document successful lesion sampling if histology is benign and non-specific, equivocal or uncertain.
- 3D Reconstruction (CPT® 76376 or CPT® 76377) is **NOT** indicated for breast ultrasound. It is commonly requested in conjunction with automated breast ultrasound (ABUS); there is no evidence to support its clinical usefulness.
- State-Specific Density Reporting and Imaging Mandate Laws
 - Breast density notification laws have been put into effect by many states. Breast density notification laws vary, but some also contain mandates for additional imaging, which may include MRI and/or ultrasound. For applicable requests involving members in these states, their legislative mandates should be followed.

MRI Breast Coding (BR-2)

Guideline

MRI Breast Coding (BR-2.1)

MRI Breast Coding (BR-2.1)

BR.MR.0002.1.A

v2.0.2024

- The use of gadolinium contrast is required for the evaluation of breast parenchyma.
- The use of gadolinium contrast is **NOT** necessary for the evaluation of implant integrity in asymptomatic, average-risk individuals.
- Computer-aided detection (CAD) is included with the MRI Breast CPT® 77049 and CPT® 77048 procedures. The use of HCPCS code C8937 (CAD including computer algorithm analysis of MRI Breast data for lesion detection/characterization, pharmacokinetic analysis, with further physician review for interpretation) is **NOT** necessary with these procedures.
 - The use of CAD has little influence on the sensitivity and specificity of MRI Breast interpretation.
 - The use of HCPCS code C8937 (CAD including computer algorithm analysis of MRI Breast data for lesion detection/characterization, pharmacokinetic analysis, with further physician review for interpretation) is currently considered investigational, experimental, and/or unproven.
 - Since the CAD software automatically performs 3D imaging, CPT® 76376 or CPT® 76377 should **NOT** be used in conjunction with MRI Breast.
- MRI-guided breast biopsy (CPT® 19085) includes the imaging component and the needle placement under MR guidance; CPT® 77021 MR guidance for needle placement is **NOT** an appropriate code to bill for a breast biopsy.
 - Additional lesions should be billed using CPT® 19086.
 - eviCore does not manage codes CPT® 19085 or CPT® 19086.

Background and Supporting Information

- Although MRI Breast has superior sensitivity in identifying new unknown malignancies, it carries a significant false positive risk when compared to mammogram and ultrasound. Incidental lesions are seen on 15% of MRI Breast and increase with younger age. The percentage of incidental lesions that turn out to be malignant varies from 3% to 20% depending on the individual population. Cancer is identified by MRI Breast in only 0.7% of those with “inconclusive mammographic lesions.”

Breast Reconstruction (BR-3)

Guideline

Breast Reconstruction (BR-3.1)

Breast Reconstruction (BR-3.1)

BR.RC.0003.1.A

v2.0.2024

- CTA or MRA of the body part from which the free-tissue transfer flap is being taken, can be performed for breast reconstruction preoperative planning.
 - For example, CTA Abdomen and/or Pelvis (CPT® 74175 or CPT® 72191 or CPT® 74174) or MRA Abdomen and/or Pelvis (CPT® 74185 and/or CPT® 72198) for Deep Inferior Epigastric Perforators (DIEP) flap.
- Routine use of CTA Chest (CPT® 72175) to evaluate recipient vessels is **NOT** indicated.
 - **Criteria exception:** In circumstances where there has been previous cardiac/vascular surgery and/or known vascular anomalies in the chest, it may be warranted.
- There is currently insufficient evidence-based data to support the need for routine advanced imaging for TRAM flaps or other flaps performed on a vascular pedicle.

MRI Breast Indications (BR-5)

Guideline

MRI Breast Indications (BR-5.1)

MRI Breast Indications (BR-5.1)

BR.RC.0005.1.U

v2.0.2024

Breast MRI Considerations

- When MRI Breast imaging is clinically indicated (per the criteria listed in the sections below), an MRI Breast Bilateral with and without contrast is supported.
- MRI Breast Unilateral is **NOT** clinically supported.
- See **Breast Ultrasound (BR-1.1)** when there is a contraindication to MRI contrast.
- See **MRI Breast Coding (BR-2)** for MRI-guided breast biopsy.
- See **Breast Cancer (ONC-11)** in the Oncology Imaging Guidelines for imaging indications related to breast cancer as follows:
 - Breast Cancer - Initial work-up/Staging
 - Breast Cancer - Restaging/Recurrence
 - Breast Cancer - Surveillance/Follow-up
 - Annual screening with prior history of breast cancer

Suspected Rupture of Breast Implants

- Routine surveillance imaging for asymptomatic individuals to assess the integrity of breast implants (silicone or saline) is **NOT** supported.
- Breast MRI is **NOT** indicated for evaluation of capsular contracture.
- For suspected ruptured breast implants (saline or silicone), with a recent equivocal clinical examination and/or conventional imaging, the appropriate imaging for further evaluation is indicated in the table below:

Evaluation of Suspected Rupture of Breast Implants		
Age	Saline Breast Implant	Silicone Breast Implant
<30	Breast Ultrasound	Breast Ultrasound or MRI Breast without contrast (CPT® 77047)
30-39	Breast Ultrasound or mammography/Digital breast tomosynthesis (DBT)	Breast Ultrasound, mammography/Digital breast tomosynthesis (DBT) or MRI Breast without contrast (CPT® 77047)
≥40	Mammography/Digital breast tomosynthesis (DBT)	Mammography/Digital breast tomosynthesis (DBT) or MRI Breast without contrast (CPT® 77047)

Malignant Phyllodes Tumor (Cystosarcoma Phyllodes)

- MRI Breast is indicated pre-operatively to establish extent of disease where a diagnosis of malignant phyllodes tumor has previously been established by tissue diagnosis. See **Background and Supporting Information**.

Mammogram and/or US with Equivocal or Occult Findings

- MRI Breast is **NOT** indicated to determine biopsy recommendations for suspicious or indeterminate lesion(s) that can be readily biopsied, either using imaging guidance or physical exam, such as palpable masses and microcalcifications.
- MRI Breast is indicated for **EITHER** of the following:
 - Radiologist Report Recommendation for MRI Breast to assess inconclusive or conflicting findings on mammography or ultrasound with **EITHER** of the following:
 - Findings that are not associated with a discrete palpable mass.
 - Inconclusive findings of fat necrosis (most commonly due to trauma or surgery) in an individual with a history of breast cancer treated with surgery (lumpectomy or mastectomy with or without reconstruction).
 - Documented histopathologic discordance between core-needle biopsy findings and imaging findings. MRI Breast is indicated for further evaluation **after** the discordant biopsy (before consideration for surgical management vs. observation).
 - Discordance exists when the biopsy result does not adequately explain the abnormal (BI-RADS™ 4 or 5) findings on mammogram and/or ultrasound.
- See **MRI BI-RADS™ 3** section for lesions categorized as BI-RADS™ 3 on MRI.
- Lesions that are categorized as BI-RADS™ 3 (low risk, probably benign) **on mammogram and/or ultrasound** are not considered equivocal. MRI Breast is **NOT** indicated for these lesions.
 - Repeat the original study type (mammogram or US) in 6 months
 - If repeat imaging remains BI-RADS™ 3, repeat original study type at 12 months, 18 months, and 24 months from the date of the initial imaging.
 - After 2 years of stability, the finding should be assessed as benign (Cat 2).
 - If repeat imaging is BI-RADS™ 1 or 2, then imaging reverts to routine per individual's risk profile. See **Risk Factors** section.
- MRI Breast is **NOT** indicated for suspicious (BI-RADS™ 4 or 5) lesion on mammogram and/or ultrasound.
 - A lesion categorized as BI-RADS™ 4 or 5 should be biopsied.

MRI BI-RADS™ 3

- A probably benign lesion on **MRI** (MRI BI-RADS™ 3) should undergo repeat MRI in 6 months.

- If repeat imaging remains MRI BI-RADS™ 3, then repeat at 12 months, 18 months, and 24 months from the date of the initial imaging.
 - After 2 years of stability, the finding should be assessed as benign (Cat 2)
- If repeat imaging is BI-RADS™ 1 or 2, then imaging reverts to routine per individual's risk profile. See **Risk Factors** section.
- For lesions initially seen on MRI Breast **and** that have benign and non-specific, equivocal or uncertain histology (based on a stereotactic, MRI-guided, or US-directed breast biopsy), an MRI Breast can be repeated at least 6 months after the biopsy to document successful lesion sampling.

Risk Factors

- To date, evidence does not suggest improved outcomes for individuals whose only risk factor is breast density. Therefore, MRI Breast is **NOT** indicated for individuals whose only risk factor is dense breasts as determined by mammogram.
 - See **Mammogram and/or US with Equivocal or Occult Findings** section.
- Routine MRI Breast following bilateral mastectomy is **NOT** indicated (even if high-risk screening criteria may otherwise be met).
- Annual MRI Breast screening is indicated for individuals meeting the high-risk criteria in the table below:

High-Risk Indications	
<i>MRI screening to begin at age 20:</i>	
1.	Li-Fraumeni Syndrome (TP53 mutation) should start annual breast screening MRI starting at age 20 or at the age of the earliest diagnosed breast cancer in the family, <u>whichever comes first</u> .
<i>MRI screening to begin at diagnosis but <u>not prior to age 25</u>:</i>	
2.	Individuals with a history of: <ul style="list-style-type: none"> • Atypical ductal hyperplasia (ADH) • Atypical lobular hyperplasia (ALH) • Lobular carcinoma in situ (LCIS)
<i>MRI screening to begin at age determined by gene mutation:</i>	
3.	BRCA 1 or BRCA 2 begin age 25
4.	STK11, Peutz-Jeghers syndrome (PJS), PTEN Mutation (Cowden Syndrome), CDH1, NF1, PALB2, ATM, CHEK2 begin age 30
5.	BARD1, RAD51C, RAD51D begin age 40

High-Risk Indications	
6.	<p>The following have unknown or insufficient evidence of breast cancer risk and additional MRI screening is NOT indicated at this time:</p> <p>MSH2, MLH1, MSH6, PMS2, EPCAM, NBN, genetic variants of unknown significance, genetic variants favoring polymorphism, and genetic variants of intermediate penetrance.</p>
<i>MRI screening begins at age 40:</i>	
7.	<p>If the individual has NOT been tested for BRCA mutation and there is a first-degree relative (parent, sibling, child; half-siblings are considered second-degree relatives) with BRCA 1 or BRCA 2 mutation.</p> <p>Annual screening is NOT indicated if the individual has been tested and is negative for BRCA 1 or BRCA 2 mutation unless they meet other criteria.</p>
<i>MRI screening begins at age 40 or 10 years before the age of relative (lineage as described below) when first diagnosed with breast cancer, <u>but not prior to the age of 25</u>:</i>	
8.	Two or more first-degree relatives with breast or ovarian cancer.
9.	One first-degree relative with breast cancer or ovarian cancer that was diagnosed ≤ age 50.
10.	One first-degree relative with bilateral breast cancer, or both breast and ovarian cancer.
11.	A first- or second-degree male relative (father, brother/half-brother, uncle, grandfather) diagnosed with breast cancer.
12.	<p>Clinical lifetime-risk estimated at greater than or equal to 20% using an acceptable genetic-risk or clinical-risk estimator.</p> <ul style="list-style-type: none"> Acceptable clinical-risk estimator models are Gail (NCI), Claus, Tyrer-Cuzick (IBIS), or BRCAPRO.

High-Risk Indications

*MRI screening to begin at **age 25 or 8 years after completion of radiotherapy** (whichever occurs later - screening MRI Breast is not supported prior to age 25):*

13.	<p>Annual MRI Breast and annual mammogram is recommended for individuals who received therapeutic radiation exposure in the following fields while they were under 30 years of age:</p> <ul style="list-style-type: none"> • Chest (thorax) • Whole lung • Mediastinal • Axilla • Mini-mantle, mantle, or extended mantle • Total (TLI) or subtotal (SLTI) lymphoid irradiation • Total body irradiation (TBI)
-----	---

Background and Supporting Information

- myRisk® Hereditary Cancer (Myriad Genetics, Inc.) is not accepted as a risk calculator to determine high-risk for breast cancer.
- MRI should not be used in lieu of biopsy of mammographically, clinically, and/or sonographically suspicious findings (ACR Practice Guidelines).
- State Specific Density Reporting and Imaging Mandate Laws
 - Breast density notification laws have been put into effect by many states. Breast density notification laws vary, but some also contain mandates for additional imaging, which may include MRI and/or ultrasound. For applicable requests involving members in these states, their legislative mandates should be followed.
- Phyllodes Tumor (Cystosarcoma Phyllodes)
 - Phyllodes tumor is usually benign and has clinical characteristics of fibroadenoma, although they may exhibit rapid growth. MRI Breast has not been shown to be of value in distinguishing fibroadenoma from phyllodes tumor.
 - Diagnosis is made by tissue diagnosis (percutaneous core biopsy or excisional biopsy). FNA biopsy is inaccurate in phyllodes tumor diagnosis and is not recommended.
 - Treatment is wide local excision. Axillary lymph node dissection is not necessary. It has a predilection for local recurrence following local excision.
 - If biopsy establishes a diagnosis of **malignant phyllodes** (cystosarcoma phyllodes), it should be treated as a soft tissue sarcoma. See **Sarcomas Bone, Soft Tissue, and GIST(ONC-12)** in the Oncology Imaging Guidelines.

Nipple Discharge/Galactorrhea (BR-6)

Guideline

Nipple Discharge/Galactorrhea (BR-6.1)

Nipple Discharge/Galactorrhea (BR-6.1)

BR.DC.0006.1.A
v2.0.2024

- Pathologic nipple discharge
 - Initial imaging should include diagnostic mammogram and ultrasound (CPT® 76641: unilateral, complete; or, CPT® 76642: unilateral, limited). If these are negative or inconclusive, MRI Breast is the next appropriate imaging study.
- Physiologic nipple discharge
 - If nipple discharge is physiologic, there are no suspicious findings on clinical exam, and mammogram and ultrasound are negative, no additional imaging is necessary, and the individual can be reassured.

Background and Supporting Information

- Physiologic nipple discharge is predominantly bilateral but may be unilateral. It is commonly multi-duct. It is predominantly milky but may be white or a variety of colors including serous, yellow, green, brown, or gray. Evaluation for hyperprolactinemia can be considered.
- For milky discharge, prolactin and TSH levels are recommended to diagnose prolactinoma; pituitary imaging is not needed if normal serum Prolactin.
- Pathologic nipple discharge is defined as unilateral, bloody or serous, arising from a single duct, persistent, and spontaneous.

Breast Pain (Mastodynia) (BR-7)

Guideline

Breast Pain (Mastodynia) (BR-7.1)

Breast Pain (Mastodynia) (BR-7.1)

BR.PA.0007.1.A
v2.0.2024

- Evaluation of breast pain requires a history and physical exam.
- Mammogram and ultrasound are the initial imaging for breast pain.
- Advanced imaging is **NOT** routinely indicated in individuals with breast pain and negative mammogram and ultrasound (CPT® 76641: unilateral, complete; or, CPT® 76642: unilateral, limited).
 - If mammogram and ultrasound are not negative, see **MRI Breast Indications (BR-5)**.

Background and Supporting Information

- The risk of malignancy following a negative clinical examination (clinical breast exam, mammogram, ultrasound) has been estimated to be only 0.5%.

Alternative Breast Imaging Approaches (BR-8)

Guideline

Alternative Breast Imaging Approaches (BR-8.1)

Alternative Breast Imaging Approaches (BR-8.1)

BR.AA.0008.1.A

v2.0.2024

Molecular Breast Imaging (MBI)

- Molecular Breast Imaging (CPT® 78800) is supported in individuals who meet criteria for breast cancer screening with MRI (per BR-5) but for whom MRI is contraindicated.
 - See **MRI Breast Indications (BR-5)**.

Risk Factors

- To date, evidence does not suggest improved outcomes for individuals whose only risk factor is breast density. Therefore, MRI Breast is **NOT** indicated for individuals whose only risk factor is dense breasts as determined by mammogram.
 - See **Mammogram and/or US with Equivocal or Occult Findings** section.
- Routine MRI Breast following bilateral mastectomy is NOT indicated (even if high-risk screening criteria may otherwise be met).
- Annual MRI Breast screening is indicated for individuals meeting the high-risk criteria in the table below:

High-Risk Indications	
<i>MRI screening to begin at age 20:</i>	
1.	Li-Fraumeni Syndrome (TP53 mutation) should start annual breast screening MRI starting at age 20 or at the age of the earliest diagnosed breast cancer in the family, <u>whichever comes first</u> .
<i>MRI screening to begin at diagnosis but <u>not prior to age 25</u>:</i>	
2.	Individuals with a history of: <ul style="list-style-type: none">• Atypical ductal hyperplasia (ADH)• Atypical lobular hyperplasia (ALH)• Lobular carcinoma in situ (LCIS)
<i>MRI screening to begin at age determined by gene mutation:</i>	
3.	BRCA 1 or BRCA 2 begin age 25
4.	STK11, Peutz-Jeghers syndrome (PJS), PTEN Mutation (Cowden Syndrome), CDH1, NF1, PALB2, ATM, CHEK2 begin age 30
5.	BARD1, RAD51C, RAD51D begin age 40

High-Risk Indications	
6.	<p>The following have unknown or insufficient evidence of breast cancer risk and additional MRI screening is NOT indicated at this time:</p> <p>MSH2, MLH1, MSH6, PMS2, EPCAM, NBN, genetic variants of unknown significance, genetic variants favoring polymorphism, and genetic variants of intermediate penetrance.</p>
<i>MRI screening begins at age 40:</i>	
7.	<p>If the individual has NOT been tested for BRCA mutation and there is a first-degree relative (parent, sibling, child; half -siblings are considered second-degree relatives) with BRCA 1 or BRCA 2 mutation.</p> <p>Annual screening is NOT indicated if the individual has been tested and is negative for BRCA 1 or BRCA 2 mutation unless they meet other criteria.</p>
<i>MRI screening begins at age 40, or 10 years before the age of relative (lineage as described below) when first diagnosed with breast cancer <u>but not prior to the age of 25</u> :</i>	
8.	Two or more first-degree relatives with breast or ovarian cancer
9.	One first-degree relative with breast cancer or ovarian cancer that was diagnosed ≤ age 50
10.	One first-degree relative with bilateral breast cancer, or both breast and ovarian cancer
11.	A first- or second-degree male relative (father, brother/half-brother, uncle, grandfather) diagnosed with breast cancer
12.	<p>Clinical lifetime- risk estimated at greater than or equal to 20% using an acceptable genetic- risk or clinical-risk estimator</p> <ul style="list-style-type: none"> Acceptable clinical-risk estimator models are Gail (NCI), Claus, Tyrer- Cuzick (IBIS), or BRCAPRO.

High-Risk Indications

MRI screening to begin at age 25 or 8 years after completion of radiotherapy (whichever occurs later - screening MRI Breast is not supported prior to age 25):

13.	<p>Annual MRI Breast and annual mammogram is recommended for individuals who received therapeutic radiation exposure in the following fields while they were under 30 years of age:</p> <ul style="list-style-type: none"> • Chest (thorax) • Whole lung • Mediastinal • Axilla • Mini-mantle, mantle, or extended mantle • Total (TLI) or subtotal (SLTI) lymphoid irradiation • Total body irradiation (TBI)
-----	---

Other Alternative Breast Imaging Techniques

Other alternative breast imaging techniques may have FDA approval, but they remain investigational with respect to **BOTH** screening and diagnosis of breast cancer. These include the following:

- Nuclear breast imaging, including:
 - Scintimammography
 - Breast specific gamma imaging (BSGI)
- PET Mammography (PEM)
- Thermography
- Impedance Mammography
- Other techniques to detect oxygen consumption, light absorption, microwave transmission, nitrous oxide production
- CT Breast (CPT® 0633T, CPT® 0634T, CPT® 0635T, CPT® 0636T, CPT® 0637T, or CPT® 0638T)
- Cone Beam CT Breast

Background and Supporting Information

- CT Breast
 - CT Breast is evolving and currently being studied as a mode of breast cancer detection. It remains under investigation, and is not to be used in lieu of conventional breast imaging modalities.
- Positron Emission Mammography
 - There is currently insufficient data available to generate appropriateness criteria for this modality, and this procedure should be considered investigational at this time.
 - High-resolution positron-emission mammography (PEM) by Naviscan™ PET Systems, also referred to as Naviscan™ or PET mammography, performs high- resolution metabolic imaging for breast cancer using an FDG tracer.

The PEM detectors are integrated into a conventional mammography system, allowing acquisition of the emission images immediately after the mammogram.

- Requesting providers often ask for PEM as CPT® 78811 or “PET scan of the breast.”
- The spatial resolution of this technique is at the individual duct level (1.5 mm) and allows visualization of intraductal as well as invasive breast cancers. This technique is especially adept at detecting ductal carcinoma in situ.
- Early clinical trials have shown high clinical accuracy in characterizing lesions identified as suspicious on conventional imaging or physical examination, as well as in detecting incidental breast cancers not seen on other imaging modalities.
- A prospective multi-center clinical trial for females with newly diagnosed breast cancer anticipating breast-conservation surgery was performed. These females underwent both high-resolution PEM imaging and breast MRI. Results showed that PEM and MRI had comparable breast-level sensitivity, although MRI had greater lesion-level sensitivity and more accurately depicted the need for mastectomy. PEM had greater specificity at the breast and lesion levels. Of these, 3.6% of the females had tumors seen only with PEM.
- The radiation exposure from a PEM study is 23 times higher than for digital mammography.

Suspected Breast Cancer in Males (BR-9)

Guideline

Suspected Breast Cancer in Males (BR-9.1)

Suspected Breast Cancer in Males (BR-9.1)

BR.MA.0009.1.A
v2.0.2024

See **Breast Ultrasound (BR-1)**

- There is limited evidence on the use of MRI in the evaluation of male breast disease.
- Further diagnostic pathway for suspicious clinical or imaging findings usually requires tissue diagnosis.

Background and Supporting Information

- Breast cancer in males presents as a mass, skin/nipple change, or pathologic nipple discharge.

Breast Evaluation in Pregnant or Lactating Females (BR-10)

Guideline

Breast Evaluation in Pregnant or Lactating Females (BR-10.1)

Breast Evaluation in Pregnant or Lactating Females (BR-10.1)

BR.PR.0010.1.A

v2.0.2024

- Breast US (CPT® 76641 or CPT® 76642) is first-line imaging in pregnant and lactating females.
- If pregnant/lactating female has a palpable mass **OR** has persistent unilateral bloody nipple discharge and US is negative or suspicious, follow with diagnostic mammogram (with lead abdominal shielding).
- IV Gadolinium is required with MRI to evaluate breast parenchyma but is contraindicated in pregnancy. Biopsy, rather than advanced imaging, is recommended after inconclusive mammogram and US.

Transgender Breast Cancer Supplemental Screening (BR-12)

Guideline

Transgender Breast Cancer Supplemental Screening (BR-12.1)

Transgender Breast Cancer Supplemental Screening (BR-12.1)

BR.TS.0012.1.A

v2.0.2024

- Annual supplemental Ultrasound **AND/OR** MRI Breast screening is indicated for the following:
 - Transmasculine (female-to-male) with **ALL** of the following risk factors:
 - Reduction mammoplasty or no chest surgery
 - Age ≥ 25
 - High-risk ($\geq 20\%$ lifetime risk)
- Annual Ultrasound and/or MRI Breast, in addition to mammogram, for breast cancer screening is **NOT** indicated in any other scenarios, including **ANY** of the following:
 - Transfeminine (male-to-female)
 - Transmasculine (female-to-male), who have had bilateral mastectomies
 - Transmasculine (female-to-male), who have **NOT** had mastectomies **AND** are at average risk or intermediate risk
- Acceptable models of calculating clinical lifetime-risk include the following: Gail (NCI), Claus, Tyrer-Cuzick (IBIS), or BRCAPRO.

3D Rendering (BR-13)

Guideline

3D Rendering (BR-13.1)

3D Rendering (BR-13.1)

BR.TD.0013.1.A

v2.0.2024

- 3D rendering (CPT® 76376 or CPT® 76377) should **NOT** be used in conjunction with **ANY** 3D mammography code.
- 3D rendering (CPT® 76376 or CPT® 76377) is **NOT** indicated for breast ultrasound. It is commonly requested in conjunction with automated breast ultrasound (ABUS); there is no evidence to support its clinical usefulness.
- 3D rendering (CPT® 76376 or CPT® 76377) should **NOT** be used in conjunction with MRI Breast.

Guideline

General Information

General Guidelines (CD-1.0)

General Information

v2.0.2024

Abbreviations for the Cardiac Imaging Guidelines

Abbreviation	Description
ACC	American College of Cardiology
ACS	acute coronary syndrome
AHA	American Heart Association
ASCOT	Anglo-Scandinavian Cardiac Outcomes Trial
ASD	atrial septal defect
BMI	body mass index
CABG	coronary artery bypass grafting
CAD	coronary artery disease
CAD-RADS	The Coronary Artery Disease Reporting and Data System
CHF	congestive heart failure
COPD	chronic obstructive pulmonary disease
CT	computed tomography
CCTA	coronary computed tomography angiography
CTA	computed tomography angiography
EBCT	electron beam computed tomography
ECP	external counterpulsation (also known as EECP)
ECG	electrocardiogram
ECP	external counterpulsation
ETT	exercise treadmill stress test
FDG	Fluorodeoxyglucose, a radiopharmaceutical used to measure myocardial metabolism
HCM	hypertrophic cardiomyopathy
IV	intravenous
LAD	left anterior descending coronary artery
LDL-C	low density lipoprotein cholesterol
LHC	left heart catheterization
LV	left ventricle

Abbreviation	Description
LVEF	left ventricular ejection fraction
MI	myocardial infarction
MPI	myocardial perfusion imaging (SPECT study, nuclear cardiac study)
MRA	magnetic resonance angiography
MRI	magnetic resonance imaging
mSv	millisievert (a unit of radiation exposure) equal to an effective dose of a joule of energy per kilogram of recipient mass
MUGA	multi gated acquisition scan of the cardiac blood pool
PCI	percutaneous coronary intervention (includes percutaneous coronary angioplasty (PTCA) and coronary artery stenting)
PET	positron emission tomography
PTCA	percutaneous coronary angioplasty
RHC	right heart catheterization
SPECT	single photon emission computed tomography
TEE	transesophageal echocardiogram
TIA	Transient Ischemic Attack
VSD	ventricular septal defect

Glossary

Agatston Score: a nationally recognized calcium score for the coronary arteries based on Hounsfield units and size (area) of the coronary calcium

Angina: principally chest discomfort, exertional (or with emotional stress) and relieved by rest or nitroglycerin

Anginal variants or equivalents: a manifestation of myocardial ischemia which is perceived by individuals to be (otherwise unexplained) dyspnea, unusual fatigue, more often seen in females and may be unassociated with chest pain

ARVD/ARVC – Arrhythmogenic Right Ventricular Dysplasia/Cardiomyopathy: a potentially lethal inherited disease with syncope and rhythm disturbances, including sudden death, as presenting manifestations

BNP: B-type natriuretic peptide, blood test used to diagnose and track heart failure (n-T-pro-BNP is a variant of this test)

Brugada Syndrome: an electrocardiographic pattern that is unique and might be a marker for significant life-threatening dysrhythmias

Double Product (Rate Pressure Product): an index of cardiac oxygen consumption, is the systolic blood pressure times heart rate, generally calculated at peak exercise; over 25000 means an adequate stress load was performed

Fabry's Disease: an infiltrative cardiomyopathy, can cause heart failure and arrhythmias

Fatigue: a subjective feeling of weakness, tiredness or exhaustion. Exertional fatigue is acute in nature, with rapid onset, short duration, and short recovery period.

Hibernating myocardium: viable but poorly functioning or non-functioning myocardium which likely could benefit from intervention to improve myocardial blood supply

Optimized Medical Therapy: should include (where tolerated) antiplatelet agents, calcium channel antagonists, partial fatty acid oxidase inhibitors (e.g. ranolazine), statins, short-acting nitrates as needed, long-acting nitrates up to 6 months after an acute coronary syndrome episode, beta blocker drugs (optional), angiotensin-converting enzyme (ACE) inhibitors/angiotensin receptor blocking (ARB) agents (optional)

Platypnea: shortness of breath when upright or seated (the opposite of orthopnea) and can indicate cardiac malformations, shunt or tumor

Silent ischemia: absence of ischemic symptoms or signs prior to objective demonstration of ischemia by stress testing and/or demonstration of obstructive CAD

Syncope: loss of consciousness; near-syncope is not syncope

Takotsubo cardiomyopathy: apical dyskinesis oftentimes associated with extreme stress and usually thought to be reversible

Troponin: a marker for ischemic injury, primarily cardiac

Practice Estimate of Effective Radiation Dose chart for Selected Imaging Studies

Imaging Study	Estimate of Effective Radiation Dose
Sestamibi myocardial perfusion study (MPI)	9-12 mSv
PET myocardial perfusion study:	3 mSv
Rubidium-82	2 mSv
NH3	
Thallium myocardial perfusion study (MPI)	22-31 mSv
Diagnostic conventional coronary angiogram (cath)	5-10 mSv

Imaging Study	Estimate of Effective Radiation Dose
Computed tomography coronary angiography (CTCA) (with prospective gating)	5-15 mSv Less than 5 mSv
CT Abdomen and Pelvis	8-14 mSv
Chest x-ray	<0.1 mSv

General Guidelines (CD-1.0)

CD.GG.0001.0.A

v2.0.2024

- A current clinical evaluation (within 60 days) is required prior to considering advanced imaging, which includes:
 - Relevant history and physical examination and appropriate laboratory studies and non-advanced imaging modalities, such as recent ECG (within 60 days), chest x-ray or ECHO/ultrasound, after symptoms started or worsened.
 - Effort should be made to obtain copies of reported “abnormal” ECG studies in order to determine whether the ECG is uninterpretable for ischemia on ETT
 - Most recent previous stress testing and its findings should be obtained
 - Other meaningful contact (telephone call, electronic mail or messaging) by an established individual can substitute for a face-to-face clinical evaluation.
 - A recent clinical evaluation documenting any subjective findings (complaints, changes in behavior) or objective findings (clinical exam findings).
 - Other meaningful contact (telephone call, electronic mail or messaging) by an established individual can substitute for a face-to-face clinical evaluation such as requests based on new increased or worsening symptoms (within the last 60 days).
 - Some conditions may require a face to face evaluation as discussed in the applicable condition -specific guideline sections (such as requests based on new physical exam findings).
 - A recent clinical evaluation may be unnecessary if the individual is undergoing a guideline -supported, scheduled follow -up imaging or other designated procedural evaluation.
 - Exceptions due to routine surveillance indications are addressed in the applicable condition -specific guideline sections
 - Vital signs, height and weight, or BMI, or description of general habitus is needed.
 - Clinical question to be answered by advanced imaging that will affect management of the individual’s clinical condition.
- Cardiac imaging is not indicated if the results will not affect clinical management decisions. If a decision to perform cardiac catheterization or other angiography has already been made, there is often no need for imaging stress testing
- Assessment of ischemic symptoms (if present) based on the descriptions below following this section.

Ischemic evaluation

- For the purposes of guideline sections addressing ischemic evaluation, symptoms can be defined as the following:
 - **Cardiac chest pain/pressure/tightness**¹ (likely anginal symptoms): Chest/epigastric/shoulder/ arm/jaw pain, chest pressure/discomfort occurring with exertion or emotional stress and relieved by rest, nitroglycerin, or both.
 - **Less-likely anginal symptoms:** Symptoms including dyspnea or fatigue when not exertional and not relieved by rest/nitroglycerin; also includes generalized fatigue or chest discomfort occurring in a time course not suggestive of angina (eg, resolves spontaneously within seconds or lasts for an extended period and is unrelated to exertion)
 - **Noncardiac explanation:** An alternative diagnosis, such as gastroesophageal reflux, chest trauma, anemia, chronic obstructive pulmonary disease, or pleurisy, is present and is the most likely explanation for the patient's symptoms
 - **Anginal equivalents** (individuals with previously documented CAD only):
 - Symptoms consistent with individual's known angina pattern in an individual with a history of CABG or PCI
 - Dyspnea on exertion
 - Fatigue (overwhelming sense of exhaustion causing a decreased capacity for physical activity or mental work)
- Other signs and symptoms suggestive of potential cardiac etiology:
 - Dyspnea
 - Orthopnea
 - Paroxysmal nocturnal dyspnea
 - Heartburn unrelated to meals/nausea and vomiting
 - Palpitations
 - Syncope
 - Heart failure
- Chest pain remains the predominant symptom reported by females among those diagnosed with an acute coronary syndrome.
- For the purpose of this guideline, evidence documenting the presence of CAD includes any of the following:
 - Prior heart catheterization or CCTA revealing any of the following:
 - $\geq 40\%$ stenosis of the left main coronary artery
 - $\geq 50\%$ stenosis for other coronary arteries
 - Significant stenosis defined by an FFR of ≤ 0.80
 - History of a prior PCI or CABG

¹ Multimodality Writing Group for Chronic Coronary Disease, Winchester DE, Maron DJ, et al. ACC/AHA/ASE/ASNC/ASPC/HFSA/HRS/SCAI/SCCT/SCMR/STS 2023 Multimodality Appropriate Use Criteria for the Detection and Risk Assessment of Chronic Coronary Disease. J Am Coll Cardiol. 2023;81(25):2445-2467. doi:10.1016/j.jacc.2023.03.411.

- For the purpose of this guideline, evidence documenting the presence of non-obstructive CAD includes prior heart catheterization or CCTA revealing any of the following:
 - <40% stenosis of the left main coronary artery
 - <50% stenosis for other coronary arteries
 - FFR >0.8
- The Coronary Artery Disease Reporting and Data System (CAD-RADS) classification of percentage luminal diameter coronary artery stenosis on coronary CT angiography (CCTA)² is as follows:
 - CAD-RADS 0: 0%
 - CAD-RADS 1: 1 to 24%
 - CAD-RADS 2: 25 to 49%
 - CAD-RADS 3: 50 to 69%
 - CAD-RADS 4: 70 to 99% or ≥50% left main coronary artery stenosis
 - CAD-RADS 5: 100% (total occlusion)
- For the purposes of this guideline, evidence documenting a prior MI includes any of the following:
 - Presence of diagnostic Q waves on an ECG
 - A fixed perfusion defect on MPI
 - Akinetic or dyskinetic wall motion on echocardiogram
 - Area of Late Gadolinium Enhancement (LGE) on cardiac MRI suggesting scar
- Findings that may alter the ECG changes during exercise or are uninterpretable for ischemia on a stress test:
 - Complete Left Bundle Branch Block (bifascicular block involving right bundle branch and left anterior hemiblock does not render ECG uninterpretable for ischemia)
 - Ventricular paced rhythm
 - Pre-excitation pattern such as Wolff-Parkinson-White
 - ≥1.0 mm ST segment depression (NOT nonspecific ST/T wave changes)
 - LVH with repolarization abnormalities, also called LVH with strain (NOT without repolarization abnormalities or by voltage criteria)
 - T wave inversion in at least two contiguous inferior and/or lateral leads. This includes leads II, AVF, V5 or V6. (T wave inversion isolated in lead III or T wave inversion in lead V1 and V2 are not included).
 - Individual on digitalis preparation

Stress Testing

Guideline

Stress Testing without Imaging – Procedures (CD-1.2)

Stress Testing with Imaging – Procedures (CD-1.3)

Stress Testing with Imaging - Indications (CD-1.4)

Stress Testing with Imaging – Preoperative (CD-1.5)

Transplant (CD-1.6)

References (CD-1)

Stress Testing without Imaging – Procedures (CD-1.2)

CD.ST.0001.2.A

v2.0.2024

The Exercise Treadmill Test (ETT) is without imaging.

- Necessary components of an ETT include:
 - ECG that can be interpreted for ischemia.
 - Individual capable of exercise to achieve target heart rate on a treadmill or similar device (5 METs or greater; see functional capacity below). Target heart rate is calculated as 85% of the maximum age predicted heart rate (MPHR). MPHR is estimated as 220 minus the individual's age.
- An abnormal ETT (exercise treadmill test) includes at least one of the following:
 - ST segment depression (horizontal or downsloping, ≥ 1.0 mm below baseline)
 - Development of chest pain
 - Drop in systolic blood pressure >10 mmHg during exercise
 - Non-sustained ventricular tachycardia ≥ 3 consecutive ventricular beats at a rate of >100 beats per minute
 - Sustained ventricular tachycardia (ventricular rhythm at rate >100 beats/minute lasting >30 seconds or requiring termination due to hemodynamic compromise in <30 seconds)
- Functional capacity ≥ 5 METs equates to the following:
 - Can walk four blocks without stopping
 - Can walk up a hill
 - Can climb one flight of stairs without stopping
 - Can perform heavy work around the house
 - Can walk 4 mph at a brisk pace

Background and supporting information

An observational study found that, compared with the Duke Activity Status Index, subjective assessment by clinicians generally underestimated exercise capacity

Upsloping ST segment depression is not considered to be an abnormal ETT finding because of its low specificity.

Stress Testing with Imaging – Procedures (CD-1.3)

CD.ST.0001.3.A

v2.0.2024

- Imaging Stress Tests include any one of the following:
 - Stress Echocardiography see **Stress Echocardiography (Stress Echo) – Coding (CD-2.7)**
 - SPECT MPI see **Myocardial Perfusion Imaging (MPI) – Coding (CD-3.1)**
 - Stress perfusion MRI see **Cardiac MRI – Indications for Stress MRI (CD-5.3)**
 - PET Perfusion see **Cardiac PET-Perfusion-Indications (CD-6.2)**
- Stress testing with imaging can be performed with maximal exercise or chemical stress (adenosine, dipyridamole, dobutamine, or regadenoson) and does not alter the CPT® codes used to report these studies.

Stress Testing with Imaging - Indications (CD-1.4)

CD.ST.0001.4.A
v2.0.2024

Stress echo, SPECT MPI or stress MRI

Codes addressed

Description	CPT®
Cardiac MRI for morphology and function without contrast, with stress imaging	75559
Cardiac MRI for morphology and function without and with contrast, with stress imaging	75563
MPI, tomographic (SPECT) including attenuation correction, qualitative or quantitative wall motion, ejection fraction by first pass or gated technique, additional quantification, when performed); single study, at rest or stress (exercise or pharmacologic)	78451
MPI, tomographic (SPECT) (including attenuation correction, qualitative or quantitative wall motion, ejection fraction by first pass or gated technique, additional quantification, when performed); multiple studies, at rest and/or stress (exercise or pharmacologic) and/or redistribution and/or rest reinjection	78452
Echocardiography (TTE), (2D), with or without m-mode, during rest and cardiovascular stress, with interpretation and report	93350
Echocardiography (TTE), (2D), m-mode, during rest and cardiovascular stress test using treadmill, bicycle exercise and/or pharmacologically induced stress, with interpretation	93351

Stress test with imaging (Stress echo, SPECT MPI, or stress MRI) is indicated for **any** of the following:

Likely anginal symptoms

New, recurrent or worsening likely anginal symptoms as defined in **General Guidelines (CD-1.0)**

Symptomatic with known CAD

Prior history of PCI (percutaneous coronary intervention) or CABG (coronary artery bypass graft surgery) or a history of obstructive CAD as defined in **General Guidelines (CD-1.0)** and **either** of the following:

- Likely anginal symptoms as defined in **General Guidelines (CD-1.0)**
- Symptoms similar to prior ischemic episode

Symptomatic with uninterpretable ECG

New, recurrent, or worsening symptoms of chest pain, or exertional dyspnea, or exertional fatigue and resting ECG is uninterpretable for ischemia due to **any** of the following:

- Complete Left Bundle Branch Block (bifascicular block involving right bundle branch and left anterior hemiblock does not render ECG uninterpretable for ischemia)
- Ventricular paced rhythm
- Pre-excitation pattern such as Wolff-Parkinson-White
- Greater or equal to 1.0 mm ST segment depression (NOT nonspecific ST/T wave changes)
- LVH with repolarization abnormalities, also called LVH with strain (NOT without repolarization abnormalities or by voltage criteria)
- T wave inversion in at least two contiguous inferior and/or lateral leads. This includes leads II, AVF, V5 or V6. (T wave inversion isolated in lead III or T wave inversion in lead V1 and V2 are not included)
- Individual on digitalis preparation

Symptomatic with inconclusive or abnormal ETT or elevated CAC

New, recurrent or worsening symptoms of chest pain, or exertional dyspnea, or exertional fatigue and any of the following:

- Inconclusive ETT (exercise treadmill test) due to any of the following:
 - <85% maximum predicted heart rate achieved
 - Exercise ECG is uninterpretable for ischemia (for example due to development of rate-related left bundle branch block during exercise)
- Abnormal ETT as defined in **Stress Testing without Imaging – Procedures (CD-1.2)**
- Coronary artery calcium (CAC) score ≥ 100

Heart failure or left ventricular systolic dysfunction

Stress test with imaging is indicated to evaluate heart failure or left ventricular systolic dysfunction when there is documentation of **any** of the following:

- New or worsening heart failure
- New left ventricular systolic dysfunction (left ventricular ejection fraction <50%)
- Worsening left ventricular systolic dysfunction (decline in left ventricular ejection fraction $\geq 10\%$)
- Significant ischemic ventricular dysfunction (suspected hibernating myocardium) to assess myocardial viability when there are persistent symptoms or heart failure and revascularization is being considered.

Note MRI, cardiac PET, SPECT MPI, or Dobutamine stress echo can be used to assess myocardial viability depending on physician preference. See also **Cardiac PET – Metabolic – Indications (CD-6.4)**

Syncope or arrhythmia

Stress test with imaging is indicated for **any** of the following:

- Syncope of suspected ischemic etiology not otherwise explained
- Sustained ventricular tachycardia (ventricular rhythm at rate >100 beats/minute lasting >30 seconds or requiring termination due to hemodynamic compromise in <30 seconds).
- Non-sustained ventricular tachycardia ≥ 3 consecutive ventricular beats at rate >100 beats/minute
- Frequent PVCs (premature ventricular contractions) > 30 PVCs per hour
- Prior to starting a Class IC antiarrhythmic agent (flecainide or propafenone) to assess for CAD and annually while taking the medication

With or without symptoms for moderate coronary artery stenosis

Stress test with imaging is indicated to evaluate the functional significance of moderate stenosis when there is documentation of **either** of the following:

- CCTA (coronary computed tomography angiography) with moderate stenosis (50 to 69% - CAD-RADS 3 as defined in **General Guidelines CD-1.0**)
- Invasive coronary angiography with intermediate severity stenosis and invasive physiological testing has not been done

Without symptoms

Stress test with imaging is indicated for any of the following:

- Prior to starting Interleukin-2

- An uninterpretable ECG as described in **General Guidelines (CD 1.0)** that has not been previously evaluated
- Every 2 years if there is a history of silent ischemia (absence of ischemic symptoms or signs prior to objective demonstration of ischemia by stress testing and/or demonstration of obstructive CAD as defined in **General Guidelines (CD-1.0)**
- Prior to starting a Class IC antiarrhythmic agent (flecainide or propafenone) to assess for CAD and annually while taking the medication
- Asymptomatic individual who has an ischemic EKG response on ETT (horizontal or downsloping ST depression ≥ 1.0 mm below baseline).

Cardiac perfusion PET codes addressed

Description	CPT®
Myocardial imaging, positron emission tomography (PET), perfusion study (including ventricular wall motion[s] and/or ejection fraction[s], when performed); single study, at rest or stress (exercise or pharmacologic), with concurrently acquired computed tomography transmission scan	78430
Myocardial imaging, positron emission tomography (PET), perfusion study (including ventricular wall motion[s] and/or ejection fraction[s], when performed); multiple studies at rest and stress (exercise or pharmacologic), with concurrently acquired computed tomography transmission scan	78431
Myocardial imaging, positron emission tomography (PET), perfusion study (including ventricular wall motion[s] and/or ejection fraction[s], when performed); single study at rest or stress (exercise or pharmacologic)	78491
Myocardial imaging, positron emission tomography (PET), perfusion study (including ventricular wall motion[s] and/or ejection fraction[s], when performed); multiple studies at rest and stress (exercise or pharmacologic)	78492

Stress test with imaging using cardiac perfusion PET (CPT® 78430, 78431, 78491, 78492) is indicated in place of stress echo, SPECT MPI, or stress MRI when **any** of the above indications for stress testing with imaging (symptomatic or regardless of symptoms) have been met **and** there is documentation of **one** of the following:

- Individual is severely obese
- Individual has large breasts or implants
- Individual incapable of exercise due to physical (musculoskeletal or neurological) inability to achieve target heart rate.

Note Target heart rate is calculated as 85% of the maximum age predicted heart rate (MPHR). MPHR is estimated as 220 minus the individual's age. See **Cardiac PET – Perfusion – Indications (CD-6.2)** for additional indications for cardiac PET perfusion

Stress Testing with Imaging – Preoperative (CD-1.5)

CD.ST.0001.5.A

v2.0.2024

- There are **2** steps that determine the need for imaging stress testing in (stable) pre-operative individuals:
 - Step1: Would the individual qualify for imaging stress testing independent of planned surgery?
 - If yes, proceed to stress testing guidelines **Stress Testing with Imaging – Indications (CD-1.4)**
 - If no, go to step 2
 - Step 2: Is the surgery considered high, moderate or low-risk? (see **Table-2**) If high or moderate-risk, proceed below. If low-risk, there is no evidence to determine a need for preoperative cardiac testing.
 - **High-Risk Surgery:** All individuals in this category should receive an imaging stress test if there has not been an imaging stress test within 1 year unless the individual has developed new cardiac symptoms or a new change in the EKG since the last stress test.
 - **Intermediate-Risk Surgery:** One or more clinical risk factors and unable to perform an ETT per guidelines if there has not been an imaging stress test within 1 year unless the individual has developed new cardiac symptoms or a new change in the EKG since the last stress test.
 - **Low-Risk:** Preoperative imaging stress testing is not supported.
 - Clinical Risk Factors (for cardiac death and non-fatal MI at time of non-cardiac surgery)
 - History of ischemic heart disease (previous MI, previous positive stress test, use of nitroglycerin, typical angina, ECG Q waves, previous PCI or CABG)
 - History of compensated previous congestive heart failure (history of heart failure, previous pulmonary edema, third heart sound, bilateral rales, chest x-ray showing heart failure)
 - History of previous TIA or stroke
 - Diabetes Mellitus
 - Creatinine level > 2 mg/dL

Table-2

Cardiac Risk Stratification List		
High-Risk (> 5%)	Intermediate-Risk (1-5%)	Low-Risk (<1%)
<ul style="list-style-type: none">• Open aortic and other major open vascular surgery• Open peripheral vascular surgery• Esophagectomy• Pneumonectomy• Open intraperitoneal and/or intrathoracic surgery with organ resection	<ul style="list-style-type: none">• Open intraperitoneal and/or intrathoracic surgery without major organ resection• Open carotid endarterectomy• Head and neck surgery• Open orthopedic surgery• Open prostate surgery	<ul style="list-style-type: none">• Endoscopic procedures• Superficial procedures• Cataract surgery• Breast surgery• Ambulatory surgery• Laparoscopic and endovascular procedures that are unlikely to require further extensive surgical intervention

Transplant (CD-1.6)

CD.ST.0001.6.A

v2.0.2024

- Stress Testing in individuals for Non-Cardiac Transplant
 - Individuals who are candidates for any type of organ, bone marrow, or stem cell transplant can undergo imaging stress testing every year (stress echo, SPECT MPI, stress MRI, or stress cardiac PET perfusion per the transplant center's protocol) prior to transplant. See **Kidney Transplant, Pre-Transplant Imaging Studies (AB-42.5)**.
 - Individuals who have undergone organ transplant are at increased risk for ischemic heart disease secondary to their medication. Risk of vasculopathy is 7% at one-year, 32% at five years and 53% at ten years. An imaging stress test can be repeated annually after transplant for at least two years or within one year of a prior cardiac imaging study if there is evidence of progressive vasculopathy.
 - After two consecutive normal imaging stress tests, repeated testing is not supported more often than every other year without evidence for progressive vasculopathy or new symptoms.
 - Stress testing after five years may proceed according to normal patterns of consideration.
- Post-Cardiac transplant assessment of transplant CAD:
 - One of the following imaging studies may be performed annually:
 - SPECT MPI
 - Stress ECHO
 - Stress MRI
 - Cardiac PET perfusion

Myocardial strain imaging (CPT® 93356) (CD-2.12)

References (CD-2)

Transthoracic Echocardiogram (TTE) - Coding (CD-2.1)

CD.EC.0002.1.A
v2.0.2024

Guideline

Transthoracic Echocardiography (TTE) - Coding
Transthoracic Echocardiography (TTE) – Coding - General Information (CD-2.1.1)
Myocardial contrast perfusion echocardiography (CPT 0439T) (CD-2.11)

Transthoracic Echocardiography (TTE) - Coding

Transthoracic Echocardiography

Description	CPT®
TTE for congenital cardiac anomalies, complete	93303
TTE for congenital cardiac anomalies, follow-up or limited	93304
TTE with 2-D, M-mode, Doppler and color flow, complete	93306
TTE with 2-D, M-mode, without Doppler or color flow	93307
TTE with 2-D, M-mode, follow-up or limited	93308

3D Echocardiography

Description	CPT®
3D echocardiographic imaging and postprocessing during transesophageal echocardiography, or during transthoracic echocardiography for congenital cardiac anomalies, for the assessment of cardiac structure(s) (eg, cardiac chambers and valves, left atrial appendage, interatrial septum, interventricular septum) and function, when performed (List separately in addition to code for echocardiographic imaging) Code with (93303-93304, 93312, 93314, 93315, 93317, 93350-93351)	+93319

Doppler Echocardiography

Description	CPT®
Doppler echo, pulsed wave and/or spectral display	+93320
Doppler echo, pulsed wave and/or spectral display, follow-up or limited study	+93321

Description	CPT®
Doppler echo, color flow velocity mapping	+93325
CPT® 93320 and CPT® 93321 should not be requested or billed together	

C Codes

C codes are unique temporary codes established by CMS. C codes were established for contrast echocardiography. Each echocardiography C code corresponds to a standard echo code (Class I CPT® code) The C code and the matching CPT code should not both be approved.

C Code	Transthoracic Echocardiography	CPT®
C8921	TTE for congenital cardiac anomalies, complete	93303
C8922	TTE for congenital cardiac anomalies, follow-up or limited	93304
C8929	TTE with 2-D, M-mode, Doppler and color flow, complete	93306
C8923	TTE with 2-D, M-mode, without Doppler or color flow	93307
C8924	TTE with 2-D, M-mode, follow-up or limited	93308

Myocardial strain imaging

Description	CPT®
Myocardial strain imaging using speckle tracking-derived assessment of myocardial mechanics (List separately in addition to codes for echocardiography imaging)	+93356

Investigational codes

Description	CPT®
Myocardial contrast perfusion echocardiography, at rest or with stress, for assessment of myocardial ischemia or viability	0439T

Transthoracic Echocardiography (TTE) – Coding - General Information (CD-2.1.1)

- Complete transthoracic echocardiogram with spectral and color flow Doppler (CPT® 93306).
 - 93306 includes the Doppler exams, so CPT® codes 93320-93325 should not be assigned together with CPT® 93306.

- Doppler codes (CPT® 93320, CPT® 93321, and CPT® 93325) are 'add-on codes' (as denoted by the + sign) and are assigned in addition to code for the primary procedure.
- For a 2D transthoracic echocardiogram without Doppler, report CPT® 93307.
- Limited transthoracic echocardiogram (CPT® 93308) should be billed if the report does not "evaluate or document the attempt to evaluate" all of the required structures.
 - A limited transthoracic echocardiogram is reported with CPT® 93308.
 - CPT® 93321 (not CPT® 93308 if Doppler is included in the study. CPT® 93325 can be reported with CPT® 93308 if color flow Doppler is included in the study.
 - A limited congenital transthoracic echocardiogram is reported with CPT® 93304.
- Doppler echo may be used for evaluation of the following:
 - Shortness of breath
 - Known or suspected valvular disease
 - Known or suspected hypertrophic obstructive cardiomyopathy
 - Shunt detection

Background and Supporting Information

- Providers performing echo on a pediatric individual, may not know what procedure codes they will be reporting until the initial study is completed.
- If a congenital issue is found on the initial echo, a complete echo is reported with codes CPT® 93303, CPT® 93320, and CPT® 93325 because CPT® 93303 does NOT include Doppler and color flow mapping.
- If no congenital issue is discovered, then CPT® 93306 is reported alone and includes 2-D, Doppler, and color flow mapping.
- Since providers may not know the appropriate code/s that will be reported at the time of the pre-authorization request, they may request all 4 codes (CPT® 93303, CPT® 93320, CPT® 93325, and CPT® 93306).
- CPT® 76376 and CPT® 76377 are not unique to 3D Echo. These codes also apply to 3D rendering of MRI and CT studies, see **3D Echocardiography – Coding (CD-2.9)**
- CPT® 93325 may also be used with fetal echocardiography
- CPT® 93319 3D echo imaging postprocessing of TEE or TTE to evaluate congenital cardiac abnormalities. see **3D Echocardiography – Coding (CD-2.9)**

Myocardial contrast perfusion echocardiography (CPT® 0439T) (CD-2.11)

- Investigational see **Transthoracic Echocardiography (TTE) – Coding (CD-2.1)**

Transthoracic Echocardiography (TTE)

Indications/initial evaluation (CD-2.2)

CD.EC.0002.2.A

v2.0.2024

Transthoracic Echocardiography (TTE) is indicated for initial evaluation for any of the following:

Symptoms or signs suggesting cardiovascular disease

- Chest pain/discomfort
- Dyspnea/shortness of breath, or hypoxemia
- Palpitations
- Presyncope/Syncope
- Headache with transcranial Doppler evidence of a shunt or high-degree of suspicion for embolic process
- Dependent lower extremity edema
- Abnormal precordial or peripheral pulse
- New or changing heart murmur or click
- Suspected hypertensive heart disease (initial evaluation)
- Initial evaluation of known/suspected heart failure based on symptoms and/or signs
- Suspected endocarditis with any:
 - Fever
 - Peripheral stigmata of endocarditis
 - New murmur
- History of rheumatic heart disease
- Suspected pericardial diseases
- Suspected cardiac injury due to blunt chest trauma

Diagnostic tests suggesting cardiovascular disease

- Newly diagnosed RBBB or LBBB
- Frequent VPCs defined as occurring more frequently than 30 times per hour or occurring in a pattern of bigeminy, trigeminy, or runs of ventricular tachycardia
- Non sustained or sustained ventricular tachycardia (VT)
- Ventricular fibrillation (VF)
- Newly diagnosed atrial fibrillation/flutter
- Cardiomegaly on a Chest X ray or other imaging
- Elevated level of cardiac biomarkers (Creatinine Kinase isoforms, Troponin I or T, Brain Natriuretic Peptide (BNP), N Terminal pro b-type natriuretic peptide (NT-

proBNP) above the normal reference range as defined by the local laboratory assays)

- Initial evaluation of known/suspected heart failure based on diagnostic tests
- Suspected inherited or acquired cardiomyopathy (e.g., restrictive, infiltrative, dilated, hypertrophic)
- Suspected pulmonary hypertension. See **Pulmonary Hypertension CD-8.1**
 - ECG changes of right ventricular hypertrophy
 - Right ventricular hypertrophy or pulmonary artery dilation on other imaging
 - Pulmonary embolism with persistent or new symptoms
- Dilated aortic root and/or ascending aorta seen on other imaging
- Suspected endocarditis with positive blood cultures indicating bacteremia
- Suspected pericardial diseases
- Cardiac mass suspected on other imaging
- To rule out intra-cardiac thrombus in individuals with left ventricular systolic dysfunction prior to undergoing catheter ablation of ventricular arrhythmia.
- ≥6 weeks post myocardial infarction

Extra-cardiac conditions and therapies associated with cardiovascular disease or risk

- CONDITIONS
 - Initial cardiac evaluation of a known systemic, congenital, or acquired disease that could be associated with structural heart disease
 - At risk for developing iron-overload cardiomyopathy (hereditary hemochromatosis or hereditary or acquired hematologic conditions requiring multiple transfusions)
 - Known or suspected connective tissue disease or a genetic condition that predisposes to an aortic aneurysm or dissection (may repeat every two years if negative) See **Screening for Vascular related genetic connective tissue Disorders PVD-2.2**
 - At risk for pulmonary hypertension. See **Pulmonary Hypertension CD-8.1**
 - Scleroderma
 - Lupus
 - Mixed connective tissue disease
 - Hereditary Hemorrhagic Telangiectasia
 - Individuals with pulmonary hypertension mutations (e.g., BMPR2)
 - Suspected pulmonary hypertension in the presence of:
 - Liver disease
 - Lung disease
 - HIV

- Newly diagnosed or strongly suspected cerebral ischemia or peripheral embolic event
- THERAPIES
 - Use of anorectic drugs, ergot derivatives, or other agents associated with valvular heart disease
 - Pre-procedure evaluation for TIPS (transjugular intrahepatic portosystemic shunt) See **Hepatic Arteries and Veins AB-43.1**
 - Prior to solid organ transplant or hematopoietic stem cell transplant
 - Prior to exposure to cardiotoxic medications or radiation therapy. See **Cardiotoxic agent/Cancer Therapeutics-Related Cardiac Dysfunction CD-12.1**

Inherited cardiovascular conditions

- Member has first degree relative diagnosed with thoracic aortic aneurysm or dissection (may repeat every two years if negative). See **Screening for Vascular related genetic connective tissue Disorders PVD-2.2**, **Thoracic Aortic Aneurysm PVD-6.2**
- Member has first degree relative diagnosed with Bicuspid aortic valve. See **Screening for TAA in individuals with bicuspid aortic valves PVD-2.3**
- Member has diagnosed first degree relative or member is genotype positive for an inherited cardiomyopathy including any of the following:
 - Hypertrophic cardiomyopathy
 - Non compaction cardiomyopathy
 - Familial Dilated Cardiomyopathy
 - Arrhythmogenic Cardiomyopathy (e.g., ARVC)

Additional indications

- One repeat echo can be approved if requested for contrast study (for evaluation of shunts or for left ventricular cavity opacification) when the results of the initial study indicate the need for contrast but contrast was not administered at the initial study.
- Evaluation of congenital heart disease: see **Adult Congenital Heart Disease CD-11** and **Congenital Heart Disease PEDCD-2** in the Pediatric Cardiology imaging guidelines

Frequency of Echocardiography Testing (CD-2.3)

CD.EC.0002.3.A

v2.0.2024

Guideline

Repeat testing by interval
Repeat testing per condition

Repeat testing by interval

Repeat Transthoracic Echocardiography (TTE) is indicated for any of the following:

Every 3 years

Valvular heart disease (See also below indications for Valve surgery or intervention)

- Bicuspid aortic valve
- Mild aortic stenosis or aortic valve sclerosis without stenosis
- Mild aortic or mitral regurgitation
- Any mitral stenosis that is not severe, mitral valve area $>1.5 \text{ cm}^2$
- Rheumatic valve changes with commissural fusion
- Surgical valve repair or replacement (including bioprosthetic valve <10 years since implant)

Cardiomyopathy

- First degree relative with a diagnosis of inherited cardiomyopathy including:
 - Hypertrophic Cardiomyopathy
 - Familial Dilated Cardiomyopathy
 - Idiopathic Dilated Cardiomyopathy
- Individuals genotype-positive for:
 - Familial Dilated Cardiomyopathy
 - Arrhythmogenic Cardiomyopathy (e.g., ARVC)

Every 2 years

Vascular disease

- First degree relative with known thoracic aortic aneurysm or dissection a repeat echo is allowed every two years when both:

- Prior aortic imaging (echo, CT, MR) is negative
- Last aortic imaging was ≥ 2 years. See **Screening for Vascular related genetic connective tissue Disorders (PVD-2.2)**

Every year

Valvular heart disease (See also below indications for Valve surgery or intervention)

- Moderate or severe regurgitation
- Moderate or severe stenosis
- Significant valve deformity (regardless of extent of regurgitation or stenosis) when there is documentation of either:
 - Thickened myxomatous valve
 - Bileaflet prolapse
- Surgical bioprosthetic valve replacement ≥ 10 years since implant

Cardiomyopathy/heart failure

- Left ventricular systolic dysfunction to evaluate the effectiveness of ongoing therapy
- Hypertrophic cardiomyopathy See below indications for hypertrophic cardiomyopathy. See **Hypertrophic Cardiomyopathy CD-14**
- Frequent right ventricular pacing $>40\%$
- Chronic LBBB
- Left ventricular non-compaction cardiomyopathy
- At risk for developing iron-overload cardiomyopathy (hereditary hemochromatosis or hereditary or acquired hematologic conditions requiring multiple transfusions)
- Inherited neuromuscular, metabolic, hematologic or cutaneous syndromes that are known to be associated with the development of cardiomyopathy

Pericardial disease

- Chronic pericardial effusions when findings would potentially alter therapy

Vascular disease

- Aortic root dilatation that has not yet been repaired See **Thoracic aortic aneurysm PVD 6.2** and
- For post-repair see **Post-Aortic Endovascular/Open Surgery Surveillance Studies PVD-6.8**

At risk for pulmonary Hypertension See **Pulmonary Hypertension CD-8.1**

- Systemic Sclerosis or Scleroderma
- Individuals with pulmonary hypertension mutations (e.g., BMPR2)
- First-degree relatives of individuals with pulmonary hypertension
- Connective tissue disorder with symptoms consistent with pulmonary hypertension
- Individuals with TR velocity ≥ 2.8 m/s, with no other findings on additional testing

- Individuals being treated with medications associated with pulmonary hypertension
- Individuals who have a concern documented for pulmonary hypertension and had a negative echocardiogram but still show signs or symptoms of pulmonary hypertension

Every 6 months or twice a year

Valvular heart disease

- Asymptomatic, severe mitral regurgitation if valve surgery is being considered

Pulmonary Hypertension (See below indications for Pulmonary Hypertension, See **Pulmonary Hypertension CD-8.1**)

- Surveillance of stable individuals with moderate or severe pulmonary hypertension (pulmonary artery systolic pressure ≥ 50 mmHg)

Anytime

Repeat transthoracic echocardiogram is indicated **anytime** (without regard for the number or timing of previous ECHO studies) if there is a **change** in clinical status, or **new signs and symptoms** with documentation of **any** of the following:

- Cardiac murmurs
- Myocardial infarction or acute coronary syndrome
- Congestive heart failure (new or worsening):
 - New symptoms of dyspnea
 - Orthopnea
 - Paroxysmal nocturnal dyspnea
 - Elevated BNP
- Known pericardial disease with clinical concern for cardiac tamponade or pericardial constriction
- Infective endocarditis for any of the following:
 - Repeat imaging within 5–7 days for initially negative or inconclusive imaging when clinical suspicion of endocarditis remains high
 - New or worsening symptoms or signs of endocarditis
 - As needed to guide changes in antibiotic therapy
 - At completion of antibiotic therapy
- Stroke/transient ischemic attack
- Decompression illness
- Prosthetic valve dysfunction or thrombosis
- Cardiac transplant
- Individuals with Left Ventricular Assist Device (LVAD)

- See also section on **Repeat testing per condition** below and **Left ventricular assist devices (LVAD) (CD-9.4)**

Repeat testing per condition

Repeat Transthoracic Echocardiography (TTE) is indicated for any of the following:

Valve surgery or intervention

Repeat Transthoracic Echocardiography (TTE) is indicated for any of the following:

- **Surgical valve repair or replacement** (including bioprosthetic valve <10 years since implant)
 - 6 weeks post-surgery to establish baseline
 - Surveillance every 3 years after surgery
- **Surgical bioprosthetic valve replacement ≥10 years since implant**
 - Annually
- **TAVR**
 - One week after procedure to establish baseline
 - 1 month post-procedure
 - 1 year post-procedure
 - Thereafter annually
- **Mitra-Clip**
 - 1 month post-procedure
 - 6 months post-procedure
 - 1 year post-procedure
 - Thereafter annually to 5 years

See also **Transcatheter Aortic Valve Replacement (TAVR) CD-4.8**

See also **Percutaneous Mitral Valve Repair (mitral valve clip) (CD-13.5)**

PFO closure, TIPS, Cardiac device therapy, LVAD

Repeat Transthoracic Echocardiography (TTE) is indicated for any of the following:

- **PFO Closure**
 - Pre-operative evaluation for closure of PFO
 - Post-procedural evaluation of PFO repair
 - 6 month follow-up after PFO repair
 - Annually if there is a residual shunt on post-operative imaging

For ASD closure see **ASD-Atrial septal defects (CD 11.2.1)**

- **TIPS (transjugular intrahepatic portosystemic shunt)** See Hepatic Arteries and Veins AB 43.1
 - One time post-procedure for routine follow-up
 - **Any time** post-procedure (either):
 - For new signs or symptoms
 - For concern for new or worsening pulmonary hypertension or heart failure
- **Cardiac device therapy**
 - Re-evaluation is indicated 3 months after revascularization or maximally tolerated optimal medical therapy to determine either:
 - Candidacy for device therapy
 - Optimal choice of device
 - One time follow up within 12 months of implantation of a CRT-D device
- **Left ventricular assist device (LVAD)** See Left ventricular assist devices (LVAD) (CD-9.4)
 - Prior to implant
 - Routine Post-implant at the following intervals:
 - 2 weeks
 - One month
 - Three months
 - Six months
 - Twelve months
 - Every 6 months thereafter

Pulmonary hypertension

Repeat Transthoracic Echocardiography (TTE) is indicated for individuals with known pulmonary hypertension for any of the following:

- **Routine follow up**
 - Every 6 months for surveillance of stable individuals with moderate or severe pulmonary hypertension (pulmonary artery systolic pressure ≥ 50 mm Hg)
- **Pregnancy**
 - Prior to planned pregnancy
 - During pregnancy as often as requested by the provider
- **Pre-procedure**
 - Prior to planned intubation (e.g., for elective surgery)
- **Clinical/therapy change:**
 - Anytime, without regard for the number or timing of previous ECHO studies to evaluate either:
 - Change in therapy

- Change in clinical findings or symptoms
- Therapy changes:
 - At baseline
 - Then every 3 months

See also **Pulmonary Hypertension CD-8.1**

Hypertrophic Cardiomyopathy (HCM)

Repeat Transthoracic Echocardiography (TTE) is indicated for individuals with hypertrophic cardiomyopathy for any of the following:

- **Routine Surveillance Imaging**
 - Every year
- **Mavacamten: Initiation of treatment**
 - Baseline at the beginning of treatment
 - 4 weeks after treatment initiation
 - 8 weeks after treatment initiation
 - 12 weeks after treatment initiation
 - Then every 12 weeks while on mavacamten
- **Mavacamten: Changes in treatment**
 - 4 weeks after any interruption of treatment (any missed dose)
 - After any dosage change (including restart of treatment):
 - 4 weeks after dosage change
 - 12 weeks after dosage change
 - After initiating a weak CYP2C19 inhibitor (e.g., omeprazole) or moderate CYP2A4 inhibitor (e.g., ciprofloxacin):
 - 4 weeks after start of medication
 - 12 weeks after start of medication
- **Post- Septal Reduction Therapy (SRT)**
 - Within 3 to 6 months after surgical myectomy or alcohol septal ablation

See also **Hypertrophic Cardiomyopathy CD-14**

Cardiac Transplant

Anytime (without regard for the number or timing of previous ECHO studies) when there is a history of cardiac transplant, per transplant center protocol

Cardiotoxic Agents

For re-evaluation in an individual previously or currently undergoing therapy with cardiotoxic agents or radiation therapy follow **Cardiotoxic agent/Cancer Therapeutics-Related Cardiac Dysfunction (CD-12.1)**

Background and supporting information

Decisions regarding routine echocardiographic follow-up should not be based on the degree of regurgitation alone, but should take into account associated structural valvular and cardiac abnormalities. For example: a structurally normal mitral valve with moderate mitral regurgitation by color flow Doppler and normal left atrial size, does not generally require routine echocardiographic follow-up. However, a thickened, myxomatous appearing mitral valve with bi-leaflet prolapse and only trivial or mild mitral regurgitation, should be followed echocardiographically at routine intervals.

Transesophageal Echocardiography (TEE) (CD-2.4) (CD-2.5)

CD.EC.0002.4.A
v2.0.2024

Guideline

Transesophageal echocardiography (TEE) – coding (CD-2.4)
Transesophageal echocardiography (TEE) – indications (CD-2.5)

Transesophageal echocardiography (TEE) – coding (CD-2.4)

TEE coding

Transesophageal Echocardiography	CPT®
TEE with 2-D, M-mode, probe placement, image acquisition, interpretation and report	93312
TEE probe placement only	93313
TEE image acquisition, interpretation, and report only	93314
TEE for congenital anomalies with 2-D, M-mode, probe placement, image acquisition, interpretation and report	93315
TEE for congenital anomalies, probe placement only	93316
TEE for congenital anomalies, image acquisition, interpretation and report only	93317
TEE for monitoring purposes, ongoing assessment of cardiac pumping function on an immediate time basis	93318

Doppler Echocardiography

Description	CPT®
Doppler echo, pulsed wave and/or spectral display	+93320
Doppler echo, pulsed wave and/or spectral display, follow-up or limited study	+93321
Doppler echo, color flow velocity mapping	+93325

Description	CPT®
Doppler echo, if performed, may be reported separately in addition to the primary TEE codes: CPT® 93312, CPT® 93314, CPT® 93315, and CPT® 93317	

C codes

HCPCS	Description	CPT®
C8925	TEE with 2-D, M-mode, probe placement, image acquisition, interpretation and report	93312
C8926	TEE for congenital anomalies with 2-D, M-mode, probe placement, image acquisition, interpretation and report	93315
C8927	TEE for monitoring purposes, ongoing assessment of cardiac pumping function on an immediate time basis	93318

- The complete transesophageal echocardiogram service, including both (1) probe (transducer) placement and (2) image acquisition/interpretation, is reported with CPT® 93312.
 - Probe placement only is reported with CPT® 93313.
 - The image acquisition/interpretation only is reported with CPT® 93314.
- Physicians assign codes CPT® 93312, CPT® 93313, and/or CPT® 93314 to report professional services if the test is performed in a hospital or other facility where the physician cannot bill globally.
 - Modifier -26 (professional component) is appended to the appropriate code
 - CPT® 93313 and CPT® 93314 should never be used together. If both services are provided, CPT® 93312 is reported.
- Hospitals should report TEE procedures using CPT® 93312 (the complete service). CPT® 93313 and CPT® 93314 are not used for hospital billing.
- Monitoring of patients undergoing cardiac surgery is CPT® 93318.

Transesophageal echocardiography (TEE) – indications (CD-2.5)

- Limited transthoracic echo window when further information is needed to guide management (e.g. suspected or confirmed endocarditis, suspected intracardiac mass, etc.)

- Assessing valvular dysfunction, especially mitral regurgitation, when TTE is inadequate and intervention is being considered to repair/replace valve.
- Evaluation of cardiac mass, suspected tumor or thrombus
- Preprocedural assessment of PFO/ASD
- Preoperative evaluation prior to planned LVAD implant
- Embolic source or intracardiac shunting when TTE is inconclusive
 - Examples: atrial septal defect, ventricular septal defect, patent foramen ovale, aortic cholesterol plaques, thrombus in cardiac chambers, valve vegetation, tumor
- Embolic events when there is an abnormal TTE or a history of atrial fibrillation
 - Clarify atria/atrial appendage, aorta, mitral/aortic valve beyond the information that other imaging studies have provided
- Cardiac valve dysfunction
 - Differentiation of tricuspid from bicuspid aortic valve in setting of aortic enlargement or significant stenosis or significant regurgitation
 - Congenital abnormalities
- Assessing for left atrial thrombus prior to cardioversion of atrial fibrillation or atrial flutter.
- Assessing for left atrial thrombus prior to planned atrial fibrillation ablation/pulmonary vein isolation procedure.
- For initial imaging of ascending and descending thoracic aortic aneurysms.
- For repeat imaging or established thoracic aneurysms, TEE is indicated **only** when imaging with CT or MR is contraindicated.
- Left atrial appendage (LAA) Closure device (e.g., WATCHMAN®)
 - Preprocedural evaluation with or without 3D imaging
 - Repeat TEE 45 days post procedure
 - If the TEE at 45 days showed a peri-device gap ≥ 5 mm or Device Related Thrombus, another follow up TEE, usually 3- 6 months can be performed before the one year surveillance
 - 1 year post procedure
 - See also **Percutaneous Mitral Valve Repair (mitral valve clip) (CD-13.5)**

Stress echocardiography (stress echo) (CD-2.6) (CD-2.7)

CD.EC.0002.7.A

v2.0.2024

Guideline

Stress echo – coding (CD-2.6)

Stress echo-indications other than ruling out CAD (CD-2.7)

Stress echo – coding (CD-2.6)

Associated codes

Stress Echocardiography	CPT®
Echo, transthoracic, with (2D), includes M-mode, during rest and exercise stress test and/or pharmacologically induced stress, with report; ³	93350
Echo, transthoracic, with (2D), includes M-mode, during rest and exercise stress test and/or pharmacologically induced stress, with report: including performance of continuous electrocardiographic monitoring, with physician supervision ⁴	93351
Doppler Echocardiography	
Doppler echo, pulsed wave and/or spectral display ⁵	+93320
Doppler echo, pulsed wave and/or spectral display, follow-up/limited study	+93321
Doppler echo, color flow velocity mapping ⁶	+93325

Associated HCPCS codes

CPT®	Stress Echocardiography	HCPCS
93350	Echo, transthoracic, with (2D), includes M-mode, during rest and exercise stress test and/or pharmacologically induced stress, with report; ⁷	C8928

³ CPT® 93350 and CPT® 93351 do not include Doppler studies

⁴ CPT® 93350 and CPT® 93351 do not include Doppler studies

⁵ Doppler echo (CPT® +93320 and CPT® +93325), if performed, may be reported separately in addition to the primary SE codes: CPT® 93350 or CPT® 93351.

⁶ Doppler echo (CPT® +93320 and CPT® +93325), if performed, may be reported separately in addition to the primary SE codes: CPT® 93350 or CPT® 93351.

⁷ CPT® 93350 and CPT® 93351 do not include Doppler studies

CPT®	Stress Echocardiography	HCPCS
93351	Echo, transthoracic, with (2D), includes M-mode, during rest and exercise stress test and/or pharmacologically induced stress, with report: including performance of continuous electrocardiographic monitoring, with physician supervision ⁸	C8930

Stress echo-indications other than ruling out CAD (CD-2.7)

CPT® 93350 or 93351

- See: **Stress Testing with Imaging – Indications (CD-1.4)**
- In addition to the evaluation of CAD, stress echo can be used to evaluate the following conditions:
 - Dyspnea on exertion (specifically to evaluate pulmonary hypertension)
 - Right heart dysfunction
 - Valvular heart disease when the outcome would affect a therapeutic or interventional decision
 - Pulmonary hypertension when the outcome will measure response to therapy and/or prognostic information
 - Hypertrophic cardiomyopathy (as defined in **Obstructive Hypertrophic Cardiomyopathy (HCM) (CD-12.3)** for **either** of the following:
 - Exercise stress echo (CPT® 93351 or 93350) is indicated for the detection and quantification of dynamic left ventricular outflow tract obstruction in symptomatic individuals with HCM who do **not** have a resting or provokable outflow tract gradient ≥ 50 mm Hg on TTE.
 - Stress echo can be repeated when there is documentation of **any** of the following:
 - In 1 to 2 years if the resting or provokable outflow tract gradient is < 30 mm Hg on prior stress echo
 - Worsening symptoms
 - There has been a therapeutic change (i.e., change in medication, surgical procedure performed).
- In general spectral Doppler (CPT® 93320 or 93321) and color-flow Doppler (CPT® 93325) are necessary in the evaluation of the above conditions and can be added to the stress echo code.

⁸ CPT® 93350 and CPT® 93351 do not include Doppler studies

3D Echocardiography (CD-2.8)(CD-2.9)

CD.EC.0002.9.A
v2.0.2024

Guideline

3D echocardiography – coding (CD-2.8)

3D echocardiography – indications (CD-2.9)

3D echocardiography – coding (CD-2.8)

- CPT® 93319 with one of the following (CPT® 93303, 93304, 93312, 93314, 93315, or 93317) for congenital cardiac abnormalities

3D echocardiography – indications (CD-2.9)

Echocardiography with 3-dimensional (3D) rendering (CPT® 93319) is becoming universally available, yet its utility remains limited based on the current literature.

- 3D Echo may be indicated when a primary echocardiogram is approved and **one** of the following is needed:
 - Left ventricular volume and ejection fraction assessment when measurements are needed for treatment decision (e.g., implantation of ICD, alteration in cardiotoxic chemotherapy)
 - Mitral valve anatomy specifically related to mitral valve stenosis
 - Preprocedural evaluation of left atrial appendage occlusion (e.g., WATCHMAN®)
 - Preoperative evaluation for LVAD implant
 - Guidance of transcatheter procedures such as:
 - Mitral valve clipping
 - TAVR
 - Left atrial appendage closure device (e.g., WATCHMAN®)

Myocardial strain imaging (CPT® 93356) (CD-2.12)

CD.EC.0002.12.A

v2.0.2024

- Myocardial strain imaging (CPT® 93356, speckle tracking longitudinal strain) is indicated for the initial evaluation of LVH, in addition to the primary echocardiogram, when there is documentation of **both**:
 - Unclear etiology
 - Concern for infiltrative cardiomyopathy
- See myocardial strain imaging in **Cardiotoxic Agent-Related Cardiac Dysfunction (CD-12)**
- Myocardial strain imaging (CPT® 93356) in addition to the primary echocardiogram in individuals receiving therapy with cardiotoxic agents for ANY of the following:
 - Initial evaluation-prior to treatment with EITHER:
 - Medications that could result in cardiotoxicity/heart failure
 - Radiation that could result in cardiotoxicity/heart failure
 - Re-evaluation of an individual previously or currently undergoing therapy as per echocardiogram parameters. See **Cardiotoxic agent/Cancer Therapeutics-Related Cardiac Dysfunction (CD-12.1)**
 - Re-evaluation of an individual undergoing therapy with worsening symptoms

Nuclear Cardiac Imaging Procedure Codes	
Myocardial Perfusion Imaging (MPI)	CPT®
MPI, tomographic (SPECT) (including attenuation correction, qualitative or quantitative wall motion, ejection fraction by first pass or gated technique, additional quantification, when performed); single study, at rest or stress (exercise or pharmacologic)	78451
MPI, tomographic (SPECT) (including attenuation correction, qualitative or quantitative wall motion, ejection fraction by first pass or gated technique, additional quantification, when performed); multiple studies, at rest and/or stress (exercise or pharmacologic) and/or redistribution and/or rest reinjection	78452
Absolute quantitation of myocardial blood flow (AQMBF), single-photon emission computed tomography (SPECT), with exercise or pharmacologic stress, and at rest, when performed (List separately in addition to code for primary procedure)	+0742T

- The most commonly performed myocardial perfusion imaging are single (at rest or stress, CPT® 78451) and multiple (at rest and stress, CPT® 78452) SPECT studies.
 - Evaluation of the individual's left ventricular wall motion and ejection fraction are routinely performed during MPI and are included in the code's definition.
 - First pass studies, (CPT® 78481 and CPT® 78483), MUGA, (CPT® 78472 and CPT® 78473) and SPECT MUGA (CPT® 78494) should not be reported in conjunction with MPI codes.
 - Attenuation correction, when performed, is included in the MPI service by code definition. No additional code should be assigned for the billing of attenuation correction.

- **Multi-day Studies:** In the absence of written payer guidelines to the contrary, it is not appropriate to bill separately for the rest and stress segments of MPI even if performed on separate calendar dates. A single code is assigned to define the entire procedure on the date all portions of the study are completed.

Note 3D rendering should not be billed in conjunction with MPI.

MPI – Indications (CD-3.2)

See: **Stress Testing with Imaging – Indications (CD-1.4)**

Absolute quantitation of myocardial blood flow (AQMBF)(SPECT)

- AQMBF obtained by CZT-SPECT is considered experimental, investigational, or unproven at this time.

MUGA – Coding (CD-3.3)

CD.NC.0003.3.A

v2.0.2024

Cardiac blood pool imaging, or radionuclide ventriculography, can be used to evaluate ventricular function. Cardiac blood pool imaging includes first pass studies (CPT® 78481 and 78483) as well as gated equilibrium studies (CPT® 78472, 78473, 78494, and +78496).

Gated equilibrium studies can also be referred to as multi-gated acquisition (MUGA) scan or equilibrium radionuclide angiography (ERNA). Imaging for gated equilibrium studies can be planar or three-dimensional (single photon emission computed tomography, SPECT).

Of note, all cardiac blood pool imaging is synchronized with electrocardiographic RR interval (EKG-gated); thus, regular rhythm is required for accurate LV assessment.

Gated Equilibrium Studies – Planar	CPT®
Cardiac blood pool imaging, gated equilibrium; planar, single study at rest or stress, wall motion study plus ejection fraction, with or without quantitative processing	78472
Cardiac blood pool imaging, gated equilibrium; planar, multiple studies, wall motion study plus ejection fraction, at rest and stress , with or without additional quantification	78473
Gated Equilibrium Studies - SPECT	CPT®
Cardiac blood pool imaging, gated equilibrium, SPECT, at rest, wall motion study plus ejection fraction, with or without quantitative processing	78494
First Pass studies	CPT®
Cardiac blood pool imaging (planar), first pass technique; single study, at rest or with stress (exercise and/or pharmacologic), wall motion study plus ejection fraction, with or without quantification	78481
Cardiac blood pool imaging (planar), first pass technique; multiple studies, at rest and with stress (exercise and/or pharmacologic), wall motion study plus ejection fraction, with or without quantification	78483
Cardiac blood pool imaging, gated equilibrium, single study , at rest, with right ventricular ejection fraction by first pass technique (List separately in addition to code for primary procedure) This CPT code is an add-on code to 78472.	+78496

- The technique employed for a MUGA service guides the code assignment.
 - CPT® 78472 is used for a planar MUGA scan at rest or stress
 - CPT® 78473 for planar MUGA scans, multiple studies at rest and stress.

- Planar MUGA studies (CPT® 78472 and CPT® 78473) should not be reported in conjunction with:
 - SPECT MPI (CPT® 78451 - CPT® 78454)
 - First pass studies (CPT® 78481- CPT® 78483)
 - SPECT MUGA (CPT® 78494).
- CPT® +78496 is assigned only in conjunction with CPT® 78472.

MUGA Study – Cardiac Indications (CD-3.4)

CD.NC.0003.4.A
v2.0.2024

MUGA (Multi Gated Acquisition) – Blood Pool Imaging Indications

- Echocardiography is the preferred method of following left ventricular systolic function.
- MUGA may be indicated when a recent ECHO, as indicated in **Transthoracic Echocardiography (TTE) – Indications (CD-2.2)** and/or **Frequency of Echocardiography Testing (CD 2.3)**, was technically limited and prevented accurate assessment of left ventricular function.
- MUGA is indicated when there is a significant discrepancy between LVEF assessment by ECHO and another modality (i.e., one study reports normal LVEF and the other, a reduced LVEF) AND there is clear documentation as to how quantitative measurement of LVEF will affect individual management (e.g., implantation of an ICD, alteration in cardiotoxic chemotherapy, etc.).
- MUGA may be performed in place of an ECHO in the following circumstances:
 - To determine candidacy for ICD/CRT and/or to determine optimal choice of device in individuals who meet criteria for ICD based on ejection fraction and other criteria.
 - When previously or currently undergoing therapy with potentially cardiotoxic agents, including chemotherapy and radiation, AND a history of previous low LV ejection fraction (LVEF <50%). See **Cardiotoxic agent/Cancer Therapeutics-Related Cardiac Dysfunction (CD-12.1)**
- MUGA is **not** indicated when requested simply to compare LVEF by the same modality, a prior MUGA is not a reason to approve another MUGA.

Right ventricular first pass study

- (CPT® 78472 and 78496) may be performed when ECHO is technically limited and prevents accurate assessment of RV function AND when further information about RV function is needed to guide management (e.g. established/diagnosed pulmonary hypertension, suspected or confirmed pulmonary embolus).

First pass studies

- First pass studies (CPT® 78481 and CPT® 78483) may be approved in place of MUGA when indications are met for MUGA and/or there is need for information that cannot be obtained by MUGA.

- First pass studies, (CPT® 78481 and CPT® 78483), MUGA (CPT® 78472 and CPT® 78473) and SPECT MUGA (CPT® 78494) should not be reported in conjunction with MPI codes.

Myocardial Sympathetic Innervation Imaging in Heart Failure (CD-3.6)

CD.CS.0009.A

v2.0.2024

- Nuclear imaging using I-123-meta-iodobenzylguanidine (I-123-mIBG) in an attempt to image increased myocardial sympathetic activity is considered to be experimental and investigational.
- The AMA has established the following set of Category III codes to report these studies:
 - **0331T** - Myocardial sympathetic innervation imaging, planar qualitative and quantitative assessment
 - **0332T** - Myocardial sympathetic innervation imaging, planar qualitative and quantitative assessment; with tomographic SPECT.

Background and supporting information

In heart failure, the sympathetic nervous system is activated in order to compensate for the decreased myocardial function. Initially, this is beneficial, however, long-term this compensatory mechanism is detrimental and causes further damage.

Markers have been developed, using radioactive iodine, in an attempt to image this increased myocardial sympathetic activity. Currently, AdreView™ (Iodine-123 meta-iodobenzylguanidine), is the only FDA-approved imaging agent available for this purpose.

Myocardial Tc-99m Pyrophosphate Imaging (CD-3.7)

CD.NC.0003.7.A

v2.0.2024

Myocardial Tc-99m Pyrophosphate Imaging	
MUGA (Multi Gated Acquisition) – Blood Pool Imaging	CPT®
Myocardial Imaging, infarct avid, planar, qualitative or quantitative	78466
Myocardial Imaging, infarct avid, planar, qualitative or quantitative with ejection fraction by first pass technique	78468
Myocardial Imaging, infarct avid, planar, qualitative or quantitative tomographic SPECT with or without quantification	78469
Radiopharmaceutical Localization Imaging Limited area	78800
Radiopharmaceutical Localization Imaging SPECT Note: When reporting CPT® 78803, planar imaging of a limited area or multiple areas should be included with the SPECT	78803
Radiopharmaceutical localization of tumor, inflammatory process or distribution of radiopharmaceutical agent(s) (includes vascular flow and blood pool imaging, when performed); tomographic (SPECT) with concurrently acquired computed tomography (CT) transmission scan for anatomical review, localization and determination/detection of pathology, single area (e.g., head, neck, chest, pelvis), single-day imaging	78830

- Historically this method of imaging the myocardium was used to identify recent infarction, hence, the term "infarct-avid scan." Although still available, the sensitivity and specificity for identifying infarcted myocardial tissue are variable and the current use for this indication is limited. See [Cardiac MRI \(CD-5\)](#).

Cardiac Amyloidosis (CD-3.8)

CD.NC.0003.8.A

v2.0.2024

- Tc-99m pyrophosphate imaging (CPT® 78803 or 78830) may be used to identify cardiac amyloidosis. Chest SPECT and planar imaging may be used, as well as whole-body imaging for identification of systemic ATTR (transthyretin) amyloidosis. See **Myocardial Tc-99m Pyrophosphate Imaging (CD-3.7)** for coding information
- For a single planar imaging session alone (without a SPECT study), report CPT® 78800 Radiopharmaceutical Localization Imaging Limited area
- Tc-99m pyrophosphate imaging can be pursued for diagnosis of ATTR amyloidosis in the presence of known systemic amyloidosis if Cardiac MRI (CMR) is either contraindicated or indeterminate in individuals undergoing evaluation for kidney transplant. See **Kidney Transplant, Pre-Transplant Imaging Studies (AB-42.5)**.
- Tc-99m pyrophosphate imaging can be pursued for diagnosis of ATTR amyloidosis after screening for presence of a monoclonal light chain to exclude AL amyloidosis:
 - Serum kappa/lambda free light chain ratio (not SPEP)
 - Abnormal if ratio is <0.26 or >1.65
 - Serum and urine immunofixation electrophoresis (IFE)
 - Abnormal if monoclonal protein detected
- Tc-99m pyrophosphate imaging may also be used for the following:
 - Diagnosis of cardiac ATTR in individuals with cardiac MRI or echocardiography findings consistent with or suggestive of cardiac amyloidosis.
 - Individuals with suspected cardiac ATTR amyloidosis and contraindications to CMR such as renal insufficiency or an implantable cardiac device.
 - Individuals with systemic amyloidosis who are being evaluated for kidney transplant if CMR is either contraindicated or indeterminate. See **Kidney Transplant, Pre-Transplant Imaging Studies (AB-42.5)**.
- Cardiac follow-up should be based on Echocardiogram, Tn, NT-proBNP, clinical exam and symptoms

Background and supporting information

- The following conditions would raise high index of suspicion:
 - Left ventricular hypertrophy but low voltage on ECG
 - Heart failure with preserved ejection fraction and an increase in left ventricular wall thickness.
 - Unexplained heart failure with preserved ejection fraction and concomitant right heart failure in an individual over the age of 60
 - Individuals, especially elderly males, with signs/symptoms of heart failure and any of the following:
 - Lumbar spinal stenosis

- Spontaneous biceps tendon rupture
- Bilateral carpal tunnel syndrome
- Atrial arrhythmia in the absence of usual risk factors
- Known or suspected familial amyloidosis.
- Low flow, low gradient aortic stenosis

Non-imaging Heart Function and Cardiac Shunt Imaging (CD-1.7)

CD.NC.0001.7.A

v2.0.2024

- Procedures reported with CPT® 78414 and CPT® 78428 are essentially obsolete and should not be performed in lieu of other preferred modalities.
- Echocardiogram is the preferred method for cardiac shunt detection, rather than the cardiac shunt imaging study described by CPT® 78428.
- Ejection fraction can be obtained by echocardiogram, SPECT MPI, MUGA study, cardiac MRI, cardiac CT, or cardiac PET depending on the clinical situation, rather than by the non-imaging heart function study described by CPT® 78414.

Associated Codes

Cardiac Imaging Procedure Codes

Cardiac CT and CCTA	CPT®
<p>CT, heart, without contrast, with quantitative evaluation of coronary calcium</p> <ul style="list-style-type: none">The code set for Cardiac CT and CCTA (CPT® 75572-CPT® 75574), include quantitative and functional assessment (for example, calcium scoring) if performedCPT® 75571 describes a non-contrast CT of the heart with calcium scoring and should be reported only when calcium scoring is performed as a stand-alone procedure.<ul style="list-style-type: none">Can be used to report a preliminary non-contrast scan which indicates an excessive amount of calcium such that the original scheduled study must be discontinued.CPT® 75571 should not be reported in conjunction with any of the contrast CT/CTA codes (CPT® 75572- CPT® 75574).	75571
CT, heart, with contrast, for evaluation of cardiac structure and morphology (including 3D image post-processing, assessment of cardiac function, and evaluation of venous structures, if performed).	75572
Computed tomography, heart, with contrast material, for evaluation of cardiac structure and morphology in the setting of congenital heart disease (including 3D image post-processing, assessment of left ventricular [LV] cardiac function, right ventricular [RV] structure and function and evaluation of vascular structures, if performed).	75573
CTA, heart, coronary arteries and bypass grafts (when present), with contrast, including 3D image post-processing (including 3D image post-processing, assessment of cardiac function, and evaluation of venous structures, if performed).	75574

Cardiac CT and CCTA	CPT®
Noninvasive estimate of coronary fractional flow reserve (FFR) derived from augmentative software analysis of the data set from a coronary computed tomography angiography, with interpretation and report by a physician or other qualified health care professional	75580

Cardiac Imaging Procedure Codes

Description	CPT®
Automated quantification and characterization of coronary atherosclerotic plaque to assess severity of coronary disease, using data from coronary computed tomographic angiography; data preparation and transmission, computerized analysis of data, with review of computerized analysis output to reconcile discordant data, interpretation and report	0623T
Automated quantification and characterization of coronary atherosclerotic plaque to assess severity of coronary disease, using data from coronary computed tomographic angiography; data preparation and transmission	0624T
Automated quantification and characterization of coronary atherosclerotic plaque to assess severity of coronary disease, using data from coronary computed tomographic angiography; computerized analysis of data from coronary computed tomographic angiography	0625T
Automated quantification and characterization of coronary atherosclerotic plaque to assess severity of coronary disease, using data from coronary computed tomographic angiography; review of computerized analysis output to reconcile discordant data, interpretation and report	0626T

Cardiac CT and CTA - General information (CD-4.1)

- Only one code from the set: CPT® 75572 - CPT® 75574 can be reported per encounter.
- CPT® 75574 includes evaluation of cardiac structure and morphology when performed; therefore, additional code/s should not be assigned.
- Automated quantification and characterization of coronary atherosclerotic plaque (CPT® 0623T, 0624T, 0625T, 0626T) is a service in which coronary computed tomographic angiography (CCTA) data are analyzed using computerized algorithms to assess the extent and severity of coronary artery disease. The use of automated quantification and characterization of coronary atherosclerotic plaque is considered investigational and experimental at this time.

Background and Supporting Information

The high negative predictive value (98%-99%) of CCTA in ruling out significant coronary artery disease has been confirmed in multiple studies.

3D rendering should not be billed in conjunction with Cardiac CT and CCTA.

CT for Coronary Calcium Scoring (CD-4.2)

CD.CT.0004.2.A
v2.0.2024

CPT® 75571

Coronary artery calcium score (CPT® 75571) is **not** supported for evaluation of CAD in symptomatic individuals.

CT Calcium Scoring-Asymptomatic and for CAD Screening

- Coronary artery calcium score (CPT® 75571) is indicated when there is documentation of **all** of the following:
 - Results will impact risk-based decisions for preventive interventions
 - An LDL-C level ≥ 70 mg/dL (1.8 mmol/L) AND < 190 mg/dL (4.9 mmol/L)
 - Individual is an adult age 40-75
 - 10-year ASCVD risk including pooled cohort equation is between 5.0% to 19.9%
 - There is no documented CAD
 - Individual is not currently on a statin
 - Individual is not a smoker
 - There is no history of diabetes
 - There is no family history of premature CAD
 - There has been no calcium score performed in the previous 5 years
 - There has been no prior calcium score > 0
- Coronary calcium scoring is **not** indicated in someone with known CAD.

CT Calcium Scoring For Low Gradient Aortic Stenosis

- Coronary artery calcium score (CPT® 75571) is indicated in low gradient aortic stenosis when symptomatic, severe aortic stenosis is suspected. Low gradient aortic stenosis is defined as an AVA < 1 and a mean gradient < 40 mmHg.

CCTA – Indications for CCTA (CD-4.3)

CD.CT.0004.3.A

v2.0.2024

CCTA (CPT® 75574) is indicated for any of the following:

- New, recurrent or worsening likely anginal symptoms as defined in **General Guidelines (CD-1.0)**
- New, recurrent or worsening symptoms of chest pain, or exertional dyspnea, or exertional fatigue and any of the following:
 - Persistent symptoms after a normal stress test
 - Equivocal, borderline, abnormal or discordant prior noninvasive evaluation where obstructive coronary artery disease remains a concern (<90 days)
 - Abnormal rest ECG findings, such as a new LBBB, or T-wave inversions, when ischemia is a concern
 - A prior CABG when **only** graft patency is a concern
- Evaluation of an individual under the age of 40 for suspected anomalous coronary artery(ies) or for treatment planning when there is a history of one or more of the following:
 - Syncopal episodes during strenuous activities
 - Persistent chest pain brought on by exertion or emotional stress, and normal stress test
 - Full sibling(s) with history of sudden death syndrome before age 40 or with documented anomalous coronary artery
 - Resuscitated sudden death and contraindications for conventional coronary angiography
 - Prior nondiagnostic coronary angiography in determining the course of the anomalous coronary artery in relation to the great vessels, origin of a coronary artery or bypass graft location (any):
 - Anomalies of origin:
 - LCA or the RCA arising from the pulmonary artery;
 - Interarterial course between the pulmonary artery and the aorta of either the RCA arising from the left sinus of Valsalva or the LCA arising from the right sinus of Valsalva
 - Anomalies of course:
 - Myocardial bridging
 - Anomalies of termination:
 - Coronary artery fistula
- Initial imaging study in individuals with hypertrophic cardiomyopathy and stable anginal symptoms.
 - Chest discomfort is common in individuals with hypertrophic cardiomyopathy. The incidence of false positive myocardial perfusion imaging abnormalities is

higher in these individuals, whereas the incidence of severe coronary artery stenosis is low.

- Individuals who have recovered from unexplained sudden cardiac arrest in lieu of invasive coronary angiography (**both**):
 - Confirm the presence or absence of ischemic heart disease
 - Exclude the presence of an anomalous coronary artery.

CCTA – Regardless of symptoms (CD-4.4)

CD.CT.0004.4.A
v2.0.2024

(CPT® 75574)

- Evaluation of newly diagnosed congestive heart failure or cardiomyopathy (all):
 - No prior history of coronary artery disease, the ejection fraction is <50 percent
 - No contraindications to cardiac CT angiography.
 - No cardiac catheterization, SPECT, cardiac PET, or stress echocardiogram has been performed since the diagnosis of congestive heart failure or cardiomyopathy.
- Unclear coronary artery anatomy despite conventional cardiac catheterization
- Re-do CABG (**either**)
 - Assess bypass graft patency
 - Evaluate the location of the left internal mammary artery (LIMA) and or right internal mammary artery (RIMA) prior to repeat bypass surgery
- Follow-up Left main stent one time at 6-12 months
- Evaluate coronary artery anomalies and other complex congenital heart disease of cardiac chambers or great vessels:
 - Report CPT® 75574 for evaluating coronary artery anomalies.
 - Report CPT® 75573 for congenital heart disease.
 - To evaluate the great vessels, CTA Chest (CPT® 71275) can be performed instead of CCTA or in addition to CCTA.
 - For anomalous pulmonary venous return, can add CT Abdomen and Pelvis with contrast (CPT® 74177).
- When CCTA will replace conventional invasive coronary angiography for any of the following:
 - Ventricular tachycardia (6-beat runs or greater)
 - Delayed presentation or retrospective evaluation of suspected Takotsubo syndrome (stress cardiomyopathy)
 - Preoperative assessment of the coronary arteries in planned surgery for any of the following:
 - Aortic dissection
 - Aortic aneurysm
 - Valvular surgery
 - Liver transplant (for initial pre-transplant evaluation and may be repeated once in 3 years)

- To assess for coronary involvement in individuals with systemic vasculitis (e.g. Giant Cell Arteritis, Takayasu's, Kawasaki's disease) when there are clinical features suggestive of underlying vasculitis including:
 - Unexplained elevated cardiac markers (erythrocyte sedimentation rate, C-reactive protein)
 - Constitutional symptoms (fever, chills, night sweats, weight loss)
 - Multiple visceral infarcts in the absence of embolic etiology
- **Cardiac Trauma:** CTA Chest (CPT® 71275) and CCTA (CPT® 75574) are useful in detecting aortic and coronary injury and can help in the evaluation of myocardial and pericardial injury see **Cardiac Trauma – Imaging (CD-10.1)**
- Preoperative assessment for planned liver or kidney transplant

Fractional Flow Reserve by Computed Tomography (CD-4.5)

CD.CT.0004.5.A

v2.0.2024

Fractional flow reserve (FFR) (CPT® 75580) is typically measured using invasive techniques. FFR can be obtained noninvasively from coronary computed tomography angiography data (FFR-CT).

- Indications for FFR-CT:
 - To further assess CAD seen on a recent CCTA that is of uncertain physiologic significance

CT Heart – Indications (CPT® 75572) (CD-4.6)

CD.CT.0004.6.A

v2.0.2024

CT heart – indications

- Cardiac vein identification for lead placement in individuals needing left ventricular pacing.
- Pulmonary vein isolation procedure (ablation) for atrial fibrillation:
 - MRI Cardiac (CPT® 75557 or CPT® 75561), MRV Chest (CPT® 71555), CTV Chest (CPT® 71275), or CT Cardiac (CPT® 75572) can be performed to evaluate the anatomy of the pulmonary veins prior to an ablation procedure performed for atrial fibrillation.
 - Study may be repeated post-procedure between 3-6 months after ablation because of a 1%-2% incidence of asymptomatic pulmonary vein stenosis
 - See **Pulmonary Vein Imaging – Indications (CD-8.2)**
- If echocardiogram is inconclusive for:
 - Cardiac or pericardial tumor or mass
 - Cardiac thrombus
 - Pericarditis/constrictive pericarditis
 - Complications of cardiac surgery
- In place of MRI when there is clinical suspicion of arrhythmogenic right ventricular dysplasia or arrhythmogenic cardiomyopathy (ARVD/ARVC) if the clinical suspicion is supported by established criteria for ARVD-see **Cardiac MRI – Indications (excluding Stress MRI) (CD-5.2)**
- Recurrent laryngeal nerve palsy due to cardiac chamber enlargement.
- CT Cardiac (CPT® 75572) can be performed instead of TEE for assessment of left atrial appendage (LAA) occlusion device or to assess for thrombus, see: **Transesophageal Echocardiography (TEE) – Indications (CD-2.5)**
- Coronary imaging is not included in the code definition for CPT® 71275.
 - The AMA definition for CPT® 71275 reads: "CTA Chest (non-coronary), with contrast material(s), including non-contrast images, if performed, and image post-processing."

CT Heart for Congenital Heart Disease (CD-4.7)

CD.CT.0004.7.A

v2.0.2024

CT Heart for Congenital Heart Disease (CPT® 75573) (CD-4.7)

- Coronary artery anomaly evaluation
 - A cardiac catheterization was performed, and not all coronary arteries were identified.
- Thoracic arteriovenous anomaly evaluation
 - A MRI Cardiac or CT angiogram Chest was performed and suggested congenital heart disease.
- Complex adult congenital heart disease evaluation
 - No CT Cardiac or MRI Cardiac has been performed, and there is a contraindication to MRI Cardiac.
 - A CT Cardiac or MRI Cardiac was performed one year ago or more.
- See also section **Adult Congenital Heart Disease (CD-11)**

Transcatheter aortic valve replacement (TAVR) (CD-4.8)

CD.CT.0004.8.A

v2.0.2024

Pre-surgical aortic valve replacement

- Once the decision has been made for aortic valve replacement, the following may be used to determine if an individual is a candidate for TAVR:
 - CTA Chest (CPT® 71275), Abdomen and Pelvis (combination code CPT® 74174) are indicated, and
 - CT Cardiac (CPT® 75572) is indicated to measure the aortic annulus or
 - Coronary CTA (CCTA CPT® 75574) is indicated to both measure the aortic annulus and assess the coronary arteries in lieu of heart catheterization
- A repeat diagnostic left heart catheterization is **not** medically necessary when the individual is undergoing a transcatheter aortic valve replacement (TAVR).

Transfemoral access not feasible

Alternative imaging can be obtained to evaluate vascular access for TAVR in individuals for whom it is documented either via the office note or prior imaging that transfemoral access would not be feasible due to **any** of the following exclusion criteria:

- Small vessels
- Highly calcified vessels
- Stenosed or occluded vessels
- Prior aortoiliac vascular intervention

Imaging is indicated based on the documented intended access site (transaxillary or transcarotid) and should be of the involved body areas. The following studies are indicated based on the documented planned access site:

- CTA of the Head (CPT® 70496) and/or Neck (CPT® 70498) for transcarotid access
- CTA of the Chest (CPT® 71275) and/or Upper extremity (CPT® 73206) for transaxillary access

Post-TAVR

CT Cardiac (CPT® 75572) is indicated:

- If any of the post-TAVR TTEs are indeterminate or raises a concern about any of the following:
 - Valve thrombosis
 - Infective endocarditis
 - Structural degeneration

- When a Valve in Valve implantation or surgical re-do AVR is being contemplated
- Routine CT surveillance or follow up for incidental Hypoattenuated Leaflet Thickening (HALT) with or without restricted leaflet motion, also referred to as Hypoattenuation Affecting Motion (HAM) is NOT recommended

3D Predictive model generation for pre-planning of cardiac procedure (CD 4.9)

CD.CT.0004.9.A
v2.0.2024

Coding

Description	HCPCS
3D predictive model generation for pre-planning of a cardiac procedure, using data from cardiac computed tomographic angiography with report	C9793

Criteria

3D predictive model generation for pre-planning of a cardiac procedure, using data from cardiac computed tomographic angiography is considered to be experimental, investigational or unproven.

Background and supporting information

Cardiac Computed Tomography Angiography is a 3D imaging acquisition, viewing and reporting system. Standard Cardiac Computed Tomography Angiography includes the viewing of 3D images. Currently, there is not enough data to support the use of 3D predictive model generation for pre-planning of cardiac procedures (CPT® C9793). It has not been shown to improve outcomes when compared with standard Cardiac Computed Tomography Angiography.

Cardiac MRI

Guideline

Cardiac MRI – Coding (CD-5.1)

Cardiac MRI and MRA Chest – Indications (excluding Stress MRI)
(CD-5.2)

Cardiac MRI – Indications for Stress MRI (CD-5.3)

Cardiac MRI – Aortic Root and Proximal Ascending Aorta (CD-5.4)

Cardiac MRI – Evaluation of Pericardial Effusion or Diagnosis of Pericardial
Tamponade (CD-5.5)

Cardiac MRI – Myocarditis (CD-5.6)

Cardiac MRI – Duchenne Muscular Dystrophy (DMD) (CD-5.7)

References (CD-5)

Cardiac MRI – Coding (CD-5.1)

CD.MRI.0005.1.A

v2.0.2024

Cardiac Imaging Procedure Codes	
Cardiac MRI	CPT®/HCPCS
Cardiac magnetic resonance imaging for morphology and function without contrast	75557
Cardiac magnetic resonance imaging for morphology and function without contrast; with stress imaging	75559
Cardiac magnetic resonance imaging for morphology and function without and with contrast and further sequences	75561
Cardiac magnetic resonance imaging for morphology and function without and with contrast and further sequences; with stress imaging	75563
Cardiac magnetic resonance imaging for velocity flow mapping (List separately in addition to code for primary procedure)	+75565
Cardiac magnetic resonance imaging for morphology and function, quantification of segmental dysfunction; with strain imaging	C9762
Cardiac magnetic resonance imaging for morphology and function, quantification of segmental dysfunction; with stress imaging	C9763

- Only one procedure code from the set (CPT® 75557- CPT® 75563) should be reported per session.
- Only one flow velocity measurement (CPT® +75565) should be reported per session when indicated.
- C9762--Cardiac magnetic resonance imaging for morphology and function, quantification of segmental dysfunction; with strain imaging. The use of CMR strain imaging for the quantification of segmental dysfunction is considered investigational and experimental at this time.
- C9763--Cardiac magnetic resonance imaging for morphology and function, quantification of segmental dysfunction; with stress imaging. The use of stress CMR for the quantification of segmental dysfunction is considered investigational and experimental at this time.

Cardiac MRI and MRA Chest – Indications (excluding Stress MRI) (CD-5.2)

CD.MRI.0005.2.A

v2.0.2024

- Assess myocardial viability (to differentiate hibernating myocardium from scar) when necessary to determine if revascularization should be performed (CPT® 75561)
- Assessment of global ventricular function, myocardial composition and mass if a specific clinical question is left unanswered by a recent echocardiogram and results will affect individual management (CPT® 75557 or CPT® 75561). Particularly useful in evaluating:
 - Cardiomyopathy (ischemic, diabetic, hypertrophic, or muscular dystrophy)
 - Non-compaction
 - Infiltrative heart disease such as amyloid, iron overload cardiomyopathy (hemosiderosis, hemochromatosis)
 - Post cardiac transplant
 - Hypertrophic cardiomyopathy
 - Suspected acute myocarditis, cardiac aneurysm, trauma, and contusions
 - Monitoring cancer chemotherapy effect on the heart (especially if an accurate assessment of right ventricular function is documented as necessary).
- Pre and post-operative congenital heart disease assessment see **Adult Congenital Heart Disease (CD-11)** for defect specific indications (CPT® 75557 or CPT® 75561).
 - MRA Chest (CPT® 71555) may be added if the aorta or pulmonary artery need to be visualized beyond the root.
 - May add CPT® +75565 in conjunction with CPT® 75557 or CPT® 75561, only if there is a need to clarify findings on a recent echocardiogram and cardiac Doppler study when there is documentation of **either** of the following:
 - Significant valvular disease that may require intervention
 - Intracardiac flow disturbances (e.g., ASD, VSD)
- MRA Chest (CPT® 71555) may be indicated for the following:
 - Thoracic aortic dissection see **Aortic Dissection and Other Aortic Conditions (PVD-6.7)** in the Peripheral Vascular Disease Imaging Guidelines
 - Coarctation of the aorta see:
 - **Coarctation of the Aorta (CD-11.3.2)** for adults
 - **Aortic Coarctation and IAA (interrupted aortic arch) (PEDCD-2.4.11)** for infants and children in the Pediatric Cardiac Imaging Guideline
 - Thoracic aortic aneurysm see **Thoracic Aortic Aneurysm (TAA) (PVD-6.2)** in the Peripheral Vascular Disease Imaging Guidelines.

- Coarctation of the aorta
 - Follow-up (surveillance) imaging after repair of coarctation:
 - Adults: see **Coarctation of the Aorta (CD-11.3.2)**
 - Infants and children: see **Aortic Coarctation and IAA (interrupted aortic arch) (PEDCD-2.4.11)** in the Pediatric Cardiac Imaging Guideline
- Arrhythmogenic right ventricular dysplasia or arrhythmogenic right ventricular cardiomyopathy (ARVD/ARVC) suspicion (CPT® 75557 or CPT® 75561)—must have one of the following:
 - Non-sustained or sustained VT of LBBB morphology OR >500 PVC's over 24 hours on event recorder or Holter monitor.
 - ARVD/ARVC confirmed in a first-degree relative either by criteria, autopsy, pathogenic genetic mutation or sudden death <35 years of age with suspected ARVD/ARVC.
 - Inverted T waves in right precordial leads (V1, V2 and V3) or beyond in individuals >14 years of age in the absence of complete RBBB
 - Right ventricular akinesis, dyskinesis or aneurysm noted on echo or RV angiography.
- Differentiate constrictive pericarditis from restrictive cardiomyopathy (CPT® 75561).
- Evaluate cardiac tumor or mass when echocardiogram is inconclusive.
- Evaluate valvular heart disease when echocardiogram is inconclusive:
 - CPT® 75557 **or** CPT® 75561
 - May add CPT® 75565 when there is documentation of either of the following:
 - Significant valvular disease that may require intervention
 - Intracardiac flow disturbances (e.g., ASD, VSD)
- MRI Cardiac (CPT® 75557 or CPT® 75561) *or* chest MRV (CPT® 71555), but not both, for pulmonary vein anatomy for planned ablation procedures in individuals with atrial fibrillation. See **Pulmonary Vein Imaging – Indications (CD-8.2)** for guidelines on follow-up imaging after ablation procedure.
- Suspected cardiac thrombus when echocardiogram is inconclusive (CPT® 75557).
- Right ventricular function evaluation (CPT® 75557 in conjunction with CPT® +75565) if there has been a recent ECHO and there is documented need to perform Cardiac MRI in order to resolve an unanswered question about flow dynamics.
- Cardiac MRI (CPT® 75557 or CPT® 75561) and CMR velocity flow mapping (CPT® 75565) for preoperative evaluation prior to planned LVAD implant
- Shunting through a VSD (CPT® 75557 in conjunction with CPT® +75565) if a recent ECHO has been done, including a bubble study, and there is documented need to perform Cardiac MRI in order to resolve an unanswered question about flow dynamics.
- Conditions that would **not** require an echo prior to an MRI:
 - Anomalous coronary arteries: Cardiac MRI (CPT® 75561) or CCTA (CPT® 75574) is much better at detecting this than conventional angiography.
 - Assess coronary arteries in Kawasaki's disease.

- Fabry disease
 - Late enhancement MRI may predict the effect of enzyme replacement therapy on myocardial changes that occur with this disease (CPT® 75561).
- Initial evaluation for cardiac sarcoidosis.

Cardiac MRI – Indications for Stress MRI (CD-5.3)

CD.MRI.0005.3.A

v2.0.2024

- For indications for Stress MRI see **Stress Testing with Imaging – Indications (CD-1.4)**.
- If a nuclear perfusion (MPI) stress test was performed and was equivocal, a stress MRI is indicated.

Cardiac MRI – Aortic Root and Proximal Ascending Aorta (CD-5.4)

CD.MRI.0005.4.A

v2.0.2024

- See- Thoracic Aortic Aneurysm (TAA) (PVD-6.2) in the Peripheral Vascular Disease imaging guidelines

Cardiac MRI – Evaluation of Pericardial Effusion or Diagnosis of Pericardial Tamponade (CD-5.5)

CD.MRI.0005.5.A

v2.0.2024

- Contrast-enhanced cardiac MRI (CPT® 75561) is useful for evaluating pericarditis, neoplastic and other effusion, tamponade or myocardial infiltration if a specific clinical question is left unanswered by echocardiogram or another recent imaging study.

Cardiac MRI – Myocarditis (CD-5.6)

CD.MRI.0005.6.A

v2.0.2024

Clinical evaluation of suspected myocarditis

Initial testing for suspected myocarditis should consist of an electrocardiogram, measurement of cardiac troponin, and an echocardiogram.

Cardiac MRI is indicated for suspected myocarditis in the presence of **all** of the following:

- New onset or persisting symptoms suggestive of myocarditis documented by **any** of the following:
 - Dyspnea
 - Chest pain
 - Palpitations
 - Syncope
 - Effort intolerance
- Evidence for recent or ongoing myocardial injury documented by **any** of the following results on initial screening:
 - Ventricular dysfunction noted on any cardiac imaging study, or
 - New or persisting ECG abnormalities suspicious for myocarditis
 - ST changes, T wave changes, Q waves, or
 - conduction abnormalities, such as LBBB or AV block, or
 - VT or VF
 - Elevated troponin
- Strong suspicion for viral etiology of myocardial injury with documentation of **both**:
 - Recent systemic viral disease, recent mRNA COVID-19 vaccination, or prior myocarditis
 - No evidence of coronary ischemia as documented by **any** of the following:
 - Lack of risk factors for CAD
 - Age under 35 years
 - Negative cardiac imaging study, such as MPI, CCTA, cath

Return to Play Screening for athletes at risk for myocarditis

Cardiac MRI is indicated for **Return to Play Screening** for athletes when there is documentation of **both** of the following:

- Individual has a history of a clinical condition associated with myocarditis (i.e., COVID-19 infection or recent mRNA COVID-19 vaccination)
- Initial screening has been performed with documentation of **either** of the following:
 - Initial screening (ECG, troponin, and TTE) showed evidence for recent or ongoing myocardial injury (as defined above in Clinical Evaluation of Suspected Myocarditis) with ongoing symptoms concerning for myocarditis (dyspnea, chest pain, palpitations, syncope, or effort intolerance).
 - Normal results of initial screening with persistent or new onset symptoms concerning for myocarditis.

Background and Supporting Information

As noted in the "2022 ACC expert consensus decision pathway on cardiovascular sequelae of COVID-19 in adults" and the 2017 "Sports cardiology: core curriculum for providing cardiovascular care to competitive athletes and highly active people", an athlete is defined as an individual who places a high premium on exercise training, competition, and sports achievement.

Cardiac MRI – Duchenne Muscular Dystrophy (DMD) (CD-5.7)

CD.MRI.0005.7.A

v2.0.2024

Cardiac MRI (CPT® 75557 or 75561-does not include 75565 or 71555 unless otherwise indicated)

- Asymptomatic individual with documented DMD can have annual surveillance cardiac MRI starting at 6 years old (yearly echo is recommended prior to age 6)
- Asymptomatic, documented carrier of DMD can have cardiac MRI every 3 years starting at 18

Cardiac PET

Guideline

Cardiac PET – Coding (CD-6.1)

Cardiac PET – Perfusion – Indications (CD-6.2)

Cardiac PET – Absolute Quantitation of Myocardial Blood Flow (AQMBF) (CD-6.3)

References

Cardiac PET – Metabolic – Indications (CD-6.4)

FDG PET/CT for infections (CD-6.5)

References (CD-6)

Cardiac PET – Coding (CD-6.1)

CD.PET.0006.1.A

v2.0.2024

Cardiac Imaging Procedure Codes	
Cardiac PET	CPT®
Myocardial imaging, positron emission tomography (PET), metabolic evaluation study (including ventricular wall motion[s] and/or ejection fraction[s], when performed), single study	78459
Myocardial imaging, positron emission tomography (PET), perfusion study (including ventricular wall motion[s] and/or ejection fraction[s], when performed); single study at rest or stress (exercise or pharmacologic)	78491
Myocardial imaging, positron emission tomography (PET), perfusion study (including ventricular wall motion[s] and/or ejection fraction[s], when performed); multiple studies at rest and stress (exercise or pharmacologic)	78492
Myocardial imaging, positron emission tomography (PET), metabolic evaluation study (including ventricular wall motion[s] and/or ejection fraction[s], when performed), single study; with concurrently acquired computed tomography transmission scan	78429
Myocardial imaging, positron emission tomography (PET), perfusion study (including ventricular wall motion[s] and/or ejection fraction[s], when performed); single study, at rest or stress (exercise or pharmacologic), with concurrently acquired computed tomography transmission scan	78430

Cardiac Imaging Procedure Codes	
Cardiac PET	CPT®
Myocardial imaging, positron emission tomography (PET), perfusion study (including ventricular wall motion[s] and/or ejection fraction[s], when performed); multiple studies at rest and stress (exercise or pharmacologic), with concurrently acquired computed tomography transmission scan	78431
Myocardial imaging, positron emission tomography (PET), combined perfusion with metabolic evaluation study (including ventricular wall motion[s] and/or ejection fraction[s], when performed), dual radiotracer (e.g., myocardial viability);	78432
Myocardial imaging, positron emission tomography (PET), combined perfusion with metabolic evaluation study (including ventricular wall motion[s] and/or ejection fraction[s], when performed), dual radiotracer (e.g., myocardial viability); with concurrently acquired computed tomography transmission scan	78433
Absolute quantitation of myocardial blood flow (AQMBF), positron emission tomography (PET), rest and pharmacologic stress (List separately in addition to code for primary procedure)	+78434
Positron emission tomography (PET) with concurrently acquired computed tomography (CT) for attenuation correction and anatomical localization imaging; skull base to mid-thigh	78815

- 3D rendering should not be billed in conjunction with PET.
- Separate codes for such related services as treadmill testing (CPT® 93015-CPT® 93018) and radiopharmaceuticals should be assigned in addition to perfusion PET. These services are paid according to each individual payer.

Cardiac PET – Perfusion – Indications (CD-6.2)

CD.PET.0006.2.A

v2.0.2024

CPT®78430, CPT® 78431, CPT®78491 and CPT®78492

- Meets all of the criteria for an imaging stress test in **Stress Testing with Imaging – Indications (CD-1.4)** and additionally any one of the following:
 - Individual is severely obese (for example BMI >40 kg/m²) or
 - Individual has large breasts or implants
 - Individual incapable of exercise due to physical (musculoskeletal or neurological) inability to achieve target heart rate. Target heart rate is calculated as 85% of the maximum age predicted heart rate (MPHR). MPHR is estimated as 220 minus the individual's age
- Equivocal nuclear perfusion (SPECT MPI) stress test
- Routine use in post heart transplant assessment of transplant CAD

Cardiac PET – Absolute Quantitation of Myocardial Blood Flow (AQMBF) (CD-6.3)

CD.PET.0006.3.A

v2.0.2024

Absolute Quantitation of Myocardial Blood Flow (CPT® 78434)

Quantitation of myocardial blood flow at rest and with stress in ml/g/min and the calculation of myocardial perfusion reserve (the ratio of stress to rest flow) can be used for diagnosis and prognosis of coronary artery disease and cardiac endothelial dysfunction that can be seen in diabetes, left ventricular hypertrophy, heart transplantation vasculopathy among other conditions.

- AQMBF with PET (CPT 78434) is an add-on procedure that is indicated when one of the following apply:
 - Primary study Myocardial PET rest/stress perfusion (CPT® 78492 or 78431 only) has been approved
 - Primary study Myocardial PET rest/stress perfusion (CPT® 78492 or 78431 only) has been ordered and is being approved at the same time (see- **Cardiac PET - Perfusion - Indications (CD-6.2)** or **Stress Testing with Imaging - Indications (CD-1.4)**).

Background and supporting information

Despite its utility, AQMBF is a technically challenging measurement. Variables include:

- Different tracers (N-13 ammonia vs Rb-82 Cl) give different values
- Different mathematical models used (static vs dynamic)
- Different stressors are used that give different hyperemic flow results (adenosine vs dipyridamole vs regadenoson)
- Data can be collected in 2D vs 3D modes. Saturation of crystals is more problematic in 3D.
- Cardiac, respiratory and patient motion can degrade measurement accuracy .
- Different vendor software is used by different reading labs.
- Resting blood flow can be elevated due to pain, anxiety, lack of vagal tone, hypertension, etc. and can be normalized by using the rate pressure product (RPP) for calculation of myocardial perfusion reserve (MBF) the ratio of myocardial hyperemic flow/rest flow.

eviCore along with the American Society of Nuclear Medicine, the American College of Cardiology, and the Society of Nuclear Medicine and Metabolic Imaging agree that to minimize the above listed variables, AQMBF should only be approved when performed by (**all**):

- Laboratories that are Intersocietal Accreditation Commission (IAC), American College of Radiology (ACR), or Joint Commission cardiac PET accredited.
- Interpreting physician(s) must be Board certified in Nuclear Cardiology (CBNC), Nuclear Medicine (ABNM), or Radiology (ABR) and have additional training in measuring AQMBF.
- Individual laboratories should have a standard protocol (same tracer, camera, software, stressor, model etc.) for use for all patients.
- Reports should contain rest myocardial blood flow (MBF) and stress MBF in ml/g/min, and myocardial blood flow reserve (MBFR) reported as the ratio of stress to rest MBF (with normal limits).
- Laboratories should have the ability to perform rate-pressure-product (RPP) correction of resting MBF when resting MBF is elevated due to elevated resting RPP and include mention of the true measured resting MBF and MBFR as well as the RPP-corrected resting MBF and RPP-corrected MBFR in the conclusions of the report.
- Health plans will be responsible for verifying requirements.

Cardiac PET – Metabolic – Indications (CD-6.4)

CD.PET.0006.4.A

v2.0.2024

- Cardiac PET Metabolic and cardiac SPECT or PET perfusion (CPT® 78429 or CPT® 78459 and CPT® 78451, or CPT® 78432, or CPT® 78433)
 - To determine myocardial viability when a previous study has shown significant left ventricular dysfunction when under consideration for revascularization
- To diagnose strongly suspected cardiac sarcoid or monitor response to therapy for established cardiac sarcoid see **Cardiac Sarcoidosis (CD-3.9)**

FDG PET/CT for infections (CD-6.5)

CD.PET.0006.5.A

v2.0.2024

- FDG PET/CT (CPT® 78815 or CPT® 78429) is indicated in the assessment of suspected prosthetic heart valve endocarditis when there is documentation of **both** of the following:
 - TTE and/or TEE are equivocal or non-diagnostic
 - Suspicion for prosthetic heart valve endocarditis remains high (all):
 - C-reactive protein ≥ 40 mg/L
 - No evidence of prolonged antibiotic therapy
 - The implantation was ≥ 3 months ago and there is no evidence of surgical adhesives used during the valve implantation
- FDG PET/CT for LVAD driveline infection (CPT® 78815 or 78429)
 - Early infection detection for LVAD drivelines is desirable, since once the infection extends to the cannula and pump pocket, eradication becomes difficult. CT findings are nonspecific and metal device artifacts of the driveline itself affects sensitivity.
 - FDG PET/CT is indicated for suspected LVAD infection if other studies and examination remain inconclusive.

with RHC and LHC and bypass grafts	93461
LHC by trans-septal or apical puncture	+93462
Angiography of non-coronary arteries and veins performed as a distinct service	Select appropriate codes from the Radiology and Vascular Injection Procedures sections.

- CPT® 93593 to 93597 are indicated for invasive evaluation of congenital heart disease. See specific conditions in **Adult Congenital Heart Disease (CD-11)**

Diagnostic Heart Catheterization – Coding Notes (CD-7.2)

- Cardiac catheterization (CPT® 93451-CPT® 93461) includes all "road mapping" angiography necessary to place the catheters, including any injections and imaging supervision, interpretation and report.
- Cardiac catheterization (CPT® 93452-CPT® 93461) (for all conditions other than congenital heart disease) includes contrast injections, imaging supervision, interpretation and report for imaging typically performed.
- Catheter placements in native coronaries or bypass grafts (CPT® 93454-CPT® 93461) include intraprocedural injections for bypass graft angiography, imaging supervision and interpretation.
- Injection codes CPT® 93563-CPT® 93565 should not be used in conjunction with CPT® 93452-CPT® 93461.
- Codes CPT® 93451-CPT® 93461 do not include contrast injections and imaging supervision, interpretation and report for imaging that is separately identified by the following specific procedure codes: CPT® 93566, CPT® 93567 and CPT® 93568.
- Separate diagnostic cardiac catheterization codes should only be assigned in conjunction with interventional procedures in the following circumstances:
 - No prior or recent diagnostic catheterization is available to guide therapy
 - Individual's condition has significantly changed since the last diagnostic cath
 - The treatment plan may be affected

- Other vessels may be identified for treatment
- Further establishment of a diagnosis from a non-invasive study is necessary

LHC – Unstable/Active Coronary Artery Syndromes (CD-7.3.1)

CD.DHC.0008.A

v2.0.2024

Diagnostic Left Heart Catheterization (LHC) is indicated for individuals in acute settings or with **active** unstable angina and should be handled as medical emergencies.

- LHC may be indicated for new onset, accelerating, or worsening ischemic symptoms suggestive of acute coronary syndrome (ACS) occurring at rest, or with minimal exertion resolving with rest, including:
 - Cardiac chest pain (typical angina) with or without new onset, evolving ischemic EKG changes
 - Symptoms consistent with the known angina pattern in an individual with a history of CABG or PCI
- Left and right heart cath may be indicated in place of a left heart cath if the above criteria has been met and there is documentation of any of the following:
 - The major component of the individual's symptoms is dyspnea
 - Newly diagnosed or worsening cardiomyopathy
 - For surgical planning prior to any of the following:
 - Heart valve surgery
 - Congenital heart defect repair
 - Lung transplant
 - Liver transplant

Diagnostic Left Heart Catheterization (LHC) (CD-7.3)

CD.DHC.0007.3.A

v2.0.2024

Guideline

Stable Established CAD Post Revascularization with CABG or PCI (CD-7.3.2)

Stable Symptomatic Suspected or Established Coronary Artery Disease (CD-7.3.3)

Exclusion of Significant Coronary Artery Disease Involvement in other Cardiac Pathology (CD-7.3.4)

Evaluation of structural heart disease (CD-7.3.5)

Angiography-Derived Fractional Flow Reserve (CD-7.3.6)

Stable Established CAD Post Revascularization with CABG or PCI (CD-7.3.2)

Note These guidelines apply to individuals with stable conditions and who are not in the acute setting (acute coronary syndrome or unstable angina).

- Diagnostic Left Heart Catheterization (LHC) is indicated in individuals with established Coronary Artery Disease (CAD) post revascularization by percutaneous coronary intervention (PCI) or coronary artery bypass graft surgery (CABG) when there is documentation of **one** of the following:
 - New, recurrent, or worsening ischemic symptoms similar to prior ischemic episode.
 - New, recurrent, or worsening likely anginal symptoms as defined in **General Guidelines (CD-1.0)**
 - New, recurrent, or worsening symptoms of chest pain, or exertional dyspnea, or exertional fatigue AND intermediate or high-risk findings on non-invasive stress testing as documented by one of the following:
 - Cardiac chest pain induced by exercise treadmill testing or dobutamine stress testing
 - Exercise treadmill testing inducing any of the following:
 - At least 1 mm downsloping ST-depression
 - 2 mm horizontal ST-depression
 - At least 1 mm ST-elevation in two leads
 - Ventricular tachycardia of at least 3 consecutive beats
 - Myocardial perfusion imaging (SPECT or PET) with ≥5% reversible ischemic burden

- Stress echo with at least 2 segments of inducible ischemia
- Severe stress induced left ventricular dysfunction (drop in left ventricular ejection fraction with stress $\geq 10\%$)
- New left ventricular systolic dysfunction (left ventricular ejection fraction $< 50\%$)
- Worsening left ventricular systolic dysfunction (decline in left ventricular ejection fraction $\geq 10\%$)
- New or worsened congestive heart failure
- Ventricular fibrillation
- Sustained ventricular tachycardia
- Left and right heart cath may be indicated in place of a left heart cath if the above criteria has been met and there is documentation of **any** of the following:
 - The major component of the individual's symptoms is dyspnea
 - Newly diagnosed or worsening cardiomyopathy
 - For surgical planning prior to any of the following:
 - Heart valve surgery
 - Congenital heart defect repair
 - Lung transplant
 - Liver transplant

Stable Symptomatic Suspected or Established Coronary Artery Disease (CD-7.3.3)

For the purpose of this guideline, likely anginal symptoms is defined in **General Guidelines (CD-1.0)**

- Diagnostic left heart catheterization to screen for coronary artery disease (CAD) in asymptomatic individuals who are not anticipating other cardiac procedures is **not** indicated
- LHC with coronary arteriography (CPT® 93454, 93455, 93458, 93459) is indicated when there is documentation of one of the following:
 - New onset, persistent, or worsening of likely anginal symptoms and either:
 - Symptomatic failure of a 12 week trial of OMT including as tolerated all of the following:
 - Anti-platelet therapy
 - Statin and/or other lipid-lowering therapy
 - Anti-anginal therapy implemented to pursue a goal heart rate of 60 beats per minute or less
 - Anti-hypertensive therapy as may be indicated to pursue a goal systolic blood pressure (sbp) of less than 140 mmHg and a goal diastolic blood pressure (DBP) of less than 90 mmHg
 - Worsening of likely anginal symptoms during 12 week trial of OMT
 - New onset, persistent, or worsening of likely anginal symptoms and documentation of **both** of the following:

- Established CAD per **General Guidelines (CD- 1.0)** or age ≥ 50 years and/or ≥ 2 CAD risk factors (diabetes mellitus, smoking, family history of premature CAD, hypertension, dyslipidemia), and
- Likely anginal symptoms at a low level of exercise or at rest despite optimal medical therapy
- LHC may be indicated irrespective of OMT for symptomatic individuals who also have high-risk findings on Coronary CT Angiography See **CCTA – Indications for CCTA (CD-4.3)**, to include any of the following:
 - Left main coronary artery stenosis $\geq 40\%$
 - Proximal or mid left anterior descending coronary artery stenosis $\geq 70\%$
 - Proximal or mid double-vessel coronary artery stenosis $\geq 60\%$
 - Proximal or mid triple-vessel coronary artery stenosis $\geq 50\%$
 - CT-FFR measured to be ≤ 0.8 in the proximal or mid segment of any coronary artery irrespective of degree of stenosis
- LHC may be indicated irrespective of OMT for symptomatic individuals who have BOTH likely anginal symptoms and high-risk findings on non-invasive stress testing including any of the following:
 - Cardiac chest pain induced by exercise treadmill testing or dobutamine stress testing
 - Myocardial perfusion imaging with $\geq 10\%$ reversible ischemic burden
 - Stress echo with at least 3 segments of inducible ischemia
 - Exercise treadmill testing inducing at least 2.5 mm downsloping ST-depression or 3 mm horizontal ST-depression in two leads
 - Ventricular tachycardia of at least 3 consecutive beats induced by an exercise treadmill test
- LHC may be indicated for any of the following if coronary artery disease is suspected:
 - New or worsened congestive heart failure
 - New left ventricular systolic dysfunction (left ventricular ejection fraction $< 50\%$)
 - Worsening left ventricular systolic dysfunction (decline in left ventricular ejection fraction $\geq 10\%$)
 - Ventricular fibrillation or sustained ventricular tachycardia
- Left and right heart cath may be indicated in place of a left heart cath if the above criteria has been met and there is documentation of any of the following:
 - The major component of the individual's symptoms is dyspnea
 - Newly diagnosed or worsening cardiomyopathy
 - For surgical planning prior to any of the following:
 - Heart valve surgery
 - Congenital heart defect repair
 - Lung transplant
 - Liver transplant

Background and supporting information

In addition to OMT, physician-guided behavioral modification therapy (BMT) is recommended including all of the following:

- Mediterranean diet
- Moderate intensity physical activity for at least thirty minutes per day at least five times per week as possible
- Attempts at smoking cessation to include at least one of the following:
 - Cognitive behavioral therapy
 - Nicotine withdrawal replacement therapy

Exclusion of Significant Coronary Artery Disease Involvement in other Cardiac Pathology (CD-7.3.4)

- LHC is indicated when the etiology is unclear for **any** of the following if coronary artery disease is suspected:
 - New or worsened congestive heart failure
 - New left ventricular systolic dysfunction (left ventricular ejection fraction <50%)
 - Worsening left ventricular systolic dysfunction (decline in left ventricular ejection fraction $\geq 10\%$)
 - Ventricular fibrillation or sustained ventricular tachycardia
 - Unheralded syncope (not near syncope)
 - Suspected myocarditis
- Left and right heart cath may be indicated in place of a left heart cath if the above criteria has been met and there is documentation of any of the following:
 - The major component of the individual's symptoms is dyspnea
 - Newly diagnosed or worsening cardiomyopathy
 - For surgical planning prior to any of the following:
 - Heart valve surgery
 - Congenital heart defect repair
 - Lung transplant
 - Liver transplant

Evaluation of structural heart disease (CD-7.3.5)

Left heart catheterization with coronary arteriography (CPT® 93458 or CPT® 93454) is indicated for any of the following

- Evaluation prior to planned invasive procedure or surgery

- Ruling out coronary artery disease prior to planned non-coronary cardiac or great vessel surgery (i.e., cardiac valve surgery, aortic dissection, aortic aneurysm, congenital disease repair such as atrial septal defect, etc.).
- Pre-organ transplant (non-cardiac) - in place of stress imaging for initial pre-transplant evaluation (per the transplant center's protocol) **or** if stress imaging is positive for ischemia. Repeat periodic screening while on a transplant waiting list (in the absence of other clinical indications) is not supported. See **Kidney Transplant, Pre-Transplant Imaging Studies (AB-42.5)**.
- Prior to catheter ablation of ventricular arrhythmia at one of the following sites:
 - Sinus of Valsalva
 - Coronary venous system
 - Epicardium
- Valvular heart disease when either:
 - There is a discrepancy between the clinical findings (history, physical exam, and non-invasive test results)
 - Valvular surgery is being considered.
- Suspected pericardial disease.
- Previous cardiac transplant:
 - Per transplant center protocol
 - To assess for accelerated coronary artery disease associated with cardiac transplantation.
- Left and right heart cath may be indicated in place of a left heart cath if the above criteria has been met and there is documentation of any of the following:
 - The major component of the individual's symptoms is dyspnea
 - Newly diagnosed or worsening cardiomyopathy
 - For surgical planning prior to any of the following:
 - Heart valve surgery
 - Congenital heart defect repair
 - Lung transplant
 - Liver transplant

Angiography-Derived Fractional Flow Reserve (CD-7.3.6)

Coding

Description	HCPCS
Catheter placement in coronary artery(s) for coronary angiography, including intraprocedural injection(s) for coronary angiography, imaging supervision and interpretation with left heart catheterization including intraprocedural injection(s) for left ventriculography, when performed and intraprocedural coronary fractional flow reserve (FFR) with 3d functional mapping of color-coded FFR values for the coronary tree, derived from coronary angiogram data, for real-time review and interpretation of possible atherosclerotic stenosis(es) intervention	C7557

Criteria

Angiography-Derived Fractional Flow Reserve based on three-dimensional reconstruction of angiographic images is considered to be experimental, investigational, or unproven.

Background and supporting information

Fractional flow reserve (FFR) is an index of the physiological significance of a coronary artery stenosis. It is derived by using a coronary artery pressure guidewire to measure the distal coronary artery pressure. Angiography-Derived Fractional Flow Reserve is an alternative approach to derive FFR without the use of a coronary artery pressure guidewire, based on three-dimensional reconstruction of angiographic images. Mathematical modeling based on hemodynamic laws is then applied to the three-dimensional reconstruction to derive the pressure dynamics along the coronary artery, with results displayed in a color-coded map. Further research is needed to evaluate the accuracy and applicability of Angiography-Derived Fractional Flow Reserve.

Right Heart Catheterization and Right and Left Heart Catheterization without Coronary Angiography (CD-7.4)

CD.DHC.0007.4.A

v2.0.2024

- Diagnostic right heart catheterization (CPT® 93451) OR Diagnostic right and left heart catheterization without coronary angiography (CPT® 93453) is indicated when results will impact the diagnosis and management of **any** of the following:
 - Atrial septal defect (ASD) including shunt detection and quantification
 - Ventricular septal defect (VSD) including shunt detection and quantification
 - Patent foramen ovale (PFO)
 - Anomalous pulmonary venous return
 - Congenital defects including persistent left vena cava
 - Pulmonary hypertension
 - Pericardial diseases (constrictive or restrictive pericarditis)
 - Valvular disease
 - Right heart failure
 - Left heart failure
 - Newly diagnosed or worsening cardiomyopathy
 - Preoperative evaluation for valve surgery
 - During a left heart cath where the etiology of the symptoms remains unclear
 - Pre-lung transplant to assess pulmonary pressures
 - Uncertain intravascular volume status with an unclear etiology
 - Prior to LVAD implant and post LVAD implant as needed for hemodynamic assessment to guide changes to therapy
 - Assessment post-cardiac transplant
 - For routine endomyocardial biopsy
 - Assess for rejection
 - Assess pulmonary artery pressure
 - Can be done per the institution protocol or anytime organ rejection is suspected and biopsy is needed for assessment
 - Evaluation of right ventricular morphology.
 - Suspected arrhythmogenic right ventricular dysplasia.

Background and supporting information

General information RHC (CPT® 93451)

- It is performed most commonly from the femoral vein, less often through the subclavian, brachial, or internal jugular vein and inter-atrial septal puncture approach.
- It includes a full oximetry for detection and quantification of shunts.
- Cardiac outputs are calculated by several techniques including the Fick thermodilution

Combined Right and Left Heart Catheterization Indications (CD-7.5)

CD.DHC.0007.5.A

v2.0.2024

Combined Right and Left Heart Catheterization (CPT® 93460 or CPT® 93461) is indicated for the following:

- Preoperative evaluation for valve surgery
- The indications for **Diagnostic Left Heart Catheterization (LHC) (CD-7.3)** are met and **any** of the following are present:
 - The major component of the individual's symptoms is dyspnea
 - The indications are met according to **Right Heart Catheterization (RHC) (CD-7.4)**
 - Newly diagnosed or worsening cardiomyopathy
- See **Right Heart Catheterization and Right and Left Heart Catheterization without Coronary Angiography (CD- 7.4)** for CPT® 93453

Planned (Staged) Procedures (CD-7.6)

CD.DHC.0007.6.A
v2.0.2024

Planned (staged) coronary intervention

- Planned (Staged) Coronary Interventions applies to individuals with clinically stable symptoms if there is documentation of a recent diagnostic catheterization finding of a significant lesion that was not intervened as part of the initial procedure and the documentation explicitly states that a subsequent procedure will be performed for planned/staged PCI of that lesion.
- The CPT® codes for percutaneous coronary interventions (PCI) include the following imaging services necessary for the procedure(s):
 - Contrast injection, angiography, 'road-mapping', and fluoroscopic guidance
 - Vessel measurement
 - Angiography following coronary angioplasty, stent placement, and atherectomy
- Separate codes for these services should not be assigned in addition to the PCI code/s because the services are already included.
- A repeat diagnostic left heart catheterization is not medically necessary when the individual is undergoing a planned staged percutaneous coronary intervention.

Planned coronary artery lesion assessment

A repeat complete diagnostic left heart catheterization is not medically necessary for the purpose of coronary artery lesion assessment using any of the following:

- Intravascular ultrasound (IVUS)
- Optical coherence tomography (OCT)
- Fractional flow reserve (FFR)
- Instantaneous wave-free ratio (iFR)

Evaluation of Conditions other than Coronary Artery Disease (CD-7.7)

CD.DHC.0077.A

v2.0.2024

- Right and left heart catheterization (CPT® 93453) is indicated for any of the following:
 - Preoperative assessment prior to planned valvular surgery
 - Evaluation of pulmonary hypertension out of proportion to or unexplained by the severity of valvular disease documented by other non-invasive imaging modalities (i.e., echo, CMR)
 - Left ventricular dysfunction out of proportion to the severity of valvular disease documented by other non-invasive imaging modalities
 - Suspected pericardial tamponade as documented by clinical findings or other non-invasive imaging modalities
 - Suspected, or clinical uncertainty, between constrictive pericarditis vs. restrictive cardiomyopathy physiology when there are questions left unanswered by other cardiac non-invasive imaging modalities
 - Known or suspected cardiomyopathy with or without heart failure documented by prior advanced imaging
 - Re-evaluation of known cardiomyopathy for any of the following:
 - Change in clinical status
 - Change in cardiac exam
 - When required to guide therapy
 - Hypertrophic Cardiomyopathy
 - Subvalvular aortic stenosis
- Right and left heart catheterization (CPT® 93453) is indicated when there is uncertainty between clinical impression and other non-invasive imaging modalities to evaluate the following valvular diseases:
 - Mitral stenosis
 - Mitral regurgitation
 - Aortic stenosis
 - Aortic regurgitation
- Left heart catheterization (CPT® 93452) for hemodynamic evaluation of the left ventricle and aorta is indicated to evaluate aortic stenosis when there is uncertainty between the clinical impression and non-invasive imaging modality findings.

Congenital heart disease – General Information (CD-11.1)

CD.CHD.0011.1.A

v2.0.2024

- This section covers adult congenital heart disease (CHD), for other associated disorders please see the condition specific sections
 - Marfan Syndrome
 - Hypertrophic cardiomyopathy (HCM)
 - Bicuspid aortic valve (BAV)

Guideline

Definitions (CD-11.1.1)

Modalities (CD-11.1.2)

Coding (CD-11.1.3)

Congenital Heart Disease Imaging Indications

Aortopathies with CHD

Definitions (CD-11.1.1)

- Physiological stages (A, B, C, D)
 - Each congenital heart lesion is divided into 4 physiological stages (A, B, C, D)

Characteristics	Physiological stage			
	A	B	C	D
NYHA functional class	I	II	III	IV
Hemodynamic or anatomic sequelae	None	Mild ventricular enlargement of dysfunction, small shunt	Moderate or greater, ventricular dysfunction. Any venous or arterial stenosis	Moderate or greater, ventricular dysfunction. Any venous or arterial stenosis
Valvular	None	Mild	Moderate or greater	Moderate or greater
Aortic enlargement	None	Mild	Moderate	Severe
Exercise capacity limitation	Normal	Abnormal objective cardiac limitation	Moderate	Severe

Characteristics	Physiological stage			
	A	B	C	D
Renal hepatic pulmonary dysfunction	None		Mild but responsive to medication	Refractory to treatment
Cyanosis/hypoxemia	None		Mild	Severe
Arrhythmias	None	Arrhythmia not requiring treatment	Needs rx	Refractory to rx
Pulmonary hypertension	None		Mild to moderate	Severe or Eisenmenger

- CHD Anatomic classification
 - Class I-Simple
 - Native disease
 - Isolated small ASD
 - Isolated small VSD
 - Mild isolated pulmonic stenosis
 - Repaired conditions
 - Previously ligated or occluded ductus arteriosus
 - Repaired secundum ASD or sinus venosus defect without significant residual shunt or chamber enlargement
 - Repaired VSD without significant residual shunt or chamber enlargement
 - Class II-Moderate Complexity
 - Repaired or unrepaired conditions
 - Aorto-left ventricular fistula
 - Anomalous pulmonary venous connection, partial or total
 - Anomalous coronary artery arising from the pulmonary artery
 - Anomalous aortic origin of a coronary artery from the opposite sinus
 - AVSD (partial or complete, including primum ASD)
 - Congenital aortic valve disease
 - Congenital mitral valve disease
 - Coarctation of the aorta
 - Ebstein anomaly (disease spectrum includes mild, moderate, and severe variations)
 - Infundibular right ventricular outflow obstruction
 - Ostium primum ASD
 - Moderate and large unrepaired secundum ASD

- Moderate and large persistently patent ductus arteriosus
- Pulmonary valve regurgitation (moderate or greater)
- Pulmonary valve stenosis (moderate or greater)
- Peripheral pulmonary stenosis
- Sinus of Valsalva fistula/aneurysm
- Sinus venosus defect
- Subvalvular aortic stenosis (excluding HCM; HCM not addressed in these guidelines)
- Supravalvular aortic stenosis
- Straddling atrioventricular valve
- Repaired tetralogy of Fallot
- VSD with associated abnormality and/or moderate or greater shunt
- Class III- Great Complexity (or Complex)
 - Cyanotic congenital heart defect (unrepaired or palliated, all forms)
 - Double-outlet ventricle
 - Fontan procedure
 - Interrupted aortic arch
 - Mitral atresia
 - Single ventricle (including double inlet left ventricle, tricuspid atresia, hypoplastic left heart, any other anatomic abnormality with a functionally single ventricle)
 - Pulmonary atresia (all forms)
 - TGA (classic or d-TGA; CCTGA or l-TGA)
 - Truncus arteriosus
 - Other abnormalities of atrioventricular and ventriculoarterial connection (i.e., crisscross heart, isomerism, heterotaxy syndromes, ventricular inversion)

Modalities (CD-11.1.2)

- Echocardiogram- transthoracic (TTE) or transesophageal (TEE)
 - Transthoracic echocardiography (TTE) is an indispensable tool in the initial and serial follow-up evaluation to identify abnormalities and changes that commonly influence management decisions.
- Cardiac MRI (CMR)
 - CMR plays a valuable role in assessment of RV size and function, because it provides data that are reproducible and more reliable than data obtained with alternative imaging techniques
 - For intracardiac congenital heart disease, CMR will typically include flow velocity mapping for shunts and flow assessment.
 - Imaging that only requires aortic arch imaging, does not require intracardiac CMR, only MRA Chest.

- Cardiac Computed Tomography (CCT) and Cardiac Computed Tomography Angiography (CCTA)
 - The most important disadvantage of CCT (including CT angiography) as an imaging technique is the associated exposure to ionizing radiation.
- Cardiac catheterization
 - (hemodynamic and/or angiographic) in individuals with adult CHD AP classification II and III, or interventional cardiac catheterization in individuals with adult CHD AP classification I to III should be performed by, or in collaboration with, cardiologists with expertise in adult CHD
- Exercise Testing
 - Exercise test does not imply stress imaging
- Stress Imaging
 - Includes-MPI, stress echo, stress MRI
 - PET stress may be included as per **Cardiac PET (CD-6)**
- Circumstances where CMR, CCT, TEE, and/or Cardiac Catheterization may be Superior to TTE
 - Assessment of RV size and function in repaired Tetralogy of Fallot (TOF), systemic right ventricles, and other conditions associated with right ventricular (RV) volume and pressure overload
 - Identification of anomalous pulmonary venous connections
 - Serial assessment of thoracic aortic aneurysms, especially when the dilation might extend beyond the echocardiographic windows
 - Accurate assessment of pulmonary artery (PA) pressure and pulmonary vascular resistance
 - Assessment for re-coarctation of the aorta
 - Sinus venosus defects
 - Vascular rings
 - Evaluation of coronary anomalies
 - Quantification of valvular regurgitation

Coding (CD-11.1.3)

Modality	
Echocardiogram	
Transthoracic echocardiogram (TTE)	CPT®
TTE for congenital cardiac anomalies; complete	93303
TTE for congenital cardiac anomalies; limited study	93304

Modality	
TTE (2D) m-mode recording, complete, with spectral and color flow doppler echocardiography	93306
TTE (2D) with or without m-mode recording; complete	93307
TTE (2D) with or without m-mode recording; limited study	93308
Transesophageal echocardiogram (TEE)	
TEE (2D) including probe placement, imaging, interpretation, and report	93312
TEE for congenital cardiac anomalies; including probe placement, imaging, interpretation, and report	93315
MRI	
cardiac (CMR)	CPT®
Cardiac MRI for morphology and function without contrast	75557
Cardiac MRI for morphology and function without and with contrast	75561
MRI Chest	
MRI Chest without contrast	71550
MRI Chest with contrast	71551
MRI Chest with & without contrast	71552
MRI Angiography (MRA) MRA Chest	
MRA Chest (excluding myocardium) with or without contrast	71555
CT	
Cardiac (CCT)	CPT®
CT, Heart, with contrast material, for evaluation of cardiac structure and morphology	75572
CT, Heart, with contrast material, for evaluation of cardiac structure and morphology in the setting of congenital heart disease	75573
CT Angiography-cardiac (CCTA)	CPT®

Modality	
CTA Heart, coronary arteries and bypass grafts (when present), with contrast, including 3D image post-processing	75574
CT-Chest	CPT®
CT Thorax without contrast	71250
CT Thorax with contrast	71260
CT Thorax without & with contrast	71270
CT Angiography-Chest (CTA Chest)	CPT®
CTA Chest without and with contrast	71275
Stress Imaging (echo, MRI, MPI)	
Stress echo	CPT®
Echocardiography (TTE), (2D), with or without m-mode, during rest and cardiovascular stress, with interpretation and report	93350
Echocardiography (TTE), (2D), m-mode, during rest and cardiovascular stress test using treadmill, bicycle exercise and/or pharmacologically induced stress, with interpretation	93351
Stress MRI	CPT®
Cardiac MRI for morphology and function without contrast, with stress imaging	75559
Cardiac MRI for morphology and function without and with contrast, with stress imaging	75563
Myocardial perfusion imaging (MPI)	CPT®
MPI, tomographic (SPECT) including attenuation correction, qualitative or quantitative wall motion, ejection fraction by first pass or gated technique, additional quantification, when performed); single study, at rest or stress (exercise or pharmacologic)	78451

Modality	
MPI, tomographic (SPECT) (including attenuation correction, qualitative or quantitative wall motion, ejection fraction by first pass or gated technique, additional quantification, when performed); multiple studies, at rest and/or stress (exercise or pharmacologic) and/or redistribution and/or rest reinjection	78452
Pulmonary perfusion imaging	CPT®
Pulmonary perfusion imaging (e.g., particulate)	78580
Pulmonary ventilation (e.g., aerosol or gas) and perfusion imaging	78582
Quantitative differential pulmonary perfusion, including imaging when performed	78597
Quantitative differential pulmonary perfusion and ventilation (e.g., aerosol or gas), including imaging when performed	78598

Congenital Heart Disease Imaging Indications

- The following sections are based on the congenital heart lesion. Requests for imaging based on other cardiac conditions, such as CAD, HCM, acquired valvular lesions, should follow the adult cardiac guidelines for those conditions.

Aortopathies with CHD

- Dilated aortic arches are not uncommon with several congenital heart diseases and postoperative procedures including- Aortic stenosis, Ross repair, Tetralogy of Fallot, Transposition of the great arteries (TGA), Pulmonary atresia, hypoplastic left heart syndrome (HLHS), Truncus Arteriosis, single ventricle.

ASD-Atrial septal defects (CD-11.2.1)

CD.CHD.0011.2.1.A

v2.0.2024

Initial studies-Diagnosis, clinical changes, consideration of surgery

- Echocardiogram at time of diagnosis
 - CMR, CCT CPT® 75573), and/or TEE are useful if echo (TTE) is suboptimal and either:
 - ASD is suspected
 - To evaluate pulmonary venous connections in known ASD
 - MRA Chest or CTA Chest may be indicated if echo shows pulmonary venous anomalies
 - If normal, repeat pulmonary vein imaging is not required.
- Transesophageal echocardiogram (TEE) is recommended to guide percutaneous ASD closure
- Diagnostic cath is indicated when there is either:
 - Evidence of pulmonary hypertension
 - Unanswered questions on CMR/CCT for venous drainage.

Post-procedure imaging

- TTE is indicated post ASD device placement:
 - 6 months to evaluate for erosion
 - 1 week (if Amplatzer)
 - 1 month
 - 6 months
 - 12 months
 - then every 1-2 years
- Due to low-risk of erosion in PFO devices- PFO device closure requires follow-up at 6-12 months. No additional evaluation unless PFO not closed

Stress imaging and coronary artery imaging is based on **Stress Testing with Imaging – Indications (CD-1.4)**

Follow-up ASD if surgically closed or if no interventions

Modality	Physiological stage / intervals for routine imaging (months)			
Physiological stage	A	B	C	D
TTE	36	24	12	12

Anomalous Pulmonary Venous Connections (CD-11.2.2)

CD.CHD.0011.2.2.A

v2.0.2024

Initial studies-Diagnosis, clinical changes, consideration of surgery

- Echocardiogram at time of diagnosis
 - CMR and/or MRA Chest, or CT Cardiac and/or CTA Chest at time of diagnosis if any issues with pulmonary veins or RV volume.
 - Cardiac Cath at time of diagnosis for hemodynamic data and issues not answered on other imaging
- Routine stress imaging or coronary artery imaging not required.
- Echo, CMR, CT, per cardiology request for clinical changes
 - Diagnostic heart catheterization if questions unanswered on imaging

Follow-up Anomalous Pulmonary Venous Connections

Modality	Physiological stage / intervals for routine imaging (months)			
Physiological stage	A	B	C	D
Echo (TTE)	36	24	12	12

Ventricular Septal Defect (VSD) (CD-11.2.3)

CD.CHD.0011.2.3.A
v2.0.2024

Initial studies-Diagnosis, clinical changes, consideration of surgery

- Echo (TTE) at time of diagnosis
 - CMR or CCT can be performed if questions are unanswered on echo
 - Catheterization at time of diagnosis for hemodynamics if pulmonary hypertension (PHT) or shunt size is a question

Long term follow-up VSD

Modality	Physiological stage / intervals for routine imaging (months)			
Physiological stage	A	B	C	D
Echo (TTE)	36	24	12	12

Atrioventricular Septal Defect (AV Canal, AVSD, endocardial cushion defect) (CD-11.2.4)

CD.CHD.0011.2.4.A
v2.0.2024

Initial studies-Diagnosis, clinical changes, consideration of surgery

- Echo (TTE) at time of diagnosis
 - CMR or CT Cardiac at time of diagnosis if there are unanswered questions on echo
 - Cardiac cath at time of diagnosis when CMR and TTE leave questions unanswered that affect individual management
- Stress imaging per **Stress Testing with Imaging – Indications (CD-1.4)**

Long term follow-up -AVSD

Modality	Physiological stage / intervals for routine imaging (months)			
Physiological stage	A	B	C	D
Echo (TTE)	24	24	12	12

Patent Ductus Arteriosus (PDA) (CD-11.2.5)

CD.CHD.0011.2.5.A
v2.0.2024

Initial studies-Diagnosis, clinical changes, consideration of surgery

- Echo at time of diagnosis
 - MR Chest or CT Chest if there are questions left unanswered by echo
 - Cardiac Cath for hemodynamics (if planned device closure, diagnostic cardiac cath is not indicated as it is included in the procedure code)
- Stress imaging per **Stress Testing with Imaging – Indications (CD-1.4)**

Long term follow-up PDA

Modality	Physiological stage / intervals for routine imaging (months)			
Physiological stage	A	B	C	D
Echo (TTE)	36	24	12	12

Cor Triatriatum (CD-11.2.6)

CD.CHD.0011.2.6.A

v2.0.2024

Initial studies-Diagnosis, clinical changes, consideration of surgery

- Echocardiogram (TTE) at time of diagnosis
 - CMR and/or MRA Chest or CT Cardiac and/or CTA Chest may be approved
 - Diagnostic cath may be approved if additional information is required for medical management

Long term follow-up

- Stress imaging per **Stress Testing with Imaging – Indications (CD-1.4)**

Congenital Mitral Stenosis (CD-11.2.7)

CD.CHD.0011.2.7.A
v2.0.2024

Initial studies-Diagnosis, clinical changes, consideration of surgery

- Echocardiogram (TTE) at time of diagnosis

Long term follow-up congenital mitral stenosis

Modality	Physiological stage / intervals for routine imaging (months)			
Physiological stage	A	B	C	D
Echo (TTE)	24	24	12	12

Subaortic Stenosis (SAS) (CD-11.2.8)

CD.CHD.0011.2.8.A
v2.0.2024

This section relates to subaortic stenosis caused by a discrete membrane or tunnel-like obstruction.

Initial imaging/diagnosis, clinical changes, consideration of surgery

Modality	Initial imaging/diagnosis	Clinical changes	Consideration of surgery
Echo (TTE) (CPT® 93303 or 93304 or 93306 or 93308)	At time of diagnosis	For any clinical changes	If cardiac intervention is being considered
Stress echo or (CPT® 93351 or 93352) OR Stress MRI (CPT® 75559 or 75563)	Once at the time of diagnosis	<ul style="list-style-type: none">New or changed signs or symptoms of ischemiaChanges in cardiac functionAny signs or symptoms allowed in <u>Stress Testing with Imaging – Indications (CD-1.4)</u>	If cardiac intervention is being considered

Long term follow-up SAS

Modality	Physiological stage / intervals for routine imaging (months)			
Physiological stage	A	B	C	D
Echo (TTE)	24	24	12	12
Stress imaging		24	24	12

Congenital Valvular Aortic Stenosis (CD-11.2.9)

CD.CHD.0011.2.9.A

v2.0.2024

Initial studies-Diagnosis, clinical changes, consideration of surgery

- Echocardiogram (TTE) at time of diagnosis
- TEE may be required if TTE limited or equivocal
- MRA Chest or CTA Chest if one of the following:
 - Suspicion of Coarctation based on exam and echocardiogram
 - Proximal ascending aorta not well visualized on TTE

Routine follow-up Congenital Valvular Aortic Stenosis

Modality	Physiological stage / intervals for routine imaging			
Stage (valvular AS)	Progressive (stage B) Mild Vmax 2.0-2.9 m/s	Progressive (stage B) Moderate Vmax 3.0-3.9 m/s	Severe (stage C) ≥ 4.0 m/s	Aortic root dilation >4.5 cm
echo (TTE)	3 years	1 years	6 months	12 months
MRA Chest or CTA				if ascending allowed yearly

Degree of aortic stenosis (AS) severity			
	Mild AS	Moderate AS	Severe AS
Vmax (m/s) ^a maximum Doppler velocity	2.0-2.9	3.0-3.9	≥ 4.0
Mean gradient (mmHg) ^a	<30	30-49	≥ 50
AVA (cm ²) aortic valve area	>1.5	1.0-1.5	<1.0

Degree of aortic stenosis (AS) severity			
	Mild AS	Moderate AS	Severe AS
AVA _i (cm ² /m ² BSA) indexed aortic valve area	≥1.0	0.6-0.9	<0.6
^a At normal transvalvular flow, BSA= body surface area			

Adapted from: ESC Guidelines for the management of grown-up congenital heart disease (new version 2010): The Task Force on the Management of Grown-up Congenital Heart Disease of the European Society of Cardiology (ESC).

Aortic disease in Turner Syndrome (CD-11.2.10)

CD.CHD.0011.2.10.A

v2.0.2024

Dissection more common for a given aortic diameter. Mid-ascending aortic disease more common and may not be reliably seen on echocardiogram

Initial studies-Diagnosis, clinical changes, consideration of surgery

- Echocardiogram (TTE) at time of diagnosis
- MRA Chest or CTA Chest to rule out mid ascending aortic aneurysm if mid aorta was not seen on echocardiogram.

Surveillance

- Echocardiogram (TTE) yearly
 - MRA Chest or CTA if mid ascending aorta not visualized
- For documented thoracic aortic aneurysm (TAA) ≤ 4 cm
 - Routine MRA Chest or CTA yearly
- For documented thoracic aortic aneurysm (TAA) > 4 cm
 - MRA Chest or CTA every 6 months.

Supravalvular Aortic Stenosis (CD-11.3.1)

CD.CHD.0011.3.1.A

v2.0.2024

Supravalvular aortic stenosis is a relatively rare condition overall but is seen commonly in individuals with Williams syndrome or homozygous familial hypercholesterolemia.

Initial studies-Diagnosis, clinical changes, consideration of surgery

- Echocardiogram (TTE) at time of diagnosis
- MRA Chest or CTA Chest
- Cardiac MRI or CTA Cardiac to assess coronary ostia
- Cardiac cath for any individuals pre-cardiac intervention for coronary arteries
- New cardiac symptoms-any of the following:
 - CT Cardiac or cardiac MR
 - CTA Chest or MRA Chest
 - Stress imaging as per **Stress Testing with Imaging – Indications (CD-1.4)**

Routine follow-up supravalvular AS

Modality	Physiological stage / intervals for routine imaging (months)			
Physiological stage	A	B	C	D
TTE	24	24	12	12
CMR or CCT	36	36	36	36

Coarctation of the Aorta (CD-11.3.2)

CD.CHD.0011.3.2.A
v2.0.2024

Coarctation is suspected based on clinical findings:

- BP higher in upper extremities than in the lower extremities
- Absent femoral pulses
- Continuous murmur
- Abdominal bruit
- Berry aneurysm with hemorrhage
- Rib notching on x-ray
- Abnormal thoracic aortic imaging and blood pressures

Initial studies-Diagnosis, clinical changes, consideration of surgery

- Echocardiogram (TTE) at time of diagnosis
 - No further imaging is required if echocardiogram (TTE), blood pressure, and exam rule out Coarctation.
 - If echo and exam are equivocal or positive one of the following is indicated:
 - CTA Chest
 - MRA Chest
 - Individuals with Coarctation of the aorta do not require intra-cardiac MRI unless issue cannot be resolved on echocardiogram.
 - Screening for intracranial aneurysm by MRA or CTA of head is allowed
- ETT for diagnosis of exercise induced hypertension does not require imaging
- Cardiac MRI not required unless issues unresolved by echo for intracardiac anatomy
- Diagnostic cath can be approved prior to stenting of the coarctation
- Stress imaging, TEE, Cardiac MRI or CT, Coronary imaging not routine

Symptomatic

- Individuals with Coarctation are at risk for dissection. When individual has new or worsening symptoms any of the following:
 - Echocardiogram (TTE)
 - MRA Chest or CTA.
- For exertional symptoms, one of the following:
 - Stress imaging-per **Stress Testing with Imaging – Indications (CD-1.4)**
 - Cardiac MRI or CT Cardiac

Routine follow-up Coarctation of the Aorta

Modality	Physiological stage / intervals for routine imaging (months)			
Physiological stage	A	B	C	D
TTE	24	24	12	12
MRA Chest or CTA Chest	36	36	12	12

Valvular Pulmonary Stenosis (CD-11.3.3)

CD.CHD.0011.3.3.A

v2.0.2024

Overview Initial studies-Diagnosis, clinical changes, consideration of surgery

- Echocardiogram (TTE) at time of diagnosis
- For issues affecting management not well visualized on TTE
 - Cardiac MRI or CT Cardiac
 - MRA Chest or CTA Chest

Valvular PS routine follow-up and testing.

- Echocardiogram-stages
 - Mild PS – peak gradient <36 mmHg (peak velocity < 3m/s)
 - Moderate PS- peak gradient 36-64 mmHg (peak velocity 3-4 m/s)
 - Severe PS- peak gradient >64 mmHg (peak velocity > 4 m/s); or mean gradient >35 mmHg.
- Routine stress imaging is not required
- Routine chest or cardiac or ischemia workup not required.

Valvular PS routine imaging

Modality	Physiological stage / intervals for routine imaging (months)			
Physiological stage	A	B	C	D
TTE	36	24	12	12

Isolated Pulmonary regurgitation after PS repair-Echo and CMR at same interval as TOF

Modality	Physiological stage / intervals for routine imaging (months)			
Physiological stage	A	B	C	D
TTE	24	12	12	12
CMR	36	24	12	12

Branch and Peripheral pulmonary stenosis (CD-11.3.4)

CD.CHD.0011.3.4.A

v2.0.2024

Overview

- Can be seen in newborns as a normal variant in the first 6 months of life
- Can be seen in surgeries of right ventricular outflow (TOF)
 - Noonan
 - Alagille
 - Williams
 - Maternal rubella exposure
 - Keutel syndrome

Initial studies-Diagnosis, clinical changes, consideration of surgery

- Echocardiogram (TTE) at time of diagnosis
- Baseline MRA Chest or CTA Chest
- Cath may be considered if other advanced imaging is not adequate for management
- VQ scan or MRA Chest for differential blood flow

Routine follow-up branch and peripheral pulmonary stenosis

Modality	Physiological stage / intervals for routine imaging (months)			
Physiological stage	A	B	C	D
TTE	24	24	12	12
Cardiac MRI or CT Cardiac	36	36	24	24
MRA Chest or CTA Chest	36	36	24	24

Double chambered RV (CD-11.3.5)

CD.CHD.0011.3.5.A
v2.0.2024

Initial studies-Diagnosis, clinical changes, consideration of surgery

- Echocardiogram (TTE) at time of diagnosis

Routine follow-up double chambered right ventricle (RV)

Modality	Physiological stage / intervals for routine imaging (months)			
Physiological stage	A	B	C	D
Echo (TTE)	24	24	12	12

Ebstein Anomaly (CD-11.3.6)

CD.CHD.0011.3.6.A
v2.0.2024

Overview Initial studies-Diagnosis, clinical changes, consideration of surgery

- Echocardiogram (TTE) at time of diagnosis
- TEE if either:
 - TTE is not adequate
 - If surgery/intervention planned
- Cardiac MRI or CT Cardiac at time of Diagnosis

Routine follow-up Ebstein Anomaly

Modality	Physiological stage / intervals for routine imaging (months)			
Physiological stage	A	B	C	D
Echo (TTE)	12	12	12	12
Cardiac MRI or CT Cardiac	60	36	24	12

Tetralogy of Fallot (TOF, VSD with PS) (CD-11.3.7)

CD.CHD.0011.3.7.A

v2.0.2024

Includes TOF with pulmonary atresia, VSD PA

Initial studies-Diagnosis, clinical changes, consideration of surgery

- Echocardiogram (TTE) at time of diagnosis
- Cardiac MR or CTA Cardiac at time of diagnosis
- MRA Chest or CTA Chest at time of diagnosis
- Cardiac catheterization if other advanced imaging leaves unanswered questions

Prior to cardiac intervention or surgery

- Repeat imaging Echo/MR/CT
- Cath prior to surgery or intervention
 - If planned Catheter Pulmonary Valve replacement, procedure includes diagnostic cath and hemodynamics and diagnostic cath is not billed separately

New or worsening symptoms

- Repeat advanced imaging
 - New or worsening symptoms
 - New EKG changes
- Stress imaging (stress echo, stress MRI, or MPI) allowed for typical chest pain, even if intermediate pretest probability at atypical symptoms in individuals with known or undefined coronary artery (CA) anatomy or CA pathology
- VQ scan or MRA chest for left/right perfusion abnormality

Routine Follow-up Tetralogy of Fallot (TOF)

Modality	Physiological stage / intervals for routine imaging (months)			
Physiological stage	A	B	C	D
TTE	24	12	12	12
Cardiac MRI or CCTA	36	24	12	12

Modality	Physiological stage / intervals for routine imaging (months)			
Physiological stage	A	B	C	D
CTA Chest or MRA	36	24	12	12

Right Ventricle-to-Pulmonary Artery Conduit (CD-11.3.8)

CD.CHD.0011.3.8.A

v2.0.2024

Initial studies-Diagnosis, clinical changes, consideration of surgery. Surgical repair for many lesions such as TOF/ Truncus /Pulmonary atresia

- Echocardiogram (TTE) at time of diagnosis
- Cardiac MRI or CTA Cardiac
- MRA Chest or CTA Chest
- Prior to interventions or surgery may repeat any of the above imaging
- Cath allowed for new symptoms or with new imaging findings as needed for management
- Stress imaging (stress echo, stress MRI or MPI) as requested for symptoms

Routine follow-up Right Ventricle-to-Pulmonary Artery Conduit

Modality	Physiological stage / intervals for routine imaging (months)			
Physiological stage	A	B	C	D
TTE	12	12	12	12
CMR or CCTA	36	36	12	12
MRA Chest or CTA Chest	36	36	12	12

Transposition of the great arteries (TGA) (CD-11.3.9)

CD.CHD.0011.3.9.A

v2.0.2024

Initial studies-Diagnosis, clinical changes, consideration of surgery

- Echocardiogram (TTE) at time of diagnosis
- Baseline Cardiac MRI or CCTA
- Baseline MRA Chest or CTA
- Stress imaging as requested for symptoms or signs of ischemia
- V/Q scan for left to right PA perfusion or MRA Chest
- Symptomatic individuals should be offered stress physiological imaging and repeat anatomic imaging considered if symptoms are suggestive of coronary ischemia (regardless of diamond forester pretest probability category)
- Cath right and left heart when issues not elucidated on advanced imaging

Routine follow-up TGA

Modality	Physiological stage / intervals for routine imaging (months)			
Physiological stage	A	B	C	D
TTE	12	12	12	12
CMR or CCTA	36	24	12	12
MRA Chest or CTA Chest	36	24	12	12

Congenitally corrected TGA (CD-11.3.10)

CD.CHD.0011.3.10.A
v2.0.2024

Initial studies-Diagnosis, clinical changes, consideration of surgery

- Echocardiogram (TTE) at time of diagnosis
- Baseline CMR and MRA Chest
- CMR and/or Echo for changes in clinical status

Routine follow-up congenitally corrected TGA

Modality	Physiological stage / intervals for routine imaging (months)			
Physiological stage	A	B	C	D
Echo (TTE)	12	12	12	12
CMR or CCTA	36	36	12	12
CTA Chest or MRA Chest	36	36	12	12

Fontan Palliation of Single Ventricle Physiology (CD-11.3.11)

CD.CHD.0011.3.11.A

v2.0.2024

Including Tricuspid Atresia and Double Inlet Left Ventricle, HLHS, HRHS, PA, Mitral atresia, AVC unbalanced, single ventricle, DIRV, pulmonary atresia, HLHS, Glen procedure, TA, double outlet right ventricle (DORV), and single ventricle physiology

Initial studies-Diagnosis, clinical changes, consideration of surgery

- Echocardiogram (TTE) at time of diagnosis and with any new Symptoms
- CMR or CCTA can be done annually (vs. based on below chart) on individuals who have prior issues that were equivocal on echo, and the data is required (i.e. very poor windows)
 - Cardiac catheterization prior to surgical interventions
- Echo/CMR or CCTA/MRA Chest or CTA Chest/cath with any new signs or symptoms
- V/Q scan or MRA for lung perfusion left vs. right

Routine follow-up Fontan Palliation of Single Ventricle Physiology

Modality	Physiological stage / intervals for routine imaging (months)			
Physiological stage	A	B	C	D
Echo (TTE)	12	12	12	12
CMR or CT Cardiac	36	24	24	24
CTA Chest or MRA	36	24	24	24
Cardiac catheterization	120 (10 years)	120 (10 years)	120 (10 years)	120 (10 years)

Severe Pulmonary artery hypertension (PHT) and Eisenmenger syndrome (CD-11.3.12)

CD.CHD.0011.3.12.A
v2.0.2024

Initial studies-Diagnosis, clinical changes, consideration of surgery

- Echo (TTE)
 - Initial diagnosis
 - With new signs or symptoms
- Cardiac cath
 - Echo (TTE) results suggest PHT
 - New signs or symptoms with PHT

Long term follow-up Severe Pulmonary artery hypertension (PHT) and Eisenmenger syndrome

Modality	Physiological stage / intervals for routine imaging (months)			
Physiological stage	A	B	C	D
TTE			6	6
CMR or CCT			As needed	As needed
MRA Chest or CTA Chest			As needed	As needed
Cath			As needed	As needed

Coronary artery anomalies (CD-11.3.13)

CD.CHD.0011.3.13.A

v2.0.2024

Initial studies-Diagnosis, clinical changes, consideration of surgery

- Echocardiogram (TTE)
 - At baseline
 - Any signs or symptoms
- Coronary CT/MR/Cath for initial evaluation
- Coronary artery from wrong sinus-baseline stress imaging regardless of symptoms
- Stress imaging for any cardiac signs or symptoms
- For Kawasaki GL regarding echo, Stress imaging, coronary imaging, see pediatric GL **Kawasaki Disease (PEDCD-6)**

Pregnancy – Maternal Imaging (CD-11.4)

CD.DHC.0011.4.A
v2.0.2024

- Overview
 - World Health Organization (WHO) classification:
 - WHO classification I: no detectable increased risk of maternal mortality and no/mild increase in morbidity.
 - Uncomplicated small or mild pulmonary stenosis
 - Patent Ductus Arteriosus (PDA)
 - Mitral valve prolapse
 - Successfully repaired simple lesions (atrial or ventricular septal defect, patent ductus arteriosus, anomalous pulmonary venous connection)
 - WHO classification II: small increase in maternal risk mortality or moderate increase in morbidity.
 - Unrepaired atrial or ventricular septal defect
 - Repaired tetralogy of Fallot
 - WHO classification II–III (depending on individual)
 - Mild left ventricular impairment
 - Native or tissue valvular heart disease not considered WHO I or IV
 - Marfan syndrome without aortic dilation
 - Aorta <45 mm in association with bicuspid aortic valve disease
 - Repaired coarctation
 - WHO classification III: significantly increased risk of maternal mortality or severe morbidity. Expert counseling required. If pregnancy is decided upon, intensive specialist cardiac and obstetric monitoring needed throughout pregnancy, childbirth and the puerperium.
 - Mechanical valve
 - Systemic right ventricle
 - Fontan circulation
 - Unrepaired cyanotic heart disease
 - Other complex congenital heart disease
 - Aortic dilation 40–45 mm in Marfan syndrome
 - Aortic dilation 45–50 mm in bicuspid aortic valve disease
 - WHO classification IV: extremely high risk of maternal mortality or severe morbidity; pregnancy contraindicated. If pregnancy occurs, termination should be discussed. If pregnancy continues, care as for WHO class III.
 - Pulmonary arterial hypertension from any cause

- Severe systemic ventricular dysfunction (LVEF <30%, NYHA functional class III–IV)
- Severe mitral stenosis; severe symptomatic aortic stenosis
- Marfan syndrome with aorta dilated >45 mm
- Aortic dilation >50 mm in aortic disease associated with bicuspid aortic valve
- Native severe coarctation of the aorta

Adapted from: Elkayam U, Goland S, Pieper PG, Silversides CK. High-Risk Cardiac Disease in Pregnancy. Journal of the American College of Cardiology.

- Congenital heart disease imaging in pregnancy
 - Echocardiogram (TTE) when planning pregnancy
 - TEE if TTE equivocal
 - CMR can be performed prior to planning pregnancy in those lesions where CMR would be routinely performed at some later date
 - CTA Chest or MRA Chest of arch if known disease with aortic involvement or if known dilation
 - Repeat echocardiogram and MR (can be without gad) can be performed based on the WHO classification II, III, IV, or other risk factors
 - Severe complex CHD TTE (93306)
 - Every 2-4 weeks for major physiological changes
 - As often as needed for any of the following:
 - Pulmonary hypertension
 - Changes in function
 - To guide delivery after 24 weeks
 - Echo can be performed if new signs or symptoms during pregnancy
 - Postpartum first year can have more frequent imaging
 - Stress imaging pre/during pregnancy for individuals with known coronary artery anomaly, pulmonary hypertension, LVOT obstruction, cardiac dysfunction, single ventricle.
 - WHO II, III, IV, can have echo/MR/CT/stress imaging prior to pregnancy
 - WHO I- one echocardiogram during pregnancy
 - WHO II- one echocardiogram per trimester during pregnancy
 - WHO II/III- echocardiogram every 2 months during pregnancy
 - WHO III/IV- echocardiogram monthly during pregnancy
 - Individuals may require more (even weekly) if treatment decision, delivery is considered.
- Syndromes that allow cardiac imaging at the time of diagnosis if not previously done. This list is not exhaustive
 - DiGeorge/velocardiofacial (22q11.2)
 - Down syndrome (trisomy 21)

- Holt Oram (TBX5)
- Klinefelter syndrome (47 XXY)
- Noonan (PTPN11, KRAS, SOS1 RAF1, NRAS, BRAF, MAP2K1)
- Turner (45X)
- Williams (7q11.23 deletion)
- Any syndrome associated with congenital heart disease.
- Echocardiogram at time of Diagnosis (either genetic testing or clinical features)
- CMR or CCTA if arch involved in disease.
- See **Maternal Imaging in Cardiovascular Disease (CD-15)**

Guideline

Maternal imaging in cardiovascular disease
Peripartum Red Flag Signs and Symptoms
Imaging Modalities in Maternal Imaging
Background and Supporting Information
References

Maternal imaging in cardiovascular disease

Ultrasound and magnetic resonance are the preferred imaging modalities to minimize radiation exposure in pregnancy. When imaging using ionizing radiation is necessary, radiation exposure should follow the ALARA principle (As Low As Reasonably Achievable). Shared decision making regarding diagnostic testing should occur in consultation with the individual, cardiologist, and obstetrical team when weighing the risk of fetal exposure to radiation against the need to diagnose or plan treatment for serious illness.

Peripartum Red Flag Signs and Symptoms

Imaging as requested, as listed within **Imaging Modalities in Maternal Imaging** (Echocardiogram, Exercise stress echo, Coronary angiography, Cardiac MRI), is indicated for peripartum individuals for any of the following **red flag** signs or symptoms:

- Chest pain
- Dyspnea
- Orthopnea
- Cough
- Lower extremity edema when there is a concern for heart disease
- Tachycardia
- Unheralded syncope
- Headache
- Acute visual changes
- New onset hypotension
- Hypertension

Imaging Modalities in Maternal Imaging

Transthoracic echocardiography (TTE)

- TTE (CPT® 93306) is the primary cardiac imaging modality in pregnancy. Baseline and surveillance echocardiography is indicated for several conditions as noted in **Maternal imaging in cardiovascular disease (CD-15.2)** Table 1.
- A repeat echocardiogram is indicated when there are new or worsening cardiovascular signs or symptoms, as described in **Peripartum Red Flags, Transthoracic Echocardiography (TTE)– Indications/initial evaluation (CD-2.2)** and **Frequency of Echocardiography Testing (CD-2.3)**, during and after pregnancy.

Exercise Stress Echo

- Exercise stress echo (CPT® 93350, 93351) is indicated pre-conception to assist with risk stratification in individuals with a documented history of **any** of the following:
 - Current left ventricular dysfunction
 - Previous history of left ventricular dysfunction
 - Valvular heart disease of any severity
 - There is a concern for myocardial reserve
- See Stress echocardiogram in **Stress Testing with Imaging – Indications (CD-1.4)** and **Stress echo–indications other than ruling out CAD (CD-2.7)**
- See **Hypertrophic Cardiomyopathy (CD-14)**

Coronary Angiography

- Fetal risk from ionizing radiation is highest before 20 weeks gestational age. When coronary angiography is medically necessary, the ALARA principle should be followed. Invasive management of acute coronary syndrome is associated with lower in-hospital mortality and should be considered. See **Diagnostic Heart Catheterization**

Cardiac MRI

- Cardiac MRI (CPT® 75557) is utilized in pregnant individuals to measure aortic dimensions, wall motion and ventricular function when the echocardiogram is non-diagnostic. Gadolinium-based contrast agents are not necessary in aortic imaging or most other indications in pregnancy. **See Cardiac MRI**

Background and Supporting Information

- Cardiovascular disease (CVD) in pregnancy has become increasingly prevalent in recent years.
- The increase in plasma volume during pregnancy requires significant physiological adaptation.
- Maternal mortality has increased in the last two decades with CVD accounting for 33% of all deaths.
- Invasive management of myocardial infarction (MI) is associated with lower in-hospital mortality.

- Research has underrepresented females of childbearing age leading to significant deficits in our knowledge of cardiovascular care of these individuals.
- **Cardiac Imaging using ionizing radiation**
 - Multiple imaging modalities expose the pregnant individual and fetus to ionizing radiation.
 - This exposure causes concern for an elevated risk of childhood cancer.
 - Shared decision-making should be employed when weighing the fetal exposure to radiation against the need to diagnose serious illness

Imaging in Pregnancy with Congenital Heart Disease (CHD) (CD-15.4)

CD.MI.0015.4.A

v2.0.2024

Pre-pregnancy imaging based on the World Health Organization (WHO) chart for imaging in pregnancy with CHD

Imaging modality and indication	CPT®
Echo (TTE) when planning pregnancy	93306
TEE if TTE equivocal	93312
CMR (cardiac MRI) can be performed prior to pregnancy in those lesions where CMR would be routinely performed at some later date	75557
CTA or MRA of chest if known aortic disease, Pulmonary artery disease, anomalous pulmonary veins, anomalous systemic veins. (also see peripartum aortopathy table.)	71275, 71555
Echo with new signs or symptoms	93303, 93304, 93306, 93308
Postpartum imaging per provider requested frequency	imaging as noted above
Stress imaging pre/during pregnancy when known Coronary artery anomaly, pulmonary hypertension, LVOT obstruction, cardiac dysfunction, single	93350, 93351, 93320, 93325
WHO II, III, IV, can have echo/MR/CT/stress imaging prior to pregnancy	imaging as noted above

Surveillance Imaging

Surveillance imaging after baseline studies.

TTE frequency after initial imaging, (Individuals who also have aortopathy can have Chest MRA in addition to echo at same frequency.) Individuals with known poor/inadequate imaging on echo, can have CMR in lieu of echocardiogram.

The World Health Organization modified classification of maternal cardiovascular risk

The World Health Organization established a modified classification of maternal cardiovascular risk used as a tool to evaluate risk status for pregnant individuals with various cardiovascular conditions. See **Pregnancy-Maternal Imaging (CD-11.4)**

Class	Risk	Sample Lesions
WHO Class I	No detectable increased risk of maternal mortality and no or mild increase in morbidity.	<ul style="list-style-type: none"> Mild Pulmonary stenosis Small PDA Mild MVP Successfully repaired simple lesions (ASD, VSD, PDA, anomalous pulmonary venous drainage) Isolated PACs or PVCs
WHO Class II	Small increased risk of maternal mortality or moderate increase in morbidity.	<ul style="list-style-type: none"> Un-operated ASD or VSD Repaired TOF (uncomplicated) Most arrhythmias
WHO Class II-III	Intermediate increased risk of maternal mortality or moderate to severe increase in morbidity.	<ul style="list-style-type: none"> Mild left ventricular impairment Hypertrophic cardiomyopathy Native or tissue valvular heart disease not considered WHO I or IV Aorta <45 mm in aortic disease associated with bicuspid aortic valve Repaired coarctation
WHO Class III	Significantly increased risk of maternal mortality or severe morbidity. <ul style="list-style-type: none"> Expert counseling required. If pregnancy is decided upon, intensive specialist cardiac and obstetric monitoring needed throughout pregnancy, childbirth and the postpartum period. 	<ul style="list-style-type: none"> Mechanical valve Systemic right ventricle Fontan circulation Unrepaired cyanotic heart disease Other complex congenital heart disease

Class	Risk	Sample Lesions

Myocardial Strain Imaging (CD-12.2)

Mavacamten for Obstructive Hypertrophic Cardiomyopathy (HCM) (CD-12.3)

References (CD-12)

Cardiotoxic agent/Cancer Therapeutics-Related Cardiac Dysfunction (CD-12.1)

Transthoracic Echocardiogram (TTE)

Transthoracic Echocardiogram (TTE) is indicated to determine Left Ventricular (LV) function in individuals on cardiotoxic chemotherapeutic drugs

- 3D echocardiography CPT® 93319 is indicated in addition to the primary TTE and is the preferred echocardiography modality for the assessment of left ventricular ejection fraction (LVEF) and cardiac volumes. See **3D Echocardiography (CD 2.9)**
- Myocardial strain imaging (CPT® 93356) to obtain a Global Longitudinal Strain (GLS) is indicated as an important adjunct in screening for CTRCD. See **Myocardial Strain Imaging (CD 12.2)**

Multimodality imaging

- Guidelines support using echocardiography rather than MUGA for the determination of LVEF and/or wall motion EXCEPT in one of the circumstances described previously in **MUGA Study – Cardiac Indications (CD-3.4)**. (see **Background and supporting information** below).
- CT coronary calcium scoring (CPT® 75571) is indicated every 5 years to screen for radiation induced coronary artery disease, unless previous coronary calcium score is >0 in cancer survivors who have received chest radiation therapy.
- Cardiac MRI (CMR) is indicated in the evaluation of CTRCD for the following:
 - TTE is not diagnostic
 - Tissue characterization for cardiomyopathy or myocarditis, particularly when Immune Checkpoint Inhibitor Myocarditis is being questioned.
 - See also **Cardiac MRI and MRA Chest – Indications (CD 5.2)**.

Frequency of CTRCD screening

- Baseline
 - All patients can have a baseline TTE prior to initiation of cardiotoxic agents
- During treatment with cardiotoxic agents
 - The frequency of monitoring depends on the agent administered and the patient's baseline cardiovascular toxicity risk. (See **Background and Supporting Information** below)
- Post treatment with cardiotoxic agents surveillance
 - One TTE is indicated 3 to 12 months after completion of therapy
- Adult cancer survivors
 - Long term surveillance TTE is indicated every 5 years, except in those with low risk
 - Additional surveillance TTE, at 1 and 3 years after cancer therapy completion is indicated in those deemed to be high risk for CTRCD
- Adult survivors of childhood and adolescent cancer
 - Surveillance TTE is indicated every 2 years for survivors with indeterminate risk due to unknown cancer therapy history
 - Surveillance TTE is indicated every 2 years for high risk survivors, defined as a history of any of the following:
 - Radiation dose ≥ 30 Gy
 - Anthracycline dose of < 100 mg/m² and radiation dose ≥ 15 Gy
 - Anthracycline dose ≥ 250 mg/m²
 - Surveillance TTE is indicated every 5 years for moderate risk survivors, defined as a history of any of the following:
 - Radiation dose ≥ 15 to < 30 Gy
 - Anthracycline dose of < 250 mg/m² and radiation dose < 15 Gy
 - No screening is indicated in low risk survivors, defined as a history of any of the following:
 - Anthracycline dose of > 0 to < 100 mg/m²
 - Radiation dose > 0 to < 15 Gy
- TTE is indicated for cancer survivors with a history of chest radiotherapy or anthracycline exposure who are pregnant or planning to become pregnant as follows:
 - Baseline exam
 - 12 weeks of pregnancy if missed the baseline TTE or in high risk survivors
 - 20 weeks of pregnancy for high risk survivors
 - TTE can be repeated for any symptoms at any other time as needed during or immediately following pregnancy

- Adults who received anthracyclines in childhood see **Cardiotoxicity and Echocardiography (PEDONC-19.2)**

Background and supporting information

- High value screening protocol to detect CTRCD using TTE (CPT® 93306 or 93308) is contingent upon careful baseline cardiotoxicity risk assessment and stratification into low, moderate and high risk. Currently, there is no universally accepted risk score, documentation of risk by the provider is sufficient to guide screening strategy.
- Advantages of Echocardiography in comparison to MUGA in individuals on cardiotoxic chemotherapy:
 - No ionizing radiation
 - No IV access required when echo contrast is not used
 - Allows view of the pericardium to look for effusion
 - Allows estimate of pulmonary pressure
 - May allow visualization of a clot or tumor in the Inferior Vena Cava (IVC) and/or the right heart

Myocardial Strain Imaging (CD-12.2)

- Myocardial strain imaging (CPT® 93356) in addition to the primary echocardiogram in individuals receiving therapy with cardiotoxic agents for ANY of the following:
 - Initial evaluation-prior to treatment with EITHER:
 - Medications that could result in cardiotoxicity/heart failure
 - Radiation that could result in cardiotoxicity/heart failure
 - Re-evaluation of an individual previously or currently undergoing therapy as per echocardiogram parameters. See **Cardiotoxic agent/Cancer Therapeutics-Related Cardiac Dysfunction (CD-12.1)**
 - Re-evaluation of an individual undergoing therapy with worsening symptoms

Mavacamten for Obstructive Hypertrophic Cardiomyopathy (HCM) (CD-12.3)

Echocardiogram (CPT® 93306) is indicated for individuals treated with mavacamten for class II-III obstructive HCM as follows:

Initiation of treatment

- Baseline-at the beginning of treatment
- 4 weeks after treatment initiation
- 8 weeks after treatment initiation
- 12 weeks after treatment initiation
- Then every 12 weeks while on mavacamten

Changes in treatment

- 4 weeks after any interruption of treatment (any missed dose)
- After any dosage change (including restart of treatment):
 - 4 weeks after dosage change
 - 12 weeks after dosage change
- After initiating a weak CYP2C19 inhibitor (e.g., omeprazole) or moderate CYP2A4 inhibitor (e.g., ciprofloxacin):
 - 4 weeks after start of medication
 - 12 weeks after start of medication
- At any time regardless of timing of prior echo when there are new cardiac signs or symptoms, or worsening of clinical status

See also **Hypertrophic Cardiomyopathy (HCM) (CD-14)**

Background and supporting information

Hypertrophic Cardiomyopathy (HCM) is a clinical diagnosis, established by imaging with 2D echocardiography or cardiovascular magnetic resonance (CMR) showing a maximal end-diastolic wall thickness of ≥ 15 mm anywhere in the left ventricle, in the absence of another cause of hypertrophy in adults. More limited hypertrophy (13–14 mm) can be diagnostic, particularly when present in family members of a patient with HCM or in conjunction with a positive genetic test, and/or associated with typical dynamic outflow obstruction, or distinctly abnormal ECG patterns.

Cardiac Sarcoidosis (CD-3.9)

CD.CS.0003.9.A
v2.0.2024

Guideline

Cardiac Sarcoidosis (CD-3.9)

References

Cardiac Sarcoidosis (CD-3.9)

Suspected cardiac sarcoidosis (see Background and Supporting Information)

- MRI imaging of the heart with gadolinium (CPT® 75561). Initial imaging for identification of suspected cardiac sarcoid should be cardiac MRI with late gadolinium enhancement (LGE) protocol unless there is a contraindication to MRI imaging (non-MRI safe pacemaker, renal failure). Absence of LGE is a strong negative predictor for low rates of cardiac morbidity and mortality from cardiac sarcoid and further testing is not usually indicated.
- PET – Metabolic imaging with F-18 FDG for diagnosis if there is a contraindication to MRI and cardiac sarcoid is suspected. Requires PET with F-18 FDG metabolic study combined with a PET perfusion study (CPT® 78432 or CPT® 78433) OR PET metabolic study (CPT® 78459 or CPT® 78429) and SPECT perfusion image (CPT® 78451).
 - For equivocal MRI
 - To confirm diagnosis if suggested by MRI

Monitoring of treatment of established cardiac sarcoidosis

- PET - Cardiac PET metabolic is indicated to monitor therapy in cardiac sarcoidosis. Requires PET with F-18 FDG metabolic study combined with a PET perfusion study (CPT® 78432 or CPT® 78433) OR PET metabolic study (CPT® 78459 or CPT® 78429) and SPECT perfusion image (CPT® 78451).
 - Prior to treatment of cardiac sarcoid
 - PET (heart FDG metabolic with perfusion study as above) can be repeated at 3-6 month intervals if there is active disease or to make therapeutic decisions.

Background and supporting information

- Cardiac imaging is reasonable to detect cardiac sarcoid in the following:
 - Any patient with extra cardiac sarcoid even if no cardiac symptoms
 - Echo with basal thinning of the intraventricular septum, depressed EF <50 or regional wall motion abnormality not associated with CAD

- Young patients with unexplained ventricular tachycardia, especially monomorphic VT
- Patients with unexplained cardiomyopathy or heart failure (i.e., CAD has been ruled out)
- Patients with unexplained arrhythmia especially advanced AV block or VT
- Full body PET/CT (CPT® 78815) is not indicated for the diagnosis or monitoring response to therapy of cardiac sarcoid. It may be considered to assist in diagnosis and/or treatment options in some instances of pulmonary sarcoid. See **Sarcoid (CH-15.1)** in the Chest Imaging Guidelines

Congestive Heart Failure (CD-9)

CD.CS.0009.A

v2.0.2024

Guideline

CHF – Imaging (CD-9.1)

Myocardial Sympathetic Innervation Imaging in Heart Failure (CD-3.6)

Left ventricular assist devices (LVAD) (CD-9.4)

References (CD-9)

CHF – Imaging (CD-9.1)

- Congestive heart failure (CHF), including post-cardiac transplant failure:
 - Echocardiogram is the first study after the clinical evaluation for suspected CHF.
 - MUGA, cardiac MRI or cardiac CT may be indicated if the ECHO is limited or does not completely answer the question.
 - Stress test to assess for CAD may be indicated. Follow stress testing guideline: **Stress Testing with Imaging – Indications (CD-1.4)**
- Arteriovenous fistula with “high output” heart failure:
 - CT Chest with contrast (CPT® 71260) and/or CT Abdomen and/or CT Pelvis with contrast (CPT® 74160 or CPT® 72193 or CPT® 74177) **OR**
 - CTA Chest (CPT® 71275) and/or CTA Abdomen and/or CTA Pelvis (CPT® 74175 or CPT® 72191 or CPT® 74174) **OR**
 - MRI Chest and/or MRI Abdomen and/or MRI Pelvis without and with contrast (CPT® 71552 and/or CPT® 74183 and/or CPT® 72197) **OR**
 - MRA Chest and/or MRA Abdomen and/or MRA Pelvis (CPT® 71555 and/or CPT® 74185 and/or CPT® 72198)
- Right-sided congestive heart failure can be a manifestation of pulmonary hypertension or serious lung disease.
 - CT Chest (CPT® 71260) or CTA Chest (CPT® 71275) to evaluate for recurrent pulmonary embolism

Myocardial Sympathetic Innervation Imaging in Heart Failure (CD-3.6)

- Nuclear imaging using I-123-meta-iodobenzylguanidine (I-123-mIBG) in an attempt to image increased myocardial sympathetic activity is considered to be experimental and investigational.
- The AMA has established the following set of Category III codes to report these studies:
 - **0331T** - Myocardial sympathetic innervation imaging, planar qualitative and quantitative assessment
 - **0332T** - Myocardial sympathetic innervation imaging, planar qualitative and quantitative assessment; with tomographic SPECT.

Background and supporting information

In heart failure, the sympathetic nervous system is activated in order to compensate for the decreased myocardial function. Initially, this is beneficial, however, long-term this compensatory mechanism is detrimental and causes further damage.

Markers have been developed, using radioactive iodine, in an attempt to image this increased myocardial sympathetic activity. Currently, AdreView™ (Iodine-123 meta-iodobenzylguanidine), is the only FDA-approved imaging agent available for this purpose.

Left ventricular assist devices (LVAD) (CD-9.4)

Left ventricular assist devices (LVAD) are implantable devices used in individuals with advanced heart failure refractory to medical therapy as a bridge to transplantation or as a destination therapy.

Pre-LVAD implant

The following imaging studies are indicated for preoperative evaluation prior to planned LVAD implant:

- TTE (CPT® 93306)
- 3D rendering for echocardiography (CPT® 76376 or CPT® 76377)
- Cardiac MRI (CPT® 75557 or CPT® 75561) and CMR velocity flow mapping (CPT® 75565)
- CT Chest (CPT® 71250 or CPT® 71260) or CTA Chest (CPT® 71275) or MRI Chest (CPT® 71552) or MRA Chest (CPT® 71555)
- CTA Abdomen and pelvis (CPT® 74174) or MRA abdomen and pelvis (CPT® 74185 and CPT® 72198)
- CT coronary angiography (CPT® 75574) in individuals post-coronary artery bypass grafting to assess the location and course of the bypass grafts to guide the surgical approach
- Transesophageal echocardiography (CPT® 93312, 93320, 93325)
- Right heart catheterization (CPT® 93451) or Right and left heart catheterization (CPT 93453)

Post LVAD implant

TTE (CPT® 93306) is indicated as follows:

- Post-implant at the following intervals:
 - 2 weeks
 - One month

- Three months
- Six months
- Twelve months
- Every 6 months thereafter

CT

- CTA Chest (CPT® 71275) or CT Chest with contrast (CPT® 71260) is indicated for evaluation of LVAD malfunction
- CT Chest without contrast (CPT® 71250) or CT Chest with contrast (CPT® 71260) indicated for the evaluation of LVAD-related infections

FDG PET/CT for LVAD driveline infection (CPT® 78815 or CPT® 78429)

- Early infection detection for LVAD drivelines is desirable, since once the infection extends to the cannula and pump pocket, eradication becomes difficult. CT findings are nonspecific and metal device artifacts of the driveline itself affects sensitivity.
- FDG PET/CT can be approved for suspected LVAD infection if other studies and examination remain inconclusive.
- See **FDG PET/CT for Infections (CD-6.5)**

Right heart catheterization (RHC)

- RHC (CPT® 93451) or Right and Left heart catheterization (CPT® 93453) as needed for hemodynamic assessment to guide changes to therapy

Pre-Surgical Cardiac Testing (CD-13)

CD.CS.0013.A

v2.0.2024

Guideline

Pre-Surgical Cardiac Testing – General Information (CD-13.1)

Primary Cardiac Surgery – No Previous Cardiac Surgery (CD-13.2)

Re-operative cardiac surgery (CD-13.3)

Minimally Invasive Valve Surgery (CD-13.4)

Percutaneous Mitral Valve Repair (mitral valve clip) (CD-13.5)

References (CD-13)

Pre-Surgical Cardiac Testing – General Information (CD-13.1)

- It is important to differentiate requests for preoperative CT imaging before cardiac surgery according to type of procedure planned:
 - Primary cardiac operation—individuals who have not had prior heart surgery
 - Redo procedures—individuals who have had a prior procedure (it is important to determine the type of procedure as this may impact which modality is most appropriate for the pre-operative assessment)
 - Minimally invasive procedures, such as minimally invasive aortic valve operations, minimally invasive or robotic mitral operations, TAVR, MitraClip™ or other percutaneous valve procedures (such as valve in valve aortic or mitral, percutaneous tricuspid and TMVR which will be increasing in the future)
- In re-operative cardiac surgery, the benefit of preoperative CT is to assess for aortic calcifications, to evaluate the anatomic relationships in the mediastinum, such as the location of the various cardiac chambers and great vessels and proximity to the sternum, and to assess for the location of prior bypass grafts. Information can then be used to change the operative strategy including non-midline approach, peripheral vascular exposure, and alternative cannulation sites and for establishing cardiopulmonary bypass before re-sternotomy. These techniques can result in decreased incidence of intraoperative injury to heart, great vessels and prior bypass grafts and lower rates of postoperative stroke. IV contrast is necessary with these studies to delineate the anatomic structures. However, in individuals with renal insufficiency, the provider might choose to forgo the contrast if does not want to contrast load the individual prior to placing them on the heart-lung machine.
- Aortic atherosclerosis is recognized as the single most important determinant of postoperative stroke. There is evidence to support that preoperative CT is associated with lower postoperative stroke rates and mortality after primary cardiac surgery.
 - CT Chest without contrast (CPT® 71250) can be performed pre-operatively to allow the surgeon to:
 - Visualize the extent and location of aortic atherosclerosis

- Change the operative strategy such as those problematic areas are avoided

Primary Cardiac Surgery – No Previous Cardiac Surgery (CD-13.2)

- CT Chest without contrast (CPT® 71250) to evaluate for the presence of ascending aortic calcification may be indicated prior to primary cardiac surgery when there is documented high-risk for aortic calcification including any of the following:
 - Aortic calcification on chest x-ray or other diagnostic test (TEE, fluoroscopy, etc.)
 - Calcific aortic stenosis
 - End stage renal disease (dialysis)

Re-operative cardiac surgery (CD-13.3)

- Individuals undergoing re-operative cardiac surgery may undergo **one** of the following tests for preoperative assessment:
 - CT Chest with contrast
 - CTA Chest
 - CCTA only if prior CABG (this might be in addition to CT with contrast as CCTA will not show the extent of the thoracic aorta that needs to be visualized)
 - CT Heart usually does not provide the necessary information, and is not indicated routinely.

Minimally Invasive Valve Surgery (CD-13.4)

- See **Transcatheter Aortic Valve Replacement (TAVR) (CD-4.8)**
- For an individual undergoing minimally invasive aortic valve surgery and minimally invasive or robotic mitral valve surgery, **ONE** of the following for preoperative assessment of an individual's suitability for the approach and for subsequent procedure planning:
 - CTA Chest, CTA Abdomen and Pelvis
 - CT Chest and CT Abdomen and Pelvis with contrast

Percutaneous Mitral Valve Repair (mitral valve clip) (CD-13.5)

- Percutaneous treatment of mitral regurgitation can be accomplished using venous access to apply a clip device (e.g., MitraClip™ currently FDA approved) to provide edge-to-edge mitral leaflet coaptation, approximating opposing sections of the anterior and posterior mitral valve leaflets. FDA approved indications include treatment for individuals with symptomatic, moderate to severe or severe primary mitral regurgitation whose surgical risks are prohibitive, as well as symptomatic moderate to severe or severe secondary mitral regurgitation who have failed optimal medical therapy. This therapy should include, if indicated, cardiac resynchronization therapy.
- The following imaging may be used to determine if an individual is eligible for the procedure:

- Transthoracic echo with or without 3D rendering
- Transesophageal echo with or without 3D rendering
- Heart catheterization, including right heart cath if requested
- Because this is a venous approach, CTA of Abdomen, Chest, and/or Pelvis **is not** indicated.
- Post-procedure transthoracic echo (TTE) can be performed at the following intervals:
 - One month
 - Six months
 - One year

Pulmonary Hypertension (PH) (CD-8.1)

CD.CS.0008.1.A
v2.0.2024

Guideline

Pulmonary Hypertension - Imaging indications References

Pulmonary Hypertension - Imaging indications

Transthoracic echocardiogram (TTE) (CPT® 93306) should be performed initially as it can help determine the probability of pulmonary hypertension.

Screening

A screening echocardiogram (TTE) for PH is indicated in individuals with documented history of **any** of the following:

- Individuals preoperatively for planned liver transplant.
- Individuals evaluated for transjugular portosystemic shunt
- Portal Hypertension
- Liver disease with signs and symptoms of PH
- Bronchopulmonary dysplasia

Annual screening echo (TTE) is indicated in individuals with a documented history of any of the following:

- Systemic sclerosis (SSc)
- Individuals with PH mutations (e.g., BMPR2)
- First-degree relatives of individuals with PH
- Connective tissue disorder with symptoms consistent with PH
- Individuals with TR velocity ≥ 2.8 m/s, with no other findings on additional testing
- Individuals being treated with medications associated with PH
- Individuals who have a concern documented for PH and had a negative echocardiogram but still show signs or symptoms of PH

Follow-up testing is not indicated in individuals with TR velocity < 2.8 m/s and no other signs, symptoms, or risk factors of PH

Initial imaging

Transthoracic echocardiogram (TTE) (CPT® 93306) is indicated for symptoms and signs of pulmonary hypertension (PH) including **any** of the following:

- Notes documenting clinical concern for pulmonary hypertension

- EKG findings concerning for PH such as **any** of the following:
 - Right ventricular hypertrophy (RVH)
 - Right axis deviation
 - Right atrial enlargement
- Right ventricular hypertrophy or pulmonary artery dilation on other images
- History of pulmonary embolism with persistent or new onset DOE, or exercise limitation
- Suspected PH in individuals with lung disease
- DOE in individuals with connective tissue disorder, HIV, portal hypertension, SSc.
- Symptoms of PH (**any** of the following):
 - Breathlessness
 - SOB
 - Decreased exercise tolerance
 - Fatigue and rapid exhaustion
 - Palpitations
 - Dyspnea on bending forward
 - Hemoptysis
 - Exercise induced abdominal distention and nausea
 - Weight gain due to fluid retention
 - Syncope during or shortly after physical activity
 - Exertional chest pain

Stress Echo (CPT® 93350 or 93351) is indicated for **any** of the following:

- To assess for treatment in the setting of concomitant valvular disease
- As indicated by **Stress Testing with Imaging - Indications (CD-1.4)** or **Stress Echo-Indications Other than Ruling out CAD (CD-2.7)**
- There is documented concern for chronic thrombo-embolic pulmonary hypertension

Cardiac MRI (CPT® 75557) is indicated when there is documentation of **any** of the following:

- TTE is equivocal or unclear (e.g., for RV function) and the information is needed for management
- MRI and TTE may both be required for individuals who need RV pressure and function assessed, and prior RV function cannot be assessed by echocardiogram
- MRI can replace TTE when the issue that makes the imaging by echo unclear is likely to be seen in future echocardiograms

Other advanced imaging is indicated after TTE for the following:

- High-resolution CT Chest (CPT® 71250) is indicated in the setting of hypoxemia to rule out restrictive lung disorders such as pulmonary fibrosis

- CTA Chest (CPT® 71275) or MRA Chest (CPT® 71555) is indicated to evaluate for suspected acute and/or chronic pulmonary embolism
- V/Q scan (CPT® 78580-Pulmonary Perfusion Imaging or CPT® 78582- Pulmonary Ventilation (e.g., Aerosol or Gas) and Perfusion Imaging) is indicated to evaluate for any of the following:
 - Suspected acute pulmonary embolism
 - To evaluate for chronic thromboembolic pulmonary hypertension at 3 to 6 months post pulmonary embolism if both of the following apply:
 - Persistent or new onset dyspnea on exertion or exercise limitation
 - Evidence of pulmonary hypertension on follow up echo
 - To evaluate for chronic thromboembolic pulmonary hypertension in individuals with pulmonary hypertension of uncertain etiology
- SPECT imaging (CPT® 78803) or SPECT/CT imaging (CPT® 78830) can be added to V/Q scan if requested
- Transesophageal (TEE) contrast echocardiography or other imaging techniques (e.g., CT angiography, cardiac MRI) may be indicated, in addition to 2D Doppler and contrast examinations, to identify CHD to detect or exclude **any** of the following:
 - Sinus venosus
 - Atrial septal defects
 - Patent ductus arteriosus
 - Anomalous pulmonary venous connections

Indications for initial Catheterization

Right heart catheterization (RHC) is indicated for **any** of the following:

- Echo findings
 - TR velocity ≥ 3.4 m/second
 - TR velocity ≥ 2.9 m/second and presence of other PH signs on echo or other testing, or risk factors or associated indications
- Individuals with SSc where breathlessness remains unexplained (RHC is recommended despite normal echocardiogram).
- Individuals with connective tissue disorder who have symptoms or concerns for PH with a negative or equivocal echocardiogram.
- When recommended to determine if shunt closure is recommended due to congenital heart disease
- RHC if **moderate** to **severe** PH on echocardiogram (See **Background and Supporting Information** for definitions of mild, moderate and severe PH)
- RHC is indicated prior to starting PH medical therapy.
- Individuals with **low**-risk profile (based on an evidence based PAH Risk Score Calculator such as REVEAL 2.0, ESC/ERS & Compera 2.0) only need cath if indicated for another reason or equivocal studies.(See **Background and Supporting Information** for additional information about PH risk profile)

- RHC allowed when LHC indicated for separate indication.
- RHC preoperative for surgical intervention treating the cause of PH (MV, TV, AV, PV).
- Eisenmenger syndrome – RHC is indicated when requested by provider.

Left heart catheterization (LHC) or Right and left heart catheterization as per the following guidelines:

- **Evaluation of Conditions Other than Coronary Artery Disease (CD-7.7)**
- **Diagnostic Left Heart Catheterization (LHC) (CD-7.3)**

Repeat Testing

Follow-up echocardiogram (TTE) on patients with PH

- Every 6 months for surveillance of stable individuals with moderate or severe pulmonary hypertension (pulmonary artery systolic pressure ≥ 50 mm Hg)
- Prior to planned intubation (e.g., for elective surgery)
- Prior to planned pregnancy
- During pregnancy as often as requested by provider
- Anytime, without regard for the number or timing of previous ECHO studies to evaluate either:
 - Change in therapy
 - Change in clinical findings or symptoms
- Echocardiogram at baseline then every 3 months with therapy changes in stable patients

Pulmonary embolism (PE)

- TTE is indicated 3 to 6 months post pulmonary embolism if **any** of the following apply:
 - Persistent or new onset dyspnea on exertion, or exercise limitation
 - Pulmonary hypertension or right ventricular dysfunction on initial echo at PE diagnosis
 - History of recurrent pulmonary embolism

RHC is indicated for known PH as follows:

- At baseline
- Then every 6 months
- Anytime for clinical changes or with treatment changes

- **Pulmonary Embolism (PE) (CH-25)** in the Chest Imaging Guidelines

Background and supporting information

Pulmonary hypertension (PH) is a complex, chronic disease with multiple etiologies, that requires extensive evaluation, including ECG (right ventricular hypertrophy with/without strain, right atrial dilatation); chest x-ray; arterial blood gas, pulmonary function testing, CT angiography based on the etiology.

PH can be subdivided into the following five groups based on the underlying cause:

- Pulmonary arterial hypertension (PAH)
- PH due to left heart disease
- PH due to lung disease
- Chronic thromboembolic PH (CTEPH)
- PH with unclear and/or multifactorial mechanisms

Probability of PH is assessed at initial evaluation:

- **High** probability:
 - TR velocity ≥ 3.4 m/s
 - TR velocity between 2.9 to 3.4 m/s and **one** of the following:
 - Right ventricle or pulmonary artery enlargement
 - Interventricular septum flattening
 - Right ventricular systolic dysfunction
- **Intermediate** probability:
 - TR velocity between 2.9 to 3.4 m/s in the absence of other signs of PH
- **Low** probability:
 - TR velocity < 2.8 m/s

Peak TR velocity ≥ 2.8 m/s may suggest PH; however, the presence or absence of PH cannot be reliably determined by TR velocity alone

In addition to the tricuspid regurgitation velocity, other findings on echo can increase the probability of PH, examples of these findings include:

- Abnormal tricuspid annular plane systolic excursion (TAPSE)
- Abnormal RV fractional area change (RV-FAC)

- Abnormal RV free-wall strain
- Abnormal tricuspid annulus velocity (S' wave) derived from tissue Doppler imaging
- Abnormal RV ejection fraction (RVEF) derived from 3D echocardiography

MRI can be a useful test especially with respect to RV function

Right heart cath is the gold standard for diagnosing PH

See **Severe Pulmonary Artery Hypertension (PH) and Eisenmenger Syndrome (CD-11.3.12)** for additional information regarding Eisenmenger Syndrome

Pulmonary Vein Imaging – Indications (CD-8.2)

CD.CS.0008.2.A

v2.0.2024

Guideline

Indications

References

Indications

- MRI Cardiac (CPT® 75557 or CPT® 75561), MRV Chest (CPT® 71555), CTV Chest (CPT® 71275), or CT Cardiac (CPT® 75572) to evaluate anatomy of the pulmonary veins:
 - Prior to planned atrial fibrillation ablation/pulmonary vein isolation procedure
 - Post-procedure between 3-6 months after ablation because of a 1% to 2% incidence of asymptomatic pulmonary vein stenosis
 - If no pulmonary vein stenosis is present, no further follow-up imaging is required
 - If pulmonary vein stenosis is present on imaging following ablation and symptoms of pulmonary vein stenosis (usually shortness of breath) are present, can be imaged at 1, 3, 6, and 12 months

Background and Supporting Information

The majority (81%) of pulmonary vein stenosis remain stable over 1 year. Progression occurs in 8.8% and regression occurs in a small percentage.

Hypertrophic Cardiomyopathy (HCM) (CD-14)

CD.CS.0014.A

v2.0.2024

Hypertrophic Cardiomyopathy (HCM) is a clinical diagnosis, established by imaging with 2D echocardiography or cardiovascular magnetic resonance (CMR) showing a maximal end-diastolic wall thickness of ≥ 15 mm anywhere in the left ventricle, in the absence of another cause of hypertrophy in adults. More limited hypertrophy (13–14 mm) can be diagnostic, particularly when present in family members of a patient with HCM or in conjunction with a positive genetic test, and/or associated with typical dynamic outflow obstruction, or distinctly abnormal ECG patterns.

Screening

- Screening for inherited hypertrophic cardiomyopathy see [Transthoracic Echocardiography \(TTE\) – Indications \(CD-2.2\)](#) and [Frequency of Echocardiography Testing \(CD-2.3\)](#)

Initial imaging, new or changed symptoms

TTE

- TTE is indicated for the initial evaluation of a genotype positive individual with inherited hypertrophic cardiomyopathy

Stress echocardiogram

- Exercise stress echo (CPT® 93351 or 93350) is indicated for the detection and quantification of dynamic left ventricular outflow tract obstruction in symptomatic individuals with HCM who do **not** have a resting or provokable outflow tract gradient ≥ 50 mm Hg on TTE.
- Stress echo can be repeated when there is documentation of **any** of the following:
 - In 1 to 2 years if the resting or provokable outflow tract gradient is < 30 mm Hg on prior stress echo
 - Worsening symptoms
 - There has been a therapeutic change (i.e., change in medication, surgical procedure performed).

CCTA (CPT® 75574)

- Initial imaging study in individuals with hypertrophic cardiomyopathy and stable anginal symptoms.
 - Chest discomfort is common in individuals with hypertrophic cardiomyopathy. The incidence of false positive myocardial perfusion imaging abnormalities is

higher in these individuals, whereas the incidence of severe coronary artery stenosis is low.

Cardiac MRI (CMR)

- Cardiac MRI (CPT® 75557 or CPT® 75561) for assessment of global ventricular function, myocardial composition and mass if a specific clinical question is left unanswered by a recent echocardiogram and results will affect patient management.

Surveillance imaging

- TTE is indicated every year when there is no change in clinical status or treatment

Monitoring treatment

Repeat TTE (CPT® 93306) is indicated in individuals with Obstructive Hypertrophic Cardiomyopathy (HCM) for the following:

Mavacamten for obstructive hypertrophic cardiomyopathy

Initiation of treatment

- Baseline-at the beginning of treatment
- 4 weeks after treatment initiation
- 8 weeks after treatment initiation
- 12 weeks after treatment initiation
- Then every 12 weeks while on mavacamten

Changes in treatment

- 4 weeks after any interruption of treatment (any missed dose)
- After any dosage change (including restart of treatment):
 - 4 weeks after dosage change
 - 12 weeks after dosage change
- After initiating a weak CYP2C19 inhibitor (e.g., omeprazole) or moderate CYP2A4 inhibitor (e.g., ciprofloxacin):
 - 4 weeks after start of medication
 - 12 weeks after start of medication
- At any time regardless of timing of prior echo when there are new cardiac signs or symptoms, or worsening of clinical status

Post- Septal Reduction Therapy (SRT)

TTE is indicated within 3 to 6 months after SRT (surgical myectomy or alcohol septal ablation) to evaluate the procedural results in individuals with hypertrophic cardiomyopathy

Abbreviations

v1.0.2024

- **ACE inhibitor** — Angiotensin-converting enzyme inhibitor
- **AMI** — Acute myocardial infarction
- **ARVC** — Arrhythmogenic right ventricular cardiomyopathy
- **AV** — Atrioventricular
- **CC** — Complications/comorbid conditions
- **CHF** — Congestive heart failure
- **CM** — Cardiomyopathy
- **CRT** — Cardiac resynchronization therapy
- **EP** — Electrophysiology
- **GDMT** — Guideline-directed medical therapy
- **HCM** — Hypertrophic cardiomyopathy
- **ICD** — Implantable cardioverter defibrillator
- **LBBB** — Left bundle branch block
- **LV** — Left ventricle
- **LVEF** — Left ventricular ejection fraction
- **MCC** — Major complications/comorbid conditions
- **MI** — Myocardial infarction
- **NCCM** — Non-compaction cardiomyopathy
- **NYHA** — New York Heart Association functional classification
- **RBBB** — Right bundle branch block
- **RV** — Right ventricle
- **TAVR** — Transcatheter aortic valve replacement
- **VF** — Ventricular fibrillation
- **VT** — Ventricular tachycardia

Glossary

v1.0.2024

- **NYHA Heart Failure Definitions** — **class I** - No symptoms and no limitation in ordinary physical activity, e.g. shortness of breath when walking, climbing stairs etc.
class II - Mild symptoms (mild shortness of breath and/or angina) and slight limitation during ordinary activity.
class III - Marked limitation in activity due to symptoms, even during less-than-ordinary activity, e.g. walking short distances (20–100 m). Comfortable only at rest.
class IV - Severe limitations. Experiences symptoms even while at rest. Mostly bedbound patients
- **Abnormal blood pressure response to exercise** — Flat response/failure to augment; rise then fall during exercise; vasoactive cardiovascular drugs may result in an abnormal blood pressure response to exercise
- **Ambulatory class IV CHF** — Class IV heart failure with: 1) no active acute coronary syndrome; 2) no inotropes; and 3) on GDMT
- **Incessant VT:** — Frequent recurrences of ongoing hemodynamically stable VT
- **Hypertrophic cardiomyopathy** — Hypertrophic Cardiomyopathy (HCM) is a clinical diagnosis, established by imaging with 2D echocardiography or cardiovascular magnetic resonance (CMR) showing a maximal end-diastolic wall thickness of ≥ 15 mm anywhere in the left ventricle, in the absence of another cause of hypertrophy in adults. More limited hypertrophy (13–14 mm) can be diagnostic, particularly when present in family members of a patient with HCM or in conjunction with a positive genetic test, and/or associated with typical dynamic outflow obstruction, or distinctly abnormal ECG patterns.
- **Long QT Syndrome (LQTS):** — A congenital disorder characterized by a prolongation of the QT interval on ECG and a propensity to ventricular tachyarrhythmias, which may lead to syncope, cardiac arrest, or sudden death. The QT interval on the ECG, measured from the beginning of the QRS complex to the end of the T wave, represents the duration of activation and recovery of the ventricular myocardium. QT intervals corrected for heart rate (QTc) longer than 0.44 seconds are generally considered abnormal, though a normal QTc can be more prolonged in females (up to 0.46 sec). The Bazett formula is the formula most commonly used to calculate the QTc, as follows: $QTc = QT / \sqrt{RR}$ (in seconds).
- **Non-Compaction Cardiomyopathy:** — A rare congenital cardiomyopathy that affects children and adults. It results from the failure of myocardial development during embryogenesis. It is also called spongiform cardiomyopathy. Symptoms are often a result of a poor pumping performance by the heart. The disease can be associated with other problems with the heart and the body.

- **Non-Sustained Ventricular Tachycardia (NSVT):** — Three or more consecutive ventricular beats at a rate of greater than 120 beats/min with a duration of less than 30 seconds
- **Optimal Medical Therapy:** — Optimal medical therapy for heart failure should include a beta-blocker and one of the following:
 - ACE inhibitor
 - angiotensin II receptor blocker
 - angiotensin receptor-neprilysin inhibitor
- **Structural Heart Disease:** — A structural or functional abnormality of the heart, or of the blood vessels supplying the heart, that impairs its normal functioning.

v1.0.2024

Guideline

Guideline development (Preface-1)

Benefits, coverage policies, and eligibility issues (Preface-2)

Clinical information (Preface-3)

References (Preface-4)

Copyright information (Preface-5)

Trademarks (Preface-6)

Guideline development (Preface-1)

- The eviCore evidence-based, proprietary clinical guidelines evaluate a range of advanced imaging and procedures, including CT, MRI, PET, and Radiation Oncology, Sleep Studies, and Cardiac and Spine interventions.
- eviCore healthcare reserves the right to change and update the guidelines. The guidelines undergo a formal review annually. eviCore's guidelines are based upon major national and international association and society guidelines and criteria, peer-reviewed literature, major treatises, and input from health plans, practicing academic and community-based physicians.
- These guidelines are not intended to supersede or replace sound medical judgment, but instead should facilitate the identification of the most appropriate imaging procedure, given the patient's clinical condition. These guidelines are written to cover medical conditions as experienced by the majority of patients. However, these guidelines may not be applicable in certain clinical circumstances, and physician judgment can override the guidelines.
- Clinical decisions, including treatment decisions, are the responsibility of the patient and his/her provider. Clinicians are expected to use independent medical judgment which takes into account the clinical circumstances to determine patient management decisions.
- eviCore supports the Choosing Wisely® initiative (www.choosingwisely.org) by the American Board of Internal Medicine (ABIM) Foundation and many national physician organizations, to reduce the overuse of diagnostic tests that are low value, no value, or whose risks are greater than the benefits.
- eviCore's guidelines are based upon expert consensus and analysis reported by the following specialty societies, publications, studies and trials:
 - The American College of Cardiology (ACC)
 - The American Heart Association (AHA)
 - The Heart Rhythm Society (HRS)

- The Multicenter Automatic Defibrillator Implantation Trial (MADIT/MADIT-2)
- The Multicenter Unsustained Tachycardia Trial (MUSTT)
- The Defibrillator in Acute Myocardial Infarction Trial (DINAMIT)
- The Resynchronization/defibrillation for Ambulatory Heart Failure Trial (RAFT)
- The Sudden Cardiac Death in Heart Failure Trial (SCD-HeFT)
- The Resynchronization Reverses Remodeling in Systolic Left Ventricular Dysfunction trial (REVERSE)
- Immediate Risk Stratification Improves Survival trial (IRIS)
- The Comparison of Medical Therapy, Pacing, and Defibrillation in Heart Failure trial (COMPANION)
- The Antiarrhythmic Versus Implantable Defibrillators trial (AVID)
- The Canadian Implantable Defibrillator Study (CIDS)
- The Cardiac Arrest Study Hamburg (CASH)

Benefits, coverage policies, and eligibility issues (Preface-2)

- Benefits, coverage policies, and eligibility issues pertaining to each Health Plan may take precedence over eviCore's guidelines. Providers are urged to obtain written instructions and requirements directly from each payer.
- Medicare Coverage Policies
 - For Medicare and Medicare Advantage enrollees, the coverage policies of CMS (Centers for Medicare and Medicaid Services) may take precedence over eviCore's guidelines
 - Payors may choose to adopt other evidence-based guidelines (such as eviCore's guidelines) rather than using Local Coverage Determinations and other Medicare coverage policy
- Investigational and Experimental Studies
 - Certain imaging studies described in these guidelines are considered investigational by various payors, and their coverage policies may take precedence over eviCore's guidelines
- Clinical and Research Trials
 - Similar to investigational and experimental studies, clinical trial imaging requests will be considered to determine whether they meet health plan coverage and eviCore's evidence-based guidelines
- State and federal legislations may need to be considered in the review of advanced imaging requests

Clinical information (Preface-3)

- The philosophy behind eviCore guidelines entails using an evidence-based approach to determine the most appropriate procedure for each individual, at the most appropriate time in the diagnostic and treatment cycle.
- Procedures should be requested after initial consultation and physician treatment planning, and following full counseling of the individual.

- Current clinical information, which may include history, physical examination, symptoms, laboratory results, and imaging reports, are necessary for determining the medical necessity of implantable cardiac devices.
- The information provided to eviCore should have clinical relevance to the request.
- If the information provided makes no reference to the potential indication for the request, then the medical necessity for the procedure(s) cannot be supported.

References (Preface-4)

- References are available at the end of the guidelines

Removal and replacement (CRID-1.2)

General Guidelines (CRID-1.0)

- Current clinical information, which may include history, physical examination, symptoms, laboratory results, and imaging reports, are necessary for determining the medical necessity of implantable cardiac devices.
- The information provided to eviCore should have clinical relevance to the request.
- If the information provided makes no reference to the potential indication for the request, then the medical necessity for the procedure(s) cannot be supported.
- Requests for a device when a same or similar device has already been placed is not supported without clear documentation that fulfills guideline criteria.

Procedure codes (CRID-1.1)

Procedure description	CPT®
Insertion of new or replacement of permanent pacemaker with transvenous electrode(s); atrial	33206
Insertion of new or replacement of permanent pacemaker with transvenous electrode(s); ventricular	33207
Insertion of new or replacement of permanent pacemaker with transvenous electrode(s); atrial and ventricular	33208
Insertion of pacemaker pulse generator only; single existing single lead	33212
Insertion of pacemaker pulse generator only; with existing dual leads	33213
Upgrade of implanted pacemaker system, conversion of single chamber system to dual chamber system (includes removal of previously placed pulse generator, testing of existing lead, insertion of new lead, insertion of new pulse generator)	33214
Removal of permanent pacemaker pulse generator with replacement of pacemaker pulse generator; single lead system	33227
Removal of permanent pacemaker pulse generator with replacement of pacemaker pulse generator; dual lead system	33228
Insertion of pacemaker pulse generator only; with existing multiple leads	33221

Procedure description	CPT®
Insertion of pacing electrode, cardiac venous system, for left ventricular pacing, with attachment to previously placed pacemaker or pacing cardioverter-defibrillator pulse generator	33224
Insertion of pacing electrode, cardiac venous system, for left ventricular pacing, at time of insertion of pacing cardioverter-defibrillator pulse generator (including upgrade to dual chamber system and pocket revision)	33225
Removal of permanent pacemaker pulse generator with replacement of pacemaker pulse generator; multiple lead system	33229
Insertion of pacing cardioverter-defibrillator pulse generator only; with existing dual leads	33230
Insertion of pacing cardioverter-defibrillator pulse generator only; with existing multiple leads	33231
Insertion of pacing cardioverter-defibrillator pulse generator only; with existing single leads	33240
Insertion or replacement of permanent pacing cardioverter-defibrillator system with transvenous lead(s), single or dual chamber	33249
Removal of pacing cardioverter-defibrillator pulse generator with replacement of pacing cardioverter-defibrillator pulse generator; single lead system	33262
Removal of pacing cardioverter-defibrillator pulse generator with replacement of pacing cardioverter-defibrillator pulse generator; dual lead system	33263
Removal of pacing cardioverter-defibrillator pulse generator with replacement of pacing cardioverter-defibrillator pulse generator; multiple lead system	33264
Insertion or replacement of permanent subcutaneous implantable defibrillator system, with subcutaneous electrode, including defibrillation threshold evaluation, induction of arrhythmia, evaluation of sensing for arrhythmia termination, and programming or reprogramming of sensing or therapeutic parameters when performed	33270
Transcatheter insertion or replacement of permanent leadless pacemaker, right ventricular, including imaging guidance (e.g., fluoroscopy, venous ultrasound, ventriculography, femoral venography) and device evaluation (e.g., interrogation or programming), when performed	33274

Procedure description	CPT®
Transcatheter implantation of wireless pulmonary artery pressure sensor for long-term hemodynamic monitoring, including deployment and calibration of the sensor, right heart catheterization, selective pulmonary catheterization, radiological supervision and interpretation, and pulmonary artery angiography, when performed	33289
Insertion of wireless cardiac stimulator for left ventricular pacing, including device interrogation and programming, and imaging supervision and interpretation, when performed; complete system (includes electrode and generator [transmitter and battery])	0515T
Insertion of wireless cardiac stimulator for left ventricular pacing, including device interrogation and programming, and imaging supervision and interpretation, when performed; electrode only	0516T
Insertion of wireless cardiac stimulator for left ventricular pacing, including device interrogation and programming, and imaging supervision and interpretation, when performed; pulse generator component(s) (battery and/or transmitter) only	0517T
Removal and replacement of wireless cardiac stimulator for left ventricular pacing; pulse generator component(s) (battery and/or transmitter)	0519T
Removal and replacement of wireless cardiac stimulator for left ventricular pacing; pulse generator component(s) (battery and/or transmitter), including placement of a new electrode	0520T
Insertion or replacement of implantable cardioverter-defibrillator system with substernal electrode(s), including all imaging guidance and electrophysiological evaluation (includes defibrillation threshold evaluation, induction of arrhythmia, evaluation of sensing for arrhythmia termination, and programming or reprogramming of sensing or therapeutic parameters), when performed	0571T
Insertion of substernal implantable defibrillator electrode	0572T
Removal and replacement of substernal implantable defibrillator pulse generator	0614T
Transcatheter insertion of permanent dual-chamber leadless pacemaker, including imaging guidance (eg, fluoroscopy, venous ultrasound, right atrial angiography, right ventriculography, femoral venography) and device evaluation (eg, interrogation or programming), when performed; complete system (ie, right atrial and right ventricular pacemaker components)	0795T
Transcatheter insertion of right atrial pacemaker component (when an existing right ventricular single leadless pacemaker exists to create a dual-chamber leadless pacemaker system)	0796T

Procedure description	CPT®
Transcatheter insertion of right ventricular pacemaker component (when part of a dual-chamber leadless pacemaker system)	0797T
Transcatheter removal of permanent dual-chamber leadless pacemaker, including imaging guidance (eg, fluoroscopy, venous ultrasound, right atrial angiography, right ventriculography, femoral venography), when performed; complete system (ie, right atrial and right ventricular pacemaker components)	0798T
Transcatheter removal of right atrial pacemaker component	0799T
Transcatheter removal of right ventricular pacemaker component (when part of a dual-chamber leadless pacemaker system)	0800T
Transcatheter removal and replacement of permanent dual-chamber leadless pacemaker, including imaging guidance (eg, fluoroscopy, venous ultrasound, right atrial angiography, right ventriculography, femoral venography) and device evaluation (eg, interrogation or programming), when performed; dual-chamber system (ie, right atrial and right ventricular pacemaker components)	0801T
Transcatheter removal and replacement of right atrial pacemaker component	0802T
Transcatheter removal and replacement of right ventricular pacemaker component (when part of a dual-chamber leadless pacemaker system)	0803T
Transcatheter insertion of permanent single-chamber leadless pacemaker, right atrial, including imaging guidance (eg, fluoroscopy, venous ultrasound, right atrial angiography and/or right ventriculography, femoral venography, cavography) and device evaluation (eg, interrogation or programming), when performed	0823T
Transcatheter removal of permanent single-chamber leadless pacemaker, right atrial, including imaging guidance (eg, fluoroscopy, venous ultrasound, right atrial angiography and/or right ventriculography, femoral venography, cavography), when performed	0824T
Transcatheter removal and replacement of permanent single-chamber leadless pacemaker, right atrial, including imaging guidance (eg, fluoroscopy, venous ultrasound, right atrial angiography and/or right ventriculography, femoral venography, cavography) and device evaluation (eg, interrogation or programming), when performed	0825T

Removal and replacement (CRID-1.2)

- Generator replacement (CPT® 33212, 33213, 33221, 33227, 33228, 33229, 33230, 33231, 33240, 33262, 33263, 33264, 0614T, 0801T, 0802T, 0803T) with a same or similar device is indicated when:
 - Interrogation shows device is nearing Elective Replacement Indicator (ERI) or End of Life (EOL).
 - Interrogation report documents the device is not functioning correctly and requires replacement.

Indications for Permanent Pacemaker Implantation (CRID-7)

CID.PM.105.A

v1.0.2024

CPT® 33206, 33207, 33208

Sinus node dysfunction

Permanent pacemaker implantation is indicated for any of the following:

- Symptomatic sinus node dysfunction as evidenced by both of the following:
 - Documented sinus node dysfunction including one of the below:
 - Sinus bradycardia at rate <50 beats per minute
 - Sinus pauses >3 seconds
 - Symptoms attributable to sinus node dysfunction including one of the below:
 - Syncope or pre-syncope
 - Heart failure symptoms
 - Exertional fatigue and impaired exercise tolerance
- Sinus bradycardia at rate <40 beats per minute and symptoms possibly related to bradycardia
- Symptomatic sinus bradycardia (as defined above) as a consequence of guideline directed management and continued treatment is clinically necessary
- Symptoms attributable to bradycardia as listed above and evidence of tachy-brady syndrome (sinus bradycardia, ectopic atrial bradycardia, or sinus pause alternating with periods of atrial flutter or atrial fibrillation)
- Symptomatic chronotropic incompetence defined as limitations due to the inability to achieve 80% of maximum predicted heart rate (220-age)

Atrioventricular block (AVB)

Permanent pacemaker implantation is indicated for any of the following:

- AVB including one of the below with or without symptoms:
 - Second-degree Mobitz type II
 - High-grade (≥ 2 consecutive P waves at a constant physiologic rate that do not conduct to the ventricles)
 - Third-degree (complete heart block)
- Any degree of AVB with one of the following symptoms that are clearly attributable to the AVB:
 - Syncope or pre-syncope

- Heart failure symptoms
- Exertional fatigue and impaired exercise tolerance
- Third-degree and advanced second-degree AV block at any anatomic level associated with sustained or non-sustained ventricular tachycardia (ventricular rhythm at rate >100 bpm lasting ≥ 3 consecutive beats) presumed due to AV block
- Marked first-degree AVB (PR interval >0.3 seconds) or second-degree AVB with symptoms similar to those of pacemaker syndrome
- Symptomatic AVB as a consequence of guideline directed management and continued treatment is clinically necessary
- Persistent or permanent atrial fibrillation and symptomatic bradycardia including one of the following:
 - Rate <50 beats per minute
 - Regular QRS intervals indicating complete AVB
- Second degree AV block with a documented pause of ≥ 5 seconds during waking in the presence of atrial fibrillation, with or without symptoms
- Second degree AV block with documented periods of asystole ≥ 3.0 seconds in the presence of sinus rhythm, with or without symptoms
- Second-degree AVB noted to be located at intra- or infra-His levels at electrophysiology study (EPS), with or without symptoms
- Any AVB indication listed above occurring after acute myocardial infarction that does not resolve within 5 days
- Congenital complete or high-degree AVB in the presence of any of the following:
 - Symptoms
 - Wide QRS escape rhythm
 - Mean daytime heart rate below 50 bpm
 - Pauses >3 times the cycle length of the ventricular escape rhythm
 - Complex ventricular ectopy
 - Prolonged QT interval
 - Ventricular dysfunction, ventricular dilatation or significant mitral regurgitation

Conduction Disorders with 1:1 Atrioventricular Conduction

Permanent pacemaker implantation is indicated for any of the following:

- Individuals with syncope and bundle branch block and one of the following at electrophysiology study (EPS):
 - Baseline HV interval ≥ 70 ms
 - Second- or third-degree intra- or infra-Hisian block during incremental atrial pacing
- Alternating bundle branch block with or without symptoms
- HV interval ≥ 100 milliseconds noted at EPS, with or without symptoms

- Intra- or infra- Hisian block noted at EPS, with or without symptoms

Recurrent syncope

Permanent pacemaker implantation is indicated for individuals with recurrent syncope and any of the following:

- Spontaneous documented symptomatic asystolic pause >3 seconds due to sinus arrest or atrioventricular block (AVB)
- Spontaneous documented asymptomatic asystolic pause >6 seconds due to sinus arrest or AVB
- Cardioinhibitory carotid sinus syndrome as documented by one of the below:
 - Syncope caused by spontaneously occurring carotid sinus stimulation
 - Carotid sinus pressure that induces syncope and/or ventricular asystole of ≥ 3 seconds
- Syncope associated with asystole of ≥ 3 seconds during tilt testing
- Bundle branch block and one of the following at electrophysiology study (EPS):
 - Baseline HV interval ≥ 70 ms
 - Second- or third-degree intra- or infra-Hisian block during incremental atrial pacing
- Syncope after cardiac transplantation with or without documentation of bradyarrhythmia

Peri-procedural and post-operative indications

Permanent pacemaker implantation is indicated for any of the following:

- Prior to a planned catheter ablation of the atrioventricular (AV) junction for one of the following:
 - Rate control strategy for management of atrial fibrillation
 - Supraventricular tachycardia resulting in tachycardia induced cardiomyopathy that is not controlled with ablation or medical therapy
- Post Transcatheter Aortic Valve Implantation (TAVI) for any of the following:
 - Complete or high-degree atrioventricular block (AVB) that persists for 24 to 48 hours after TAVI
 - New-onset alternating bundle branch block after TAVI
 - Pre-existing right bundle branch block (RBBB) and new conduction abnormality onset during or after (TAVI) such as:
 - Transient high-degree AVB
 - PR prolongation
 - QRS axis change

- Sinus node dysfunction or AVB associated with symptoms or hemodynamic instability occurring after cardiac surgery that does not resolve within 5 days
- Post cardiac transplant for any of the following:
 - Relative bradycardia that is prolonged or recurrent, which limits rehabilitation or discharge after postoperative recovery
 - Syncope with or without documentation of bradyarrhythmia

Neuromuscular diseases known to involve the heart

Permanent pacemaker implantation may be considered for progressive neuromuscular diseases known to involve the heart with any degree of atrioventricular (AV) block including first degree AV block or any fascicular block, with or without symptoms, because there may be unpredictable progression of AV conduction disease.

Progressive neuromuscular diseases known to involve the heart include:

- Myotonic muscular dystrophy
- Kearns-Sayre syndrome
- Erb dystrophy (limb-girdle muscular dystrophy)
- Peroneal muscular atrophy

Permanent Pacemaker Implantation - Non-indications (CRID-9)

CID.PM.103.A

v1.0.2024

- Permanent pacemaker implantation is **not** indicated in any of the following settings:
 - Sinus node dysfunction when there is documentation of any of the following
 - Individual is asymptomatic
 - The symptoms suggestive of bradycardia have been clearly documented to occur in the absence of bradycardia
 - Sinus node dysfunction is due to nonessential drug therapy
 - Fascicular block without AV block or without symptoms concerning for AV block
 - Incidentally noted hypersensitive cardioinhibitory response to carotid sinus stimulation when the individual remains asymptomatic or has vague symptoms
 - Asymptomatic first-degree AV block
 - Asymptomatic type-1 second-degree AV block at the supra-His (AV node) level or that which is not known to be intra- or infra-Hisian
 - Asymptomatic transient AV block in the absence of intraventricular conduction defects or in isolated single fascicular block
 - Situational vasovagal syncope when avoidance behavior is effectively preventing syncopal episodes
 - Prior to Transcatheter Aortic Valve Replacement (TAVR) as a prophylactic measure in individuals with right bundle branch block (RBBB) when there is no indication for permanent pacing
 - For the purpose of cardiac contractility modulation

Leadless pacemaker (CRID-11.1)

CID.PM.104.A

v1.0.2024

Leadless right ventricular pacemaker (CRID-11.1.1)

Indications for permanent right ventricular leadless pacemaker (CPT® 33274) implant - **all** of the following must be met:

- Meets **one** of the following indications for leadless right ventricular pacemaker:
 - Symptomatic paroxysmal or permanent high-grade AV block in the presence of Atrial Fibrillation (AF)
 - Symptomatic paroxysmal or permanent high-grade AV block in the absence of AF, as an alternative to dual chamber pacing, when atrial lead placement is considered difficult, high risk, or not deemed necessary for effective therapy
 - Symptomatic bradycardia-tachycardia syndrome or sinus node dysfunction (sinus bradycardia or sinus pauses), as an alternative to atrial or dual chamber pacing, when atrial lead placement is considered difficult, high risk, or not deemed necessary for effective therapy
- The following contraindications for leadless pacemaker are **not** present:
 - An implanted inferior vena cava filter
 - A mechanical tricuspid valve

Leadless dual chamber pacemaker system (CRID-11.1.2)

Indications for permanent dual chamber leadless pacemaker implant (CPT® 0795T) - **all** of the following must be met:

- Meets one of the following indications for leadless dual chamber pacemaker:
 - Sick sinus syndrome
 - Chronic, symptomatic second- and third-degree AV block
 - Recurrent Adams-Stokes syndrome
 - Symptomatic bilateral bundle branch block when tachyarrhythmia and other causes have been ruled out
- The following contraindications for leadless pacemaker are **not** present:
 - An implanted inferior vena cava filter
 - A mechanical tricuspid valve

Leadless right atrial pacemaker (CRID-11.1.3)

Indications for permanent leadless right atrial pacemaker implant (CPT® 0823T) - **all** of the following must be met:

- Meets the following indication for leadless right atrial pacemaker:
 - Sinus node dysfunction with normal AV and intraventricular conduction systems
- The following contraindications for leadless pacemaker are not present:

- An implanted inferior vena cava filter
- A mechanical tricuspid valve

General information

Right ventricular leadless pacemaker

The permanent right ventricular leadless pacemakers (CPT® 33274) consists of a single leadless device implanted directly into the right ventricle. The Medtronic Micra™ VR and Abbott Aveir™ VR right ventricular leadless pacemakers are capable only of VVI and VVIR pacing. The Medtronic Micra™ AV right ventricular leadless pacemaker is also capable of VDD pacing. The right ventricular leadless pacemakers do not have capability for atrial pacing. The estimated battery life is about 10 years

Dual chamber leadless pacemaker

In contrast to the right ventricular leadless pacemakers referred to above, the dual chamber leadless pacemaker (i.e., Abbott Aveir™ DR leadless pacemaker system) has dual-chamber sensing and pacing functionality. The Abbott Aveir™ DR leadless pacemaker system consists of two separate components: one implanted in the right atrium and the other in the right ventricle.

Implantable cardioverter-defibrillator (ICD) Devices

Guideline

Definite indications for ICD implantation (CRID-2)

Reasonable indications for ICD implantation (CRID-3)

ICD implantation non-indications (CRID-4)

Definite indications for ICD implantation (CRID-2)

CID.ICD.100.A

v1.0.2024

Procedures included

CPT® 33249, 33270

Guideline

Survivors of cardiac arrest (CRID-2.1)

Structural heart disease with sustained VT (CRID-2.2)

Syncope of undetermined origin and positive EP study (CRID-2.3)

Unexplained syncope (CRID-2.4)

Ischemic cardiomyopathy (CRID-2.5)

Non-ischemic dilated cardiomyopathy (DCM) (CRID-2.6)

Survivors of cardiac arrest (CRID-2.1)

- ICD implantation is indicated in individuals who are survivors of cardiac arrest due to ventricular tachycardia (VT) or ventricular fibrillation (VF) after evaluation has excluded any completely reversible causes

Structural heart disease with sustained VT (CRID-2.2)

- ICD implantation is indicated in individuals with structural heart disease (such as prior myocardial infarction (MI), congenital heart disease, and/or ventricular dysfunction) and spontaneous, sustained VT (greater than 30 seconds), whether hemodynamically stable or unstable

Syncope of undetermined origin and positive EP study (CRID-2.3)

- ICD implantation is indicated in individuals with syncope of undetermined origin who have clinically relevant, hemodynamically significant sustained VT or VF induced at electrophysiology (EP) study

Unexplained syncope (CRID-2.4)

- ICD implantation is indicated in individuals with unexplained syncope, significant left ventricular (LV) dysfunction (LV ejection fraction less than 50%), and structural heart disease such as prior myocardial infarction (MI), congenital heart disease, and/or ventricular dysfunction

Ischemic cardiomyopathy (CRID-2.5)

- ICD implantation is indicated in individuals with **any** of the following:
 - Left ventricular systolic dysfunction due to ischemic heart disease and **all** of the following:
 - LV ejection fraction $\leq 35\%$ despite ≥ 3 months of **optimal medical therapy**
 - Symptomatic heart failure (NYHA functional Class II or III)
 - Left ventricular systolic dysfunction due to ischemic heart disease and **all** of the following:
 - LV ejection fraction $\leq 30\%$ despite ≥ 3 months of **optimal medical therapy**
 - NYHA functional Class I
 - Left ventricular systolic dysfunction due to ischemic heart disease and **all** of the following:
 - LV ejection fraction $\leq 40\%$ despite ≥ 3 months of **optimal medical therapy**
 - Non-sustained ventricular tachycardia
 - Inducible sustained monomorphic ventricular tachycardia at electrophysiological (EP) study

Optimal medical therapy should include a beta-blocker and **one** of the following:

- ACE inhibitor
- angiotensin II receptor blocker
- angiotensin receptor-neprilysin inhibitor

Non-ischemic dilated cardiomyopathy (DCM) (CRID-2.6)

- ICD implantation is indicated in individuals with nonischemic dilated cardiomyopathy who have **all** of the following:
 - LV ejection fraction $\leq 35\%$ despite ≥ 3 months of **optimal medical therapy**
 - Symptomatic heart failure (NYHA Class II or III CHF)

Reasonable indications for ICD implantation (CRID-3)

CID.ICD.101.A

v1.0.2024

Procedures included

CPT® 33249, 33270

Guideline

General considerations (CRID-3.1)

Sustained ventricular tachycardia with normal LV function (CRID-3.2)

Cardiomyopathy (CRID-3.3)

Long QT syndrome (CRID-3.4)

Brugada syndrome (CRID-3.5)

Catecholaminergic polymorphic ventricular tachycardia (CRID-3.6)

Muscular Dystrophy (CRID-3.8)

Other indications (CRID-3.7)

General considerations (CRID-3.1)

- For the “reasonable” or “considered” indications listed in this CRID-3 guideline, consensus opinion is less clear about the use of ICD implantation in these settings. Limited evidence suggests that ICD placement may be reasonable or may be considered; this category includes VF or hypotensive VT events where pharmaceutical or ablative techniques are indicated but the results of treatment are too unpredictable to withhold ICD implantation.

Sustained ventricular tachycardia with normal LV function (CRID-3.2)

- ICD implantation is reasonable for individuals with sustained VT and normal or near-normal ventricular function

Cardiomyopathy (CRID-3.3)

Individuals with cardiomyopathy who have one or more risk factors for sudden cardiac death

Hypertrophic Cardiomyopathy:

ICD implantation is reasonable for individuals with hypertrophic cardiomyopathy who have one or more risk factors for sudden cardiac death including the following:

- Unheralded syncope
- Family history of sudden death
- Septal wall thickness ≥ 30 mm

- Abnormal blood pressure response to exercise (SBP increase of <20mm/hg with exercise or a drop in BP)
- Ventricular tachycardia, sustained or nonsustained
- LV apical aneurysm, independent of size
- LV ejection fraction < 50%

Cardiomyopathy due to Arrhythmogenic Right Ventricular Cardiomyopathy (ARVC):

ICD implantation is reasonable for individuals with ARVC who have one or more risk factors for sudden cardiac death Risk factors for sudden cardiac death include the following:

- Unheralded syncope
- Family history of sudden death
- Ventricular tachycardia, sustained or nonsustained
- Clinical signs of RV failure

Long QT syndrome (CRID-3.4)

- ICD implantation is reasonable in Long-QT Syndrome in the following settings:
 - Syncope and/or VT while receiving beta-blockers or if beta-blockers are contraindicated
 - Asymptomatic with other risk factors for sudden cardiac death
 - Risk factors for sudden cardiac death include the following:
 - QT_c greater than 500 msec or
 - LQT 2 or 3
 - Family history of sudden death

Brugada syndrome(CRID-3.5)

- ICD implantation is reasonable for individuals with Brugada Syndrome who have had the following:
 - Syncope or
 - Documented or inducible VT or VF

Catecholaminergic polymorphic ventricular tachycardia (CRID-3.6)

- ICD implantation is reasonable for individuals with catecholaminergic polymorphic VT who have syncope and/or documented sustained VT while receiving beta-blockers.

Muscular Dystrophy (CRID-3.8)

- ICD implantation is reasonable, regardless of LV ejection fraction for **any** of the following:
 - Emery-Dreifuss muscular dystrophy (EDMD)
 - Limb-Girdle Type 1B muscular dystrophy (LGMD1B)
 - Myotonic Dystrophy Type 1 with an indication for a permanent pacemaker
 - Lamin A/C (LMNA) mutation (for patients who don't meet the above criteria of EDMD or LGMD1B) when there is documentation of **two or more** of the following risk factors for sudden cardiac death:
 - Non-sustained ventricular tachycardia
 - LVEF < 45%
 - Non-missense mutation (ins-del/truncating or mutations affecting splicing)
 - Male sex at birth
 - For sustained VT see **Sustained Ventricular Tachycardia with Normal LV Function**

Other indications (CRID-3.7)

- ICD implantation is reasonable, regardless of LV ejection fraction measurement, for individuals with:
 - Cardiac sarcoidosis
 - Giant cell myocarditis
 - Chagas disease
- LV non compaction
 - ICD implantation should be considered for the primary prevention of sudden cardiac death due to malignant ventricular arrhythmias in individuals with non-compaction cardiomyopathy and impaired LV function (LV ejection fraction less than 50%)
 - ICD implantation is also indicated for normal LV function (LVEF greater than 50%) primary prevention cases with positive family history of sudden cardiac death. This exception is due to the presence of sarcomeric gene mutations reported in non-compaction cardiomyopathy
- ICD implantation may be considered in affected individuals with a familial cardiomyopathy associated with sudden death

ICD implantation non-indications (CRID-4)

CID.ICD.102.A

v1.0.2024

Guideline

Ischemic cardiomyopathy (CRID-4.1)
NYHA class IV CHF (CRID-4.2)
Limited life expectancy (CRID-4.3)
Incessant VT or VF (CRID-4.4)
Psychiatric conditions (CRID-4.5)
Reversible causes of VT/VF (CRID-4.6)
Ablation candidate, no structural heart disease (CRID-4.7)
Substernal implantable cardioverter-defibrillator (CRID-4.8)

Ischemic cardiomyopathy (CRID-4.1)

- ICD implantation is **not** indicated in individuals who have had a myocardial infarction within the past 40 days or who have had coronary revascularization within the past 90 days **unless** the following applies:
 - A separate indication for permanent pacemaker implantation exists (thus preventing a likely repeat procedure for an upgraded device in the near future)

NYHA class IV CHF (CRID-4.2)

- ICD implantation is **not** indicated for individuals with NYHA functional class IV symptoms **unless** one of the following applies:
 - It is a CRT-D device meeting the indications for CRT-D implantation listed in **Sinus Rhythm, Dilated Cardiomyopathy with NYHA Class II, III, or IV Congestive Heart Failure (CHF)**
 - The individual is awaiting heart transplantation
 - Left ventricular assist device (LVAD) is being used as destination therapy

Limited life expectancy (CRID-4.3)

- ICD implantation is **not** indicated for individuals who do not have a reasonable expectation of survival with an acceptable functional status for at least one year, even if they meet ICD implantation criteria listed in:
 - **Definite Indications for ICD Implantation** or
 - **Reasonable Indications for ICD Implantation**

Incessant VT or VF (CRID-4.4)

- ICD implantation is **not** indicated for individuals with incessant VT or VF
 - Incessant VT or VF is defined as hemodynamically stable VT or VF continuing for hours

Psychiatric conditions (CRID-4.5)

- ICD implantation is **not** indicated in individuals with significant psychiatric illnesses that may be aggravated by device implantation or that may preclude systematic follow-up.

Reversible causes of VT/VF (CRID-4.6)

- ICD implantation is **not** indicated when VF or VT is due to a reversible cause such as:
 - Severe electrolyte disturbance
 - Drug-induced torsades de pointes
 - Acute, reperfused myocardial infarction with preserved ejection fraction

Ablation candidate, no structural heart disease (CRID-4.7)

- ICD implantation is **not** indicated if the individual has no structural heart disease and is a candidate for ablation. Surgical or catheter ablation can be curative in this setting.

Substernal implantable cardioverter-defibrillator (CRID-4.8)**CPT® 0571T**

- Substernal implantable cardioverter-defibrillator systems involve inserting a defibrillator lead directly beneath the sternum anterior to the heart, and is intended to provide anti-tachycardia pacing as well as post-shock pacing without intravenous leads.
- At this time substernal implantable cardioverter-defibrillator systems are considered experimental and investigational.

Cardiac Resynchronization Therapy (CRT) Devices

Guideline

Indications for cardiac resynchronization therapy (CRT)-D implantation (CRID-5)

Cardiac resynchronization therapy (CRT)-D implantation - non-indications (CRID-6)

Cardiac resynchronization therapy (CRT)-P (CRID-10)

Wireless Cardiac Resynchronization (CRID-11.2)

Indications for cardiac resynchronization therapy (CRT)-D implantation (CRID-5)

CID.CRT.100.A
v1.0.2024

Procedures included

CPT® 33224, 33225, 33208, 33229, 33249, 33264

Guideline

Sinus rhythm, dilated cardiomyopathy with LBBB (CRID-5.1)
Sinus rhythm, dilated cardiomyopathy with non-LBBB (CRID-5.3)
Atrial fibrillation and NYHA class II, III, or IV Congestive Heart Failure (CRID-5.4)
Dilated Cardiomyopathy with atrial fibrillation requiring AV Junction ablation for heart rate control (CRID-5.5)
Dilated Cardiomyopathy with high-grade AV block (CRID-5.6)
Indications for upgrade to CRT-D (CRID-5.7)

Sinus rhythm, dilated cardiomyopathy with LBBB (CRID-5.1)

- CRT-D is indicated in individuals with ischemic or nonischemic dilated cardiomyopathy who have **all** of the following
 - LV ejection fraction $\leq 35\%$ despite **optimal medical therapy (OMT)**
 - Left bundle branch block with QRS ≥ 120 msec
 - Symptomatic heart failure NYHA functional Class II, III, or ambulatory class IV
- CRT-P can be indicated when all of the requirements of CRT-D have been met and the individual in consultation with the providing physician declines the ICD function

Sinus rhythm, dilated cardiomyopathy with non-LBBB (CRID-5.3)

- CRT-D is indicated in individuals with ischemic or nonischemic dilated cardiomyopathy who have **all** of the following
 - LV ejection fraction $\leq 35\%$ despite **optimal medical therapy (OMT)**
 - Non-LBBB pattern with QRS duration ≥ 150 ms
 - Symptomatic heart failure NYHA class III, or ambulatory class IV
- CRT-P can be indicated when all of the requirements of CRT-D have been met and the individual in consultation with the providing physician declines the ICD function

Atrial fibrillation and NYHA class II, III, or IV Congestive Heart Failure (CRID-5.4)

- CRT-D is indicated in individuals with atrial fibrillation who have **all** of the following:
 - LV ejection fraction $\leq 35\%$ despite **optimal medical therapy (OMT)**
 - Meet one of the following CRT criteria:
 - Left bundle branch block (LBBB) with a QRS duration ≥ 120 ms and symptomatic heart failure New York Heart Association (NYHA) functional class II, III, or ambulatory class IV
 - Non-LBBB pattern with a QRS duration ≥ 150 and symptomatic heart failure NYHA class III or ambulatory class IV
 - Non-pharmacologic or pharmacologic rate control will allow near 100% biventricular pacing with CRT
- CRT-P can be indicated when all of the requirements of CRT-D have been met and the individual in consultation with the providing physician declines the ICD function

Dilated Cardiomyopathy with atrial fibrillation requiring AV Junction ablation for heart rate control (CRID-5.5)

CRT-D is indicated in individuals with atrial fibrillation and **all** of the following:

- LV ejection fraction $\leq 35\%$ **optimal medical therapy (OMT)**
- Uncontrolled heart rate requiring atrioventricular (AV) Junction ablation

CRT-P can be indicated when all of the requirements of CRT-D have been met and the individual in consultation with the providing physician declines the ICD function

Dilated Cardiomyopathy with high-grade AV block (CRID-5.6)

CRT-D is indicated in individuals in sinus rhythm or atrial fibrillation who have **all** of the following:

- LV ejection fraction $\leq 35\%$ despite **optimal medical therapy (OMT)**
- High-grade atrioventricular (AV) block requiring ventricular pacing

CRT-P can be indicated when all of the requirements of CRT-D have been met and the individual in consultation with the providing physician declines the ICD function

Indications for upgrade to CRT-D (CRID-5.7)

Upgrade to CRT-D is indicated in individuals who have **all** of the following:

- LV ejection fraction $\leq 35\%$ despite **optimal medical therapy (OMT)**
- New or worsening symptomatic heart failure (NYHA functional Class II, III, or ambulatory class IV) following implantation of a non-CRT pacemaker or cardioverter-defibrillator (ICD)
- Ventricular pacing $> 40\%$

CRT-P can be indicated when all of the requirements of CRT-D have been met and the individual in consultation with the providing physician declines the ICD function

Cardiac resynchronization therapy (CRT)-D implantation - non-indications (CRID-6)

CID.CRT.101.A
v1.0.2024

Guideline

Ischemic cardiomyopathy (CRID-6.1)

Reversible causes of cardiomyopathy (CRID-6.2)

Ischemic cardiomyopathy (CRID-6.1)

- CRT-D or CRT-P implantation is **not** indicated in individuals who have had a myocardial infarction within the past 40 days or who have had coronary revascularization within the past 90 days **unless** the following applies
 - A separate indication for permanent pacemaker implantation exists (thus preventing a likely repeat procedure for an upgraded device in the near future)

Reversible causes of cardiomyopathy (CRID-6.2)

- CRT-D implantation is **not** indicated in the setting of a reversible cardiomyopathy such as: toxic, metabolic, or tachycardia induced cardiomyopathy
 - Once the reversible aberration is corrected, clinical reassessment is indicated

Cardiac resynchronization therapy (CRT)-P (CRID-10)

CID.CRT.102.A

v1.0.2024

Indications for CRT-P (CRID-10.1)

Procedures included

CPT® 33224, 33225, 33208, 33229

CRT-P is indicated for any of the following:

- High grade AV block and NYHA Class I, II or III Congestive Heart Failure:
 - CRT-P implantation is indicated in individuals who have **all** of the following:
 - LV ejection fraction <50%
 - NYHA Class I, II, or III heart failure
 - High grade AV block, including AV nodal ablation, requiring more than 40% ventricular pacing (CRT)-P
- Pacing-induced cardiomyopathy
 - Upgrade from non-CRT pacemaker to CRT-P is indicated in individuals who have **all** of the following:
 - LV EF >50% prior to implantation of non-CRT pacemaker
 - Right ventricular pacing burden ≥40%
 - One of the following occurring after implantation of non-CRT pacemaker:
 - Decline in LV EF ≥10%
 - New or worsening heart failure symptoms NYHA Class II or III
- See also **Indications for Cardiac Resynchronization Therapy (CRT)-D Implantation** for individuals who have met requirements for CRT-D, but decline the ICD function

Indications for conduction system pacing

His bundle pacing or left bundle branch area pacing (CPT® 33207 or CPT® 33208) may be considered when CRID 10.1 indications for CRT-P are met and one of the following applies:

- LV lead placement was attempted and was unsuccessful or suboptimal
- His bundle pacing or left bundle branch area pacing is planned in place of biventricular pacing

Wireless Cardiac Resynchronization (CRID-11.2)

CID.CRT.104.A

v1.0.2024

Wireless cardiac resynchronization - Criteria (CRID-11.2)

- Permanent LV leadless pacemakers (CPT® 0515T) are implanted directly in the left ventricle for synchronization with RV leads in the setting of cardiac resynchronization therapy. At this time they are considered experimental and investigational.

Other Cardiac Implantable Devices

Guideline

Wireless Pulmonary Artery Pressure Sensor (CRID-11.3)

Wireless Pulmonary Artery Pressure Sensor (CRID-11.3)

CID.OD.100.A

v1.0.2024

Wireless pulmonary artery pressure sensor - Criteria

Wireless Pulmonary Artery Pressure Sensor devices (CPT® 33289) such as, CardioMEMS™ HF System, are implanted into a branch of the pulmonary artery during right heart catheterization and require a specialized delivery system. These devices monitor constant pulmonary artery pressures over time, utilizing the concept that as pulmonary artery pressures increase, outpatient medical therapy can be adjusted. This can potentially reduce inpatient admissions and treatment.

- Although FDA approved, these devices have yet to be incorporated into the standard of care and remain investigational and experimental at this time.

SPN	solitary pulmonary nodule
SVC	superior vena cava

General Guidelines (CH-1.0)

CH.GG.0001.0.A

v2.0.2024

- A pertinent clinical evaluation since the onset or change in symptoms is required prior to considering advanced imaging.
 - A pertinent clinical evaluation should include the following:
 - A detailed history and physical examination
 - Appropriate laboratory studies and basic imaging, such as plain radiography or ultrasound
 - A recent chest x-ray since the onset or change in symptoms that has been over read by a radiologist would be performed in many of these cases prior to considering advanced imaging.^{1,2}
 - Identify and compare with previous chest films to determine presence and stability.
 - For an established individual a meaningful technological contact (telehealth visit, telephone call, electronic mail or messaging) since the onset or change in symptoms can serve as a pertinent clinical evaluation.

General Guidelines – Chest X-Ray (CH-1.1)

CH.GG.0001.1.A

v2.0.2024

- Chest x-ray can help identify previously unidentified disease and direct proper advanced imaging for such conditions as:
 - Pneumothorax (See **Pneumothorax/Hemothorax (CH-19.1)**)
 - Pneumomediastinum (See **Pneumothorax/Hemothorax (CH-19.1)**)
 - Fractured ribs (See **Chest Trauma (CH-21.1)**)
 - Chest wall mass (See **Chest Wall Mass (CH-22.1)**)
 - Acute and chronic infections (See **Pneumonia and Coronavirus Disease 2019 (COVID-19) (CH-13)** and **Other Chest Infections (CH-14)**)
 - Malignancies
- Exceptions to preliminary chest x-ray include such conditions as:
 - Supraclavicular lymphadenopathy (See **Supraclavicular Region (CH-2.1)**)
 - Known Bronchiectasis (See **Bronchiectasis (CH-7.1)**)
 - Suspected Interstitial lung disease (See **Interstitial Lung Disease (ILD)/Diffuse Lung Disease (DLD) (CH-11.1)**)
 - Positive PPD or tuberculosis (See **Other Chest Infections (CH-14)**)
 - Suspected Pulmonary AVM (See **Pulmonary Hypertension (CH-26.1)**)

General Guidelines – Chest Ultrasound (CH-1.2)

CH.GG.0001.2.A**v2.0.2024**

- Chest ultrasound (CPT® 76604) includes transverse, longitudinal, and oblique images of the chest wall with measurements of chest wall thickness, and also includes imaging of the mediastinum.
 - Chest ultrasound:
 - CPT® 76604
 - Breast ultrasound:
 - CPT®76641: unilateral, complete.
 - CPT®76642: unilateral, limited.
 - CPT®76641 and CPT®76642 should be reported only once per breast, per imaging session
 - Axillary ultrasound:
 - CPT® 76882 (unilateral); if bilateral, can be reported as CPT® 76882 x 2

General Guidelines – CT Chest (CH-1.3)

CH.GG.0001.3.A
v2.0.2024

- Intrathoracic abnormalities found on chest x-ray, fluoroscopy, CT Abdomen, or other imaging modalities can be further evaluated with CT Chest with contrast (CPT® 71260).
- CT Chest without contrast (CPT® 71250) can be used for the following:
 - Individual has contraindication to contrast
 - Follow-up of pulmonary nodule(s)
 - High Resolution CT (HRCT)
- Low-dose CT Chest (CPT® 71271) See **Lung Cancer Screening (CH-33)**
- CT Chest without and with contrast (CPT® 71270) does not add significant diagnostic information above and beyond that provided by CT Chest with contrast, unless a question regarding calcification, most often within a lung nodule, needs to be resolved.¹

CT Chest Coding Notes:

- High resolution CT Chest should be reported only with an appropriate code from the set CPT® 71250-CPT® 71270.
 - No additional CPT® codes should be reported for the “high resolution” portion of the scan. The “high resolution” involves additional slices which are not separately billable.

General Guidelines – CTA Chest (CPT® 71275) (CH-1.4)

CH.GG.0001.4.A

v2.0.2024

- CTA Chest (CPT® 71275) can be considered for suspected Pulmonary Embolism and Thoracic Aortic disease.
 - CTA prior to minimally invasive or robotic surgery (See **Transcatheter Aortic Valve Replacement (TAVR) (CD-4.8)** in the Cardiac Imaging Guidelines).

General Guidelines – MRI Chest without and with Contrast (CPT® 71552) (CH-1.5)

CH.GG.0001.5.A

v2.0.2024

- Indications for MRI Chest are infrequent and may relate to concerns about CT contrast such as renal insufficiency or contrast allergy. MRI may be indicated:
 - Clarification of some equivocal findings on previous imaging studies, which are often in the thymic mediastinal region or determining margin (vascular/soft tissue) involvement with tumor and determined on a case-by-case basis.
 - Certain conditions include:
 - Chest wall mass (See **Chest Wall Mass (CH-22.1)**)
 - Chest muscle tendon injuries (See **Muscle/Tendon Unit Injuries/Diseases (MS-11.1)** in the Musculoskeletal Imaging Guidelines)
 - Pectoralis tendon rupture (See **Shoulder (MS-19)**)
 - Brachial plexopathy (See **Brachial Plexus (PN-4.1)** in the Peripheral Nerve Disorders Imaging Guidelines)
 - Thymoma (See **Thymoma and Thymic Carcinoma - Suspected/Diagnosis (ONC-10.5)** in the Oncology Imaging Guidelines)

General Guidelines – Nuclear Medicine (CH-1.6)

CH.GG.0001.6.A

v2.0.2024

CPT	Description
78580	Pulmonary perfusion imaging (eg, particulate)
78582	Pulmonary ventilation (eg, aerosol or gas) and perfusion imaging
78597	Quantitative differential pulmonary perfusion, including imaging when performed
78598	Quantitative differential pulmonary perfusion and ventilation (e.g., aerosol or gas), including imaging when performed

- Pulmonary perfusion imaging (eg, particulate) (CPT® 78580) and Pulmonary ventilation (eg, aerosol or gas) and perfusion imaging (CPT® 78582) See **Pulmonary Embolism (CH-25.1)**
- Quantitative differential pulmonary perfusion, including imaging when performed (CPT® 78597) and Quantitative differential pulmonary perfusion and ventilation (e.g., aerosol or gas), including imaging when performed (CPT® 78598) See **Pre-Operative Assessment (CH-5.2)**

Navigational Bronchoscopy (CH-1.7)

CH.GG.0001.7.A

v2.0.2024

- CPT® 76497 (Unlisted CT procedure) can be considered if:
 - A CT Chest has been performed within the last 6 weeks and study is needed for navigational bronchoscopy.
- CT Chest without contrast (CPT® 71250) can be considered for:
 - Previous diagnostic scan was ≥ 6 weeks ago and study is needed for navigational bronchoscopy

Background and Supporting Information

- Navigational Bronchoscopy: This is a form of guided bronchoscopy. A special sensor inside a bronchoscopy is used to navigate to the desired location within the lung. Computer software generates a virtual bronchial tree which provides a road map to the target lesion. A thin-cut CT Chest with optimized reconstruction parameters is required to generate the virtual map of the lungs. A previous CT Chest may not be usable for navigation if it was not formatted correctly, even if done just a few days prior.

Lymphadenopathy (CH-2)

Guideline

Supraclavicular Region (CH-2.1)

Axillary Lymphadenopathy (and Mass) (CH-2.2)

Mediastinal Lymphadenopathy (CH-2.3)

References (CH-2)

Supraclavicular Region (CH-2.1)

CH.LA.0002.1.A

v2.0.2024

- Ultrasound (CPT® 76536) is the initial study for palpable or suspected lymphadenopathy.
 - Allows simultaneous ultrasound-guided core needle biopsy (CPT® 76942)
 - CT Neck with contrast (CPT® 70491) or CT Chest with contrast (CPT® 71260) if ultrasound is indeterminate
 - See **General Guidelines (Neck-1.0)** in the Neck Imaging Guidelines

Axillary Lymphadenopathy (and Mass) (CH-2.2)

CH.LA.0002.2.A

v2.0.2024

- There is no evidence-based support for advanced imaging of clinically evidenced axillary lymphadenopathy prior to a biopsy.^{2,3} If axillary node biopsy reveals benign findings, advanced imaging is not indicated. If axillary node biopsy reveals findings concerning for malignancy, pathology results will determine the need for further advanced imaging. See **Carcinoma of Unknown Primary Site (ONC-31.7)** in the Oncology imaging Guidelines for imaging recommendations for carcinoma found in an axillary lymph node.
- Localized axillary lymphadenopathy:
 - Axillary US (CPT® 76882)
 - Initial evaluation of any axillary mass or enlarged node
 - Search for adjacent hand or arm injury or infection, and
 - 3-4 week observation if benign clinical picture (for ipsilateral COVID vaccination-related adenopathy, observation for 12 or more weeks is recommended)⁴. Follow-up imaging with ultrasound can be obtained if there is a significant risk of metastatic adenopathy (e.g., breast, head and neck, upper extremity/trunk melanoma or lymphoma⁵)
 - If axillary adenopathy is unchanged, then consider additional follow up 6 months after initial presentation⁴
 - Ultrasound directed core needle biopsy or surgical excisional biopsy of the most abnormal lymph node if condition persists, or malignancy is suspected, or surgical excisional biopsy if core needle biopsy results are non-diagnostic.
 - No advanced imaging indicated.
- Generalized axillary lymphadenopathy:
 - Axillary US (CPT® 76882)
 - Initial evaluation of any axillary mass or enlarged node
 - Ultrasound directed core needle biopsy or surgical excisional biopsy of the most abnormal lymph node if condition persists, if malignancy is suspected, or surgical excisional biopsy if core needle biopsy results are non-diagnostic.
 - Diagnostic work-up, including serological tests, for systemic diseases
 - See **Non-Hodgkin Lymphomas (ONC-27)** in the Oncology Imaging Guidelines.
- Occult Primary Cancer in axillary lymph node(s):
 - See **Metastatic Cancer, Carcinoma of Unknown Primary Site, and Other Types of Cancer (ONC-31)** in the Oncology Imaging Guidelines.

Background and Supporting Information

- Adenocarcinoma is the most common histology, with breast cancer seen most often; non-palpable breast cancer and axillary metastases accounts for less than 0.5% of all breast cancers. Carcinomas of the lung, thyroid, stomach, colon, rectum, and pancreas have the potential to spread to axillary lymph nodes, but these metastases are rarely the first manifestations of disease.
- COVID-19 vaccine-related unilateral axillary adenopathy has been well documented to occur in 12% of recipients after the first dose and up to 16% after the second dose.¹ In some series the incidence has been as high as 53%.² Adenopathy usually develops within the first few days after vaccination and lasts a mean of 10 days. However, 29% had lymphadenopathy which persisted >6 weeks.³ PET-CT can provide false positive results of unilateral axillary adenopathy up to 7-10 weeks post vaccination. Due to these concerns, in individuals with cancer history it is recommended that the vaccination be provided in the contralateral arm, especially in case of unilateral breast cancer.
- The Society for Breast Imaging (SBI) recommends that for unilateral axillary adenopathy on screening exams who received a recent COVID-19 vaccination in the ipsilateral upper extremity, a follow up interval of 12 or more weeks is recommended. If axillary adenopathy persists after short term follow up, then consider lymph node sampling to exclude breast and non-breast malignancy.⁴ Imaging for urgent cancer related clinical indication should not be delayed in relationship to COVID vaccine timing. For routine surveillance, screening and similar non-urgent indications, postponement of imaging for at least 6 weeks after vaccinations should be considered.⁵ However, the SBI no longer recommends delaying screening mammograms around COVID-19 vaccinations.^{4, 5}

Mediastinal Lymphadenopathy (CH-2.3)

CH.LA.0002.3.A

v2.0.2024

- CT Chest with contrast (CPT® 71260) if mediastinal abnormalities are detected on a chest x-ray (over read by a radiologist), other non-dedicated advanced chest imaging, or clarification of mediastinal abnormalities on a non-contrast CT Chest.
 - Follow-up CT Chest (CPT® 71260) after 3-6 months if:
 - Enlarged lymph nodes, ≥ 15 mm, are in the mediastinum with no other thoracic abnormalities; and
 - Low risk or no clinical suspicion for malignancy.
 - Thereafter, stability or decreasing size, does not require further advanced imaging.
 - Further evaluations:
 - Lymph node biopsy (see methods below) should be considered for:
 - Persistent or increasing lymphadenopathy on follow-up CT Chest; or
 - Suspected malignancy.
 - See **Non-Hodgkin Lymphomas (ONC-27)** and/or **Hodgkin Lymphoma (ONC-28)** in the Oncology Imaging Guidelines for suspicion of Lymphoma
- PET/CT (CPT® 78815) can be considered for enlarged lymph nodes, ≥ 15 mm with no explainable disease or increasing lymph node size on follow-up CT Chest

Background and Supporting Information

- Incidentally detected lymph nodes < 15 mm (in short axis) in individuals with no other findings do not require further evaluation.
- Most benign nodes have smooth and well-defined borders, show uniform and homogeneous attenuation, and demonstrate a central fatty hilum
- Explainable disease such as emphysema, interstitial lung disease, sarcoidosis, cardiac disease.
- Unexplained causes, consider lymphoma, undiagnosed metastatic disease, including testicular carcinoma in young male, and infection.
- Lymphadenopathy from neoplasms as well as from benign sources of inflammation can result in a positive PET scan. Therefore, the use of PET may not be helpful prior to histologic diagnosis.
- Less invasive methods of mediastinal biopsies are CT or ultrasound directed percutaneous biopsy, transbronchial biopsy, transbronchial biopsy using endobronchial ultrasound, and endoscopic ultrasound-guided FNA.
- More invasive and traditional methods are mediastinoscopy or thoracoscopy/thoracotomy.

Cough (CH-3)

Guideline

Cough (CH-3.1)

References (CH-3)

Cough (CH-3.1)

CH.CH.0003.1.A

v2.0.2024

- Initial evaluation should include a recent chest x-ray after the current episode of cough started or changed.^{1,2}
 - In addition all medications known to cause coughing (e.g. ACE inhibitors, Sitagliptin) should be discontinued.^{1,2,3}
- CT Chest (either with contrast [CPT® 71260] or without contrast [CPT® 71250]), if the initial chest x-ray is without abnormalities and all medications known to cause coughing have been discontinued, for the following:
 - Non-Smoker cough after the following sequence for a total 3-week trial and investigation after ALL of the following:⁴
 - Antihistamine and decongestant or intranasal glucocorticoid treatment.^{1,2,7}
 - Spirometry and/or pulmonary function tests (PFT's).^{1,4,8}
 - Empiric trial of corticosteroids (oral or inhaled) and/or leukotriene receptor antagonist (e.g. Montelukast).^{1,2,4,8,9}
 - Treatment of gastroesophageal reflux disease (GERD).^{1,2,4,8,9}
 - See **Sinus and Facial Imaging (HD-29.1)** in the Head Imaging Guidelines.
 - Current or past cigarette smokers with either⁴:
 - New cough lasting greater than 2 weeks.
 - Changed chronic cough in worsening frequency or character
 - See **Hemoptysis (CH-6.1)**
 - For any abnormalities present on the initial chest x-ray, advanced chest imaging can be performed according to the relevant Chest Imaging Guidelines section.¹
- CT Maxillofacial without contrast (CPT® 70486) or CT Sinus, limited without contrast (CPT® 76380) is indicated in those with suspicion of Upper Airway Cough Syndrome (UACS) in the following:^{4,5,6}
 - Clinical criteria for chronic rhinosinusitis (CRS) or acute/recurrent rhinosinusitis are met, as per Sinus and Facial Imaging (HD 29.1); **OR ALL** of the following:
 - At least a one week trial of daily antihistamine/decongestant
 - Initial evaluation with a chest x-ray and/or CT Chest after the current episode of cough started or changed
 - All medications known to cause cough have been discontinued

Background and Supporting Information

- The resolution of cough usually will occur at a median time of 26 days of stopping use of the angiotensin-converting enzyme (ACE) inhibitor drug.² Smoking cessation is “almost always effective” in resolving cough in smoker.²
- Cough after URI (Upper Respiratory Infection) can typically last beyond 2-3 weeks.³

- Objective evidence of classic asthmatic cough conventionally requires some evidence of variable airflow obstruction such as peak flow variability, or reversibility to bronchodilator of >12-15%.⁸
- In adult patients with chronic cough suspected to be due to reflux-cough syndrome, it is recommended that treatment include (1) diet modification to promote weight loss in overweight or obese patients; (2) head of bed elevation and avoiding meals within 3 hours of bedtime; and (3) in patients who report heartburn or regurgitation, PPI's, H-2 receptor antagonists, alginate or antacid therapy sufficient to control these symptoms.⁹

Non-Cardiac Chest Pain (CH-4)

Guideline

Non-Cardiac Chest Pain (CH-4.0)

Non-Cardiac Chest Pain – Imaging (CH-4.1)

Costochondritis/Other Musculoskeletal Chest Wall Syndrome (CH-4.2)

References (CH-4)

Non-Cardiac Chest Pain (CH-4.0)

CH.CP.0004.0.A
v2.0.2024

- See the following guidelines:
 - **Pulmonary Embolism (PE) (CH-25.1)**
 - **General Guidelines (CD-1)** in the Cardiac Imaging Guidelines
- “Evidence is not conclusive whether Triple-rule-out CT (CAD, PE, and AD) will improve efficiency of patient management” with acute chest pain.¹
- MRI is not supported in the evaluation of chest pain.

Non-Cardiac Chest Pain – Imaging (CH-4.1)

CH.CP.0004.1.A

v2.0.2024

- Initial evaluation should include a chest x-ray.
 - CT Chest with contrast (CPT® 71260) or CTA Chest (CPT® 71275) if x-ray is abnormal. See **Pneumonia (CH-13.1)**
- Sub-Sternal Non-Cardiac Chest Pain:
 - If x-ray is normal and the chest pain is substernal, the individual should undergo evaluation of other possible causes of pain prior to advanced imaging (CT Chest with contrast or CTA Chest) including:^{1,2,3}
 - Cardiac evaluation^{1,2} (See **General Guidelines (CD-1)** in the Cardiac Imaging Guidelines)
 - GI any ONE of the following since GERD is the cause in almost 60%:
 - Trial of anti-reflux medication, or pH probe, or esophageal manometry¹ or
 - Barium swallow or endoscopy
 - Pulmonary Function Test (PFT's)^{1,2}
 - CT Chest with contrast (CPT® 71260) if persistent:
 - The initial chest x-ray reveals no abnormalities with known Sickle cell disease²
- Non-Cardiac Chest Pain, other than Sub-Sternal:
 - If x-ray is normal and the chest pain is in a location other than substernal:
 - CT Chest with (CPT® 71260) or without (CPT® 71250) contrast and/or bone scan for:
 - Known or suspected malignancy, including individuals with chest pain associated with cough and weight loss
 - CT Chest with (CPT® 71260) or without (CPT® 71250) contrast for:
 - Suspected infectious or inflammatory condition
 - History of prior chest intervention (surgery, Radiation Therapy)
 - MRI Chest without and with contrast (CPT® 71552) for:
 - Necrotizing fasciitis
 - Surgical planning prior to debridement procedures

Costochondritis/Other Musculoskeletal Chest Wall Syndrome (CH-4.2)

CH.CP.0004.2.A

v2.0.2024

- Costochondritis or other suggested musculoskeletal chest wall syndrome does not require advanced imaging (CT or MRI) unless it meets other criteria in these guidelines.

Background and Supporting Information

- Chest x-ray could identify pneumothorax, pneumomediastinum, fractured ribs, acute and chronic infections, and malignancies.¹
- Costochondritis can be readily diagnosed with palpation tenderness and/or hooking maneuver and imaging is non-specific.³

Dyspnea/Shortness of Breath (CH-5)

Guideline

Dyspnea/Shortness of Breath (CH-5.1)

Pre-Operative Assessment (CH-5.2)

Post Endobronchial Valve (EBV) Placement (CH-5.3)

References (CH-5)

Dyspnea/Shortness of Breath (CH-5.1)

CH.SB.0005.1.A

v2.0.2024

- Initial evaluation should include a recent chest x-ray.^{1,2}
 - CT Chest without contrast (CPT® 71250) if x-ray is abnormal.^{1,2}
 - CT Chest without contrast (CPT® 71250, including HRCT), or CT Chest with contrast (CPT® 71260) if the initial chest x-ray is indeterminate and the following evaluations have been conducted and are indeterminate:²
 - ECG, echocardiogram or stress testing,² and
 - Pulse oximetry and pulmonary function studies (PFT's)²
- If pulmonary embolus (PE) is suspected, See **Pulmonary Embolism (PE) (CH-25)**.

Background and Supporting Information

- Dyspnea is the subjective experience of breathing discomfort.

Pre-Operative Assessment (CH-5.2)

CH.SB.0005.2.A

v2.0.2024

- For pre-operative assessment prior to a planned segmental, lobar or lung removal,^{3,4} as well as for pre-interventional assessment prior to a planned endobronchial valve (e.g. Zephyr valve) placement, the following can be considered:
 - “Split Function Studies” (CPT® 78597-Quantitative Differential Pulmonary Perfusion, Including Imaging When Performed or CPT® 78598-Quantitative Differential Pulmonary Perfusion and Ventilation (e.g., Aerosol or Gas), Including Imaging When Performed) or SPECT/CT (CPT® 78830) AND/OR
 - CT Chest (CPT® 71250, CPT® 71260 or CPT® 71270) for pre-interventional procedure assessment prior to a planned endobronchial valve (e.g. Zephyr Valve) placement.

Post Endobronchial Valve (EBV) Placement (CH-5.3)

CH.SB.0005.3.A

v2.0.2024

- Suspected Post EBV Complication:
 - Initial evaluation should include a recent chest x-ray
 - CT Chest without contrast (CPT® 71250) or CT Chest with contrast (CPT® 71260) is appropriate for:
 - Acute loss of benefit, lack of initial benefit, increased dyspnea, sudden chest pain, increased cough, suspected valve malposition/migration, or to evaluate target lobe volume reduction

Hemoptysis (CH-6)

Guideline

Hemoptysis (CH-6.1)

Reference (CH-6)

Hemoptysis (CH-6.1)

CH.HS.0006.1.A

v2.0.2024

- Following a chest x-ray performed after hemoptysis started or worsened the following is indicated:
 - CT Chest with contrast (CPT® 71260) or CTA Chest (CPT® 71275)
- For recurrent hemoptysis, (hemoptysis occurring after medical therapy or embolization), the following is indicated:
 - CTA Chest (CPT® 71275)

NOTE:

- CT Chest without contrast, (CPT® 71250), is only warranted in individuals with poor renal function or life-threatening contrast allergy.
- There is no data to support the use of CT Chest without and with contrast, (CPT® 71270), in the diagnosis of hemoptysis.

Background and Supporting Information

- Chest x-ray has been shown to predict the side and cause of bleeding in up to 82% of individuals and can be abnormal in up to 90% of cases. The most common cause of hemoptysis was acute bronchitis with the second most common cause as respiratory tract neoplasm. Bronchiectasis and tuberculosis were additional common causes

Bronchiectasis (CH-7)

Guideline

Bronchiectasis (CH-7.1)

Adult Cystic Fibrosis (CH-7.2)

References (CH-7)

Bronchiectasis (CH-7.1)

CH.BR.0007.1.A

v2.0.2024

- High resolution CT Chest (HRCT) without contrast (CPT® 71250) for ANY of the following:^{4,5}
 - To confirm suspected diagnosis of bronchiectasis after an initial x-ray.^{1,2}
 - For known bronchiectasis with worsening symptoms or worsening PFT's.²
 - For hemoptysis with known or suspected bronchiectasis.³

Adult Cystic Fibrosis (CH-7.2)

CH.BR.0007.2.A

v2.0.2024

- CT Chest without contrast (CPT® 71250) or with contrast (CPT® 71260) is indicated for the following (without initial Chest x-ray):
 - Suspected or initial diagnosis of Cystic Fibrosis
 - Biennially, (every 2 years), for routine surveillance
 - Persistent respiratory symptoms with reduced lung function despite therapy
 - Exacerbations when Chest x-ray is indeterminate
 - Hemoptysis
 - Suspected fungal pneumonia
 - Pre and post-lung transplant evaluation
- See **Bronchiectasis (CH-7.1)**

Asbestos Exposure (CH-9)

Guideline

Asbestos Exposure (CH-9.1)

References (CH-9)

Asbestos Exposure (CH-9.1)

CH.AE.0009.1.A

v2.0.2024

- Chest x-ray as radiographic screening for asbestos exposure.^{1,2}
 - Stable calcified pleural plaques on chest x-ray do not require advanced imaging of the chest.²
- CT Chest should not be used to screen populations at risk for asbestos-related diseases.²
- High resolution CT Chest (HRCT) (CPT® 71250) for ANY of the following:²
 - Any change seen on chest x-ray.
 - Progressive respiratory symptoms that may indicate the development or progression of asbestos related interstitial fibrosis.

Background and Supporting Information

- Asbestosis and asbestos-related diseases include: pleural effusion, pleural plaques, lung cancer, and malignant mesothelioma. The risk of developing mesothelioma increases with increasing intensity and duration of exposure.

References (CH-9)

v2.0.2024

Chronic Obstructive Pulmonary Disease (COPD) (CH-10)

Guideline

COPD (CH-10.1)

References (CH-10)

COPD (CH-10.1)

CH.PD.0010.1.A

v2.0.2024

- Chest x-ray should be performed initially.
 - CT Chest without contrast (CPT® 71250) or CT Chest with contrast (CPT® 71260)^{1,2} can be performed if:
 - Emphysema is known or suspected and a pre-operative study for Lung Volume Reduction Surgery (LVRS) is being requested.¹ OR
 - Definitive diagnosis is not yet determined by PFT's, appropriate laboratory studies and chest x-ray and ONE of the following is suspected:
 - Bronchiectasis
 - Sarcoidosis
 - Emphysema
 - Pneumoconiosis
 - Idiopathic pulmonary fibrosis
 - Langerhans cell histiocytosis
 - Hypersensitivity pneumonitis
 - Bronchiolitis obliterans
 - Lipoid pneumonia
 - Drug toxicity
 - Lymphangitic cancer²
 - Alpha-1-Antitrypsin Deficiency
- Lung cancer screening is discussed in the following guideline:
 - See "Screening Indications" in **Lung Cancer Screening (CH-33)**
- Pre-interventional lung procedure assessment prior to a planned endobronchial valve (e.g. Zephyr valve) placement
 - See **Pre-Operative Assessment (CH-5.2)**

Background and Supporting Information

- COPD includes asthmatic bronchitis, chronic bronchitis, and emphysema. COPD is airflow reduction (FEV1/FVC ratio <0.7 or FEV1 <80% predicted) in the presence of respiratory symptoms, such as dyspnea. Advanced chest imaging is not typically indicated in COPD exacerbation, which is an acute change in baseline dyspnea, cough, and/or sputum beyond normal day-to-day variations.²

Interstitial Disease (CH-11)

Guideline

Interstitial Lung Disease (ILD)/Diffuse Lung Disease (DLD) (CH-11.1)
E-cigarette, or Vaping, Product Use–Associated Lung Injury (EVALI)
(CH-11.2)
References (CH-11)

Interstitial Lung Disease (ILD)/Diffuse Lung Disease (DLD) (CH-11.1)

CH.ID.0011.1.A

v2.0.2024

- High resolution CT Chest (HRCT) without contrast (CPT® 71250) is the diagnostic modality of choice to evaluate or CT Chest with contrast (CPT® 71260)¹⁰ (See **Background and Supporting Information**) for:
 - Interstitial changes or diffuse parenchymal changes identified on other imaging (including chest x-ray) in individuals with pulmonary symptoms and abnormal pulmonary function studies (PFT's) (See **Dyspnea/Shortness of Breath (CH-5.1)**)¹⁻⁶
 - In individuals with pulmonary symptoms and abnormal pulmonary function studies (PFT's) and normal chest x-ray with high clinical suspicion for ILD or DLD, including but not limited to entities such as Hypersensitivity Pneumonitis, Cryptogenic Organizing Pneumonia (COP, formally known as BOOP), and Eosinophilic Pneumonia, as chest x-ray can be normal in up to 10% of ILD^{8,9}
 - Initial imaging to identify interstitial disease with a connective tissue disease diagnosis, or significant exposures including (chest x-ray not required):
 - Rheumatoid arthritis
 - Scleroderma
 - Idiopathic inflammatory myopathies (polymyositis, dermatomyositis, inclusion body myositis)
 - Systemic lupus erythematosus
 - Sjögren's syndrome
 - Mixed connective tissue disease
 - Significant exposure and concern for:
 - Asbestosis
 - Silicosis
 - Coal miner's lung disease^{1-6,11}
 - At any time for detection of Progressive Pulmonary Fibrosis (PPF), in individuals with ILD of known or unknown etiology, defined by at least one of the following:¹²
 - New or worsening respiratory symptoms
 - Worsening PFT's, defined as decline of either:
 - FVC of 5% or greater within the past year
 - DLCO of 10% or greater within the past year
 - Once a year in individuals with known pulmonary fibrosis if needed for:¹⁰
 - Serial examination for improvements in diagnostic accuracy, or
 - Evaluation of disease reversibility, stability, or progression.
- Concern for interstitial lung disease post-COVID See **Coronavirus Disease 2019 (COVID-19) (CH-13.2)**

Background and Supporting Information

- DLD refers to diffuse parenchymal lung diseases or interstitial lung diseases. There are a multitude of pathologies that demonstrate involvement of the alveola, airways, or both, in addition to the pulmonary interstitium. A single term of ILD would not fully address the entities that are mostly parenchymal in nature, hence the term Diffuse Lung Disease is more technically correct. Both terms are included here for convenience and recognition.
- There is no relevant literature to support the use of CT with IV contrast for initial or follow-up imaging of ILD; however, IV contrast may be of use in evaluation of alternative diagnoses with overlapping clinical features or conditions that also involve the pleura, mediastinum, and pulmonary vessels.
- Progression of fibrosis is typically assessed visually, relying on the percentage of lung volume containing fibrotic features in the upper, mid, and lower lung zones. An increased extent of fibrotic features denotes progression. These may include increased traction bronchiectasis and bronchiolectasis, new ground-glass opacity with traction bronchiectasis, new fine reticulation, increased coarseness of reticular abnormality, new or increased honeycombing, and increased lobar volume loss.¹²

E-cigarette, or Vaping, Product Use– Associated Lung Injury (EVALI) (CH- 11.2)

CH.ID.0011.2.A

v2.0.2024

- CT Chest with or without contrast (CPT® 71250 or CPT® 71260) if EVALI is suspected.⁷

Pneumonia and Coronavirus Disease 2019 (COVID-19) (CH-13)

Guideline

Pneumonia (CH-13.1)

Coronavirus Disease 2019 (COVID-19) (CH-13.2)

References (CH-13)

Pneumonia (CH-13.1)

CH.PN.0013.1.A

v2.0.2024

- Chest x-ray should be performed initially in all individuals with suspected pneumonia, prior to considering advanced imaging.^{1, 2}
 - CT Chest without or with contrast (CPT® 71250 or CPT® 71260) if initial or repeat chest x-ray findings reveal:
 - Complication of pneumonia (e.g. abscess, effusion, hypoxemia, respiratory distress, necrotizing pneumonia, pneumothorax).^{1,2}
 - Possible lung mass associated with the infiltrate.²
- CT Chest without or with contrast (CPT® 71250 or CPT® 71260) for immunocompromised individuals with any of the following:¹⁵
 - High suspicion for pneumonia despite equivocal or negative CXR
 - Persistent radiographic abnormalities
 - Multiple or diffuse opacities or nodules

Coronavirus Disease 2019 (COVID-19) (CH-13.2)

CH.PN.0013.2.A

v2.0.2024

- CT Chest without contrast (CPT®71250), or with contrast (CPT®71260) in the following clinical situations:
 - Imaging for initial diagnosis:
 - Symptomatic COVID-19 positive individuals with underlying comorbidities (including but not limited to age >65 years, chronic lung disease, current or former smoker, chronic kidney disease, chronic liver disease, dementia, diabetes, Down's syndrome, HIV or other primary, secondary or acquired immunodeficiency, mood disorders, BMI ≥30, pregnancy, solid organ or blood stem cell transplant, cerebrovascular disease, substance use disorder, tuberculosis, cardiovascular disease, malignancy, bronchopulmonary dysplasia, chronic infections, or immunocompromised state). See CDC's list of higher risk for severe COVID for additional information: <https://www.cdc.gov/coronavirus/2019-ncov/need-extra-precautions/people-with-medical-conditions.html>
 - Moderate to severe symptomatic individuals with evidence of significant pulmonary dysfunction or damage (e.g., hypoxemia, moderate-to-severe dyspnea), suspected of having COVID-19, regardless of COVID-19 test results or when viral testing is not available.
 - Thromboembolic complications including pulmonary embolism, stroke and mesenteric ischemia are recognized complications of COVID-19. See **Pulmonary Embolism (CH-25.1)**, **Mesenteric Ischemia (AB-6.1)** in the Abdomen Imaging Guidelines, and **Stroke/TIA (HD-21.1)** in the Head Imaging Guidelines for appropriate imaging guidance.
 - Other systemic complications are being recognized as medical knowledge about this condition evolves. Imaging for possible COVID-19 complications should be managed by the appropriate condition based guidelines.
 - Imaging after initial diagnosis:
 - Imaging in the following clinical circumstances:
 - If there is significant worsening of symptoms in a COVID-19 positive individual and imaging will be used to modify individual management.
 - A recovered COVID-19 positive individual with significant residual functional impairment and/or persistence hypoxemia.
 - Symptomatic post-COVID individuals with concern for interstitial lung disease including organizing pneumonia imaging can be considered pre and post treatment.¹¹

Background and Supporting Information

- The role of advanced imaging in the diagnosis and management of COVID-19 is very dynamic in this rapidly evolving condition.
- Findings on both Chest X-ray and CT Chest are non-specific. Chest X-rays may show patchy opacities with lower lung predominance. CT may show peripheral multifocal ground glass opacities with lower lung predominance. However, a significant portion of cases have opacities without a clear or specific distribution.^{3,4,6} A reverse halo sign or other findings of organizing pneumonia may be seen later during the course of illness. Atypical findings include isolated lobar or segmental consolidation without ground glass opacities, discrete small centrilobular ("tree-in-bud") nodules, pleural effusion.⁸
 - Pediatric individuals may have less pronounced imaging findings than adults.
- CT Chest abnormalities are common 3 months after discharge in adults who have been hospitalized for COVID-19 and are associated with more severe acute disease. Fibrosis was seen in a minority of people.^{13,14} Most people re-imaged at one year showed radiologic improvement.¹³
- Major professional society guidelines to date:
 - The American College of Radiology (ACR) recommends that CT Chest should not be used for screening or as a first-line test to diagnose COVID-19.³
 - The Centers for Disease Control and Prevention (CDC) recommends viral testing as the only specific method of diagnosis.⁴
 - The CDC has stated that symptoms may appear 2-14 days after exposure to the virus. These symptoms may include:⁵
 - Fever or chills
 - Cough
 - Shortness of breath or difficulty breathing
 - Fatigue
 - Muscle or body aches
 - Headache
 - New loss of taste or smell
 - Sore throat
 - Congestion or runny nose
 - Nausea or vomiting
 - Diarrhea
 - The Fleischner Society consensus statement published on April 7, 2020, recommends against the use of imaging in individuals with suspected COVID-19 who are either asymptomatic or have only mild symptoms without evidence of significant pulmonary dysfunction or damage (e.g., absence of hypoxemia, no or mild dyspnea).⁶
 - According to The American Society of Transplantation, screening donors is based on methods below. Screening donors encompasses three different methods.⁷

- Epidemiologic screening for travel and potential exposures
- Screening for symptoms suggestive of COVID-19
- Viral testing (Nucleic acid testing of specimens)
- There is no current indication for screening asymptomatic donors with advanced imaging

Other Chest Infections (CH-14)

Guideline

PPD or TB (Mycobacterium tuberculosis and Nontuberculous Mycobacterial Pulmonary Disease (NTM-PD)) (CH-14.1)

Fungal Infections (Suspected or Known) (CH-14.2)

Wegener's Granulomatosis/Granulomatosis with Polyangiitis (CH-14.3)

Suspected Sternal Dehiscence (CH-14.4)

References (CH-14)

PPD or TB (Mycobacterium tuberculosis and Nontuberculous Mycobacterial Pulmonary Disease (NTM-PD)) (CH-14.1)

CH.CI.0014.1.A

v2.0.2024

- CT Chest with contrast (CPT® 71260) or CT Chest without contrast (CPT® 71250) with ANY of the following:
 - Normal or equivocal chest x-ray with ONE of the following:¹
 - Positive PPD skin test or other positive tuberculin skin tests OR
 - Positive QuantiFERON-TB Gold OR
 - Suspected active (or reactivated) tuberculosis
 - Suspected complications or progression of tuberculosis (e.g. pleural tuberculosis, empyema, and mediastinitis)²
 - Suspected NTM-PD
 - If CT Chest is unremarkable, there is insufficient data to support performing subsequent CT Chest unless symptoms develop or chest x-ray shows a new abnormality.
 - Follow-up CT Chest with contrast (CPT® 71260) or without contrast (CPT® 71250) with frequency at the discretion of or in consultation with the pulmonary or infectious disease specialist (not to exceed 3 studies in 3 months).
 - Re-evaluate individuals undergoing active treatment who had abnormalities seen only on CT Chest.

Fungal Infections (Suspected or Known) (CH-14.2)

CH.CI.0014.2.A**v2.0.2024**

- CT Chest with contrast (CPT® 71260) or High resolution CT Chest (HRCT) without contrast (CPT® 71250):^{3,4}
 - Initial diagnosis of any fungal pneumonia or chest infection^{3,4}
 - Suspected complications or progression of the fungal chest infection (e.g. worsening pneumonitis; pleural effusion, empyema, mediastinitis)
 - Suspected Allergic Bronchopulmonary Aspergillosis (ABPA) in asthmatics with atypical presentation or poor response to conventional therapy.^{7,8,9}
- Follow-up CT Chest with contrast (CPT® 71260) or High resolution CT Chest (HRCT) without contrast (CPT® 71250) with frequency at the discretion of or in consultation with the pulmonary or infectious disease specialist.

Wegener's Granulomatosis/Granulomatosis with Polyangiitis (CH-14.3)

CH.CI.0014.3.A

v2.0.2024

- CT Chest without contrast (CPT® 71250)* should be done in all individuals who have pulmonary symptoms and are newly diagnosed or suspected of having Antineutrophil cytoplasmic autoantibody (ANCA)-associated vasculitides (AAV) for a baseline prior to initiating immunosuppressive therapy.^{5,6}
- Selective use of additional imaging is useful in evaluating individuals who are suspected or known to have AAV, including CT Head (sinuses, orbits, mastoids) in individuals with visual or upper respiratory track symptoms or signs, and CT Neck (subglottic region) in individuals with symptoms or signs of subglottic stenosis.⁶

*In most situations, CT scans in individuals with AAV should be performed without an iodinated contrast agent administered.⁶

Suspected Sternal Dehiscence (CH-14.4)

CH.CI.0014.4.A

v2.0.2024

- Sternal wound dehiscence is primarily a clinical determination.
- Chest x-ray is performed prior to advanced imaging to identify abnormalities in the sternal wire integrity and/or a midsternal stripe. Other findings include rotated, shifted or ruptured wires.
- CT Chest without contrast (CPT® 71250) or CT Chest with contrast (CPT® 71260) for:
 - Differentiating sternal wire migration from sternal dehiscence¹⁰
 - Planned debridement and/or repair.

See **Infection – General (MS-9.1)** for concerns for osteomyelitis or soft tissue infection

Sarcoid (CH-15)

Guideline

Sarcoid (CH-15.1)

References (CH-15)

Sarcoid (CH-15.1)

CH.SA.0015.1.A

v2.0.2024

- CT Chest with contrast (CPT® 71260) or without contrast (CPT® 71250) for:
 - Establish or rule out the diagnosis when suspected
- Subsequent CT Chest with contrast (CPT® 71260) or without contrast (CPT® 71250), in known sarcoid, for ANY of the following:¹
 - Development of worsening symptoms
 - New symptoms appear after a period of being asymptomatic
 - Treatment change is being considered
- If CT is equivocal, definitive diagnosis can only be made by biopsy.^{2,3,4}
- PET/CT should not be used in the standard work-up of all sarcoid individuals. There is currently no evidence to support the use of PET/CT for screening.
- PET/CT (CPT® 78815) can be considered under the following conditions:^{5,6,7}
 - Help guide biopsy location if:
 - Known lesion on CT Chest is difficult to access, to help identify alternative biopsy location
 - No apparent lung involvement and to identify an extrapulmonary biopsy site
 - Differentiation of reversible granulomatous disease from irreversible pulmonary fibrosis and will affect treatment options
 - Help identify treatment failure where either current treatment will be modified or new treatment will be introduced

Solitary Pulmonary Nodule – Imaging (CH-16.1)

CH.SN.0016.1.A

v2.0.2024

- For these guidelines, manual nodule measurements should be based on the average of long- and short-axis diameters. The size threshold (<6 mm) corresponds to a rounded measurement of 5 mm or less in these guidelines. Measurements should be rounded to the nearest millimeter. Prediction models used to estimate malignancy yield better results with the average diameter than with the maximum transverse diameter. The dimension of small pulmonary nodules (<10mm) should be expressed as the average of the maximal long-axis and perpendicular maximal short-axis measurements in the same plane. For larger nodules and for masses larger than 10 mm, it is generally appropriate to record both long- and short-axis dimensions, with the long-axis dimension being used to determine the T factor in lung cancer staging and being a criterion for tumor response to treatment.^{1,13}
- A pulmonary nodule can be determined to have changed in size when its average diameter has increased or decreased by at least 2mm (rounded to the nearest millimeter). Smaller changes do not reliably indicate change.¹³
- Maximum intensity projection (MIP), and Minimum intensity projection (MinIP) are 2D projections of the volumetric (3D) acquisition data.^{11,12} These projections may be of use in evaluation pulmonary nodules, but these projections are included in the cross sectional imaging base codes, and is not separately reimbursable.
- CT Chest with contrast (CPT® 71260) or CT Chest without contrast (CPT® 71250) initially for discrete nodule(s) in the following scenarios:^{1,2,3}
 - Lung nodule(s) seen on an imaging study other than a “dedicated” CT or MRI Chest. Examples of other studies:
 - Chest x-ray
 - CT Abdomen
 - MRI Spine
 - Coronary CTA¹
 - But NOT in the following which are considered initial dedicated advanced chest imaging:
 - CT Chest without and with contrast (CPT® 71270)
 - CTA Chest (CPT® 71275)
 - MRI Chest without contrast (CPT® 71550)
 - MRI Chest without and with contrast (CPT® 71552)
 - MRA Chest without and with contrast (CPT® 71555)
- Comparisons should include the earliest available study and the more recent previous CT Chest scans to determine if nodule was present and stable.¹
 - Similar-sized pleural nodule(s) is treated as a pulmonary nodule(s)

- The size of the lung or pleural nodule(s) is crucial information for decisions making regarding follow-up. The largest of multiple lung and/or pleural nodules will guide the surveillance interval. (See **Incidental Pulmonary Nodules Detected on CT Images (CH-16.2)**, and **Pleural-Based Nodules and Other Abnormalities (CH-17.1)**)

Background and Supporting Information

Abnormality examples include: mass, opacity, lesion, density, nodule, and calcification.

Incidental Pulmonary Nodules Detected on CT Images (CH-16.2)

CH.SN.0016.2.A

v2.0.2024

Incidentally Detected Solid Pulmonary Nodules Follow-up Recommendations*				
Nodule Type	<6 mm (<100 mm ³)	6–8 mm	>8 mm	Comments
Single Nodule	Follow-up (optional) CT at 12 months. No routine follow-up if stable at 12 months	CT at 6–12 months, then CT at 18–24 months if stable	CT at 3 months, then CT at 6–12 and then at 18–24 months if stable. Consider PET/CT** or biopsy	Certain individuals at high-risk with suspicious nodule morphology, upper lobe location, or both may warrant 12-month follow-up
Multiple Nodules	Follow-up (optional) CT at 12 months. *No routine follow-up if stable at 12 months	CT at 3–6 months, then at 18–24 months if stable	CT at 3–6 months, then at 18–24 months if stable. Consider PET/CT** or biopsy	Use most suspicious nodule as a guide to management. Follow-up intervals may vary according to size and risk.

Incidentally Detected Sub-Solid Pulmonary Nodules Follow-up Recommendations			
Nodule Type	<6mm (<100 mm ³)	≥6mm (≥100 mm ³)	Comments
Single Ground glass opacity (GGO)	Consider follow-up at 2 and 4 years. If solid component(s) or growth develops, consider resection.	CT at 6–12 months to confirm persistence, then follow-up with CT every 2 years until 5 years	In certain suspicious nodules, <6 mm, consider follow-up at 2 and 4 years. If solid component(s) or growth develops, consider resection.

Incidentally Detected Sub-Solid Pulmonary Nodules Follow-up Recommendations			
Single Part-solid	Consider follow-up at 2 and 4 years. If growth develops, consider resection.	CT at 3–6 months to confirm persistence. If unchanged and solid component remains <6 mm, then annual CT should be performed for 5 years. If the solid component has suspicious morphology (i.e., lobulated margins or cystic components), is >8 mm or is growing: Consider PET/CT** or biopsy	In practice, part-solid nodules cannot be defined as such until ≥6 mm. Persistent part-solid nodules with solid components ≥6 mm should be considered highly suspicious.
Multiple Part-Solid	CT at 3–6 months. If stable, consider CT at 2 and 4 years.	CT at 3–6 months. Subsequent management based on the most suspicious nodule(s).	Multiple <6 mm pure ground-glass nodules are usually benign.

(*Following the Fleischner Society Guidelines for high-risk which include American College of Chest Physicians intermediate and high-risk categories.^{1,2})

Pulmonary Cyst(s)¹⁰

- May represent a rare form of adenocarcinoma, squamous cell carcinoma, or small cell carcinoma.
- Short-term initial imaging to exclude rapid growth can be considered at 3-6 months.
- Further imaging can be managed according to the part-solid pathway above.

**PET/CT consider for ≥8 mm solid lung nodule or solid component of a sub-solid nodule, not for groundglass opacity.

If a PET/CT was found to be negative, follow-up with CT at 3 months, 9 months, and 21–24 months, if stable.

If a PET/CT was found to be positive, a biopsy was negative or non-diagnostic, follow-up with CT at 3 months, 12 months, and 24 months, if stable.

Interval Imaging Outcomes (CH-16.3)

CH.SN.0016.3.A

v2.0.2024

- No further advanced imaging is necessary if a nodule has been:
 - Stable for 2 years
 - Nodules(s) stable on chest x-ray.
 - Nodule(s) ≥ 6 mm stable on CT Chest.¹
 - Stable for 1 year
 - Nodule(s) < 6 mm.¹
 - At any time, if:
 - Classically benign characteristics by chest x-ray or previous CT (e.g. benign calcification pattern typical for a granuloma or hamartoma).
 - Decreasing or disappearing nodule(s).³
- Lung nodule(s) which increases in size or number should no longer be considered for CT screening or surveillance.^{1,2,3,7}
 - With an increase in nodule(s) size or number, tissue sampling or other further diagnostic investigations should be considered.
 - PET, for solid nodules ≥ 8 mm, should be considered (See **PET (CH-16.4)**)

PET (CH-16.4)

CH.SN.0016.4.A

v2.0.2024

- PET/CT (CPT® 78815) for a solid lung nodule ≥ 8 mm on dedicated advanced chest imaging, as described in **Solitary Pulmonary Nodule – Imaging (CH-16.1)**. See Non-Small Cell Lung Cancer – Suspected/Diagnosis (ONC-8.2) in the Oncology Imaging Guidelines for lung mass ≥ 3.1 cm
 - If there is a history of malignancy, refer to the appropriate Oncology restaging/recurrence guideline for indications for PET imaging
 - Pleural nodule, See **Pleural-Based Nodules and Other Abnormalities (CH-17.1)**
 - Serial PET studies are not considered indicated
 - Not appropriate for infiltrate, ground glass opacity, or hilar enlargement
 - Mediastinal lymphadenopathy - See **Mediastinal Lymphadenopathy (CH-2.3)** or Sarcoid concerns – See **Sarcoid (CH-15.1)**

Background and Supporting Information

- A **nodule** is any pulmonary or pleural lesion that is a discrete, spherical opacity 2-30 mm in diameter surrounded by normal lung tissue. A larger nodule is called a mass. Entities that are not nodules, and are considered benign, include non-spherical linear, sheet-like, two-dimensional or scarring opacities.³
- **Malignant** nodule features can include spiculation, abnormal calcification, size greater than 7-10 mm, interval growth, history of a cancer that tends to metastasize to the lung or mediastinum, and/or smoking history.^{1,3}
 - A nodule that grows at a rate consistent with cancer (doubling time 100 to 400 days) may be sampled for biopsy or resected.¹
 - Less than 1% of <6 mm lung nodules are malignant.¹
 - Three percent of all 8 mm lung nodules are malignant.¹
 - Only one follow-up at 6-12 months is sufficient for 6-8 mm nodules and not all require traditional 2 year follow-up.¹
 - The larger the solid component of a subsolid nodule, the greater the risk of invasiveness and metastases.¹
 - Increased risk of primary cancer as the total nodule count increased from 1 to 4 but decreased risk in individuals with 5 or more nodules, most of which likely resulted from prior granulomatous infection.¹
 - A nodule that does not grow in 6 months has a risk of malignancy at $<10\%$.
- **Benign** features in solid nodules can include benign calcification (80% granuloma, 10% hamartoma), multiple areas of calcification, small size, multiple nodules, negative PET, and stability of size over 2 years.³
- **Ground glass** or subsolid opacities, which can harbor indolent adenocarcinoma with average doubling times of 3–5 years.¹

- **Repeat PET** is discouraged. If the original PET is positive, biopsy may be performed. If the original PET is negative but subsequent CT Chest shows an increase in nodule size, biopsy may be performed.
- **Positive PET** is defined as a standardized uptake value (SUV) in the lung nodule greater than the baseline mediastinal blood pool. A positive PET can occur with infection or inflammation, including absence of lung cancer with localized infection, presence of lung cancer with associated (post-obstructive) infection and/or related inflammation.
- **False negative PET** can be seen in individuals with adenocarcinoma in situ (formally known as bronchoalveolar carcinoma), carcinoid tumors, a small size nodule, non-solid or ground glass opacity.⁹ High pre-test likelihood of malignancy with negative findings on PET only reduces the likelihood of malignancy to 14%; while in an individual with a low pre-test likelihood (20%) of malignancy, a negative PET reduces the likelihood of malignancy to 1%.⁶
- Individuals aged 35 years or younger¹
 - Considered to have an overall low risk for pulmonary malignancy
 - In this age group, nodules are most likely to be infectious rather than cancer
 - Management of incidentally-found pulmonary nodules in this group should be individualized

Pleural-Based Nodules and Other Abnormalities (CH-17)

Guideline

Pleural-Based Nodules and Other Abnormalities (CH-17.1)

Reference (CH-17)

Pleural-Based Nodules and Other Abnormalities (CH-17.1)

CH.PB.0017.1.A

v2.0.2024

- CT Chest with contrast (CPT® 71260) or CT Chest without contrast (CPT® 71250) (with contrast is preferred for initial evaluation) for pleural nodule(s).¹
 - Pleural nodule(s) seen on an imaging study other than a “dedicated” CT or MRI Chest.¹
 - Pleural nodule(s) identified incidentally on any of the following dedicated chest studies can replace CT Chest as the initial dedicated study.¹
 - CT Chest without and with contrast (CPT® 71270).
 - CTA Chest (CPT® 71275).
 - MRI Chest without contrast (CPT® 71550).
 - MRI Chest without and with contrast (CPT® 71552).
 - MRA Chest without and with contrast (CPT® 71555).
 - After preliminary comparison with any available previous chest films to determine presence and stability.
 - Using largest measurement of multiple nodule(s). (See **Solitary Pulmonary Nodule – Imaging (CH-16.1)**).
 - Following the Fleischner Society Guidelines for high-risk. (See **Incidental Pulmonary Nodules Detected on CT Images (CH-16.2)**)¹
- PET/CT (CPT® 78815) can be considered if dedicated CT or MRI Chest identifies a pleural nodule/mass or defined area of pleural thickening that is ≥8 mm when there is a likelihood of malignancy including current or previous malignancy, pleural effusion, bone erosion, chest pain.¹

Background and Supporting Information

- Pleural nodule/mass or thickening without suggestion of malignancy would undergo surveillance or biopsy.
- A study looking at over 8,700 LDCT chest scans identified 943 noncalcified nodules attached to the costal pleura, of these 897 were < 10 mm in size. There were 603 that were either lentiform, oval, semicircular or triangular in shape and had smooth margins. All of these nodules, that met these qualifications of shape, size and smooth margins, were benign. Follow-up with annual screening, rather than more immediate work-up, was recommended.²

Pleural Effusion (CH-18)

Guideline

Pleural Effusion (CH-18.1)

References (CH-18)

Pleural Effusion (CH-18.1)

CH.EF.0018.1.A

v2.0.2024

- CT Chest with contrast (CPT® 71260) after:^{1,2}
 - Chest x-ray including lateral decubitus films; **and**
 - Thoracentesis to determine if fluid is exudative or transudative and remove as much as possible (this fluid can obscure the underlying lung parenchyma and possibly a mass) **or**
 - Concern for loculated effusion, empyema, paramediastinal location, subpleural lung abscess or cavitation³
- Chest ultrasound (CPT® 76604) can be used as an alternative to chest x-ray to evaluate for the presence of fluid within the pleural spaces and guide thoracentesis.

Background and Supporting Information

- Bilateral effusions are more often systemic related transudates (congestive heart failure, renal failure, liver insufficiency, etc.), and advanced imaging is rarely needed. Large unilateral effusions can be malignant. Analysis of fluid may include: cytology, culture, cell count, and biochemical studies.

References (CH-18)

Pneumothorax/ Hemothorax (CH-19)

Guideline

Pneumothorax/Hemothorax (CH-19.1)

Pneumomediastinum; Subcutaneous Emphysema (CH-19.2)

References (CH-19)

Pneumothorax/Hemothorax (CH-19.1)

CH.PT.0019.1.A

v2.0.2024

Chest x-ray and CT Chest are the first line tests for detecting pneumothorax/hemothorax and ruling out other lung diseases.⁸

- Chest x-ray initially.
 - CT Chest with contrast (CPT® 71260) or without contrast (CPT® 71250) if:
 - Diagnosis of a small pneumothorax is in doubt, and the presence of a pneumothorax will affect individual treatment decisions.¹
 - Preoperative study for treatment of pneumothorax.¹
 - Pneumothorax associated with hemothorax.²
 - Suspected complications from hemothorax (e.g. empyema).²
 - Suspected Alpha-1-Antitrypsin Deficiency (even without pneumothorax).³
 - Suspected Cystic Lung Disease, including Lymphangioleiomyomatosis (LAM), tuberous sclerosis (TS), or Birt-Hogg-Dube (BHD) syndrome.^{6,7}
 - To determine the etiology of persistent pneumothorax/air leak, such as chest tube malposition, bronchopleural fistula, loculated pneumothorax, lung parenchymal disease.¹¹
 - Suspected catamenial pneumothorax/thoracic endometriosis⁸
 - MRI Chest without and with contrast (CPT® 71552) or MRI Chest without contrast (CPT® 71550) for:
 - Detecting diaphragmatic endometriosis
 - Pre-surgical planning for thoracic endometriosis^{8,9,10}

Pneumomediastinum; Subcutaneous Emphysema (CH-19.2)

CH.PT.0019.2.A

v2.0.2024

- Chest x-ray initially.
 - CT Chest with contrast (CPT® 71260) or without contrast (CPT® 71250) if:
 - Recent vomiting and/or suspected esophageal perforation.^{4,5}
 - Associated pneumopericardium.^{4,5}
 - Associated pneumothorax.^{4,5}
 - Preoperative study for treatment.^{4,5}

Background and Supporting Information

- An expiration chest x-ray can enhance the evaluation of equivocal plain x-ray. There is no data supporting the use of serial CT Chest to follow individuals with a known pneumothorax, pneumomediastinum, or hemothorax who are asymptomatic or have stable symptoms. With the exception of the indications above, advanced imaging of the chest is rarely indicated in the diagnosis or management of pneumothorax, or pneumomediastinum. Inspiratory/expiratory chest x-rays are helpful in defining whether a pneumothorax is present.

Mediastinal Mass (CH-20)

Guideline

Mediastinal Mass (CH-20.1)

References (CH-20)

Mediastinal Mass (CH-20.1)

CH.MM.0020.1.A

v2.0.2024

- CT Chest with contrast (CPT® 71260) or CT Chest without contrast (CPT® 71250) or MRI Chest without and with contrast (CPT® 71552) or MRI Chest without contrast (CPT® 71550), to evaluate mediastinal abnormalities, may include, but not limited to mediastinal cyst including bronchogenic, thymic, pericardial or esophageal, seen on chest x-ray or other non-dedicated chest imaging.
- MRI Chest without and with contrast (CPT® 71552) or MRI Chest without contrast (CPT® 71550) can be considered for indeterminate mediastinal mass on CT Chest.
 - Lesions that remain indeterminate on MRI, if biopsy is not performed, surveillance imaging could be performed at 3-12 month intervals over 2 years or more with MRI Chest, depending upon level of clinical concern.
- FDG PET/CT offers limited additional value beyond that of conventional CT in the initial assessment of mediastinal mass(es), with the exception of primary mediastinal lymphoma. See **Non-Hodgkin Lymphomas (ONC-27)** or **Hodgkin Lymphoma (ONC-28)** in the Oncology Imaging Guidelines. A positive FDG PET/CT has little value for discrimination between benign and malignant lesions.
 - MRI Chest without and with contrast (CPT® 71552) or MRI Chest without contrast (CPT® 71550) can be considered for indeterminate mediastinal mass on FDG PET/CT
- CT Chest with contrast (CPT® 71260), or CT Chest without contrast (CPT® 71250) or MRI Chest without and with contrast (CPT® 71552), or MRI Chest without contrast (CPT® 71550) for subsequent evaluations if:
 - New signs or symptoms, or
 - Preoperative assessment
- For Adenopathy; See **Lymphadenopathy (CH-2)**.
- For Goiter; See **Thyroid Nodule (NECK-8.1)** in the Neck Imaging Guidelines.
- For Myasthenia Gravis; See **Neuromuscular Junction Disorders (PN-6.1)** in the Peripheral Nerve Disorders Imaging Guidelines.

Chest Trauma (CH-21)

Guideline

Chest Trauma (CH-21.1)

References (CH-21)

Chest Trauma (CH-21.1)

CH.CT.0021.1.A

v2.0.2024

- Chest X-ray initially.
 - CT Chest without contrast (CPT® 71250) or with contrast (CPT® 71260) for the following situations:¹
 - Rib¹ or Sternal² Fracture:
 - With associated complications identified clinically or by other imaging, including pneumothorax, hemothorax, pulmonary contusion, atelectasis, flail chest, cardiovascular injury and/or injuries to solid or hollow abdominal organs.¹
 - Uncomplicated, single fractures, multiple fractures, non-acute fractures, or occult rib fractures are NOT an indication for CT Chest unless malignancy is suspected as the etiology.¹
 - Routine follow-up advanced imaging of rib or sternal fractures is not indicated.¹
 - CT Chest without contrast (CPT® 71250) or Tc-99m bone scan whole body (CPT® 78306) for suspected pathological rib fractures, with or without a history of trauma.¹
- Clavicle Fractures:
 - CT Chest with contrast (CPT® 71260) or CT Chest without contrast (CPT® 71250) or MRI Chest without and with contrast (CPT® 71552) or MRI Chest without contrast (CPT® 71550) for proximal (medial) 1/3 fractures or sternoclavicular dislocations.³
 - X-ray is adequate for evaluation of middle and distal 1/3 fractures.³
- No advanced imaging of the abdomen or pelvis is indicated when there is chest trauma and no physical examination or laboratory evidence of abdominal and/or pelvic injury.

Chest Wall Mass (CH-22)

Guideline

Chest Wall Mass (CH-22.1)

References (CH-22)

Chest Wall Mass (CH-22.1)

CH.CM.0022.1.A

v2.0.2024

- Chest x-ray is useful in the workup of a soft-tissue mass and is almost always indicated as the initial imaging study.¹
 - Chest ultrasound (CPT® 76604) may be useful as an initial imaging study in the setting of a suspected superficial or subcutaneous lipoma. This modality may also be valuable in differentiating cystic from solid lesions and has also been used to assess the vascularity of lesions.¹
 - Following a non-diagnostic Chest x-ray that does not show an obvious lipoma(s) or clearly benign entity (see **Soft Tissue Mass or Lesion of Bone (MS-10)** in the Musculoskeletal Imaging Guidelines), the following may be appropriate:^{1,2}
 - MRI Chest without and with contrast (CPT® 71552) or
 - MRI Chest without contrast (CPT® 71550) or when MRI is contraindicated,
 - CT Chest with contrast (CPT® 71260)

Background and Supporting Information

- Chest x-rays of chest wall masses can detect calcification, ossification, or bone destruction as well as location and size.^{1,2}
- CT Chest without contrast is usually not beneficial in the evaluation of a soft tissue mass. With modern CT technology, calcification can usually be distinguished from vascular enhancement on contrast enhanced scan. In the evaluation of suspected tumors, contrast imaging is especially useful in distinguishing vascularized from potentially necrotic regions of the tumor.¹

Pectus Excavatum and Pectus Carinatum (CH-23)

Guideline

Pectus Excavatum and Carinatum (CH-23.1)

References (CH-23)

Pectus Excavatum and Carinatum (CH-23.1)

CH.EC.0023.1.U

v2.0.2024

- CT Chest without contrast (CPT® 71250) or MRI Chest without and with contrast (CPT® 71552) and 3-D reconstruction (CPT® 76377 or CPT® 76376) if:
 - Candidates for surgical correction.^{1,2}
 - Cardiac or pulmonary dysfunction has been identified^{1,2}
 - ECG and echocardiography if cardiac symptoms or evidence of cardiac function abnormalities.
 - Chest x-ray and PFT's if increasing shortness of breath.¹

Background and Supporting Information

- Chest measurements derived from CT Chest, such as the Haller Index or the correction index, are helpful to the thoracic surgeon in pre-operative assessment of chest wall deformities to assess for the appropriateness of operative repair prior to the development of symptomatic pectus deformities.
- The Haller index is calculated using the width of the chest divided by the distance between the posterior surface of the sternum and the anterior surface of the spine. A Haller index score is normal at 2.5 to 2.7 and severe at 3.25 or greater. The correction index uses an equation of $(b-a)/b \times 100$, in which a is the minimum distance between the anterior spine and the posterior surface of the sternum, and b is the maximum distance between the anterior spine and most anterior internal rib. It yields a percentage that the chest would need to be corrected to achieve normal dimensions, with a normal level being 10% or less.³
- Some have suggested that a CXR can replace the CT Chest for Haller Index calculation with a strong correlation and high diagnostic accuracy.⁴
- Expert consensus from The Society of Thoracic Surgeons 2023, recommended that a comprehensive evaluation with spirometry, ECG, and echocardiography be done with any cardio-pulmonary complaint. The Haller index, correction index, pulmonary compression or failed previous repair, in and of itself, was not an indication for surgery. Corrective surgery indications for those with severe pectus excavatum included; progression of deformity, presence of cardio-pulmonary symptoms, mitral valve prolapse, arrhythmia, significant body image disturbances, abnormal PFTs, abnormal cardiac function test or the presence of cardiac compression on imaging, (echo or CT).⁵

Pulmonary Arteriovenous Fistula (AVM) (CH-24)

Guideline

Pulmonary AVM (CH-24.1)

References (CH-24)

Pulmonary AVM (CH-24.1)

CH.AV.0024.1.A

v2.0.2024

- CT Chest with contrast (CPT® 71260), CT Chest without contrast (CPT® 71250), CTA Chest (preferred modality for pre-intervention planning) (CPT® 71275), or MRA Chest (CPT® 71555) for evaluation of:^{1,2,3,5,6,7}
 - Suspected pulmonary AVM, including individuals with HHT (Hereditary Hemorrhagic Telangiectasia) or who have a first degree relative with HHT^{4,5}
 - First degree relatives of an individual with a primary pulmonary AVM
 - Evaluation of individuals with paradoxical embolus/stroke and no evidence of patent foramen ovale on echocardiogram
 - Follow-up of treated AVM's at 6 months post embolization and then every 3-5 years⁴
 - Follow-up of untreated AVM's to be determined by treating physician but no more than annually. Usually the interval is 3-5 years due to the slow-growth nature of PAVM's⁴
 - Treated or untreated PAVM's with recurrent symptoms⁴

Background and Supporting Information

- Pulmonary AVMs are abnormal connections between pulmonary arteries and veins, usually found in the lower lobes, that can be either primary (such as in individuals with HHT) or acquired (such as trauma, bronchiectasis). They can be identified in up to 98% of chest x-rays by a peripheral, circumscribed, non-calcified lesion connected by blood vessels to the hilum of the lung. Treatment is often by surgery or embolization of the feeding artery using platinum coils or detachable balloons.

Pulmonary Embolism (PE) (CH-25)

Guideline

Pulmonary Embolism (CH-25.1)

References (CH-25)

Pulmonary Embolism (CH-25.1)

CH.PE.0025.1.A

v2.0.2024

- CT Chest with contrast with PE protocol (CPT® 71260) or CTA Chest (CPT® 71275) if at least one symptom, clinical/laboratory finding or risk factor from each of the lists below are present.
 - With any ONE of the 3:^{6,7,8}
 - Dyspnea, new onset and otherwise unexplained;
 - Chest Pain, pleuritic;
 - Tachypnea
 - AND, with any ONE of the 3:^{6,7,8}
 - Abnormal **D-dimer** test;
 - Wells Criteria score* higher than 4 points;
 - One Risk Factor** or Symptom** of new onset demonstrating high clinical probability of PE

RISK FACTORS** 6,7,8	SYMPTOMS ATTRIBUTED TO PE** 6,7,8
Immobilization at least 3 days or surgery in last 4 weeks or recent trauma	Signs or symptoms of DVT
Previous history of DVT or PE	Hemoptysis
Cancer actively treated in last 6 months or receiving palliative treatment	Right heart strain or failure
Recent history of a long airplane flight	Systolic BP <90
Use of estrogen-based contraceptives (birth control pills, the patch, and vaginal ring)/Oral estrogen ¹	Syncope
Advanced age (≥70)	Cough
Congestive heart failure	Heart Rate >100
Obesity (BMI ≥35)	Palpitations
Suspicion or diagnosis of COVID-19	

Well's Criteria for Clinical Probability of PE* 6	
Clinical signs/symptoms of DVT (at minimum: leg swelling and pain with palpation of the deep veins)	3
PE is likely or equally likely diagnosis	3
Heart rate >100	1.5

Well's Criteria for Clinical Probability of PE* ⁶	
Immobilization at least 3 days or surgery in last 4 weeks	1.5
Previous history of DVT or PE	1.5
Hemoptysis	1
Cancer actively treated in last 6 months or receiving palliative treatment	1
Calculate Probability: Low <2 Moderate 2 to 6 High >6	
Using the above criteria, only 3% of individuals with a low pretest probability had PE versus 63% of those with a high pretest probability.	

- Non-urgent cases which do not meet above 2-step criteria, should undergo prior to advanced imaging:⁹
 - Chest x-ray (to rule out other causes of acute chest pain).
 - Primary cardiac and pulmonary etiologies should be eliminated.
- Pregnancy is a risk factor for thrombo-embolic events in and of itself. Additional risk factors are not required. Pregnant individuals with suspected PE are suggested to proceed with:^{11,12,13}
 - If signs/symptoms of DVT are present, Doppler studies of the lower extremities (CPT® 93925 bilateral study or CPT® 93926 unilateral study)
 - If no signs/symptoms of DVT, then chest x-ray should be done first
 - If chest x-ray is normal, then V/Q scan is preferred test
 - If chest x-ray is abnormal or after non-diagnostic V/Q scan or if V/Q scanning is not readily available, then CTA Chest (CPT® 71275) or CT Chest with contrast with PE protocol (CPT® 71260).
- Ventilation-perfusion scans, also called V/Q, scans (CPT® 78580-Pulmonary Perfusion Imaging; CPT® 78582-Pulmonary Ventilation (e.g., Aerosol or Gas) and Perfusion Imaging) or SPECT/CT (CPT® 78830):¹⁵
 - Is not a replacement for CTA Chest⁹
 - Can be considered in any of the following:
 - Suspected pulmonary embolism if there is a contraindication to CT or CTA Chest (ventilation-perfusion scans CPT® 78582)
 - Suspected pulmonary embolism when a chest x-ray is negative and CTA Chest is not diagnostic (CPT® 78580 or CPT® 78582)
 - Follow-up of an equivocal or positive recent ventilation-perfusion lung scan to evaluate for interval change (CPT® 78580)

- Suspected Chronic thromboembolic disease or Chronic thromboembolic pulmonary hypertension*, usually after 3 months of effective anticoagulation¹⁴
- Follow-up Imaging in Stable or Asymptomatic Individuals with Known PE is not warranted^{2,3,4,10}
- Follow-up imaging with CT Chest with contrast with PE protocol (CPT® 71260) or CTA Chest (CPT® 71275) for ANY of the following indications:
 - Recurrent or persistent signs or symptoms such as dyspnea, particularly if present after 3 months of anticoagulation, or
 - Elevated d-dimer which is persistent or recurrently elevated, or
 - Right heart strain or failure identified by EKG, ECHO or Heart catheterization.
- *Pulmonary Artery Hypertension (PAH) - See **Pulmonary Artery Hypertension (PAH) – Indications (CD-8.1)** in the Cardiac Imaging Guidelines

Background and Supporting Information

- Pulmonary embolism is found in approximately 10% of all those that present with suspicion of PE. Dyspnea, pleuritic chest pain and tachypnea occur with about 50% incidence with leg swelling or pain just over 50%.
- D-dimer level has a high sensitivity and low specificity for diagnosing PE.
 - A negative D-dimer in combination with low or moderate PE risk classification has a negative predictive value approaching 100%.
 - D-dimer can be falsely elevated with recent surgery, injury, malignancy, sepsis, diabetes, pregnancy, or other conditions where fibrin products are likely to be present.
- CT imaging has supplanted V/Q scanning since the latter is difficult to obtain quickly, does not provide a substantial cost savings, and does not diagnose other pulmonary pathology.
- The decision to terminate anticoagulation treatment after previous pulmonary embolism (PE) with absent or stable symptoms is based on clinical evaluation and risk factors.
- Repeat studies do not allow one the ability to distinguish new from residual clot, with luminal diameter and clot character poorly correlated to symptoms and ECHO findings.
- Two thirds of individuals with primary thromboembolism have residual pulmonary artery clot at 6 months and 50% remain at one year.
- Subsequent persistence or elevation of D-dimer is associated with increased risk of recurrent PE. ECHO and Right Heart Catheterization (RHC) can identify those with pulmonary hypertension. Yet, 1/2 of all have persistent or new pulmonary hypertension after primary thromboembolism and only half of this latter group has dyspnea at rest or exercise intolerance.
- Of note, pregnancy is accompanied by a progressive increase in D-dimer levels and as such, D-Dimer levels may not be helpful to rule-in or rule-out DVT/PE in pregnancy.^{11,12}

Modality	Fetal radiation exposure in mGy
CXR	0.002-0.1
V/Q	0.32 – 0.74
CTPA	0.03 – 0.66

- Compared with V/Q scan, computed tomography pulmonary angiography (CTPA), is associated with a higher radiation dose to the mother: the calculated doses to breast and lung tissue have been estimated to range from 10 to 60 mGy and 39.5 mGy, respectively with CTPA as compared with 0.98 to 1.07 mGy and 5.7 to 13.5 mGy, respectively with V/Q scan.¹²

Pulmonary Hypertension (CH-26)

Guideline

Pulmonary Hypertension (CH-26.1)

Pulmonary Hypertension (CH-26.1)

CH.PH.0026.1.A

v2.0.2024

- See the **Pulmonary Artery Hypertension (PAH) – Indications (CD-8.1)**

Subclavian Steal Syndrome (CH-27)

Guideline

Subclavian Steal Syndrome – General (CH-27.0)

Subclavian Steal Syndrome (CH-27.1)

References (CH-27)

Subclavian Steal Syndrome – General (CH-27.0)

CH.SS.0027.0.A

v2.0.2024

- Occurs from blood flowing up the contralateral vertebral artery to the basilar artery and retrograde down the ipsilateral vertebral artery (reversal of flow) to supply collateral circulation to the arm on the side and past the stenotic or occluded proximal subclavian or innominate artery to perfuse that arm.

Subclavian Steal Syndrome (CH-27.1)

CH.SS.0027.1.A

v2.0.2024

- Initial evaluation should include clinical findings satisfying the symptom complex (See **Background and Supporting Information**) and initial imaging with Carotid duplex study (CPT® 93882).
 - Carotid duplex study (CPT® 93882) is the initial and definitive imaging study
 - Reversal of flow in the ipsilateral vertebral artery.
 - If the carotid duplex is not diagnostic for reversal of flow in the ipsilateral vertebral artery, then neurological symptoms should be evaluated according to the Head guidelines.
- MRA Neck and Chest (CPT® 70548 and CPT® 71555) or CTA Neck and Chest (CPT® 70498 and CPT® 71275) can be performed for diagnosis in individuals with symptoms of vertebrobasilar ischemia with either of the following:
 - Clinical exam and duplex study are positive or indeterminate
 - Preoperative studies if they will substitute for invasive angiography.
- MRA Upper extremity (CPT® 73225) or CTA Upper extremity (CPT® 73206) can be performed in symptomatic individuals if needed to exclude pathology distal to the subclavian artery and if they will substitute for invasive angiography.
- See **Stroke/TIA (HD-21.1)** (for vertebrobasilar stroke) in the Head Imaging Guidelines.
- Treatment options include ligation of the ipsilateral vertebral artery, aorta-subclavian artery bypass graft, or subclavian endarterectomy.

Background and Supporting Information

- While MRA does not expose the individual to radiation, CTA should be considered the test of choice for subclavian steal syndrome given its superior spatial and temporal resolution.
- Satisfying the symptom complex
 - Physical examination findings suggestive of subclavian stenosis include a discrepancy of >15 mmHg in blood pressure readings taken in both upper extremities, delayed or decreased amplified pulses in the affected side, and a bruit in the supraclavicular area on the affected side.
 - Symptoms include vertebral basilar artery insufficiency, vertigo, limb paresis, and paresthesias. Bilateral cortical visual disturbances, ataxia, syncope, and dysarthria occur less frequently.
 - Symptoms of cerebral ischemia may be produced by exercise of the affected arm

Superior Vena Cava (SVC) Syndrome (CH-28)

Guideline

SVC Syndrome (CH-28.1)

References (CH-28)

SVC Syndrome (CH-28.1)

CH.SV.0028.1.A

v2.0.2024

- CT Chest with contrast (CPT® 71260) for the evaluation of suspected SVC syndrome based on the facial cyanosis and upper extremity swelling without anasarca.^{1,2}
- MRV (CPT® 71555) or CTV (CPT® 71275) Chest when stenting of the SVC is being considered.^{1,2}

Background and Supporting Information

- SVC syndrome is caused by acute or subacute, intrinsic or extrinsic obstruction of the SVC, most commonly from lung cancer (80-85%) and less often benign (fibrosis, mediastinitis, indwelling devices). Other symptoms include dyspnea, headache and dizziness.

Elevated Hemidiaphragm (CH-30)

Guideline

Elevated Hemidiaphragm (CH-30.1)

References (CH-30)

Elevated Hemidiaphragm (CH-30.1)

CH.EH.0030.1.A

v2.0.2024

- CT Chest with contrast (CPT® 71260) and/or CT Neck with contrast (CPT® 70491) with new diaphragmatic paralysis after:^{1,2}
 - Previous chest x-rays are available and reviewed to determine if the diaphragmatic elevation is a new finding, and/or
 - Fluoroscopic examination (“sniff test”) to differentiate true paralysis from weakness.
- CT Abdomen with contrast (CPT® 74160) to rule out liver or abdominal process if CT Chest is negative.^{1,2}
- Repeat advanced imaging studies in the absence of new signs or symptoms are not indicated.

Background and Supporting Information

- The right hemidiaphragm sits about 2 cm higher than the left.
- “Eventration” is thin membranous replacement of muscle, usually on the right, as the most common cause of elevation.
- Any injury to the phrenic nerve from neck to diaphragm can lead to paralysis.
- Common phrenic causes are traumatic or surgical injury or malignancy involving the mediastinum.
- Any loss of lung volume or increased abdominal pressure can lead to diaphragm elevation.

References (CH-30)

Thoracic Outlet Syndrome (TOS) (CH-31)

Guideline

Thoracic Outlet Syndrome (CH-31.1)

References (CH-31)

Thoracic Outlet Syndrome (CH-31.1)

CH.TO.0031.1.A

v2.0.2024

- Chest x-ray should be performed initially in all cases, after the onset of symptoms or if there has been a change in symptoms, since it can identify bony abnormalities or other causes of upper extremity pain.^{1,2}
- Preferred imaging modality in individuals with suspected TOS varies depending upon suspected etiology. More than one type of imaging may be required for diagnosis in complex cases.^{1,2}
- Neurogenic Thoracic Outlet Syndrome:
 - See **Brachial Plexus (PN-4.1)** in the Peripheral Nerve Disorders Imaging Guidelines
- Venous Thoracic Outlet Syndrome:
 - CT Chest with Contrast (CPT® 71260) (preferred study) or MRI Chest with contrast (CPT® 71551) or CTV Chest (CPT® 71275)
- Arterial Thoracic Outlet Syndrome:
 - CTA Chest (CPT® 71275) (preferred study) or MRA Chest (CPT® 71555) (preferred study) or CT Chest either without or with contrast (CPT® 71250 or CPT® 71260) or MRI Chest with contrast (CPT® 71551)
- CT Chest with contrast (CPT® 71260) or CT Neck with contrast (CPT® 70491) can be used in place of MRI for:
 - Suspected anomalous ribs or fractures, as bone anatomy is more easily definable with CT.
 - Postoperative individuals in whom there is a question regarding a remnant first rib.
 - Dialysis-dependent renal failure, claustrophobia, or implanted device incompatibility.
- See **Brachial Plexus (PN-4.1)** in the Peripheral Nerve Disorders Imaging Guidelines.

Background and Supporting Information

- TOS refers to compression of the subclavian vessels and/or brachial plexus at the thoracic outlet of the chest (the area bounded by the two scalene muscles and the first rib).
- There are 3 types, with neurogenic causes seen in 80%, venous causes (also called effort thrombosis) found in 15% and the remaining 5% being arterial in etiology.
- Since this is such a rare entity and diagnosis is difficult, specialist evaluation by a vascular surgeon or thoracic surgeon is helpful in determining the appropriate imaging pathway.

Lung Transplantation (CH-32)

Guideline

Pre-Transplant Imaging Studies (CH-32.1)

Post-Transplant Imaging Studies (CH-32.2)

Reference (CH-32)

Pre-Transplant Imaging Studies (CH-32.1)

CH.LT.0032.1.A

v2.0.2024

- Individuals on the waiting list or being considered for the lung transplant can undergo advanced imaging per that institution's protocol as long as the studies do not exceed the following:
 - CT Chest with and without contrast (CPT® 71270), CT Chest with contrast (CPT® 71260), or CT Chest without contrast (CPT® 71250)
 - ECHO
 - Imaging Stress Test (MPI, SE, MRI) or Heart Catheterization (Right and Left); Heart catheterization can also be done after a positive stress test.
 - CTA Chest and/or CTA Abdomen and Pelvis and/or CTA Aorta with bilateral lower extremity run-off is indicated without initial ABI's and/or arterial duplex for the following individuals:
 - Prior abdominal or lower extremity vascular intervention (any timeframe is acceptable)
 - Known peripheral artery disease (PAD) from prior imaging
 - Current symptoms of claudication, rest pain or gangrene
 - CTA Chest and/or CTA Abdomen and Pelvis and/or CTA Aorta with bilateral lower extremity run-off is indicated after initial ABI's and/or arterial duplex for the following individuals:
 - Initial ABI's and/or arterial duplex suggest the presence of PAD per one of the following:
 - ABI of <0.9
 - Presence of plaque
 - Presence of vascular calcification, stenosis or occlusion
 - Small vessel size on the duplex
 - CT Abdomen and Pelvis with or without contrast (CPT® 74177 or CPT® 74176) for determining extracorporeal membrane oxygenation (ECMO) candidacy
- Other studies that will be considered include V/Q scan, Six Minute Walk Test.
- See **Transplant (CD-1.6)** in the Cardiac Imaging Guidelines.

Post-Transplant Imaging Studies (CH-32.2)

CH.LT.0032.2.A

v2.0.2024

- CT Chest with and without contrast (CPT® 71270), CT Chest with contrast (CPT® 71260), or CT Chest without contrast (CPT® 71250) is supported for:²
 - Initial post-transplant follow-up.
 - Suspected complication, either surgical, medical or infectious, (See **Background and Supporting Information**)
 - Worsening PFT's
 - New finding on other imaging, including chest x-ray
- See **Transplant (CD-1.6)** in the Cardiac Imaging Guidelines.

Background and Supporting Information

- Complications from lung transplantation are a major cause of morbidity and mortality.
- The three main categories of complications are surgical, medical and infectious.
 - Surgical complications include; anastomotic complications, bronchial dehiscence, bronchial stenosis, pneumothorax, hemothorax, hematoma, wound dehiscence and infection.
 - Medical complications include; primary graft dysfunction, pulmonary embolism and pulmonary infarction, Tracheobronchomalacia, posttransplant lymphoproliferative disease, primary disease recurrence, acute and chronic allograft rejection, including bronchiolitis obliterans and restrictive allograft syndrome.
 - Infectious complications include; hospital and community acquired nonmycobacterial pulmonary infections, mycobacterial infections, fungal infections, and viral infections, (CMV most common).

Lung Cancer Screening (CH-33)

Guideline

U.S. Preventive Services Task Force: Lung Cancer Screening (Commercial and Medicaid) (CH-33.1)

National Coverage Determination (NCD) for Lung Cancer Screening with Low Dose Computed Tomography (LDCT) (Medicare) (CH-33.2)

Incidental Pulmonary Nodules Detected on Low Dose CT Chest (LDCT) Images (CH-33.3)

References (CH-33)

U.S. Preventive Services Task Force: Lung Cancer Screening (Commercial and Medicaid) (CH-33.1)

CH.CS.0033.1.A

v2.0.2024

- Low-dose CT Chest (CPT® 71271) for lung cancer screening annually if all of the following criteria are met:

Screening Indications – Commercial and Medicaid	Imaging Study
<ul style="list-style-type: none"> All criteria below must be met: <ul style="list-style-type: none"> Individual has not received a low-dose CT lung screening in less than 12 months; and Individual has NO health problems that substantially limit life expectancy or the ability or willingness to have curative lung surgery*; and Individual is between 50 and 80 years of age; and Individual has at least a 20 pack-year history of cigarette smoking; and Currently smokes or quit within the past ≤15 years 	Low-Dose CT Chest without contrast (CPT® 71271)

For incidental nodule(s) detected on previous imaging but do not qualify for LDCT, Lung Cancer Screening See **Solitary Pulmonary Nodule (SPN) (CH-16)**, for CPT® 71250 and CPT® 71260.

*This is based on a range of chest or other organ signs, symptoms or conditions which would question the member's ability to undergo surgical or non-surgical treatment if a lung cancer was discovered. For example, congestive heart failure, advanced cancer from another site or a member with COPD who uses oxygen when ambulating, would be examples of conditions that would "substantially limit life expectancy." Conversely, stable COPD and its symptoms, including cough, shortness of breath would not "substantially limit life expectancy."

National Coverage Determination (NCD) for Lung Cancer Screening with Low Dose Computed Tomography (LDCT) (Medicare) (CH-33.2)

CH.CS.0033.2.A

v2.0.2024

- Medicare criteria for LDCT for Lung Cancer Screening (CPT® 71271) See **NCD 210.14**

Incidental Pulmonary Nodules Detected on Low Dose CT Chest (LDCT) Images (CH-33.3)

CH.CS.0033.3.A

v2.0.2024

- Any Lung-RADS less than 1 year interval follow-up is coded as Low-Dose CT Chest (CPT® 71250) (Not CPT® 71271 which is ONLY the annual screen)
- For lung nodules, including incidental findings from studies other than screening LDCT, or if no longer qualify for screening LDCT, See **Incidental Pulmonary Nodules Detected on CT Images (CH-16.2)**

Lung-RADS Primary Category/Category Descriptor*	Management
0: Incomplete	If findings suggestive of an inflammatory or infectious process, follow-up with LDCT (CPT 71250) in 1-3 months
2: Benign appearance or behavior - very low likelihood of becoming a clinically active cancer due to size or lack of growth	Annual LDCT screening (CPT® 71271) in 12 months
3: Probably benign finding(s) - short term follow-up suggested; includes nodules with a low likelihood of becoming a clinically active cancer	6 month LDCT (CPT® 71250) and if unchanged on this CT it is coded as category 2 and returned to annual LDCT screening (CPT® 71271) in 12 months
4A: Suspicious - Findings for which additional diagnostic testing and/or tissue sampling is recommended	PET/CT (CPT® 78815) when there is a ≥8 mm solid nodule or solid-component Follow-up with LDCT (CPT® 71250) in 3 months and if stable or decreased in size on this CT, it is coded as category 3 with follow-up LDCT (71250) at 6 months, if stable or decreased in size on this CT, return to annual LDCT screening (CPT® 71271) in 12 months

Lung-RADS Primary Category/Category Descriptor*	Management
4B or 4X: Suspicious - Findings for which additional diagnostic testing and/or tissue sampling is recommended	<p>CT Chest with or without contrast, PET/CT (CPT® 78815) and/or tissue sampling depending on the probability of malignancy and comorbidities. PET/CT (CPT® 78815) when there is a ≥ 8 mm solid component.</p> <p>If there is low suspicion of lung cancer, follow-up with LDCT (CPT® 71250) in 3 months with another LDCT (CPT® 71250) in 6 months and if unchanged on this CT return to annual LDCT screening (CPT® 71271) in 12 months</p>

- For those that no longer qualify for annual LDCT for lung cancer screening but have known lung nodules, follow criteria for follow-up under CH-16. For example, a nodule that is new on the last screening LDCT may warrant continued diagnostic CT evaluation per **CH-16.2**.

*Please see note section of the official ACR Lung-RADS V2022 for additional details concerning specific recommendations-<https://www.acr.org/-/media/ACR/Files/RADS/Lung-RADS/Lung-RADS-2022.pdf>

Abbreviations for Head Imaging Guidelines

v2.0.2024

Abbreviations for Head Imaging Guidelines	
ACTH	adrenocorticotrophic hormone
AD	Alzheimer’s Disease
ADH	antidiuretic hormone
AION	arteritic ischemic optic neuritis
AVM	arteriovenous malformation
CBCT	Cone-beam computerized tomography
CMV	Cytomegalovirus
CSF	cerebrospinal fluid
CT	computed tomography
CTA	computed tomography angiography
DNA	deoxyribonucleic acid
DWI	diffusion weighted imaging (for MRI)
EEG	electroencephalogram
ENT	Ear, Nose, Throat
ESR	erythrocyte sedimentation rate
FDG	fluorodeoxyglucose
FSH	follicle-stimulating hormone
FTD	Frontotemporal Dementia
GCA	giant cell arteritis
GCS	Glasgow Coma Scale
HIV	human immunodeficiency virus
LH	luteinizing hormone
MMSE	mini mental status examination
MRA	magnetic resonance angiography
MRI	magnetic resonance imaging
MRN	magnetic resonance neurography
MS	multiple sclerosis

Abbreviations for Head Imaging Guidelines

MSI	magnetic source imaging
NAION	non-arteritic ischemic optic neuritis
NPH	normal pressure hydrocephalus
PET	positron emission tomography
PML	progressive multifocal leukoencephalopathy
PNET	primitive neuro ectodermal tumor
PWI	perfusion weighted imaging (for MRI)
SAH	subarachnoid hemorrhage
SIADH	Syndrome of Inappropriate Antidiuretic Hormone Secretion
SLE	systemic lupus erythematosus
TIA	transient ischemic attack
TMJ	temporomandibular joint disease
TSH	thyroid-stimulating hormone
VBI	vertebrobasilar insufficiency
VP	ventriculoperitoneal
XRT	radiation therapy

General Guidelines (HD-1.0)

HD.GG.0001.0.A

v2.0.2024

- A pertinent clinical evaluation including a detailed history, physical examination including a neurological examination since the onset or change in symptoms, and appropriate laboratory studies should be performed prior to considering the use of an advanced imaging (CT, MR, Nuclear Medicine) procedure.
 - A pertinent clinical evaluation furnished via telehealth since the onset or change in symptoms, is treated the same as an in-person clinical evaluation.
 - An exception to a pertinent clinical evaluation can be made if the individual is undergoing a guideline-supported, scheduled follow-up imaging evaluation.
 - Scheduled follow-up of known problems such as, multiple sclerosis, tumors, or hydrocephalus, scheduled surveillance with no new symptoms, screening asymptomatic individual due to family history or otherwise meet criteria for repeat imaging, as well as appropriate laboratory studies and non-advanced imaging modalities
 - A detailed neurological exam is required prior to advanced imaging except in the following scenarios:
 - Tinnitus, TMJ, sinus or mastoid disease, ear pain, hearing loss, eye disease, pituitary disease, and epistaxis. (A pertinent clinical evaluation since onset of symptoms is still required)
 - The request is from a neurologist, neurosurgeon, neuro-ophthalmologist, endocrinologist, gynecologist, otolaryngologist, or ophthalmologist who has seen the individual since onset of symptoms, or any provider in consultation with one of the above specialists.
- Other meaningful contact (telephone call, electronic mail or messaging) since the onset or change in symptoms, with an established individual can substitute for a face-to-face clinical evaluation
- CT head contrast as requested (CPT® 70450 OR CPT® 70460 OR CPT® 70470) is supported when MRI is contraindicated.

General Guidelines – Anatomic Issues

(HD-1.1)

HD.GG.0001.1.A

v2.0.2024

- If two studies using the same modality both cover the anatomic region of clinical interest, only one is generally needed, with the exception of the following scenarios:
 - CT Maxillofacial (CPT® 70486, CPT® 70487, or CPT® 70488) or CT Orbit/Temporal bone (CPT® 70480, CPT® 70481, or CPT® 70482): both cover the structures of the orbits, sinuses, and face. Two separate imaging studies are only supported if there is suspicion of simultaneous involvement of more posterior lesions, especially of the region involving the middle or inner ear.
 - Pituitary Gland: one study (either MRI Brain [CPT® 70553] or MRI Orbit, Face, Neck [CPT® 70543]) is adequate to report the imaging of the pituitary. If a previous routine MRI Brain was reported to show a possible pituitary tumor, a repeat MRI with dedicated pituitary protocol is supported.
 - Internal Auditory Canal: (IAC) MRI can be reported as a limited study with one code from the set (CPT® 70540, CPT® 70542, or CPT® 70543), but should not be used in conjunction with MRI Brain codes (CPT® 70551, CPT® 70552, or CPT® 70553) if IAC views are performed as part of the brain.
 - Mandible (jaw): CT Maxillofacial (CPT® 70486, CPT® 70487, or CPT® 70488) or CT Neck (CPT® 70490, CPT® 70491, or CPT® 70492) can be used to report imaging of the mandible. CT Neck will also image the submandibular space.
 - If MRI is indicated, MRI Orbit/Face/Neck (CPT® 70540, CPT® 70542, or CPT® 70543) can be used to report imaging of the mandible and submandibular space.
 - MRI Temporomandibular Joint(s) (TMJ) is reported as CPT® 70336. This code is inherently bilateral and should not be reported twice on the same date of service.
- Cranial Neuropathies
 - MRI Brain without and with contrast (CPT® 70553) or without contrast (CPT® 70551) is indicated for all individuals with new or worsening specific cranial nerve abnormalities.²⁹
 - MRI Orbit/Face/Neck without and with contrast (CPT® 70543) or without contrast (CPT® 70540) is also indicated for individuals with abnormalities in cranial nerves I, II, III, IV, V, VI, VII, IX, X, XI, or XII^{13, 29}
 - CT Neck with contrast (CPT® 70491) is supported for evaluation of abnormalities involving cranial nerves IX, X, XII, or XII²⁹
 - Imaging of the Brain and Orbit, Face and/or Neck may be performed concurrently when requested.²⁹
 - For specific cranial neuropathies²⁹, see the corresponding guideline section listed below:

- CN I: Olfactory nerve (see **Taste and Smell Disorders (HD-2.1)**)
- CN II, III, IV, VI: Optic, Oculomotor, Trochlear and Abducens (see **Eye Disorders and Visual Loss (HD-32.1)**)
- CN V: Trigeminal nerve (see **Trigeminal Neuralgia and other Centrally Mediated Facial Pain Syndromes (HD-10.1)**)
- CN VII: Facial nerve (see **Facial Palsy (HD-6.1)**)
- CN VIII: Vestibulocochlear nerve (see **Dizziness/Vertigo (HD-23.1)**, **Hearing Loss (HD 27.1)**, **Tinnitus (HD 27.2)**, **Acoustic Neuroma and Other Cerebellopontine Angle Tumors (HD 33.1)**). For isolated nystagmus (see **Eye Disorders and Visual Loss (HD-32.1)**)
- CN IX: Glossopharyngeal nerve (see **Glossopharyngeal Neuralgia/Glossopharyngeal Neuropathy (HD-10.2)**)
- CN X: Vagal nerve, imaging as detailed above (see also **Recurrent Laryngeal Palsy/Vocal Cord Palsy (Neck-7.1)**)
- CN XI: Spinal accessory nerve, imaging as indicated above
- CN XII: Hypoglossal nerve, imaging as indicated above
- For cranial neuropathies, whether isolated or multiple, due to clinically suspected stroke and/or vascular dissection (see **General Guidelines - CT and MR Angiography (CTA and MRA) (HD-1.5)**, **Headache and Suspected Vascular Dissection (HD-11.1)** and **Stroke/TIA (HD-21.1)**)

Background and Supporting Information

If a detailed clinical evaluation is unable to localize the site of the lesion, imaging of the entire course of the relevant cranial nerve is required, as cranial neuropathy can result from pathology affecting the nerve fibers at any point along the course of the nerve, from the cranial nerve origin in the brainstem to the end organ supplied by the nerve, requiring multiple imaging modalities.

Number	Cranial Nerve Name	Nerve dysfunction on exam	Guideline Section in HD
I	Olfactory (smell)	Anosmia, hyposmia, parosmia, phantosmia	2
II	Optic (vision)	Optic neuritis, disc edema, papilledema, afferent pupillary defect APD)	16, 17, 32
III	Oculomotor (eye and pupil movement)	Eye "down and out", +/- dilated pupil, ptosis, diplopia	32
IV	Trochlear (depresses the eye)	Inability to depress the eye, diplopia	32

Number	Cranial Nerve Name	Nerve dysfunction on exam	Guideline Section in HD
V	Trigeminal (sensation, mastication, taste)	Pain, numbness, corneal reflex loss, jaw deviation, trigeminal neuralgia, loss of taste	10
VI	Abducens (lateral movement of the eye)	Eye turns medially, inability to abduct, lateral rectus palsy, diplopia	32
VII	Facial (movement facial muscles, taste at 2/3, salivation/lacrimation)	Inability to close eyelid, smile, nasolabial fold flattening, hyperacusis, impaired taste, salivation, lacrimation	6
VIII	Auditory, Vestibular, Vestibulochochlear (hearing and balance)	Hearing loss, tinnitus, vertigo, nystagmus, abnormal gait/balance, sway on Romberg	23, 27, 33
IX	Glossopharyngeal (swallow, sensation, pharynx, posterior 1/3 tongue, parotid salivary gland)	Depressed gag reflex and palate, dysphagia, uvula deviation, throat pain	10.2
X	Vagus (swallow, speech, parasympathetic to heart, lungs, GI tract)	Vocal cord paralysis, recurrent laryngeal nerve palsy, spasmodic dysphonia	7.1, 1.1
XI	Spinal Accessory (motor function neck/shoulder)	Sternocleidomastoid (SCM) weakness when turning head opposite, shoulder elevation, winging scapula	1.1

Number	Cranial Nerve Name	Nerve dysfunction on exam	Guideline Section in HD
XII	Hypoglossal (tongue movement)	Tongue deviation, atrophy, fasciculation	1.1
INO	Internuclear Ophthalmoplegia (lesion of medial longitudinal fasciculus, CN III, CN VI)	Impaired adduction of ipsilateral eye with nystagmus of abducting eye	16, 21, 22
Horner Syndrome	Disruption of sympathetic innervation to eye and face	Ptosis, miosis (constricted pupil), facial anhidrosis (absence of sweating)	32.2, 11.3

General Guidelines – Modality (HD-1.2)

HD.GG.0001.2.A

v2.0.2024

- MRI is preferable to CT for most indications. For exceptions, See **General Guidelines – CT Head (HD-1.4)**
- MRI for these indications following an initial CT:
 - MRI Brain without and with contrast (CPT® 70553) to follow-up abnormalities seen on CT Head without contrast (CPT® 70450) when a mass, lesion, or infection is found.
 - MRI Brain without contrast (CPT® 70551) or MRI Brain without and with contrast (CPT® 70553) (preferred) to follow-up abnormalities seen on CT Head without contrast (CPT® 70450) when there is suspected Multiple Sclerosis or other demyelinating disease.
 - MRI Brain without contrast (CPT® 70551) or MRI Brain without and with contrast (CPT® 70553) to follow up on stroke or TIA when initial CT Head was done on emergent basis.
 - MRI Brain without and with contrast (CPT® 70553) or MRI Brain without contrast (CPT® 70551) for evaluation of new onset seizures.

General Guidelines – MRI Brain (HD-1.3)

HD.GG.0001.3.A

v2.0.2024

- MRI Brain with contrast (CPT® 70552) should not be ordered except to follow-up on a very recent non-contrast MRI Brain.
- After an MRI Brain without contrast (CPT® 70551), a follow up MRI brain with contrast (CPT® 70552) may be performed at the discretion of a neurologist, a neurosurgeon, or a neuro-ophthalmologist, or any provider in consultation with a neurologist, neurosurgeon, or neuro-ophthalmologist, and/or at the recommendation of the radiologist.³²
- Gadolinium is relatively contraindicated in pregnancy, MRI Brain without contrast (CPT® 70551) is supported.³³
- The AMA CPT manual does not describe nor assign any minimum or maximum number of sequences for any CT or MRI study. Both MRI and CT imaging protocols are often influenced by the individual clinical situation of the individual and additional sequences are not uncommon. There are numerous MRI sequences that are performed to evaluate specific clinical questions, and this technology is constantly undergoing development. Additional sequences, however, are still performed and coded under the routine MRI Brain CPT® 70551, CPT® 70552, or CPT® 70553.

General Guidelines – CT Head (HD-1.4)

HD.GG.0001.4.A

v2.0.2024

- Scenarios in which MRI is contraindicated (i.e. pacemakers, ICDs, cochlear implants, aneurysm clips, orbital metallic fragments, etc.)
- In urgent cases, CT Head, contrast as requested is supported [CT Head without and with contrast (CPT® 70470), CT Head with contrast (CPT® 70460) or CT Head without contrast (CPT® 70450)]
- CT Head without contrast (CPT® 70450) is supported for:
 - Mass effect
 - Blood/blood products
 - Urgent/emergent settings due to availability and speed of CT
 - Trauma
 - Recent hemorrhage, whether traumatic or spontaneous
 - Bony structures of the head evaluations including dystrophic calcifications
 - Hydrocephalus evaluation and follow-up (some centers use limited non-contrast “fast or rapid MRI” (CPT® 70551) to minimize radiation exposure in children).
 - Prior to lumbar puncture in individuals with cranial complaints (without contrast) (CPT® 70450)
 - Evaluation of optic disc edema and/or papilledema, a non-contrast CT Head is useful to assess for space-occupying processes such as intracranial hemorrhage, mass effect, and hydrocephalus, See **Papilledema/Pseudotumor Cerebri (HD-17.1)** and **Eye Disorders and Visual Loss (HD-32.1)**

General Guidelines – CT and MR Angiography (CTA and MRA) (HD-1.5)

HD.GG.0001.5.A

v2.0.2024

- MRA Head may be performed without contrast (CPT® 70544), with contrast (CPT® 70545), or without and with contrast (CPT® 70546)
- MRA Neck may be done without contrast (CPT® 70547), with contrast (CPT® 70548), or without and with contrast (CPT® 70549), depending on facility preference and protocols and type of scanner
- CTA Head is performed without and with contrast (CPT® 70496)
- CTA Neck is performed with and without contrast (CPT® 70498)
- Indications for CTA or MRA Head and Neck vessels include, but are not limited to the following:^{12,24}
 - Pulsatile tinnitus
 - Hemifacial spasm if consideration for surgical decompression
 - Evaluation of stroke or TIA (see **Stroke/TIA (HD-21.1)**) including collateral assessment
 - Trigeminal neuralgia having failed medical therapy (see **Trigeminal Neuralgia and other Centrally Mediated Facial Pain Syndromes (HD-10.1)**)
 - Cerebral venous sinus thrombosis suspected with increased intracranial pressure (refractory headaches, papilledema, diagnosis of pseudotumor cerebri)
 - Aneurysm suspected with acute “thunderclap” headache syndrome and appropriate screening or evaluation of known subarachnoid hemorrhage and pseudoaneurysms (appropriate to limit CTA to include only the head to avoid unnecessary radiation to the individual)
 - Non-inflammatory vasculopathy, including radiation vasculopathy
 - Traumatic vascular injuries
 - Vascular malformations, vascular anatomic variants and fistulas
 - Arterial dissections
 - Tumors of vascular origin or involving vascular structures
 - Surgical and radiation therapy localization, planning and neuronavigation
 - Evaluation for vascular intervention and follow-up including postsurgical/posttreatment vascular complications
 - Intra-cranial pre-operative planning if there is concern of possible vascular involvement or risk for vascular complication from procedure
 - Vasculitis and collagen vascular disease
 - Eagle Syndrome - Dynamic/positional CTA to assess for vascular compression (also known as bow-hunter's syndrome)¹² (see **Eagle Syndrome (Neck-10.3)**)
 - NOTE: Evaluation of posterior circulation disease requires both neck and head MRA/CTA to visualize the entire vertebral-basilar system.

- MRA Head (CPT® 70544, CPT® 70545, or CPT® 70546) or CTA Head (CPT® 70496) is indicated for follow up of aneurysm clipping or coiling procedures (see **Intracranial Aneurysms (HD-12.1)**)
- MRA Head (CPT® 70544, CPT® 70545, or CPT® 70546) or CTA Head (CPT® 70496) **AND/OR** MRA Neck (CPT® 70547, CPT® 70548, or CPT® 70549) or CTA Neck (CPT® 70498) is indicated if arterial dissection is suspected, or known and re-evaluation is needed (as directed by neurologist or neurosurgeon or any provider in consultation with a neurologist or neurosurgeon)^{12,24}
 - There are high risk scenarios including but not exclusive to: Fibromuscular dysplasia (FMD), Marfan Disease, motor vehicle accident (MVA) with whiplash, or chiropractic manipulation
- Other vascular imaging indications for headaches require additional information.
 - See **Stroke/TIA (HD-21.1)**, **Sudden Onset of Headache (HD-11.3)**, **New Headache Onset Older than Age 50 (HD-11.7)**, **Abnormal Blood Clotting (HD-11.9)**, **Pregnancy (HD-11.10)**, **Physical Exertion (HD-11.11)**, and **Systemic Infections (HD-11.13)**
- CT and MR Venography (CTV and MRV) are reported with the same codes as the CTA/MRA counterpart (there is no specific code for CT/MR venography):
 - If arterial and venous CT or MR studies are both performed in the same session, only **one** CPT® code is used to report both procedures
 - If an arterial CTA or MRA study has been performed and subsequently a repeat study is needed to evaluate the venous anatomy, then this study is supported
 - If a venous CTV or MRV study has been performed and subsequently a repeat study is needed to evaluate the arterial anatomy, then this study is supported
 - MRA without and with contrast with venous sinus thrombosis to differentiate total from subtotal occlusion is supported

General Guidelines – PET Coding Notes (HD-1.6)

HD.GG.0001.6.A

v2.0.2024

- Metabolic Brain PET should be reported as Metabolic Brain PET (CPT® 78608)
- Amyloid Brain PET should be reported as limited PET (CPT® 78811) or limited PET/CT (CPT® 78814)

General Guidelines – Other Imaging Situations (HD-1.7)

HD.GG.0001.7.A

v2.0.2024

- Nausea and vomiting, persistent, unexplained and a negative GI evaluation: MRI Brain without contrast (CPT® 70551) or without and with contrast (CPT® 70553) is supported.
- Screening for metallic fragments before MRI should be done initially with Plain x-ray.
 - The use of CT Orbital to rule out orbital metallic fragments prior to MRI is rarely necessary
 - Plain x-rays are generally sufficient; x-ray detects fragments of 0.12 mm or more, and CT detects those of 0.07 mm or more
- Plain x-ray is generally sufficient to screen for aneurysm clips
- CPT® 76377 (3D rendering requiring image post-processing on an independent workstation) or CPT® 76376 (3D rendering not requiring image post-processing on an independent workstation) can be considered when performed in conjunction with conventional angiography (i.e.: conventional 4 vessel cerebral angiography).
- Eagle Syndrome
 - See: **Eagle Syndrome (Neck-10.3)**
 - See: **General Guidelines – CT and MR Angiography (CTA and MRA) (HD-1.5)** for vascular imaging related to Eagle Syndrome.¹⁵
- For facial feminization/masculinization procedural planning:
 - Pre-operative CT requests for CT Maxillofacial without contrast (CPT® 70486) with or without 3D rendering (CPT® 76376 or CPT® 76377), and/or CT Neck with contrast (CPT® 70491) are supported if the individual has a health plan benefit covering the facial feminization/masculinization and laryngoplasty surgeries and the surgery has been approved.
 - Additionally, CT Head without (CPT® 70450) for the following:
 - History of prior cranial surgery
 - History of head trauma
 - Presence of neurological signs and symptoms
 - Pre-operative imaging is not supported if the facial feminization/masculinization and laryngoplasty surgeries are not health plan covered benefits
- 3D Rendering
 - CPT® 76377 (3D rendering requiring image post-processing on an independent workstation) or CPT® 76376 (3D rendering not requiring image post-processing on an independent workstation) is supported in the following clinical scenarios:
 - Bony conditions

- Evaluation of congenital skull abnormalities in newborns, infants, and toddler (usually for pre-operative planning)
- Complex joint fractures or pelvis fractures
- Spine fractures (usually for pre-operative planning)
- Complex facial fractures
- Pre-operative planning for other complex surgical cases
- Cerebral angiography (see: **Intracranial Aneurysms (HD-12.1)**, **Arteriovenous Malformations (AVMs) and Related Lesions (HD-12.2)**, **Stroke/TIA (HD-21.1)**, and **Cerebral Vasculitis (HD-22.1)**)²⁶
- 3D Rendering (CPT® 76377 or CPT® 76376) for surgical planning and surgical follow up after craniotomy when ordered by surgical specialist or any provider in consultation with a surgical specialist.
- 3D Rendering indications in pediatric head imaging are identical to those in the general imaging guidelines.
- See **3D Rendering (Preface-4.1)** in the Preface Imaging Guidelines

Taste and Smell Disorders (HD-2)

Guideline

Taste and Smell Disorders (HD-2.1)

References (HD-2)

Taste and Smell Disorders (HD-2.1)

HD.TS.0002.1.A

v2.0.2024

- MRI Brain without and with contrast (CPT® 70553) or without contrast (CPT® 70551) AND/OR MRI Orbits/Face/Neck without (CPT® 70540) or without and with contrast (CPT® 70543) is indicated with unexplained unilateral or bilateral anosmia (inability to perceive odor) or dysgeusia (complete or partial loss of taste)
- CT Maxillofacial (CPT® 70486, CPT® 70487 or CPT® 70488) is indicated initially if sinus or facial bone disorders are suspected
- For individuals who test positive for SARS-CoV-2 (see: **Neuro-COVID-19 and Sars-CoV-2 Vaccines (HD-14.2)** and **Stroke/TIA (HD-21.1)**)

Background and Supporting Information

In those individuals with consideration of COVID-19 due to signs/symptoms, testing to identify for SARS-CoV-2 is encouraged.

References (HD-2)

Ataxia (HD-3)

Guideline

Ataxia (HD-3.1)

References (HD-3)

Ataxia (HD-3.1)

HD.AX.0003.1.A

v2.0.2024

- Common manifestations include: poor coordination, an abnormal (including wide-based) gait, abnormal finger to nose testing, abnormal rapid alternating movements, abnormal eye movements, and/or difficulty with navigation of stairs and around corners.³
- MRI Brain without and with contrast (CPT® 70553) **OR** MRI Brain without contrast (CPT® 70551) is indicated in all individuals with ataxia:
 - MRI Cervical without contrast or without and with contrast (CPT® 72141 or CPT® 72156) **AND/OR** MRI Thoracic without contrast or without and with contrast (CPT® 72146 or CPT® 72157) **AND/OR** MRI Lumbar Spine without contrast or without and with contrast (CPT® 72148 or CPT® 72158) may be added if spinal disease is suspected
 - If these symptoms are acute and stroke is suspected, see **Stroke/TIA (HD-21.1)**
 - If MS is suspected, see **Multiple Sclerosis (MS) (HD-16.1)**
 - CT Head without contrast (CPT® 70450) **AND/OR** CT Orbit/Temporal Bone without contrast (CPT® 70480) may be added if these symptoms are acute following head trauma, (see also: **Head Trauma (HD-13.1)**)
- If brain tumor is suspected, see **Primary Central Nervous System Tumors (ONC-2.1)** in the Oncology Imaging Guidelines.
- For suspected Normal Pressure Hydrocephalus, see **Normal Pressure Hydrocephalus (NPH) (HD-8.4)**

Background and Supporting Information

- In general, MRI is preferred over CT, unless there is a history of acute trauma or contraindication to MRI. For all other causes, MRI provides better visualization of the cerebellum and posterior fossa.

Mental Health Disorders and Mental Status Change (HD-4)

Guideline

Autism Spectrum Disorders (HD-4.0)
Mental Health Related Disorders (HD-4.1)
Mental Status Change (HD-4.2)
References (HD-4)

Autism Spectrum Disorders (HD-4.0)

HD.BD.0004.0.A

v2.0.2024

- This group of diagnoses, including Asperger syndrome, is classified as pervasive development disorders (PDD). These diagnoses are established on clinical criteria, and no imaging study can confirm the diagnosis.
- Comprehensive evaluation for autism might include history, physical exam, audiology evaluation, speech, language, and communication assessment, cognitive and behavioral assessments, and academic assessment.
 - MRI Brain without and with contrast (CPT® 70553) is indicated for **ANY** of the following:
 - New or worsening focal neurologic findings documented on a pertinent physical
 - Loss of developmental milestones and/or regression
 - PET imaging is considered not medically necessary in the evaluation of individuals with autism spectrum disorders.

Mental Health Related Disorders (HD-4.1)

HD.BD.0004.1.A

v2.0.2024

- Mental health diagnoses, to include Attention Deficit Hyperactivity Disorder (ADHD), do not routinely require advanced imaging.¹²
- MRI Brain without contrast (CPT® 70551) **OR** MRI Brain without and with contrast (CPT® 70553) **OR** CT Head without contrast (CPT® 70450) may be indicated for the exceptions listed below:
 - Acute mental status change, disturbance in consciousness or arousal state
 - Psychotic disorders (including schizophrenia), bipolar disorder and related disorders in the following clinical presentations:
 - Acute psychosis
 - Late onset over age 40
 - Presentation of acute psychiatric symptoms with comorbid serious medical illness
 - Non-auditory hallucinations (e.g., visual, tactile, olfactory) with no known etiology
 - Nonresponse to adequate medication trials
 - Symptoms of an organic brain disorder (e.g., focal deficits, severe headache, or seizures)
- Prior to electroconvulsive therapy (ECT) treatment, the following may be utilized to screen for intracranial disease: MRI Brain without contrast (CPT® 70551) **OR** CT Head without contrast (CPT® 70450)
- Deep Brain Stimulation Therapy for psychiatric disorders is considered not medically necessary, except for medically refractory Obsessive Compulsive Disorder (OCD).¹¹
 - Imaging supported prior to Deep Brain Stimulation (DBS) therapy for medically refractory Obsessive Compulsive Disorder (OCD):
 - MRI Brain without contrast (CPT® 70551) **OR** MRI Brain without and with contrast (CPT® 70553) **AND/OR** unlisted CT procedure code (CPT® 76497)

Mental Status Change (HD-4.2)

HD.BD.0004.2.A

v2.0.2024

- An initial assessment should be performed prior to imaging requests. The initial assessment should include a history describing the onset, duration, and timeframe (constant versus intermittent or episodic nature) of symptoms.
- Bedside neurologic exam should include a mental status evaluation that provides a description of the level of alertness, other characteristics and/or cognitive testing.
- CT Head without contrast (CPT® 70450) **OR** MRI Brain without contrast (CPT® 70551) **OR** MRI Brain without and with contrast (CPT® 70553) is supported for **ANY** of the following²:
 - Acute or worsening (this includes repeat imaging) mental status change
 - Presence of any Red Flag, including:
 - Language, focal motor or sensory deficit (see **Stroke/TIA (HD-21.1)**)
 - Headache associated with acute mental status or other cognitive change. (see **Headaches with Red Flags (HD-11.2)**)
 - Presence of fever and/ or tachycardia (see **CNS and Head Infection (HD-14.1)**)
 - History of COVID-19 (see **Neuro-COVID-19 and Sars-CoV-2 Vaccines (HD 14.2)**)
 - History of hypertensive urgency associated with the mental status change (see **Stroke/TIA (HD-21.1)** and **Sudden Onset of Headache (HD 11.3)**)
 - Presence of coagulopathy or anticoagulant use (see **Abnormal Blood Clotting (HD 11.9)**)
 - Altered mental status in pregnancy and postpartum period (see **Pregnancy (HD 11.10)**)
 - History of significant antecedent trauma (see **Head Trauma (HD 13.1)**)
 - History of known underlying malignancy (see **Brain Metastases (ONC 31.3)**)
 - Fluctuating alertness or consciousness
 - Glasgow Coma Scale (GCS) score of less than 15 (see **Head Trauma (HD 13.1)**) in the setting of antecedent trauma
 - Acute onset of mental status change or worsening symptoms (this includes repeat imaging) in the setting of **known intracranial process** (mass, recent hemorrhage, recent infarct, central nervous system infection, etc.)
 - MRI Brain without contrast (CPT® 70551) **OR** MRI Brain without and with contrast (CPT® 70553) is supported with or without a previous CT Head.
 - CT Head without and with contrast (CPT 70470) is supported if clinical concern exists for initial diagnosis or progression of intracranial infection (such as abscesses or empyema), tumor, hemorrhage/stroke and/or inflammatory conditions. (See **CNS and Head Infection (HD 14.1)**, **Neuro-COVID-19 and Sars-CoV-2 Vaccines (HD 14.2)**, **Stroke/TIA (HD-21.1)** and/or **Brain Metastases (ONC 31.3)**).

- CT Head contrast as requested (CPT® 70450 **OR** CPT® 70460 **OR** CP™ 70470) is supported when:
 - MRI is contraindicated¹³
 - Clinical urgent setting when head imaging is otherwise supported.
- Condition specific imaging is listed in the associated guideline. These may include but are not limited to:
 - Seizure or suspected seizure. A description of events may include transient alteration of awareness, any neurologic deficit with rapid onset and offset of symptoms, episodic occurrence of symptoms, and/or abnormal rhythmic body movements. (See **Epilepsy/Seizures (HD 9.1)**)
 - Post-COVID syndrome/Long haul COVID/COVID-related neurocognitive syndrome, including associated brain fog, (See **Neuro-COVID-19 and Sars-CoV-2 Vaccines (HD 14.2)**)
 - History of significant antecedent head trauma or possible head trauma is present (See **Head Trauma (HD 13.1)**)
 - Concern for ischemic stroke, intracranial hemorrhage, or focal motor or sensory deficits (See **Stroke/TIA (HD-21.1)**)
 - Concern for mass (See **Low Grade Gliomas (ONC 2.2)**, **High Grade Gliomas (ONC 2.3)** and/or **Brain Metastases (ONC 31.3)**)
 - Suspected increased intracranial pressure (See **Papilledema/Pseudotumor Cerebri (HD 17.1)** and/or **Hydrocephalus Shunts (HD 11.14)**)
 - Hallucinations and/or delusions are present (See **Mental Health Related Disorders (HD-4.1)**)

Background and Supporting Information

This section refers to acute and subacute mental status change, generally implicating signs and symptoms occurring over minutes to days.

Acute mental status change or encephalopathy is characterized by changes in behavior or alertness, agitation, confusion, as opposed to chronic, progressive cognitive decline, such as dementia related disorders.

The terms delirium and psychosis are narrowly defined as follows:

- Delirium refers to acute onset of deficits in attention, awareness, and cognition that fluctuate in severity over time, often associated with psychomotor disturbance, altered sleep cycle, and emotional variability. These disturbances may be hyperactive (restlessness, agitation) or hypoactive (psychomotor retardation, lethargy). There may be accompanying fever, and autonomic symptoms (tachycardia, sweating) depending on underlying etiology.
- Psychosis refers to a disorder of impaired reality testing characterized by the presence of hallucinations and/ or delusions, or both without (without insight into their pathologic nature). This may be associated with disorganized behavior, thought blocking, illogicality, tangentiality, perseveration, neologisms.

The purpose of the initial assessment is to define the category of the etiology. These may include: toxic/ metabolic (hypoglycemic, drug exposures), structural (trauma, stroke, hypoxic-ischemic, hydrocephalus, tumor), paroxysmal (seizure, psychiatric), inflammatory (infectious, autoimmune).

Of note even a mild or trivial, acute insult superimposed upon a chronic pathophysiologic process may cause acute mental status change, and head imaging may or may not be necessary, depending on the provider's pretest suspicion of a new significant diagnosis.

Non response to adequate medication trials may include, but is not limited to, implantation of Vagal Nerve Stimulator (VNS), which is FDA approved for treatment of depression.

v2.0.2024

Indication	Supported Imaging
Initial Evaluation for suspected or known Chiari malformations:	<ul style="list-style-type: none">MRI Brain without contrast (CPT® 70551) or MRI Brain without and with contrast (CPT® 70553) <p>AND/OR</p> <ul style="list-style-type: none">MRI Cervical Spine without contrast (CPT® 72141) or MRI Cervical Spine without and with contrast (CPT® 72156) <p>AND/OR</p> <ul style="list-style-type: none">MRI Thoracic Spine without contrast (CPT® 72146) or MRI Thoracic Spine without and with contrast (CPT® 72157) <p>AND/OR</p> <ul style="list-style-type: none">MRI Lumbar Spine without contrast (CPT® 72148) or MRI Lumbar Spine without and with contrast (CPT® 72158)

Indication	Supported Imaging
Repeat imaging for one of the following: <ul style="list-style-type: none"> New or worsening signs or symptoms Surgical procedure is actively being considered At the discretion of or in consultation with a neurologist and/or neurosurgeon coordinating the individual's care 	<ul style="list-style-type: none"> MRI Brain without contrast (CPT® 70551) or MRI Brain without and with contrast (CPT® 70553) <p>AND/OR</p> <ul style="list-style-type: none"> MRI Cervical Spine without contrast (CPT® 72141) or MRI Cervical Spine without and with contrast (CPT® 72156) <p>AND/OR</p> <ul style="list-style-type: none"> MRI Thoracic Spine without contrast (CPT® 72146) or MRI Thoracic Spine without and with contrast (CPT® 72157) <p>AND/OR</p> <ul style="list-style-type: none"> MRI Lumbar Spine without contrast (CPT® 72148) or MRI Lumbar Spine without and with contrast (CPT® 72158)

- Familial screening is NOT indicated for Chiari Malformations.
- For CSF flow imaging (see **CSF Flow Imaging (HD-24.4)**)

Background and Supporting Information

Chiari I malformations involve caudal displacement or herniation of the cerebellar tonsils. Chiari I may be associated with syringomyelia and rarely with hydrocephalus. Most cases are asymptomatic and discovered incidentally on a head scan performed for another indication. When symptoms are present, they are usually nonspecific but can include headache, lower cranial nerve palsies, or sleep apnea.

Chiari II malformations are more severe than Chiari I malformations. These individuals usually present at birth. Myelomeningocele is always present, and syringomyelia and hydrocephalus are extremely common.

Chiari III malformations include cerebellar herniation into a high cervical myelomeningocele. Chiari IV malformation refers to complete cerebellar agenesis. Both Chiari III and IV malformations are noted at birth and are rarely compatible with life.

Repeat brain and spine imaging in individuals with Chiari I malformations and known syringomyelia or hydromyelia is highly individualized.

Chiari II Malformations (Arnold Chiari Malformation) (HD-5.2)

HD.CM.0005.2.A

v2.0.2024

- See Chiari Malformations (HD-5.1)

Chiari III and IV Malformations (HD-5.3)

HD.CM.0005.3.A
v2.0.2024

- See Chiari Malformations (HD-5.1)

Basilar Impression/Basilar Invagination (HD-5.4)

HD.CM.0005.4.A

v2.0.2024

Imaging indications for suspected or known Basilar Impression or Basilar Invagination:

- MRI Brain (CPT® 70551) **AND/OR** MRI Cervical Spine (CPT® 72141) without contrast
- If surgery is being considered, CT Head (CPT® 70450) **AND/OR** CT Cervical Spine (CPT® 72125) without contrast are also indicated **AND/OR** MRA Head (CPT® 70544, CPT® 70545, or CPT® 70546) **OR** CTA Head (CPT® 70496) **AND/OR** MRA Neck (CPT® 70547, CPT® 70548, or CPT® 70549) **OR** CTA Neck (CPT® 70498).¹⁴
- One-time screening of first-degree relatives with MRI Brain without contrast (CPT® 70551) is supported.

Background and Supporting Information

Basilar impression involves malformation of the occipital bone in relation to C1-2 (cervical vertebrae 1 and 2). The top of the spinal cord is inside the posterior fossa and the foramen magnum is undersized. Over time, this can lead to brain stem and upper spinal cord compression. Basilar impression can also be associated with the Chiari malformation, producing very complex anatomical abnormalities.

Basilar invagination is an abnormality at the craniovertebral junction, either congenital or degenerative, resulting in the odontoid prolapsing into the already limited space of the foramen magnum. It is commonly associated with conditions such as Chiari malformation, syringomyelia, and Klippel-Feil syndrome.¹²

Platybasia (HD-5.5)

HD.CM.0005.5.A
v2.0.2024

Imaging indications for suspected or known Platybasia:

- MRI Brain without contrast (CPT®70551) or CT Head without contrast (CPT®70450)
- If surgery is being considered,
 - CT Head (CPT®70450) **AND/OR**
 - CT Cervical Spine without contrast (CPT®72125) **AND/OR**
 - MRA Head (CPT® 70544, CPT® 70545, or CPT® 70546) **OR**
 - CTA Head (CPT® 70496) **AND/OR**
 - MRA Neck (CPT® 70547, CPT® 70548, or CPT® 70549) **OR**
 - CTA Neck (CPT® 70498)¹⁴

Background and Supporting Information

Platybasia is a flattening malformation of the skull base, in which the clivus has a horizontal orientation.

Facial Palsy (Bell's Palsy)/Hemifacial Spasm (HD-6)

Guideline

Facial Palsy (HD-6.1)

Hemifacial Spasm (HD-6.2)

References (HD-6)

Facial Palsy (HD-6.1)

HD.FP.0006.1.A

v2.0.2024

- MRI Brain without and with contrast (CPT® 70553) (with attention to posterior fossa and IACs) or without contrast (CPT® 70551) **AND/OR** MRI Orbit/Face/Neck without contrast (CPT® 70540) or with and without contrast (CPT® 70543) are supported with the following “red flags” of unexplained facial paresis/paralysis in clinical scenarios with²:
 - Trauma to the temporal bone
 - History of tumor, systemic cancer, HIV or Lyme disease
 - No improvement in 8 weeks
 - No full recovery in 3 months
 - Gradual onset over weeks to months
 - Vertigo or hearing loss
 - Bilateral involvement
 - Other atypical or inconsistent features including:
 - Second episode of paralysis on the same side
 - Paralysis of isolated branches of the facial nerve
 - Paralysis associated with other cranial nerves
- MRI Brain without and with contrast (CPT® 70553) for known sarcoidosis with suspected neurosarcoid or CNS involvement is supported, (see also: **Autoimmune/Paraneoplastic Encephalitis & NeuroInflammatory Disorders (HD-14.3)**)
- CT Orbit/Temporal Bone without contrast (CPT® 70480), in the presence of red flags, to assess osseous integrity of the temporal bone, to characterize fractures, pre-surgical anatomy, inflammatory middle ear disease, bone tumor, facial canal foraminal expansion and/or bone erosion.²
- CT Orbit/Temporal Bone with contrast (CPT® 70481), in the presence of red flags, for suspected tumors and/or infection.²
- CT Maxillofacial without contrast (CPT® 70486) to assess bony facial nerve canal **OR** with contrast (CPT® 70487) when infection or tumor are suspected, if requested per institutional protocol.²
- MRA Head without contrast (CPT® 70544), with contrast (CPT® 70545), or without and with contrast (CPT® 70546) **AND/OR** MRA Neck without contrast (CPT® 70547), with contrast (CPT® 70548), or without and with contrast (CPT® 70549) **OR** CTA Head (CPT® 70496) **AND/OR** CTA Neck (CPT® 70498) for clinically suspected stroke.² (see also: **General Guidelines- CT and MR Angiography (CTA and MRA) (HD-1.5)** and **Stroke/TIA (HD-21.1)**)

Background and Supporting Information

Typical features of Bell's palsy include variable initial ipsilateral temporal and auricular pain before facial weakness, onset over 72 hours, ipsilateral complete facial weakness, and an otherwise normal neurological and systemic examination. There is usually slow improvement over several months. Unless "red flags" are present, imaging is not necessary.

Hemifacial Spasm (HD-6.2)

HD.FP.0006.2.A

v2.0.2024

- For hemifacial spasm, facial synkinesis, or blepharospasm:
 - MRI Brain without and with contrast (CPT® 70553)
 - Add CTA Head (CPT® 70496) or MRA Head (CPT® 70544, CPT® 70545, or CPT® 70546) for consideration of vascular decompression surgical procedure to clarify the vascular anatomy in individuals who have failed conservative medical management

Imaging Related to Alzheimer's Treatment and Amyloid Reduction

Medications (HD-8.5)

References (HD-8)

Dementia (HD-8.1)

HD.DM.0008.1.A

v2.0.2024

- For acute mental status change See **Mental Status Change (HD-4.2)** and **Stroke/TIA (HD-21.1)**
- For members being considered for amyloid reducing medications for the treatment of Mild Cognitive Impairment (MCI) due to Alzheimer's disease or mild dementia due to Alzheimer's disease see **Imaging related to Alzheimer's Treatment and Amyloid Reduction Medications (HD-8.5)**
- MRI Brain without contrast (CPT® 70551) or MRI Brain without and with contrast (CPT® 70553) or CT Head without contrast (CPT® 70450) is supported after an initial clinical diagnosis of dementia has been established.
 - The following components are required:
 - A detailed neurological exam is not required when dementia is diagnosed with abnormal bedside mental status testing by score results
 - Established diagnosis of dementia: date of onset of symptoms with documentation of 6 months of cognitive decline based on a detailed history of memory loss with impairment of day-to-day activities confirmed by family members or others with knowledge of the individual's status
 - OR**
 - Results of bedside testing and/or neuropsychological testing can be performed when history and bedside mental status examination cannot provide a confident diagnosis.
 - Examples of abnormal bedside mental status testing such as Mini-Mental Status Exam (MMSE) with score <26, Montreal Cognitive Assessment Survey (MoCA) with score <26, Memory Impairment Screen (MIS) with score <5, the St. Louis University Mental Status (SLUMS) with score <21, or the Eight-item Informant Interview to Differentiate Aging and Dementia (AD8) Dementia Score > 2³¹.
 - Presumptive causes or etiology/ies of dementia
 - Cannot occur exclusively during bouts of delirium
 - Cannot be explained by another mental disorder
 - For the evaluation of Normal Pressure Hydrocephalus, see **Normal Pressure Hydrocephalus (HD-8.4)**.
 - Quantitative Magnetic Resonance Image (MRI) Analysis of the Brain
 - Volumetric analysis of the temporal lobes and hippocampus or Neuro Quant may be ordered as 3D rendering (CPT® 76376 and CPT® 76377) or quantitative analysis of the brain (CPT® 0865T or CPT® 0866T). These studies lack sufficient specificity and sensitivity to be clinically useful in the evaluation or follow up of individuals with dementia. Their use is limited to research studies and are otherwise considered to be not medically necessary in routine clinical practice.

Dementia - PET (HD-8.2)

HD.DM.0008.2.A

v2.0.2024

- Prior to consideration of PET imaging for a diagnosis of dementia, all of the following components are required:
 - Established diagnosis of dementia: date of onset of symptoms with documentation of 6 months of cognitive decline based on a detailed history of memory loss with impairment of day-to-day activities confirmed by family members or others with knowledge of the individual's status
 - OR**
 - Results of bedside testing and/or neuropsychological testing can be performed when history and bedside mental status examination cannot provide a confident diagnosis.
 - Examples of abnormal bedside mental status testing such as Mini-Mental State Exam (MMSE) with score <26, Montreal Cognitive Assessment Survey (MoCA) with score <26, Memory Impairment Screen (MIS) with score <5, the St. Louis University Mental Status (SLUMS) with score <21 or the Eight-item Informant Interview to Differentiate Aging and Dementia (AD8) Dementia Score > 2³¹.
 - Results of any structural imaging (MRI or CT Head) performed.
 - Presumptive causes or etiology/ies of dementia
 - Cannot occur exclusively during bouts of delirium
 - Cannot be explained by another mental disorder

CPT® 78608 is used to report FDG PET metabolic brain studies for dementia, seizure disorders, and dedicated PET tumor imaging studies of the brain.

CPT® 78609 is used to report PET Brain perfusion studies that are not performed with FDG. These scans are nationally noncovered by Medicare.

CPT® 78811 (limited PET) or CPT® 78814 (limited PET/CT) are used to report Amyloid Brain PET (these codes are for static images to measure amyloid, as opposed to the FDG PET which is a metabolic study).

- FDG PET for Dementia and Neurodegenerative Diseases
 - For Medicare members, see the **Medicare National Coverage Determinations (NCD) Manual, Section 220.6.13** for the coverage policy
 - FDG Brain PET (CPT® 78608) is useful in distinguishing between Alzheimer's disease (AD) and Frontotemporal dementia (FTD).
 - It is otherwise considered not medically necessary for the purpose of diagnosis and management of mild cognitive impairment (MCI) and other forms of dementia including, but not limited to, Lewy Body disease, Parkinson's disease, Normal Pressure Hydrocephalus and Chronic Traumatic Encephalopathy.

- Appropriate documentation should support concern for one of the variants of Frontotemporal dementia (Behavioral Variant or Primary Progressive Aphasia type FTD) based on a detailed history and exam findings (which includes neuropsychological testing) and meet the following criteria:
 - Meets diagnostic criteria for AD and FTLD (frontotemporal lobar dementia) **AND**
 - Has a documented cognitive decline of at least 6 months **AND**
 - Evaluation has ruled out specific alternative neurodegenerative disease or causative factors; and
 - Cause of clinical symptoms is uncertain **AND**
 - The results are expected to help clarify the diagnosis between FTLD and AD and help guide future treatment.
- Amyloid Brain PET
 - Amyloid Brain PET (CPT® 78811 or CPT® 78814) imaging is only indicated for treatment with amyloid-reducing medications (see **Imaging Related to Alzheimer's Treatment and Amyloid Reduction Medications (HD-8.5)**).
 - Otherwise, these studies are considered not medically necessary in the diagnosis and/or treatment of Alzheimer's disease and in differentiating between Alzheimer's disease and other neurodegenerative/neurologic disorders.
- For Cerebral Amyloid Angiopathy, see **Stroke/TIA (HD-21.1)**
- FDG-PET(CPT® 78608)/MRI Brain without contrast (CPT® 70551) OR MRI Brain without and with contrast (CPT® 70553) imaging may be considered on a case by case basis for those imaging centers that will utilize FDG-PET/MRI during an initial evaluation (instead of MRI alone) and who also have a standardization of imaging protocol.^{27, 28, 29, 30}

Background and Supporting Information

- The frontotemporal dementias (FTDs) are a group of neurodegenerative disorders that differ from Alzheimer's disease. The basic pathology involves accumulation of tau proteins in the brain rather than amyloid. Onset tends to be younger (less than 65) and progression usually more rapid than in senile dementia-Alzheimer type (SDAT). There is no treatment, and the medications used to help memory in Alzheimer's disease are not effective.
- There are several subtypes of FTD; most common are the behavioral variant with early loss of executive functions, impaired judgment disinhibition and impulsivity, and the semantic variant with primary and progressive loss of language ability. Other less common subtypes include progressive supranuclear palsy, corticobasal syndrome, and FTD associated with motor neuron disease.
- Diagnosis is based on clinical features, neuropsychological testing, and brain imaging (preferably MRI) to rule out other structural disease. Metabolic (FDG) PET Brain is helpful by demonstrating patterns of abnormality more consistent with FTD than Alzheimer's disease.
- Health plans may have specific criteria that differ in their coverage policies

- Recent research has examined the utility of PET/MRI for evaluation of patients with Dementia. Due to the prolonged acquisition time, motion during a PET may lead to artifacts such as blurring of the images. Use of co-registration of PET with MRI can lead to better PET assessment especially with quantitative measurements^{27,30}. Utilization of PET/MRI provides greater confidence in imaging reading by permitting greater structural correlation. A recent study compared FDG-PET/CT and FDG-PET/MRI in a memory disorders clinic. This study identified more patient with cerebrovascular disease (stroke) and better cortical atrophy characterization²⁸. The authors found that PET/MRI provided significant improvement in diagnosis and management of patients in which dementia is a consideration. Finally a Canadian study suggested that FDG-PET/MRI is "financial justifiable"²⁹.

Lewy Body Dementia (LBD) - SPECT Brain Scan (HD-8.3)

HD.DM.0008.3.A

v2.0.2024

- Dementia with Lewy bodies is often hard to diagnose because its early symptoms may resemble those of Alzheimer's or a psychiatric illness. Over time people with LBD often develop similar symptoms due to the presence of Lewy bodies in the brain.
 - Clinicians and researchers may use the "1-year rule" to help make a diagnosis. If cognitive, psychiatric, emotional, and/or personality symptoms appear at the same time as or at least a year before movement problems/parkinsonism, the diagnosis is dementia with Lewy bodies. If cognitive problems develop more than a year after the onset of movement problems, Parkinson's disease, the diagnosis is Parkinson's disease dementia (PDD).
- Core Clinical Symptoms
 - Dementia
 - Movement problems/parkinsonism
 - Cognitive fluctuations
 - Visual hallucinations
 - REM sleep behavior disorder
- Supportive Clinical Symptoms
 - Extreme sensitivity to antipsychotic medications
 - Falls, fainting
 - Severe problems with involuntary functions (maintaining blood pressure, incontinence, constipation, loss of smell)
 - Changes in personality and mood (depression, apathy, anxiety)
- Prior to consideration of SPECT Brain Scan for a diagnosis of LBD, all of the following components are required:
 - Established diagnosis of dementia: date of onset of symptoms with documentation of 6 months of cognitive decline based on a detailed history of memory loss with impairment of day-to-day activities confirmed by family members or others with knowledge of the individual's status **OR**
 - Results of bedside testing and/or neuropsychological testing can be performed when history and bedside mental status examination cannot provide a confident diagnosis.
 - Examples of abnormal bedside mental status testing such as Mini-Mental State Exam (MMSE) with score <26, Montreal Cognitive Assessment Survey (MoCA) with score <26, Memory Impairment Screen (MIS) with score <5, the St. Louis University Mental Status (SLUMS) with score <21, or the Eight-item

Informant Interview to Differentiate Aging and Dementia (AD8) Dementia Score > 2³¹.

- Results of any structural imaging (MRI or CT Head) performed
- SPECT Brain Scan (CPT® 78803 or CPT® 78830) is supported after all of the above criteria are met
- PET Brain is not indicated for LBD

Background and Supporting Information

Test Results Supporting Diagnosis

- Abnormal 123iodine-MIBG myocardial scintigraphy showing reduced communication of cardiac nerves
- Sleep study confirming REM sleep behavior disorder without loss of muscle tone

Normal Pressure Hydrocephalus (NPH) (HD-8.4)

HD.DM.0008.4.A

v2.0.2024

- CT Head without contrast (CPT® 70450) **OR** MRI Brain without contrast (CPT® 70551) is indicated if the individual has at least two symptoms involving gait abnormality (see **Background and Supporting Information**), urinary incontinence, or dementia **AND**
 - The clinical symptoms cannot be completely explained by other neurological or non-neurological disease, **AND**
 - There is no apparent preceding disorder that would cause hydrocephalus^{24,25,26}
- The components of Dementia are delineated in **Dementia (HD-8.1)**, but include:
 - Results of testing and/or neuropsychological testing can be performed when history and mental status examination cannot provide a confident diagnosis.
 - Examples of abnormal mental status testing such as Mini-Mental State Exam (MMSE) with score <26, Montreal Cognitive Assessment Survey (MoCA) with score <26, Memory Impairment Screen (MIS) with score <5, the St. Louis University Mental Status (SLUMS) with score <21, or the Eight-item Informant Interview to Differentiate Aging and Dementia (AD8) Dementia Score > 2³¹.
 - Presumptive causes or etiology/ies of dementia
 - Cannot occur exclusively during bouts of delirium
 - Cannot be explained by another mental disorder
- MRI Brain (CPT® 70551, CPT® 70552, or CPT® 70553) is not generally indicated for the diagnosis of NPH if a CT has been performed. However, MRI Brain is indicated if needed for pre-surgical planning.
 - After neuro imaging the next step is CSF sampling, drainage, and dynamics
- Follow-up imaging for individuals diagnosed with NPH with a shunt should follow **Hydrocephalus Shunts (HD-11.14)**, **Low Pressure Headache and CSF Leak (HD-11.15)**, or **Nuclear Medicine (HD-36.1)**

Background and Supporting Information

Normal Pressure Hydrocephalus (NPH) seen typically in the elderly. It comprises a triad of symptoms: cognitive dysfunction, incontinence of urine, and gait disturbance (typically a “magnetic”, small-step, or broad based gait). The reported neuroradiologic marker for this is ventriculomegaly (enlarged ventricles) in the brain. Unfortunately, these symptoms and this neuroradiologic finding is common in the elderly, making the diagnosis of NPH in any given individual problematic. It is radiographically common and clinically rare.

Imaging Related to Alzheimer's Treatment and Amyloid Reduction Medications (HD-8.5)

HD.DM.0008.5.A
v2.0.2024

Health plans may have specific criteria that differ in their coverage policies.

A pertinent clinical evaluation including a detailed history, mental status testing results, and appropriate laboratory studies should be performed prior to considering treatment with amyloid reduction medications.

Medical records should be provided that support a clinical diagnosis of Mild Cognitive Impairment (MCI) due to Alzheimer's Dementia (AD) or early Alzheimer's Dementia (AD). Other conditions such as Dementia with Lewy Bodies (DLB), Frontotemporal Dementia (FTD), vascular dementia, pseudodementia due to mood disorder, vitamin B12 deficiency, untreated thyroid disease, traumatic brain injury, and/or encephalopathy, have been excluded.

Results of bedside testing and/or neuropsychological testing can be performed when history and mental status examination cannot provide a confident diagnosis.

Prior to treatment initiation, when ALL criteria are met:

- Patient is ≥ 50 years of age and ≤ 85 years of age **AND**
- A clinical diagnosis of Mild Cognitive Impairment (MCI) due to Alzheimer's Dementia (AD) or early Alzheimer's Dementia (AD) **AND**
- Qualifying test scores include Mini-Mental Status Exam (MMSE) with score ≥ 22 , Clinical Dementia Rating global score of 0.5 or 1.0, Clinical Dementia Rating-Sum of Boxes (CDR-SB) ≥ 0.5 and/or a Memory Box score of 0.5 or greater **AND**
- Patient has no history of brain hemorrhage, bleeding disorder or recent history (within 12 months) of stroke or transient ischemic attacks or any history of seizures **AND**
- Patient is not taking anticoagulant or antiplatelet agents (except aspirin for prevention of cardiovascular or thromboembolic events) **AND**
- Not currently taking another amyloid reducing drug **AND**
- The medication is prescribed by a neurologist

Lecanemab (Leqembi)

Indication	Supported Imaging
Consideration of Lecanemab (Leqembi) therapy	<p>Baseline MRI Brain (<i>within 3 months of medication initiation</i>)</p> <ul style="list-style-type: none"> MRI Brain without contrast (CPT® 70551) OR MRI Brain without and with contrast (CPT® 70553) <p>AND/OR</p> <ul style="list-style-type: none"> Amyloid PET Brain (CPT® 78811 or CPT® 78814)
On Lecanemab therapy prior to 5 th , 7 th and 14 th infusions	<ul style="list-style-type: none"> MRI Brain without contrast (CPT® 70551) OR MRI Brain without and with contrast (CPT® 70553)

Post-treatment imaging at 18 months	<ul style="list-style-type: none"> Amyloid PET Brain (CPT® 78811 OR CPT® 78814)

Background and Supporting Information

Amyloid reduction medications are indicated for the treatment of Mild Cognitive Impairment (MCI) due to Alzheimer's disease and mild, early stage Alzheimer's disease^{32,33}.

These medications are monoclonal antibodies that selectively bind to aggregated forms of beta amyloid. The accumulation of amyloid plaques in the brain is a defining pathophysiologic feature of Alzheimer's disease. In clinical trials, these medications reduce amyloid beta plaque compared with placebo^{32,33}.

Amyloid related imaging abnormalities (ARIA) have been caused by these medications. ARIA usually occurs early in treatment and may be asymptomatic although serious and life-threatening events may occur. Screening MRI brain prior to treatment initiation and periodic monitoring during treatment is recommended. For moderate to severe ARIA, treatment may be suspended. Once ARIA is identified on a brain MRI, follow up MRIs are indicated to assess for radiographic resolution and/or symptom resolution with the imaging time frame determined by the treating physician. Resumption of dosing is guided by clinical judgment^{32,33}.

ARIA may be further characterized as ARIA with edema (ARIA-E) or ARIA with hemosiderin (ARIA-H). ARIA-E presents on MRI as brain edema or sulcal effusions. ARIA-H includes microhemorrhage and superficial siderosis. ARIA-E and ARIA-H may occur simultaneously^{32,33}.

Although ARIA is usually asymptomatic, symptoms associated with ARIA include headache, confusion, visual changes, dizziness, nausea, aphasia, weakness, gait difficulty and seizures, including status epilepticus. Focal neurologic deficits may also occur^{32,33}. The risk of ARIA is increased in apolipoprotein E ϵ 4 (ApoE ϵ 4) homozygotes³³.

Epilepsy/Seizures (HD-9)

Guideline

Epilepsy/Seizures (HD-9.1)

Perioperative Evaluations for Drug-Resistant Epilepsy (HD-9.2)

References (HD-9)

Epilepsy/Seizures (HD-9.1)

HD.EP.0009.1.A

v2.0.2024

- MRI Brain without and with contrast (CPT® 70553) **OR** MRI Brain without contrast (CPT® 70551) for:
 - Evaluation of new onset seizures
 - Refractory or drug resistant seizures
 - Change in the type of seizure
 - If CT Head was performed for an initial evaluation for new onset seizure, MRI (as described above) is indicated for additional evaluation
 - Follow-up MRI Brain with “Epilepsy Protocol” is supported.
- Repeat imaging at discretion of the neurologist
- MRI Brain without and with contrast (CPT® 70553) **OR** MRI Brain without contrast (CPT® 70551) **OR** CT Head without contrast (CPT® 70450)¹
- CT Head without contrast (CPT® 70450) for:
 - Evaluation of structural findings in seizure etiologies that contain dystrophic calcifications, such as with oligodendrogliomas and tuberous sclerosis.
 - Acute setting of seizure evaluation
- CT Head (contrast as requested) (CPT® 70450, CPT® 70460 **OR** , CPT® 70470) when:
 - MRI is contraindicated
 - Request is urgent
- For Seizure and/or Altered Mental Status associated with Head Trauma, see **Head Trauma (HD-13.1)**
- 3D T1 and/or FLAIR sequences are useful in improving lesion detection for the diagnosis and monitoring of epilepsy. 3D T1 and FLAIR sequences do not require an additional CPT® for 3D rendering (CPT® 76376 and CPT® 76377).¹²

Perioperative Evaluations for Drug-Resistant Epilepsy (HD-9.2)

HD.EP.0009.2.A

v2.0.2024

- The following requests are supported for consideration of potential surgery:
 - MRI Brain without contrast (CPT® 70551) **OR** MRI Brain with and without contrast (CPT® 70553)
 - Follow-up MRI Brain after a previous routine study if performed with special "Epilepsy Protocol" (typically 3T or 7T magnet, thin sections with angled slices through hippocampus and temporal lobes)
 - FDG PET (CPT® 78608)
 - Medicare covers FDG PET for pre-surgical evaluation for the purpose of localization of a focus of refractory seizure activity. The complete coverage policy is found in the **Medicare National Coverage Determinations (NCD) Manual, Section 220.6.9**
 - PET/MRI is MRI Brain without contrast (CPT® 70551) **OR** MRI Brain with and without (CPT® 70553) co-registered **WITH** FDG-PET Brain (CPT® 78608) and is supported for pre-surgical evaluation of refractory seizure when requested by neurosurgeon or neurologist or any provider in consultation with a neurosurgeon or neurologist.^{27, 25, 27}
 - Ictal SPECT (CPT® 78803)
 - Functional MRI (fMRI) (CPT® 70555 or CPT® 70554)
 - If MRA Head (CPT® 70544) is indicated but Functional MRI (CPT® 70554 or CPT® 70555) was erroneously ordered, then CPT® 70544 may be substituted when appropriate, (see **Functional MRI (fMRI) (HD-24.2)**)
 - MRI Brain without contrast (CPT® 70551) **OR** MRI Brain with and without (CPT® 70553)
 - Indicated if co-registered with Magnetoencephalography (MEG)¹
 - 3D rendering CPT® 76377 (3D rendering requiring image post-processing on an independent workstation) or CPT® 76376 (3D rendering not requiring image post-processing on an independent workstation) is not necessary for epilepsy surgery alone, since 3D rendering can be obtained as part of the MRI Brain epilepsy protocol, unless complicated surgical repair considerations involving craniotomy are required.¹²
- When non-invasive EEG monitoring is insufficient, intracranial monitoring with stereo-EEG or grids/strips and depth electrodes is indicated with additional imaging for neuronavigation. See **Neurosurgical Imaging (HD-28.1)** and **Neuronavigation (HD-28.2)**
 - Post-operative imaging including after intracranial (EEG) monitoring per neurosurgeon or neurologist or any provider in consultation with neurosurgeon or neurologist.

- See **Primary Central Nervous System Tumors-General Considerations (ONC-2.1)** in the Oncology Imaging Guidelines and/or **Neurosurgical Imaging (HD-28.1)** for additional imaging requests for surgery

Background and Supporting Information

- Magnetoencephalography (MEG) plays an important role in clarifying the significance of abnormalities seen on both structural and functional imaging, for the purpose of epileptogenic zone localization for surgical planning. When used in conjunction with other techniques, MEG plays a major role in the non-invasive epilepsy surgery evaluation. Currently, eviCore reviews only for the MRI co-registered with MEG.
- MEG followed by co-registration with Brain MRI is referred to as Magnetic Source Imaging (MSI)²⁰

Below are examples of surgical treatment or an interventional modality that may be under active consideration for individuals with intractable epilepsy (not all inclusive):

- Focal Resection
 - Temporal Lobe Resection
 - Extratemporal Resection
- Lesionectomy
- Multiple Subpial Transections
- Laser Interstitial Thermal Therapy (LITT)
- Anatomical or Functional Hemispherectomy and Hemispherotomy
- Corpus Callosotomy
- Stereotactic Radiosurgery
- Neurostimulation Device Implantations (Neuromodulation) including
 - Vagus Nerve Stimulation (VNS)
 - Responsive Neurostimulation (RNS) system also known as NeuroPace
 - Deep Brain Stimulation (DBS)

Trigeminal Neuralgia and other Centrally Mediated Facial Pain Syndromes (HD-10)

Guideline

Trigeminal Neuralgia/Trigeminal Neuropathy (HD-10.1)

Glossopharyngeal Neuralgia/Glossopharyngeal Neuropathy (HD-10.2)

References (HD-10)

Trigeminal Neuralgia/Trigeminal Neuropathy (HD-10.1)

HD.TM.0010.1.A

v2.0.2024

- MRI Brain without and with contrast (CPT® 70553) (with special attention to the skull base) or MRI Brain without contrast (CPT® 70551) **AND/OR** facial imaging, MRI Orbit/ Face/Neck without contrast (CPT® 70540) or MRI Orbit/Face/Neck with and without contrast (CPT® 70543)⁵ for:
 - Symptoms of trigeminal neuropathy⁵
 - Suspected trigeminal neuralgia or one of its cranial nerve variants such as glossopharyngeal neuralgia (CN IX), (see **Glossopharyngeal Neuralgia/Glossopharyngeal Neuropathy (HD-10.2)**)
 - Concern about an underlying diagnosis of multiple sclerosis
 - Trigeminal neuralgia which involves the ophthalmic nerve, (periorbital or forehead pain), once post-herpetic neuralgia (a complication of shingles) has been excluded by history
- CT Maxillofacial without contrast (CPT® 70486) or CT Maxillofacial with contrast (CPT® 70487) for evaluating the skull base and neural foramina⁵
- Contrast-enhanced navigation protocol CT (CPT® 76497) for gamma knife stereotactic radiosurgery for trigeminal neuralgia⁵, (see also, **Neuronavigation (HD-28.2)** and **Post Operative Imaging (HD-28.3)**) for post-treatment imaging studies
- MRA Head (CPT® 70544, CPT® 70545 or CPT® 70546) or CTA Head (CPT® 70496) for:
 - Trigeminal neuralgia (vascular imaging may be obtained concurrently with structural brain imaging)⁵
 - Failed medical treatment
 - Surgical planning

Background and Supporting Information

The differential diagnosis of facial pain is extensive, complex, and difficult, and there is considerable case-to-case variation in optimal imaging pathway.

Symptoms of trigeminal neuropathy include facial pain, facial numbness, and/or weakness of the muscles of mastication.

Trigeminal neuralgia, also known as tic douloureux (the involuntary wincing associated with the occurrence of pain), refers to sudden, severe, shooting "electrical" pains along one or more sensory divisions of the trigeminal nerve, provoked by movements such as chewing, or by external stimuli, such as wind blowing or touching the face.

Glossopharyngeal Neuralgia/Glossopharyngeal Neuropathy (HD-10.2)

HD.TM.0010.2.A
v2.0.2024

- MRI Brain without and with contrast (CPT® 70553) or MRI Brain without contrast (CPT® 70551) **AND/OR** MRI Orbit/Face/Neck without and with contrast (CPT® 70543) or MRI Orbit/Face/Neck without contrast (CPT® 70540) for suspected glossopharyngeal neuralgia or neuropathy⁵
- CT Neck with contrast (CPT® 70491) to delineate skull base erosion, deep space neck masses, calcifications, the skull base bony anatomy and/or the stylohyoid ligament⁵ (see also **Eagle Syndrome (Neck-10.3)**)
- MRA Head with contrast (CPT® 70545), or MRA Head without and with contrast (CPT® 70546) **AND/OR** MRA Neck with contrast (CPT® 70548), or MRA Neck without and with contrast (CPT® 70549), to assess for neurovascular compression for the evaluation of glossopharyngeal neuralgia⁵

Background and Supporting Information

- Glossopharyngeal neuralgia presents as severe pain in the throat and neck, classically triggered by swallowing⁵.
- Glossopharyngeal neuropathy may present with pain, dysphagia, loss of gag reflex, impaired taste, and impaired sensation along posterior one-third of the tongue and/or inability to elevate the palate⁵.

Headache General Guidelines (HD-11.0)

HD.HA.0011.0A

v2.0.2024

- Advanced imaging of the head is NOT indicated for any of the following:
 - Primary headache disorder in the absence of focal neurological deficits or "red flags" (see **Headaches with Red Flags (HD-11.2)** and **Advanced Imaging Indications Related to Migraines (HD-11.17)**)
 - Newly diagnosed migraine or tension-type headache with a normal neurologic exam or for chronic stable headache including migraine with no neurologic deficit.¹⁶
 - Duplex Ultrasound Carotid Arteries (CPT® 93880) does not have a role in the evaluation of headaches (including migraines), except for suspected carotid dissection (see **Initial Imaging (PVD-3.1)** in the Peripheral Vascular Disease Imaging Guidelines, **Headache and Suspected Vascular Dissection (HD-11.1)**, and **Stroke/TIA (HD-21.1)**)

Background and Supporting Information

- The yield of detecting abnormal, treatable lesions by CT or MRI in individuals with headache but normal neurological exam has been found to be low¹⁶

Headache and Suspected Vascular Dissection (HD-11.1)

HD.HA.0011.1A

v2.0.2024

- CTA Neck (CPT® 70498) and MRA Neck (CPT® 70547, CPT® 70548, or CPT® 70549) are appropriate in the evaluation for headache with suspected carotid or vertebral artery dissection and in certain high risk scenarios including, but not exclusive to: Fibromuscular dysplasia (FMD), Marfan Disease, acute MVA with whiplash, and acute headache and/or neck pain due to chiropractic manipulation.
 - CTA Head (CPT® 70496) or MRA Head (CPT® 70544, CPT® 70545, or CPT® 70546) is indicated if there is concern for extension of a carotid dissection to the skull base or above
 - Evaluation of posterior circulation disease requires both neck and head MRA/CTA to visualize the entire vertebral-basilar system
- MRA Neck (CPT® 70547, CPT® 70548, or CPT® 70549) or CTA Neck (CPT® 70498) if arterial dissection is suspected, or known and re-evaluation is needed (as directed by neurologist or neurosurgeon or any provider in consultation with a neurologist or neurosurgeon)
- MRA Head (CPT® 70544, CPT® 70545, or CPT® 70546) or CTA Head (CPT® 70496, or CPT® 70498) if arterial dissection is suspected, or known and re-evaluation is needed (as directed by neurologist or neurosurgeon or any provider in consultation with a neurologist or neurosurgeon)
- Other vascular imaging indications for headaches require additional information.
 - See **Stroke/TIA (HD-21.1)**, **Sudden Onset of Headache (HD-11.3)**, **New Headache Onset Older than Age 50 (HD-11.7)**, **Abnormal Blood Clotting (HD-11.9)**, **Pregnancy (HD-11.10)**, **Physical Exertion (HD-11.11)**, and **Systemic Infections (HD-11.13)**

Headaches with Red Flags (HD-11.2)

HD.HA.0011.2A

v2.0.2024

- MRI Brain without and with contrast (CPT® 70553) or MRI Brain without contrast (CPT® 70551) or CT Head without contrast (CPT® 70450) supported for any of the following:
 - Headache accompanied by seizures, vomiting, focal neurological complaints including dizziness, visual change, altered mental status, or acute hypertension (see **Primary Central Nervous System Tumors – General Considerations (ONC-2.1)** in the Oncology Imaging Guidelines and **Stroke/TIA (HD-21.1)**)
 - Abnormal examination findings (including, but not limited to, altered mental status, papilledema, focal signs or symptoms including unilateral weakness or sensory loss, hyperreflexia, clonus, increased tone, Hoffman or Babinski sign, loss of coordination, seizures, gait disturbance, cranial nerve abnormality, vision loss, nystagmus, dysarthria, dysphagia, fever, meningismus)
- Headaches with any of the following Red Flags - If any of the below unusual symptoms or history are present advanced imaging studies are supported (see relevant section):
 - Cancer history or immunosuppression (see **Cancer or Immunosuppression (HD-11.8)**)
 - Sudden onset (see **Sudden Onset of Headache (HD-11.3)**)
 - New onset age >50 (see **New Headache Onset Older than Age 50 (HD-11.7)** and **Migraine Exceptions (HD-11.17)**)
 - History of head trauma (see **Headaches Associated with Head Trauma (HD-11.12)**, and **Head and Facial Trauma (HD-13)**)
 - Headache precipitated by cough or valsalva, physical exertion, or sexual activity (see **Physical Exertion (HD-11.11)**)
 - Currently pregnant (including pregnancy and the immediate postpartum period) (see **Pregnancy (HD-11.10)**)
 - Hypercoagulable state or bleeding disorder (see **Abnormal Blood Clotting (HD-11.9)**)
 - New persistent headache (see **Migraine Exceptions (HD-11.17)**)
 - Headache awakens individual from sleep (see **Sudden Onset of Headache (HD-11.3)**)
- Chronic headache with significant change in character, severity or frequency of headache (For example: progressively worsening headache over a period of days or weeks, transformation of established migraine to chronic daily headaches):
 - MRI Brain without and with contrast (CPT® 70553); or
 - MRI Brain without contrast (CPT® 70551); or
 - CT Head without contrast (CPT® 70450)

- MRA/MRV Head (CPT® 70544, CPT® 70545, or CPT® 70546) or CTA/CTV Head (CPT® 70496) can be added to evaluate the recent onset of a progressive, severe, daily headache, with or without papilledema and concern for cerebral venous sinus thrombosis.
 - CT and MR Venography (CTV and MRV) are reported with the same codes as the CTA/MRA counterpart. If arterial and venous CT or MR studies are both performed in the same session, only **ONE** CPT® code should be used to report both procedures
- For papilledema, see **Papilledema/Pseudotumor Cerebri (HD-17.1)**

Background and Supporting Information

Aura symptoms may accompany or precede a headache within 60 minutes and may include, but are not exclusive to the following symptoms:²⁸

- Visual (flashing lights, loss of vision)
- Sensory (paresthesia)
- Speech and/or language (difficulty speaking)
- Motor (any weakness)
- Brainstem (dizziness, double vision) and retinal (visual complaints)

Sudden Onset of Headache (HD-11.3)

HD.HA.0011.3.A

v2.0.2024

- For sudden onset of headache including:
 - Worst, most severe headache ever experienced or thunderclap-type (example: awakening from sleep)
 - Sudden onset unilateral headache, suspected carotid or vertebral dissection or ipsilateral Horner's syndrome
 - Consideration of reversible cerebral vasoconstriction syndrome (RCVS) (typically bilateral headache)
 - High risk scenarios including Fibromuscular Dysplasia (FMD), Marfan Disease, MVA with whiplash, and chiropractic manipulation
- If any of these onset of headache features are present, the following are supported:
 - CT Head without contrast (preferred study) (CPT® 70450) **OR** MRI Brain without contrast (CPT® 70551) **OR** MRI Brain without and with contrast (CPT® 70553) **AND/OR**
 - CTA Head (CPT® 70496) **or** MRA Head (CPT® 70544, CPT® 70545, or CPT® 70546)
 - MRA Neck (CPT® 70547, CPT® 70548, or CPT® 70549) **OR** CTA Neck (CPT® 70498) if carotid or vertebral dissection is suspected
 - CT and MR Venography (CTV and MRV) are reported with the same codes as the CTA/MRA counterpart. If arterial and venous CT or MR studies are both performed in the same session, only **ONE** CPT® code should be used to report both procedures
- Repeat MRA/CTA Head and Neck imaging in 2-4 weeks if suspicion of Reversible Cerebral Vasoconstriction Syndrome (RCVS) is high⁸
- MRA Neck (CPT® 70547, CPT® 70548, or CPT® 70549) or CTA Neck (CPT® 70498) if arterial dissection is suspected, or known and re-evaluation is needed (as directed by neurologist or neurosurgeon or any provider in consultation with a neurologist or neurosurgeon)
- MRA Head (CPT® 70544, CPT® 70545, or CPT® 70546) or CTA Head (CPT® 70496, or CPT® 70498) if arterial dissection is suspected, or known and re-evaluation is needed (as directed by neurologist or neurosurgeon or any provider in consultation with a neurologist or neurosurgeon)
- Other vascular imaging indications for headaches require additional information.
 - See **Stroke/TIA (HD-21.1)**, **New Headache Onset Older than Age 50 (HD-11.7)**, **Abnormal Blood Clotting (HD-11.9)**, **Pregnancy (HD-11.10)**, **Physical Exertion (HD-11.11)**, **Intracranial Aneurysms (HD-12.1)**, and **Systemic Infections (HD-11.13)**

Trigeminal Autonomic Cephalgias (HD-11.4)

HD.HA.0011.4.A
v2.0.2024

- For trigeminal autonomic cephalgias and cluster headache²⁷:
 - MRI Brain without and with contrast (preferred study) (CPT® 70553) **OR**
 - MRI Brain without contrast (CPT® 70551)
 - May also include pituitary screening (see **Pituitary (HD-19)**)
- For facial pain (see **Trigeminal Neuralgia and other Centrally Mediated Facial Pain Syndromes (HD-10)**)

Background and Supporting Information

Trigeminal autonomic cephalgias includes cluster headache, short-lasting, unilateral, neuralgiform headache attacks with conjunctival injection and tearing (SUNCT) syndromes; short-lasting unilateral neuralgiform headache attacks with cranial autonomic symptoms (SUNA) and hemicrania paroxysmal and continua.

Skull Base, Orbit, Periorbital or Oromaxillary (HD-11.5)

HD.HA.0011.5.A

v2.0.2024

- Skull base, orbital, periorbital or oromaxillary¹ imaging is indicated for concern of skull base tumors in individuals with head and neck cancers, other skull base abnormalities seen on previous imaging, any invasive sinus infections as well as sinus tumors or orbital tumors with intracranial extension.
- In these clinical scenarios, the following studies are indicated:
 - MRI Brain and/or Orbits/Face/Neck without and with contrast (preferred study) (CPT® 70553 and/or CPT® 70543) **OR**
 - MRI Brain and/or Orbits/Face/Neck without contrast (CPT® 70551 and/or CPT® 70540) **OR**
 - CT Head and/or Orbits/Temporal bone without and with contrast (CPT® 70470 and/or CPT® 70482) **OR**
 - CT Head and/or Orbits/Temporal bone with contrast (CPT® 70460 and/or CPT® 70481)

Suspected Intracranial Extension of Sinusitis or Mastoiditis (HD-11.6)

HD.HA.0011.6.A

v2.0.2024

- For suspected intracranial extension of sinusitis or mastoiditis:
 - MRI Brain without and with contrast (CPT® 70553)
 - See **Mastoid Disease or Ear Pain (HD-26.1)** and **Skull Base, Orbit, Periorbital or Oromaxillary (HD-11.5)**

New Headache Onset Older than Age 50 (HD-11.7)

HD.HA.0011.7.A

v2.0.2024

- For new onset headache in individuals older than 50 years of age:
 - MRI Brain without and with contrast (preferred study) (CPT® 70553) **OR**
 - MRI Brain without contrast (CPT® 70551) **OR**
 - CT Head without contrast (CPT® 70450)
 - If Giant Cell Arteritis, also known as Temporal Arteritis, is suspected, MRA Head (CPT® 70544, CPT® 70545, or CPT® 70546), see **Cerebral Vasculitis (HD-22)**

Cancer or Immunosuppression (HD-11.8)

HD.HA.0011.8A

v2.0.2024

- For new headache in individuals with cancer or who are immunocompromised:
 - MRI Brain without and with contrast (preferred study) (CPT® 70553) **OR**
 - MRI Brain without contrast (CPT® 70551)

Abnormal Blood Clotting (HD-11.9)

HD.HA.0011.9A

v2.0.2024

- MRI Brain without and with contrast (CPT® 70553) **OR** MRI Brain without (CPT® 70551) **OR** CT Head without contrast (CPT® 70450):
 - New onset headaches in individual with hypercoagulable states or bleeding disorder
 - MRA/MRV Head (CPT® 70544, CPT® 70545, or CPT® 70546) or CTA/CTV Head (CPT® 70496) may be added for venogram when requested.
 - CT and MR Venography (CTV and MRV) are reported with the same codes as the CTA/MRA counterpart. If arterial and venous CT or MR studies are both performed in the same session, only **ONE** CPT® code should be used to report both procedures
 - Individuals with potential for bleeding diathesis
 - Taking anticoagulants or two or more antiaggregants or having a medical condition that predisposes to bleeding (for example, but not limited to: thrombocytopenia, liver failure, Idiopathic Thrombocytopenic Purpura (ITP), etc.).

Pregnancy (HD-11.10)

HD.HA.0011.10.A

v2.0.2024

- For new onset headache during pregnancy or immediate post-partum period (within 3 months after delivery):
 - MRI Brain without contrast (Gadolinium relatively contraindicated in pregnancy) (CPT® 70551)
 - MRA/MRV Head (CPT® 70544, CPT® 70545, or CPT® 70546) or CTA/CTV Head (CPT® 70496) when venogram is requested
 - CT and MR Venography (CTV and MRV) are reported with the same codes as the CTA/MRA counterpart. If arterial and venous CT or MR studies are both performed in the same session, only one CPT® code should be used to report both procedures. (Gadolinium relatively contraindicated in pregnancy)
 - Vascular imaging can be performed concurrently with brain imaging
- Important causes of secondary headache include vascular disorders, such as pre-eclampsia, reversible cerebral vasoconstriction syndrome, and cerebral venous thrombosis, as well as idiopathic intracranial hypertension^{1,6}
- For post LP/epidural anesthesia, see **Low Pressure Headache and CSF Leak (HD-11.15)**

Physical Exertion (HD-11.11)

HD.HA.0011.11.A

v2.0.2024

- For onset of headache with Valsalva maneuver, cough, physical exertion, change in position, **or** sexual activity, but not merely a worsening of a pre-existing headache with these activities, the following procedures are supported:²⁶
 - MRI Brain without and with contrast (preferred study) (CPT® 70553) **OR**
 - MRI Brain without contrast (CPT® 70551) **OR**
 - CT Head without contrast (CPT® 70450) **AND/OR**
 - MRA Head (CPT® 70544, CPT® 70545, or CPT® 70546) **OR**
 - CTA Head without and with contrast (CPT® 70496)
 - MRA Neck (CPT® 70547, CPT® 70548, or CPT® 70549) or CTA Neck (CPT® 70498) if carotid or vertebral artery dissection or aneurysm is suspected

Headaches Associated With Head Trauma (HD-11.12)

HD.HA.0011.12.A

v2.0.2024

- New or progressively worsening headache with subacute head trauma, defined as within 7 days to three months post-trauma, with or without unexplained cognitive or neurologic deficits:¹⁴
 - CT Head without contrast (CPT® 70450) **OR**
 - MRI Brain without contrast (CPT® 70551)
- Persistent headaches attributed to traumatic injury to the head persisting for longer than 3 months following the injury, with or without unexplained cognitive or neurologic deficits:¹⁴
 - MRI Brain without contrast (CPT® 70551) **OR**
 - MRI Brain without and with contrast (CPT® 70553)
- Acute head trauma with headache, see **Head Trauma (HD-13.1)**
- Acute headache attributed to traumatic injury to the head that developed within 7 days of injury¹⁴ that does not meet criteria under **Head and Facial Trauma (HD-13)**, other subsections may apply including, but not exclusive to: **Headaches with Red Flags (HD-11.2)** and **Sudden Onset of Headache (HD-11.3)**

Systemic Infections (HD-11.13)

HD.HA.0011.13.A

v2.0.2024

- Headaches in the setting of acute, subacute, or chronic systemic infections:
 - MRI Brain without and with contrast (preferred study) (CPT® 70553); or MRI Brain without contrast (CPT® 70551)
 - MRA/MRV Head (CPT® 70544, CPT® 70545, or CPT® 70546)
 - CT and MR Venography (CTV and MRV) are reported with the same codes as the CTA/MRA counterpart. If arterial and venous CT or MR studies are both performed in the same session, only one CPT® code should be used to report both procedures
 - CT Head without contrast (CPT® 70450) or CT Head without and with contrast (CPT® 70470) when MRI Brain is contraindicated (see **General Guidelines – CT Head (HD-1.4)** for additional CT Head indications)
 - CT Head without (CPT® 70450) prior to performance of Lumbar Puncture (aka spinal tap)
- See **CNS and Head Infection (HD-14.1)**
- See **Neuro-COVID-19 and Sars-CoV-2 Vaccines (HD-14.2)** for headache related to neuro-COVID-19 or SARS-CoV-2 vaccines

Hydrocephalus Shunts (HD-11.14)

HD.HA.0011.14A

v2.0.2024

Initial Imaging Indications

- MRI Brain without and with contrast (CPT® 70553) is indicated

Repeat Imaging Indications including CSF flow shunting and Ventriculostomy

- MRI Brain without contrast (CPT® 70551) or CT Head without contrast (CPT® 70450) for any of the following:
 - New signs or symptoms suggesting shunt malfunction or endoscopic third ventriculostomy (ETV) malfunction
 - Symptoms may include but are not limited to: sepsis after shunt setting adjustments, decreased level of consciousness, protracted vomiting, visual or neurologic deterioration, decline of mentation after initial improvement, or new or changing pattern of seizures
 - Requests ordered by a neurologist, neurosurgeon, or any provider in consultation with a neurologist or neurosurgeon
- MRI Brain without contrast (CPT® 70551) or CT Head without contrast (CPT® 70450) is indicated in the post-operative period following shunt placement or ETV, with further follow-up imaging 6-12 months after the procedure and then every 12 months for individuals with stable clinical findings
- Shunting into the peritoneum (VP shunts) can give rise to abdominal complications, but these are generally symptomatic, so surveillance imaging of the abdomen is not indicated.
 - Abdominal ultrasound (CPT® 76700) for suspicion of CSF pseudocyst formation or distal shunt outlet obstruction.
- See **General Guidelines – Other Imaging Situations (HD-1.7)**

Additional Rarely Used Studies

- Cisternogram (CPT® 78630) for the following:
 - Known hydrocephalus with worsening symptoms.
 - Suspected obstructive hydrocephalus.
 - Suspected normal pressure hydrocephalus with gait disturbance and either dementia or urinary incontinence.
 - CSF Leak (see **Low Pressure Headache and CSF Leak (HD-11.15)** and **Nuclear Medicine (HD-36.1)**)
- Cerebrospinal Ventriculography (CPT® 78635) for the following:
 - Evaluation of internal shunt, porencephalic cyst, or posterior fossa cyst.
- Nuclear Medicine Shunt Evaluation (CPT® 78645) and CSF Flow SPECT (CPT® 78803) for the following:

- Suspected malfunction of ventriculoperitoneal, ventriculopleural, or ventriculovenous shunts.
- For CSF flow imaging, see **CSF Flow Imaging (HD-24.4)**
- See also **General Guidelines - CT Head (HD-1.4)**

Background and Supporting Information

- Ventriculomegaly is the condition where ventricles are enlarged, and this may be due to 1) hydrocephalus, a condition of increased intracranial pressure (ICP) (imaging shows ventricles are disproportionately enlarged compared to sulci), or 2) brain atrophy, most commonly related to age or trauma, which is not associated with increased ICP (imaging shows ventricles and sulci are proportionately enlarged).
- Hydrocephalus is divided into obstructive/non-communicating vs. communicating types, and these usually have different etiologies and radiographic features.
- Obstructive or non-communicating hydrocephalus classically involves an intraventricular obstruction in which CSF flow over the convexities and between the ventricles is reduced, and the proximal ventricle(s) is/are dilated. This is a medical emergency.
- Communicating hydrocephalus involves extraventricular obstruction, poor absorption or overproduction of CSF. There is normal intracranial CSF flow and absence of disproportionate ventricular dilation, yet there is still a mildly increased CSF pressure. Normal pressure hydrocephalus is an example of this type.
- Distinguishing between ventriculomegaly due to brain atrophy and non-communicating hydrocephalus can be difficult with MRI Brain or CT Head alone, and modalities which visualize CSF flow may be useful such as cisternography or CT cisternography.

Low Pressure Headache and CSF Leak (HD-11.15)

HD.HA.0011.15A

v2.0.2024

- Evaluation of suspected CSF leak (rhinorrhea/otorrhea) or refractory post-lumbar puncture or low pressure headache:¹⁵

Indication	Supported Imaging
Intracranial imaging	<ul style="list-style-type: none"> MRI Brain without and with contrast (CPT® 70553)
Spinal imaging (MRI)	<ul style="list-style-type: none"> MRI Cervical Spine without contrast (CPT® 72141) or without and with contrast (CPT® 72156) <p>AND/OR</p> <ul style="list-style-type: none"> MRI Thoracic Spine without contrast (CPT® 72146) or without and with contrast (CPT® 72157) <p>AND/OR</p> <ul style="list-style-type: none"> MRI Lumbar Spine without contrast (CPT® 72148) or without and with contrast (CPT® 72158)
Spinal imaging, post-myelogram	<ul style="list-style-type: none"> CT Cervical Spine with contrast (CPT® 72126) <p>AND/OR</p> <ul style="list-style-type: none"> CT Thoracic Spine with contrast (CPT® 72179) <p>AND/OR</p> <ul style="list-style-type: none"> CT Lumbar Spine with contrast (CPT® 72132)
Cisternogram, radionuclide (111 In-DTPA)	<ul style="list-style-type: none"> Radionuclide cisternogram (CPT® 78630)

Indication	Supported Imaging
Cisternogram, post-myelogram (iodinated contrast)	<ul style="list-style-type: none"> CT Head with contrast (CPT® 70451) OR <ul style="list-style-type: none"> CT Maxillofacial with contrast (CPT® 70487) OR <ul style="list-style-type: none"> CT Temporal Bone with contrast (CPT® 70481)
Symptoms of CSF rhinorrhea or otorrhea	<ul style="list-style-type: none"> CT Head without contrast (CPT® 70450) AND/OR <ul style="list-style-type: none"> CT Maxillofacial without contrast (CPT® 70486) OR <ul style="list-style-type: none"> CT Temporal Bone without contrast (CPT® 70480)

- Additional Cisternogram (CPT® 78630) indications:
 - Known hydrocephalus with worsening symptoms (for example headache)
 - Suspected obstructive hydrocephalus
- Individuals with a Shunt (see **Hydrocephalus Shunts (HD-11.14)**)

Background and Supporting Information

- Common radiological findings of CSF leaks include: abnormalities of the cribriform plate or ethmoid sinus, dural dehiscence at the anterior skull base, pneumatization of the sphenoid sinus, and fluid within the middle ear.
- CSF leaks may occur in:
 - CSF shunt overdrainage
 - Traumatic CSF leaks
 - Thecal holes and rents from lumbar punctures and epidural catheterizations
 - Spinal and cranial surgeries including skull base and some sinus surgeries
 - Proximal brachial plexus and nerve root avulsion injuries
 - Spontaneous leaks may occur in, but not exclusive to:
 - Pre-existing weakness of the dural sac including:
 - Disorders of connective tissue matrix including Marfan syndrome, Marfanoid features

- Joint hypermobility
- Trivial trauma in the setting of preexisting dural weakness
- Spondylotic spurs, herniated discs

Cervicogenic Headaches Including Occipital Neuritis/Neuralgia (HD-11.16)

HD.HA.0011.16A

v2.0.2024

- Brain imaging should follow applicable sections in **Headache (HD-11)**
- MRI Cervical Spine without contrast (CPT® 72141) or CT Cervical Spine without contrast (CPT® 72125)
 - Failure of recent (within 3 months) 6-week trial of provider-directed treatment (unless presence of a red flag) as defined in **Red Flag Indications (SP-1.2)**, and clinical re-evaluation after treatment period.
 - See **Neck (Cervical Spine) Pain Without/With Neurological Features (Including Stenosis) (SP-3.1)** and **Neck (Cervical Spine) Trauma (SP-3.2)** in the Spine Imaging Guidelines
 - Exemptions to the 6 weeks of conservative care include:
 - High risk mechanism of cervical spine injury within the last 3 months (see **Neck (Cervical Spine) Trauma (SP-3.2)** in the Spine Imaging Guidelines in the Spine Imaging Guidelines)
 - **Red Flag Indications (SP-1.2)** in the Spine Imaging Guidelines
 - **ANY** of the following:
 - Bony abnormalities: Atlanto-axial dislocations/instability (including but not limited to: Down's syndrome, Ehlers-Danlos and Marfan syndromes and rheumatoid arthritis), platybasia, osteomas, callous formation of the posterior C1/2 arches
 - Posterior fossa lesions, Chiari malformations, demyelinating disease
 - Myelopathy/myelitis (see **Myelopathy (SP-7.1)** in the Spine Imaging Guidelines)

Background and Supporting Information

- Cervicogenic Headache
 - Headache caused by a disorder of the cervical spine, usually accompanied by neck pain or other signs and symptoms of cervical disease. Typical findings include reduced cervical range of motion, side-locked pain, and symptoms exacerbated by provocative maneuvers such as head movement or digital pressure.
- Occipital Neuralgia/Neuritis - Occipital neuralgia is classified unilateral or bilateral paroxysmal, shooting or stabbing pain in the posterior part of the scalp, in the distribution(s) of the greater, lesser and/or third occipital nerves, sometimes accompanied by diminished sensation or dysaesthesia in the affected area and commonly associated with tenderness over the involved nerve(s).

- Pain has at least two of the following three characteristics:
 - Recurring in paroxysmal attacks lasting from a few seconds to minutes
 - Severe in intensity
 - Shooting, stabbing or sharp in quality
- Pain is associated with both of the following:
 - Dysaesthesia and/or allodynia apparent during innocuous stimulation of the scalp and/or hair
 - Either or both of the following:
 - Tenderness over the affected nerve branches
 - Trigger points at the emergence of the greater occipital nerve or in the distribution of C2
- Pain is eased temporarily by local anaesthetic block of the affected nerve(s)

Advanced Imaging Indications Related To Migraines (HD-11.17)

HD.HA.0011.17A

v2.0.2024

- Advanced imaging of the head is NOT indicated for newly diagnosed migraine with a normal neurological exam or chronic stable migraine with no neurological deficit and/or no red flags (see **Headaches with Red Flags (HD-11.2)**).
 - See below for advanced imaging indications related to migraines.
- MRI Brain without (CPT® 70551) preferred or MRI Brain with and without (CPT® 70553) or CT Head without (CPT® 70450) for the following:
 - New migraine with age ≥50 (see **New Headache Onset Older than Age 50 (HD-11.7)**)
 - Change in frequency or severity of migraine (See **Headaches with Red Flags (HD-11.2)**)
 - Unusual, prolonged or persistent aura (greater than 60 minutes) (See **Background and Supporting Information**)
 - Worst migraine
 - Hemiplegic migraine
 - Migraine with any motor weakness.
 - Migrainous accompaniments
 - Passing neurological symptoms that can affect vision, speech, movement, and behavior-“mimic stroke”
 - Migraine aura without headache
 - Migraine with an aura in which the aura is neither accompanied nor followed by a headache within 60 minutes.
 - Side-locked migraine (unilateral)
 - Unilateral hemicranial pain – includes primary and secondary causes.
 - New daily persistent headache (new daily headache present greater than three months)
 - Trigeminal autonomic cephalgias includes cluster headache short-lasting, unilateral, neuralgiform headache attacks with conjunctival injection and tearing (SUNCT) syndromes; short-lasting unilateral neuralgiform headache attacks with cranial autonomic symptoms (SUNA) and hemicrania paroxysmal and continua are covered in **Trigeminal Autonomic Cephalgias (HD-11.4)**
 - Post-traumatic migraine
 - See **Head Trauma (HD-13.1)** and **Headaches Associated with Head Trauma (HD-11.12)**

Background and Supporting Information

- Aura symptoms may accompany or precede a headache within 60 minutes and may include, but are not exclusive to, the following symptoms:²⁸
 - Visual (flashing lights, loss of vision)
 - Sensory (paresthesia)
 - Speech and/or language (difficulty speaking)
 - Motor (any weakness)
 - Brainstem (dizziness, double vision) and retinal (visual complaints)

Aneurysm and AVM (HD-12)

Guideline

Intracranial Aneurysms (HD-12.1)

Arteriovenous Malformations (AVMs) and Related (HD-12.2)

References (HD-12)

Intracranial Aneurysms (HD-12.1)

HD.AN.0012.1.A

v2.0.2024

- CTA Head (CPT® 70496) or MRA Head (CPT® 70544, CPT® 70545, or CPT® 70546) in ANY of the following clinical scenarios:
 - Symptoms or signs of cerebral aneurysm, including:
 - "Thunderclap headache" (see **Sudden Onset of Headache (HD-11.3)**)
 - Third nerve palsy with pupillary involvement (pupil-sparing third nerve palsies are not caused by external compression)
 - Suspicion of aneurysm bleed [CT Head or MRI Brain or CSF exam showing evidence of subarachnoid hemorrhage (SAH) or intracerebral hemorrhage]
 - Abnormal CT Head or MRI Brain suggesting possible aneurysm
 - Screening for High Risk Populations as defined by the following criteria (screening usually begins at age 20 unless unusual circumstances as aneurysms are uncommon in children and adolescents):
 - Positive Family History: Two or more first degree relatives (parent, sibling, or child) with history of cerebral aneurysm or SAH: screening every 5 years beginning at age 20
 - One first degree relative (parent, sibling, or child) with history of cerebral aneurysm or SAH can have one screening study but risks and benefits should be discussed with individual
 - Autosomal dominant polycystic kidney disease (screening begins at age 20 to 65 and is repeated at ten-year intervals)
 - Coarctation of the aorta or bicuspid aortic valve
 - Neurofibromatosis Type 1
 - Type 4 (Vascular) Ehlers-Danlos Syndrome
 - Marfan Syndrome
 - Loeys-Dietz Syndrome
 - Microcephalic osteodysplastic primordial dwarfism
 - Presence of an azygos anterior cerebral artery
 - Diagnosis of fibromuscular dysplasia (one screening study after confirmed diagnosis)
 - Pseudoxanthoma elasticum
 - Hereditary hemorrhagic telangiectasia (Osler-Weber-Rendu Syndrome)
 - Alpha-1-antitrypsin deficiency
 - Pheochromocytoma
 - Klinefelter syndrome
 - Tuberous sclerosis
 - Noonan syndrome
 - Alpha-glucosidase deficiency
 - Klippel-Trenaunay-Weber Syndrome

- Kawasaki disease
- Glucocorticoid-remediable aldosteronism (GRA)²⁵
- CTA Head (CPT® 70496) to confirm questionable or equivocal findings on an initial MRA Head
- For suspected or confirmed cerebral aneurysm, ruptured or unruptured, for initial evaluation, treatment, intervention or follow up, 3D rendering (CPT® 76377 or CPT® 76376) with cervicocerebral angiography/arteriography and/or cerebral angiography²² (See **General Guidelines - Other Imaging Situations (HD-1.7)**)
- Follow up of known cerebral aneurysm:
 - The optimal interval and duration for radiologic follow-up has not been determined. Radiographic follow-up with MRA Head (CPT® 70544, CPT® 70545, or CPT® 70546) or CTA (CPT® 70496) for unruptured or treated intracranial aneurysm upon request by the neurosurgeon or team managing the intracranial aneurysm.²²
- MRI Brain without contrast (CPT® 70551) or with and without (CPT® 70553) in the following scenarios:
 - If there are new signs, symptoms or clinical findings
 - To evaluate and treat a giant aneurysm (>2.5 cm)
 - Posterior fossa aneurysms
 - Thrombosed or partially thrombosed aneurysms
 - To evaluate the relationship of the aneurysm to the dura
 - To evaluate for the presence of calcification
 - Other surveillance criteria as per the neurosurgeon or team managing the aneurysm repair
- Head imaging (CT Head or MRI Brain contrast as requested) to assess for subacute complications, (i.e. vasospasm, delayed cerebral ischemia and hydrocephalus), beginning days to weeks arising from a subarachnoid hemorrhage and aneurysm treatment upon request from the neurosurgeon and team managing the episode.
- MRI Spinal (Cervical, Thoracic, Lumbar (without and with contrast) [CPT® 72156, CPT® 72157, CPT® 72158]) is indicated to evaluate individuals with SAH and negative studies for brain aneurysm in whom spinal abnormalities (i.e. AVM) may be suspected as the cause of hemorrhage.
- MRA Neck (CPT® 70547, CPT® 70548, or CPT® 70549) or CTA Neck (CPT® 70498) are not supported for screening and for follow-up on surgically treated cerebral aneurysms, except if they are located in the vertebral-basilar system.
- Initial catheter arteriography can be negative in 10%-20% of cases of subarachnoid hemorrhage (SAH). CTA Head (CPT® 70496) and/or MRA Head (CPT® 70544, CPT® 70545, or CPT® 70546) if these had not been initially performed. If initial catheter angiography is negative, repeat imaging is indicated.²²
- If an intracranial etiology for SAH has not been found, CTA (CPT® 70498) or MRA Neck (CPT® 70547, CPT® 70548, or CPT® 70549) to evaluate for less common causes of SAH.

- High risk scenarios for vascular dissection include, but are not limited to: Fibromuscular dysplasia (FMD), Marfan Disease, MVA with whiplash, and chiropractic manipulation
 - MRA Neck (CPT® 70547, CPT® 70548, or CPT® 70549) or CTA Neck (CPT® 70498) if arterial dissection is suspected, or known and re-evaluation is needed (as directed by neurologist or neurosurgeon or any provider in consultation with a neurologist or neurosurgeon)
 - MRA Head (CPT® 70544, CPT® 70545, or CPT® 70546) or CTA Head (CPT® 70496, CPT® 70498) if arterial dissection is suspected, or known and re-evaluation is needed (as directed by neurologist or neurosurgeon or any provider in consultation with a neurologist or neurosurgeon)
- Other vascular imaging indications for headaches require additional information. See **Stroke/TIA (HD-21.1)**, **Sudden Onset of Headache (HD-11.3)**, **New Headache Onset Older than Age 50 (HD-11.7)**, **Abnormal Blood Clotting (HD-11.9)**, **Pregnancy (HD-11.10)**, **Physical Exertion (HD-11.11)**, and **Systemic Infections (HD-11.13)**

Arteriovenous Malformations (AVMs) and Related (HD-12.2)

- 3D imaging (CPT® 76376 or CPT® 76377) with MRI Brain without and with contrast (CPT® 70553) **OR** MRI Brain without contrast (CPT® 70551) is supported

- 3D Rendering (CPT® 76377 or CPT® 76376) with cerebral angiography to define the presence, location, and anatomy of intracranial and cervical vascular malformations at diagnosis and for follow up, including post-treatment.^{11,26}
- See **General Guidelines - Other Imaging Situations (HD-1.7)** and **Background and Supporting Information**
- See **General Guidelines – CT and MR Angiography (CTA and MRA) (HD-1.5)**
- Functional MRI (CPT® 70554 OR CPT® 70555) for surgical planning, see **Functional MRI (fMRI) (HD-24.2)**¹¹

Background and Supporting Information

- Trauma is the most common reason for subarachnoid hemorrhage. Ruptured berry aneurysm is the most common reason for non-traumatic subarachnoid hemorrhage in adults
- Small aneurysms are present in about 1% to 2% of adults, but very few ever reach a size for which bleeding is a risk (>5 mm). Small (<3 to 4 mm) unruptured aneurysms in those with no personal history of SAH have a 0.1% to 0.5% a year rate of bleeding. The risk of cerebral aneurysm with family history ranges from 2% with one first degree relative to 30% to 35% for identical twin or two parents. The risks and benefits of screening these populations need to be considered before advanced imaging.
- AVMs most often come to clinical notice either by bleeding or by acting as a seizure focus. They are usually congenital, recognized later in life and have an initial risk of bleeding of 2% per year.
- Cerebral angiography is a form of angiography which provides images of blood vessels in and around the brain and/or neck. This is a catheter based procedure, using x-ray imaging guidance and iodine-based contrast to visualize blood vessels.
- Most intracranial AVMs are congenital, vary widely in their location and type, and are discovered at birth due to associated clinical findings or incidentally later in life. Certain hereditary conditions are associated with an increased risk for AVM development.
- Vascular malformations include arteriovenous, venous, cavernous, and capillary malformations.
- Hereditary AVMs usually have an autosomal dominant pattern of inheritance.^{10,19,31,33}

Head and Facial Trauma (HD-13)

Guideline

Head Trauma (HD-13.1)

Facial Trauma (HD-13.2)

References (HD-13)

Head Trauma (HD-13.1)

HD.TR.0013.1.A

v2.0.2024

For acute head trauma (0 to 7 days post-trauma)⁷

- CT Head without contrast (CPT® 70450) is preferred in individuals with **ANY** of the following modified Canadian CT Head Rule/New Orleans Criteria.^{1,7,9}
 - Regardless of documented or stated head impact, ANY "dangerous mechanism of injury", either direct or indirect, including, but not exclusive to:
 - Fall from height greater than 3 feet
 - Fall greater than 5 steps down stairs
 - Any pedestrian motor vehicle accident
 - High impact motor vehicle accident
 - Individual >60 years old
 - Loss of consciousness, amnesia, or disorientation accompanying blunt head trauma within 24 hours
 - Taking one anticoagulant or two antiaggregants, (e.g., aspirin and Plavix)
 - Known platelet or clotting disorder
 - Glasgow coma scale (GCS) score of less than 15 at 2 hours following injury
 - >30 minutes of amnesia before impact
 - Suspected open skull fracture
 - Signs of basilar skull fracture (Battle's sign, Raccoon eyes, CSF rhinorrhea, cranial nerve palsy, hemotympanum, acute hearing loss)
 - Vomiting
 - Alcohol or drug intoxication
 - Visible trauma above clavicles
 - Deficits in short term memory, altered level of alertness, abnormal behavior or focal neurological deficit
 - Seizure
 - Headache [See **Headache Associated with Head Trauma (HD-11.12)**]

For subacute head trauma (7 days to 3 months post-trauma)⁷ and chronic head trauma (greater than 3 months post-trauma) symptoms⁷

- MRI Brain without contrast (CPT® 70551) or CT Head without contrast (CPT® 70450) is indicated for the initial imaging of individuals with subacute or chronic head trauma and unexplained cognitive or neurologic deficits.⁷
- MRI Brain without and with contrast (CPT® 70553) if post-traumatic infection is suspected

Repeat and follow-up imaging

- Follow-up imaging for known subdural hematomas, intracerebral hemorrhage, or contusions can be done at the discretion of the ordering provider with one of the following:
 - MRI Brain without and with contrast (CPT® 70553) **OR**
 - MRI Brain without contrast (CPT® 70551) **OR**
 - CT Head without and with contrast (CPT® 70470) **OR**
 - CT Head without contrast (CPT® 70450)
- For short term follow-up imaging of acute traumatic brain injury (TBI) without neurologic deterioration, CT Head without contrast (CPT® 70450) is the most appropriate imaging study in individuals with ANY of the following risk factors
 - subfrontal/temporal intraparenchymal contusions
 - anticoagulation
 - age >65 years
 - intracranial hemorrhage
- MRI Brain without contrast (CPT® 70551) or MRI Brain without and with contrast (CPT® 70553) can be approved as a complementary study when neurological findings or symptoms are not sufficiently explained by CT or in subacute and chronic TBI for new, persistent, or slowly progressive symptoms.⁷

For suspected intracranial venous or arterial injury

- CTA/CTV Head (CPT® 70496) **OR** MRA/MRV Head (CPT® 70544, CPT® 70545, or CPT® 70546)
 - CT and MR Venography (CTV and MRV) are reported with the same codes as the CTA/MRA counterpart. If arterial and venous CT or MR studies are both performed in the same session, only one CPT® code should be used to report both procedures (see **General Guidelines - CT and MR Angiography (CTA and MRA) (HD-1.5)**)

SPECT, PET, CT/MRI perfusion, DTI (diffusion tensor imaging), functional MRI, and MR spectroscopy are not considered routine clinical practice at this time.^{3,7}

See **Neck (Cervical Spine) Pain Without/With Neurological Features (Including Stenosis) and Trauma (SP-3.2)** in the Spine Imaging Guidelines

See **General Guidelines – CT and MR Angiography (CTA and MRA) (HD-1.5)** for traumatic vascular injuries

Background and Supporting Information

Individuals with head trauma are at risk for facial and cervical trauma.

Recent studies have shown that Diffusion tensor MRI tractography may be more sensitive in demonstrating abnormalities such as axonal injury in closed head injury than conventional MRI, but these techniques are best described presently as research tools and their use in clinical practice is not determined.^{3,8}

Decisions regarding return to normal activities, including sports, are made based on the clinical status of the individual and repeat imaging is unnecessary.

In cases of post-traumatic infection, contrast-enhanced MRI or CT may be helpful

Facial Trauma (HD-13.2)

HD.TR.0013.2.A

v2.0.2024

- CT Maxillofacial without contrast (CPT® 70486) indicated for any concern regarding significant injury to facial structures including but not limited to:
 - Concern for orbital, maxillary, or mandibular fractures
 - Trauma with associated symptoms of anosmia, hearing, vision or speech changes, vertigo, facial numbness
 - Physical exam findings of CSF rhinorrhea (suspected post traumatic CSF leak), malocclusion, severe focal facial tenderness, focal loss of facial sensation
- CT Orbits/Temporal Bone without contrast (CPT® 70480) and/or CT Head without contrast (CPT® 70450)¹¹:
 - Concern for orbital injury or orbital wall fracture
 - Symptoms of diplopia, blurred vision, vision loss
 - Physical exam findings of enophthalmos, entrapment of extraocular muscle(s)
 - Suspicion for temporal bone fracture
 - Physical exam findings of CSF otorrhea (suspected post-traumatic CSF leak)
- If concern for CSF leak and CT Maxillofacial or Temporal bone is inconclusive⁷ (see **Low Pressure Headache and CSF Leak (HD-11.15)**)

Background and Supporting Information

Imaging is not necessary in the evaluation of simple nasal fractures if tenderness and swelling is limited to the nasal bridge, the individual can breathe through each naris, and there is no septal hematoma.

CNS and Head Infection/ Neuro-COVID-19 (HD-14)

Guideline

CNS and Head Infection (HD-14.1)

Neuro-COVID-19 and Sars-CoV-2 Vaccines (HD-14.2)

Autoimmune/Paraneoplastic Encephalitis & Neuroinflammatory
Disorders (HD-14.3)

References (HD-14)

CNS and Head Infection (HD-14.1)

HD.HI.0014.1.A

v2.0.2024

INITIAL IMAGING

- Signs of intracranial infection include, but are not limited to
 - headaches, seizures, meningeal signs (neck stiffness)
 - new focal neurological deficits in a setting of fever or elevated white blood cell count (WBC)
 - known infection elsewhere or
 - immunosuppression
- **ONE** of the following studies for suspected intracranial infection if any of these signs of infection are present:
 - MRI Brain without and with contrast (CPT® 70553) (preferred) **OR** MRI Brain without contrast (CPT® 70551) **OR**
 - CT Head (CPT® 70450, CPT® 70460, or CPT® 70470) in cases where MRI is contraindicated
 - If vascular involvement is suspected, in addition to MRI Brain, the following are supported²¹:
 - MRA Head (CPT® 70544, CPT® 70545, or CPT® 70546) **OR**
 - CTA Head (CPT® 70496) **AND/OR**
 - MRA Neck (CPT® 70547, CPT® 70548, or CPT® 70549) **OR**
 - CTA Neck (CPT® 70498)
 - (CT and MR Venography (CTV and MRV) are reported with the same codes as the CTA/MRA counterpart (there is no specific code for CT/MR venography)
 - Concern for vasculitis, see **Cerebral Vasculitis (HD-22.1)**

REPEAT IMAGING

- As requested by an infectious disease specialist, neurologist, neurosurgeon, radiologist or any provider coordinating care with an infectious disease specialist, neurologist, neurosurgeon or radiologist
- Repeat imaging would refer to any of the CPT codes listed above as initial imaging.
 - See **General Guidelines – CT Head (HD-1.4)** regarding additional indications for CT Head.
 - See **Skull Base Osteomyelitis (SBO) (HD-20.1)**, **Sinus and Facial Imaging (HD-29.1)**, **Dental/Periodontal/Maxillofacial Imaging (HD-30.2)**, **Mental Status Change (HD-4.2)**, and **Eye Disorders and Visual Loss (HD-32.1)**

Neuro-COVID-19 and Sars-CoV-2 Vaccines (HD-14.2)

HD.HI.0014.2.A

v2.0.2024

- The following studies are supported for evaluation of:
 - Acute or chronic Neuro-COVID-19 syndrome
 - MRI Brain without contrast (CPT® 70551) **OR**
 - MRI Brain without and with contrast (CPT® 70553) **OR**
 - CT head without contrast (CPT® 70450) **OR**
 - CT head without and with contrast (CPT® 70470) is supported if there is a contraindication to MRI **AND/OR**
 - MRA Head (CPT® 70544, CPT® 70545, or CPT® 70546) OR CTA Head (CPT® 70496) **AND/OR**
 - MRA Neck (CPT® 70547, CPT® 70548, or CPT® 70549) or CTA Neck (CPT® 70498)
 - CT and MR Venography (CTV and MRV) are reported with the same codes as the CTA/MRA counterpart (there is no specific code for CT/MR venography):
 - If arterial and venous CT or MR studies are both performed in the same session, only one CPT® code is used to report both procedures
 - If an arterial CTA or MRA study has been performed and subsequently a repeat study is needed to evaluate the venous anatomy, then this study is supported
 - If a venous CTV or MRV has been performed and subsequently a repeat study is needed to evaluate the arterial anatomy, then this study is supported
 - MRA without and with contrast with venous sinus thrombosis to differentiate total from subtotal occlusion is supported
 - Suspected neurologic adverse reactions after SARS- CoV-2 vaccination:
 - MRI Brain without contrast (CPT® 70551) **OR**
 - MRI Brain without and with contrast (CPT® 70553) **OR**
 - CT head without contrast (CPT® 70450) **OR**
 - CT head without and with contrast (CPT® 70470) is supported if there is a contraindication to MRI **AND/OR**
 - MRA Head (CPT® 70544, CPT® 70545, or CPT® 70546) OR CTA Head (CPT® 70496) **AND/OR**
 - MRA Neck (CPT® 70547, CPT® 70548, or CPT® 70549) or CTA Neck (CPT® 70498)
 - CT and MR Venography (CTV and MRV) are reported with the same codes as the CTA/MRA counterpart (there is no specific code for CT/MR venography):

- If arterial and venous CT or MR studies are both performed in the same session, only one CPT® code is used to report both procedures
- If an arterial CTA or MRA study has been performed and subsequently a repeat study is needed to evaluate the venous anatomy, then this study is supported
- If a venous CTV or MRV has been performed and subsequently a repeat study is needed to evaluate the arterial anatomy, then this study is supported
- MRA without and with contrast with venous sinus thrombosis to differentiate total from subtotal occlusion is supported
- If suspected transverse myelitis and/or COVID infection, then ANY the following are supported:
 - MRI Cervical without and with contrast (CPT® 72156)
 - MRI Thoracic without and with contrast (CPT® 72157)
 - MRI Lumbar Spine without and with contrast (CPT® 72158)^{35,36}
 - See **Stroke/TIA (HD-21.1)** for vascular imaging
 - See **Transverse Myelitis (HD-16.4)** regarding spine imaging to evaluate for post-vaccination neurological syndrome
- Repeat imaging considered on a case-by-case basis for a change in neurological symptoms or signs on the neurological exam and/or change in the treatment.

Background and Supporting Information

- The findings observed in the central nervous system in the acute-phase of COVID-19 may extend into a prolonged symptomatic phase of Neuro-COVID in long haulers with chronic COVID syndrome. Symptoms may include, but are not inclusive to: "brain fog", dizziness, inability to concentrate, psychiatric symptoms, and confusion.^{8,9}
- Acute-phase neurologic manifestations of COVID-19 include: headache, dizziness, taste and smell dysfunction, impaired consciousness (described as confusion or agitation), cerebrovascular events (ischemic stroke, cerebral venous sinus thrombosis, cerebral hemorrhage), seizures, meningoencephalitis, and immune-mediated neurologic diseases (Guillan-Barre syndrome, Miller-Fisher syndrome, polyneuritis cranialis, transverse myelitis).^{10,11,15,16,20}
- Neurologic adverse reactions in those receiving SARS-CoV-2 vaccines, including mRNA vaccines (Pfizer, Moderna), have been reported, and include, although not limited to: headache, Guillan-Barre syndrome, transverse myelitis, facial nerve palsy, small fiber neuropathy, autoimmune encephalitis, reversible cerebral vasoconstriction syndrome, multiple sclerosis, neuromyelitis optica, intracerebral bleeding, cerebral venous sinus thrombosis, hypophysitis, epilepsy, encephalopathy, and acute disseminated encephalomyelitis.^{13,14,17,18,19,21}
- Cases of Thrombosis with Thrombocytopenia Syndrome (TTS) following administration of the Johnson & Johnson/Janssen COVID-19 Vaccine have been reported in males and females, in a wide age range of individuals 18 years and

older, with the highest reporting rate (approximately 8 cases per 1,000,000 doses administered) in females ages 30-49 years; overall, approximately 15% of TTS cases have been fatal. Currently available evidence supports a causal relationship between TTS and the Johnson & Johnson/Janssen COVID-19 Vaccine. The clinical course of these events shares features with autoimmune heparin-induced thrombocytopenia. In individuals with suspected TTS following administration of the Johnson & Johnson/Janssen COVID-19 Vaccine, the use of heparin may be harmful and alternative treatments may be needed. Consultation with hematology specialists is strongly recommended. The American Society of Hematology has published considerations relevant to the diagnosis and treatment of TTS following administration of the Janssen COVID-19 Vaccine (<https://www.hematology.org/covid-19/vaccine-induced-immunethrombotic-thrombocytopenia>). (see Full EUA Prescribing Information).

- Janssen COVID-19 Vaccine EUA Fact Sheet for Healthcare Providers 03132023 ([fda.gov](https://www.fda.gov))

Autoimmune/Paraneoplastic Encephalitis & Neuroinflammatory Disorders (HD-14.3)

HD.HI.0014.3.A
v2.0.2024

Indications:

When acute/ subacute or rapid progression (< 3 months) of altered mental status, focal findings including cranial nerve, motor or sensory symptoms or memory loss or psychiatric symptoms, seizure, and/ or focal CNS findings are present.²⁶

OR

There is a stated concern for neuro-inflammatory encephalitis from a neurologist, neurosurgeon or psychiatrist²⁶:

Initial Imaging ²⁶:

- MRI Brain without and with contrast (CPT® 70553; preferred study) **OR** MRI Brain without contrast (CPT® 70551) **OR**
- CT Head without contrast (CPT® 70450) **OR** CT Head without and with contrast (CPT® 70470) when MRI is contraindicated or for bony pathology concerns
- CTA Head (CPT® 70496) **AND/OR** CTA Neck (CPT® 70498) for evaluating large vessel obstructions, aneurysms and vascular malformations, dissection, vasospasm, and vasculopathies such as CNS vasculitis (see **Cerebral Vasculitis (HD 22.1)**, **Intracranial Aneurysms (HD 12.1)**, **Arteriovenous Malformations (AVMs) and Related Lesions (HD 12.2)**, **Stroke/TIA (HD 21.1)**)

Repeat Imaging:

MRI Brain without and with contrast (CPT® 70553) **OR** MRI Brain without contrast (CPT® 70551) when specialized sequences are needed such as, but not limited to²⁶:

- High T2 contrast sequences (CISS, FIESTA) sequences to identify blood (SWI) or
- To identify acute cytotoxic edema (DWI) or
- When requested by a neurologist, oncologist, rheumatologist or infectious disease specialist

Metabolic (FDG) Brain PET (CPT® 78608) is indicated to evaluate individuals suspected of having encephalitis, including autoimmune encephalitis, if diagnosis remains unclear after evaluation with MRI Brain, CSF analysis, and/or lab testing including serology.²⁶

Neurosarcoidosis ^{31,32,33,34}:

- Supported for known or suspected neurosarcoidosis.
 - MRI Brain without and with contrast (CPT® 70553)

AND/OR

- If spinal cord involvement suspected, then
 - MRI Cervical Spine without and with contrast (CPT® 72156) **AND/OR**
 - MRI Thoracic Spine without and with contrast (CPT® 72157) **AND/OR**
 - MRI Lumbar Spine without and with contrast (CPT® 72158)

AND/OR

- If peri-orbital involvement suspected, then
 - MRI Orbits/Face/Neck without and with contrast (CPT® 70543)
- Repeat imaging supported if requested by neurologist, rheumatologist, ophthalmologist, oncologist or radiologist or provider in consultation with a neurologist, rheumatologist, ophthalmologist, oncologist or radiologist.
- For non-neurologic imaging related to sarcoidosis (see **Sarcoid (CH-15.1)**)

Background and Supporting Information ²⁶

Supportive studies in the evaluation of Autoimmune/Paraneoplastic Encephalopathy include:

- CSF pleocytosis (>5 WBC/μL) or
- EEG changes or
- Supporting labs (including positive CSF antibody positivity and/or serologies)

Potential etiologies:

- Paraneoplastic
 - NMDA Receptor encephalitis
 - LGI1 antibody encephalitis
- Autoimmune
 - Neurosarcoidosis can involve any of the following:
 - Brain, Cranial Nerves, Spinal Cord and/or Peripheral Nerves
 - Acute Disseminated Encephalomyelitis (ADEM), Anti-MOG Syndrome, Multiple Sclerosis (MS), Neuromyelitis Optica (NMO)
 - IgG4 related disease
 - CNS histiocytosis
- Neuro-rheumatologic
 - ANCA related disease
 - Behcet's disease
 - Sjogren Syndrome +/- Rheumatoid Arthritis (RA)

FDG-PET imaging of the brain for paraneoplastic and autoimmune encephalitis may be more sensitive than Brain MRI (87% vs. 56%) but is nonspecific. Areas of hypometabolism are seen in neurodegenerative disorders such as dementias. However,

topographic patterns of hypometabolism may help characterize the disorder as autoimmune/ paraneoplastic encephalitis, in a way that may help clarify diagnosis and alter management strategies. For example, anterior to posterior gradient of hypometabolism is seen in NMDA Receptor encephalitis. Hemispheric hypometabolism out of proportion to atrophy characterizes Rasmussen encephalitis.²⁶

Non-head Imaging

- MRI is helpful in determining the length of spine lesion (short versus longitudinally extensive transverse myelitis), width (partial versus transverse), and location (eccentric, central, hemicord, anterior versus posterior, conus, tracts, or meningeal).
 - See **Myelopathy (SP 7.1)** and **Anti-MOG Syndromes (HD 16.3)**
- The Trident Sign on axial MRI, which has been described in relation to neurosarcoidosis, demonstrates leptomeningeal or dorsal subpial enhancement that may or may not involve the central canal.
 - See **Myelopathy (SP 7.1)**
- Involvement of the conus medullaris is a clue to Anti-MOG (Myelin Oligodendrocyte Glycoprotein-associated disorder) as the cause of longitudinally extensive transverse myelitis.
 - See **Transverse Myelitis (HD 16.4)**
- CT of the chest, abdomen, and pelvis with contrast is a generally accepted first method of screening for occult malignancy or systemic inflammation (e.g., sarcoidosis).
 - See **Paraneoplastic Syndromes (ONC 30.3)** and **Sarcoid (CH 15.1)**

Movement Disorders (HD-15)

Guideline

Movement Disorders (HD-15.1)

References (HD-15)

Movement Disorders (HD-15.1)

HD.MD.0015.1.A

v2.0.2024

- The majority of movement disorders are diagnosed based on a clinical diagnosis and do not require imaging. These include:
 - Typical Parkinson's Disease
 - Essential Tremor or tremors of anxiety or weakness
 - Restless Leg Syndrome
 - Tics or spasms which can be duplicated at will
- MRI Brain without contrast (CPT® 70551) or MRI brain without and with contrast (CPT® 70553) in the following clinical scenarios:
 - Clinical diagnostic uncertainty
 - Incomplete or uncertain response to medication
 - Atypical Parkinsonism suspected because of unusual clinical features. These may include, but are not limited to:
 - Persistent unilateral signs or symptoms
 - Onset under age 50
 - Rapid progression
 - See **Background and Supporting Information** for further information on atypical parkinsonism and Parkinson's Plus Syndromes
 - Suspected Huntington Disease
- Evaluation for surgical treatment of Essential Tremor, Parkinson's disease, and/or Spasmodic Torticollis/Dystonia, see **Torticollis and Dystonia (Neck-10.2)** in the Neck Imaging Guidelines
 - Deep Brain Stimulation (DBS) therapy
 - MRI Brain without contrast (CPT® 70551) **OR** MRI Brain without and with contrast (CPT® 70553) **AND/OR** unlisted CT procedure code (CPT® 76497)
 - MR guided Focused Ultrasound:
 - CT Head without contrast (CPT® 70450) to evaluate bone density **AND/OR** MRI Brain without contrast (CPT® 70551) **OR** MRI Brain without and with contrast (CPT® 70553)
 - Repeat imaging studies for pre-surgical evaluation, MRI Brain without contrast (CPT® 70551) **OR** MRI Brain without and with contrast (CPT® 70553) **AND/OR** CT Head without contrast (CPT® 70450), when ordered by a Neurosurgeon or Neurologist or any provider in consultation with a Neurosurgeon or Neurologist if greater than 6 months old **and/or** for new symptoms/signs
 - Post op imaging when ordered by a Neurosurgeon or Neurologist or any provider in consultation with a Neurosurgeon or Neurologist for either procedure, see also **Post-Operative Imaging (HD-28.3)** indications

- Dopamine Transporter Scan [DAT-SPECT Radiopharmaceutical Localization SPECT (Ioflupane I-123 SPECT)] (CPT® 78803 or CPT® 78830 **OR** Fluorodopa F¹⁸ (F-DOPA) PET Brain (CPT® 78606))^{2,3 16,17,18}.
 - To evaluate motor symptoms (tremor, rigidity, bradykinesia, and/or postural instability) in suspected Parkinsonian Syndromes (Parkinson Disease, Multiple System Atrophy, Progressive Supranuclear Palsy, Corticobasal Degeneration) when the diagnosis is unclear, to differentiate from non-neurodegenerative disorders, such as Essential Tremor, drug-induced tremor, vascular parkinsonism, and/or psychogenic tremor
 - Imaging with either modality, **not both**, is supported when the diagnosis remains unclear after evaluation by a neurologist, medication trials and brain imaging.¹
 - See **Background and Supporting Information** for additional information regarding Parkinson's Plus Syndromes.
 - Neither DAT Scans nor F-DOPA PET scans are useful for differentiation of subtypes of Parkinson's syndromes, to monitor progression of disease or predict risk of development of disease mainly to exclude other conditions with similar clinical presentations.
- MRI Brain with and without (CPT® 70553) for initial imaging for suspected motor neuron disease (see **Motor Neuron Disease/Amyotrophic Lateral Sclerosis (ALS) (PND-8.1)** in the Peripheral Nerve Disorders Imaging Guideline)
- Dementia associated with movement disorder (see **Lewy Body Dementia (LBD) – SPECT Brain Scan (HD-8.3)**)

Background and Supporting Information

- Parkinson's Plus Syndromes are a group of disorders characterized by atypical parkinsonism. They are NOT Parkinson's disease. They represent different neurodegenerative diseases with features of PD, and may be confused with PD. These syndromes include, but are not limited to:
 - Multiple system atrophy: orthostatic hypotension (dysautonomia), dysphonia, dysarthria
 - Progressive Supranuclear Palsy: balance difficulties, vertical gaze paresis
 - Corticobasal Syndrome: dysphasia, apraxia, myoclonus, alien-limb phenomenon
- These are distinct entities. Care must be taken to determine if there are unusual features present that will suggest atypical parkinsonian syndrome.
- Dementia with Lewy bodies (DLB): dementia prior to movement disorder (see **Lewy Body Dementia (LBD) - SPECT Brain Scan (HD-8.3)**)

Neuromyelitis Optica and NMO Spectrum Disorders (HD-16.2)

MOG Antibody-Associated Disease (MOGAD) (HD-16.3)

Transverse Myelitis (HD-16.4)

References (HD-16)

Multiple Sclerosis (MS) (HD-16.1)

HD.MS.0016.1.A

v2.0.2024

Establishing a New Diagnosis of Multiple Sclerosis

Indication	Supported Imaging
<p>Establishing a new diagnosis of Multiple Sclerosis is based on the following:</p> <ul style="list-style-type: none"> Clinical suspicion based on recurrent episodes of variable neurological signs and/or symptoms <p>AND</p> <ul style="list-style-type: none"> Baseline exclusion of appropriate alternative conditions that can mimic MS 	<ul style="list-style-type: none"> MRI Brain without and with contrast (CPT® 70553) (preferred study) OR MRI Brain without contrast (CPT® 70551) if there is a contraindication to gadolinium <p>If optic neuritis** is suspected the following imaging is ALSO indicated:</p> <ul style="list-style-type: none"> MRI Orbit without and with contrast (CPT® 70543) OR MRI Orbit without contrast (CPT® 70540) <p>**For additional information related to optic neuritis see <u>Eye Disorders and Visual Loss (HD-32.1)</u></p> <p>AND/OR</p> <ul style="list-style-type: none"> MRI Cervical Spine without and with contrast (CPT® 72156) OR MRI Cervical Spine without contrast (CPT® 72141) <p>AND/OR</p> <ul style="list-style-type: none"> MRI Thoracic Spine without and with contrast (CPT® 72157) OR MRI Thoracic Spine without contrast (CPT® 72146)

Unclear Diagnosis

Indication	Supported Imaging
<p>Diagnosis of Multiple Sclerosis remains unclear or equivocal after initial MRI</p> <ul style="list-style-type: none"> May repeat imaging 3- 6 months after initial MRI Brain 	<ul style="list-style-type: none"> MRI Brain without contrast (CPT® 70551) OR MRI Brain without and with contrast (CPT® 70553)

Clinically Isolated Syndrome (CIS)

Indication	Supported Imaging
<p>Clinically Isolated Syndrome (CIS)* based on ALL of the following:</p> <ul style="list-style-type: none"> First episode of neurologic symptoms and neurologic deficits concerning for possible demyelinating disease. Symptoms last ≥ 24 hours⁴³ Initial episode of neurologic symptoms and neurologic deficits Baseline exclusion of appropriate alternative conditions that can mimic MS <p>*For more information about CIS, see Background and Supporting Information</p>	<ul style="list-style-type: none"> MRI Brain without and with contrast (CPT® 70553) (preferred study) OR MRI Brain without contrast (CPT® 70551) if there is a contraindication to gadolinium <p>If optic neuritis is suspected **, the following imaging is ALSO indicated:</p> <ul style="list-style-type: none"> MRI Orbit without and with contrast (CPT® 70543) OR MRI Orbit without contrast (CPT® 70540) <p>**For additional information related to optic neuritis, see Eye Disorders and Visual Loss (HD-32.1)</p> <p>AND/OR</p> <ul style="list-style-type: none"> MRI Cervical Spine without and with contrast (CPT® 72156) OR MRI Cervical Spine without contrast (CPT® 72141) <p>AND/OR</p> <ul style="list-style-type: none"> MRI Thoracic Spine without and with contrast (CPT® 72157) OR MRI Thoracic Spine without contrast (CPT® 72146)

Radiologically Isolated Syndrome (RIS)

Indication	Supported Imaging
<p>Radiologically Isolated Syndrome (RIS)* based on ALL of the following:</p> <ul style="list-style-type: none"> Individual with brain MRI obtained for unrelated reason with findings conspicuous for demyelinating disease⁴¹ No history of recurrent neurologic symptoms suggestive of CIS or RRMS Baseline exclusion of appropriate alternative conditions that can mimic MS <p>*For more information about RIS, see <u>Background and Supporting Information</u></p>	<ul style="list-style-type: none"> MRI Brain without and with contrast (CPT® 70553) OR MRI Brain without contrast (CPT® 70551) <p>AND/OR</p> <ul style="list-style-type: none"> MRI Cervical Spine without and with contrast (CPT® 72156) OR MRI Cervical Spine without contrast (CPT® 72141) <p>AND/OR</p> <ul style="list-style-type: none"> MRI Thoracic Spine without and with contrast (CPT® 72157) OR MRI Thoracic Spine without contrast (CPT® 72146)

New Episode of Neurological Deficit in an Individual with Multiple Sclerosis and/or Concern for Possible Diagnosis of Demyelinating Disease

Indication	Supported Imaging
New episode of neurological deficit in an individual with Multiple Sclerosis and/or concern for a possible diagnosis of demyelinating disease	<ul style="list-style-type: none"> MRI Brain without contrast (CPT® 70551) OR MRI Brain without and with contrast (CPT® 70553) <p>If optic neuritis is suspected**, the following imaging is ALSO indicated:</p> <ul style="list-style-type: none"> MRI Orbit without and with contrast (CPT® 70543) OR MRI Orbit without contrast (CPT® 70540) <p>**For additional information related to optic neuritis, see <u>Eye Disorders and Visual Loss (HD-32.1)</u></p> <p>If there are new or worsening symptoms concerning for spinal cord involvement, the following imaging is ALSO indicated:</p> <ul style="list-style-type: none"> MRI Cervical Spine without contrast (CPT® 72141) OR MRI Cervical Spine without and with contrast (CPT® 72156) <p>AND/OR</p> <ul style="list-style-type: none"> MRI Thoracic Spine without contrast (CPT® 72146) OR MRI Thoracic Spine without and with contrast (CPT® 72157)

Baseline Imaging with Disease Modifying Therapy (DMT)

Indication	Supported Imaging
<ul style="list-style-type: none"> Before starting or changing disease modifying therapy (DMT)¹ <p>AND/OR</p> <ul style="list-style-type: none"> 3-6 months after starting or changing DMT to establish a new MRI treatment baseline <p>AND/OR</p> <ul style="list-style-type: none"> If new abnormal MRI Brain findings without clinical symptoms, an additional follow up MRI Brain is supported after 6 months¹ 	<ul style="list-style-type: none"> MRI Brain without contrast (CPT® 70551) OR MRI Brain without and without contrast (CPT® 70553)

Current Treatment with Disease Modifying Therapy (DMT)

Indication	Supported Imaging Every 3-6 Months	Supported Imaging Annually
<p>Individuals treated with DMT* associated with either the risk progressive multifocal leukoencephalopathy (PML) AND/OR other CNS opportunistic infections</p> <p>* For list of medications, see Background and Supporting Information</p>	<ul style="list-style-type: none"> MRI Brain without contrast (CPT® 70551) OR MRI Brain without and with contrast (CPT® 70553) 	<ul style="list-style-type: none"> MRI Cervical Spine without contrast (CPT® 72141) OR MRI Cervical Spine without and with contrast (CPT® 72156) <p>AND/OR</p> <ul style="list-style-type: none"> MRI Thoracic Spine without contrast (CPT® 72146) OR MRI Thoracic Spine without and with contrast (CPT® 72157)

Annual Supported Imaging

Indication	Supported Imaging <i>Annually</i>
<p>Individuals with diagnosed Multiple Sclerosis with EITHER of the following:</p> <ul style="list-style-type: none"> Not treated with disease modifying therapy (DMT)* <p>OR</p> <ul style="list-style-type: none"> Treated with beta interferon or glatiramer acetate medications <p>* For list of DMT medications, see <u>Background and Supporting Information</u></p>	<ul style="list-style-type: none"> MRI Brain without contrast (CPT® 70551) OR MRI Brain without and with contrast (CPT® 70553) <p>AND/OR</p> <ul style="list-style-type: none"> MRI Cervical Spine without contrast (CPT® 72141) OR MRI Cervical Spine without and with contrast (CPT® 72156) <p>AND/OR</p> <ul style="list-style-type: none"> MRI Thoracic Spine without contrast (CPT® 72146) OR MRI Thoracic Spine without and with contrast (CPT® 72157)

Treatment with Tysabri® (natalizumab)

Indication	Supported Imaging <i>Every 3-6 Months</i>	Supported Imaging <i>Annually</i>
<p>Individuals treated with Tysabri® (natalizumab) with the following medical history:</p> <ul style="list-style-type: none"> ≥ 18 months of treatment <ul style="list-style-type: none"> During Tysabri® (natalizumab) treatment and up to 9-12 months after transitioning off Tysabri® (natalizumab)¹ <p>AND</p> <ul style="list-style-type: none"> JC virus antibody positive 	<ul style="list-style-type: none"> MRI Brain without contrast (CPT® 70551) OR MRI Brain without and with contrast (CPT® 70553) 	<ul style="list-style-type: none"> MRI Cervical Spine without contrast (CPT® 72141) OR MRI Cervical Spine without and with contrast (CPT® 72156) <p>AND/OR</p> <ul style="list-style-type: none"> MRI Thoracic Spine without contrast (CPT® 72146) OR MRI Thoracic Spine without and with contrast (CPT® 72157)

PML Symptoms during Treatment with Tysabri® (natalizumab) or other Medication with Similar Risk

Indication	Supported Imaging
<p>Symptoms suggestive of Progressive Multifocal Leukoencephalopathy (PML)* during treatment with Tysabri® (natalizumab) or other medication with similar risk</p> <p>* For more information about PML, see <u>Background and Supporting Information</u></p>	<ul style="list-style-type: none"> • MRI Brain without contrast (CPT® 70551) OR • MRI Brain without and without contrast (CPT® 70553)

History of Clinically Isolated Syndrome (CIS) or Radiologically Isolated Syndrome (RIS)

Indication	Supported Imaging <i>Annually</i>
<p>Patient with history of Clinically Isolated Syndrome* (CIS)¹</p> <p>OR</p> <p>Patient with history of Radiologically Isolated Syndrome* (RIS)¹</p> <p>*For more information about CIS or RIS, see <u>Background and Supporting Information</u></p>	<ul style="list-style-type: none"> • MRI Brain without contrast (CPT® 70551) OR • MRI Brain without and with contrast (CPT® 70553)

- MRI Lumbar Spine is not needed since Cervical and Thoracic studies will usually visualize the entire spinal cord. If the clinical concern is for lumbosacral radiculopathy, See **Lower Extremity Pain with Neurological Features (Radiculopathy, Radiculitis, or Plexopathy and Neuropathy) with or without Low Back (Lumbar Spine) Pain (SP-6.1)** in the Spine Imaging Guidelines
- Family members need not be screened, unless they exhibit suspicious signs or symptoms suggestive of MS.
- 3D FLAIR sequences are useful in improving lesion detection for the diagnosis and monitoring of multiple sclerosis. 3D FLAIR sequences do not require an additional CPT® for 3D rendering (CPT® 76376 and CPT® 76377).¹
- Quantitative Magnetic Resonance Image (MRI) Analysis of the Brain
 - Volumetric analysis of the temporal lobes and hippocampus or Neuro Quant may be ordered as 3D rendering (CPT® 76376 and CPT® 76377) or quantitative analysis of the brain (CPT® 0865T or CPT® 0866T). These studies lack sufficient

specificity and sensitivity to be clinically useful in the evaluation or follow up of individuals with Multiple Sclerosis. Their use is limited to research studies and are otherwise considered to be not medically necessary in routine clinical practice.

Background and Supporting Information

- Multiple sclerosis is an autoimmune disease that is associated with inflammation, demyelination, and neurodegenerative changes within the optic nerves, brain and spinal cord (i.e. central nervous system (CNS)).
- A diagnosis of multiple sclerosis can be established after an individual has at least one clinical attack suggestive of central nervous system (CNS) demyelination with evidence of separation of space and time as well as reasonably excluding other possible conditions that could account for the clinical and imaging findings.^{1,45}
 - MRI lesions in multiple sclerosis are round or ovoid T2-hyperintense lesions that are well circumscribed and 3mm² or greater in size.
 - MRI findings that can establish dissemination of space include:
 - Involvement in two or more of the following locations:
 - ≥ 1 brainstem lesion
 - ≥ 1 juxtacortical (abutting the cortex) or cortical lesion
 - ≥ 1 periventricular lesion (abutting the ventricle)
 - ≥ 1 spinal cord lesion
 - MRI findings that can establish dissemination of time:
 - New T2-hyperintense lesion irrespective of timing
 - Presence of simultaneous enhancing and non-enhancing lesions on MRI
 - Multiple sclerosis commonly begins with a relapsing-remitting course with partial or complete neurologic recovery following attacks.
 - An acute attack lasts at least 24 hours or longer
 - Common types of MS attacks include:
 - Unilateral optic neuritis
 - Brainstem or cerebellar syndrome (i.e. trigeminal neuralgia, diplopia or intranuclear ophthalmoplegia (INO), and/or ataxia)
 - Partial transverse myelitis
 - Females are more frequently diagnosed with relapsing-remitting multiple sclerosis (RRMS) compared to males.
 - Individuals are most often diagnosed during their twenties or thirties.
 - Individuals with relapsing multiple sclerosis may later transition into a more progressive phase of the disease that is characterized by insidious cognitive and/or physical decline.
 - Primary progressive multiple sclerosis (PPMS) is characterized by progressive neurologic decline in the absence of acute attacks.

- The incidence of primary progressive multiple sclerosis is equal among males and females.
- It is often diagnosed at 45-50 years of age.
- The first event concerning for demyelinating disease without meeting criteria for separation of time is known as a clinically isolated syndrome (CIS).⁴³
 - A diagnosis of multiple sclerosis can occur when an individual with CIS has a second attack and/or develops a new lesion on MRI.
- Natural history studies and clinical trials of disease modifying therapies (DMT) have shown that individuals with CIS with characteristic MRI brain lesions carry a high risk for meeting diagnostic criteria for multiple sclerosis.⁴³
- Clinical trials of MS disease modifying therapy in CIS show that fewer individuals treated with a disease modifying therapy develop a second attack and have reduced MRI activity.⁴³
- Individuals who undergo a brain MRI for other indications (i.e. headaches, trauma, seizure) which incidentally reveals abnormalities that are characteristic for demyelination in the absence of clinical symptoms is known as radiologically isolated syndrome (RIS).^{41,43,45}
 - A diagnosis of RIS is established by the following:⁴⁵
 - Absence of a clinical attack suggestive of demyelination.
 - MRI abnormalities not related to the effects of substances (recreational drugs, toxic exposure) or other medical condition.
 - The central nervous system (CNS) MRI abnormalities cannot be accounted for by another disease process.
 - MRI white matter abnormalities associated with a vascular pattern of disease.
 - Factors associated with a higher risk for transitioning to multiple sclerosis include⁴¹
 - Younger age at diagnosis
 - Male patients
 - Individuals with spinal cord and/or brain stem lesions
 - Presence of oligoclonal bands in the cerebrospinal fluid (CSF)
 - A recent randomized, placebo-controlled trial for individuals with radiologically isolated syndrome (RIS) using dimethyl fumarate showed potential benefit in delaying clinical events and MRI activity.
 - Recent studies on radiologically isolated syndrome suggests that this is likely a pre-clinical phase for individuals with multiple sclerosis.
- Progressive Multifocal Leukoencephalopathy (PML) is a progressive multi-focal disease of the central nervous system that can occur in individuals with treated with immunosuppressive or immunomodulatory medications.⁴⁶
 - There is a relatively high incidence of PML in individuals treated with natalizumab although other disease modifying therapies have been associated with PML.^{1,46}

- Increased risk of developing PML has been associated with individuals treated with natalizumab who received prior immunosuppressive medication, have a high JC virus antibody index, and/or have received natalizumab for ≥ 18 months.¹
- More frequent MRI monitoring has been associated with lower PML lesion volume at diagnosis and a better outcome than annual monitoring.¹
- Frequent MRI surveillance is recommended after discontinuing natalizumab due to the potential of carry-over PML that can occur.¹
- A diagnosis of PML is established by neurological symptoms, characteristic MRI abnormalities and positive PCR for the JC virus in cerebrospinal fluid (CSF).
- Common symptoms of PML may include but are not limited to hemiparesis, ataxia, gait disorder, visual deficits (i.e. homonymous hemianopia), and/or seizures.⁴⁶
- Sagittal MRI Spinal Cord with phased array detector coil (CPT[®] 72156 or CPT[®] 72157) is an alternative spinal imaging.
- Interferon beta medications include (but are not limited to): Avonex[®], Betaseron[®], Extavia[®], Plegridy[®], Rebif[®]
- Glatiramer acetate medications include (but are not limited to): Copaxone, Glatopa[®]
- Medications with high risks of PML as Tysabri[®] (natalizumab) and/or other CNS opportunistic infections (i.e. herpes encephalitis, cryptococcal meningitis) include (but are not limited to): Tecfidera[®] (dimethyl fumarate), Gilenya[®] (fingolimod), Tascenso[®] ODT (fingolimod), Aubagio[®] (teriflunomide), Ocrevus[®] (ocrelizumab), Kesimpta[®] (ofatumumab), Mavenclad[®] (cladribine), Mayzent[®] (siponimod), Ponvory[®] (ponesimod), Vumerity[®] (diroximel fumarate), Zeposia[®] (ozanimod), Lemtrada[®] (alemtuzumab), Bafiertam[®] (monomethyl fumarate), Briumvi[®] (ublituximab), Rituxan[®] (rituximab)

Neuromyelitis Optica and NMO Spectrum Disorders (HD-16.2)

HD.MS.0016.2.A

v2.0.2024

Initial evaluation of Neuromyelitis Optica Spectrum Disorders (NMOSD) with any of the following:

Indication	Supported Imaging
Clinical concern for optic neuritis when requested by a neurologist, neuro-ophthalmologist, ophthalmologist or any provider in consultation with a neurologist, neuro-ophthalmologist, or ophthalmologist	<p>MRI Orbit without and with contrast (CPT® 70543) OR</p> <p>MRI Orbit without contrast (CPT® 70540)</p>
Recurrent hiccups or intractable nausea and/or vomiting (clinical concern for area postrema syndrome)	<p>MRI Brain without and with contrast (CPT® 70553) OR</p> <p>MRI Brain without contrast (CPT® 70551)</p>
Other neurologic signs or symptoms concerning for brain involvement ordered by a neurologist or any provider in consultation with a neurologist	<p>MRI Brain without and with contrast (CPT® 70553) OR</p> <p>MRI Brain without contrast (CPT® 70551)</p>
Clinical concern for transverse myelitis when ordered by a neurologist or any provider in consultation with a neurologist	<ul style="list-style-type: none"> MRI Cervical Spine without and with contrast (CPT® 72156) OR MRI Cervical Spine without contrast (CPT® 72141) <p>AND/OR</p> <ul style="list-style-type: none"> MRI Thoracic Spine without and with contrast (CPT® 72157) OR MRI Thoracic Spine without contrast (CPT® 72146) <p>AND/OR</p> <p>Due to potential for conus involvement,</p> <ul style="list-style-type: none"> MRI Lumbar spine without and with contrast (CPT® 72158) OR MRI Lumbar spine without contrast (CPT® 72148)

Indication	Supported Imaging
Positive NMO antibody test when ordered by a neurologist or any provider in consultation with a neurologist ³⁷	<ul style="list-style-type: none"> MRI Brain without and with contrast (CPT® 70553) OR MRI Brain without contrast (CPT® 70551) <p>AND/OR</p> <ul style="list-style-type: none"> MRI Orbit without and with contrast (CPT® 70543) OR MRI Orbit without contrast (CPT® 70540) <p>AND/OR</p> <ul style="list-style-type: none"> MRI Cervical Spine without and with contrast (CPT® 72156) OR MRI Cervical Spine without contrast (CPT® 72141) <p>AND/OR</p> <ul style="list-style-type: none"> MRI Thoracic Spine without and with contrast (CPT® 72157) OR MRI Thoracic Spine without contrast (CPT® 72146)

Patient with established diagnosis of (NMOSD) with any of the following:

Indication	Supported Imaging
Clinical concern for optic neuritis when requested by a neurologist, neuro-ophthalmologist, ophthalmologist or any provider in consultation with a neurologist, neuro-ophthalmologist, or ophthalmologist	MRI Orbit without and with contrast (CPT® 70543) OR MRI Orbit without contrast (CPT® 70540)
New neurologic signs or symptoms concerning for brain involvement when requested by a neurologist or any provider in consultation with a neurologist	MRI Brain without and with contrast (CPT® 70553) OR MRI Brain without contrast (CPT® 70551)

Indication	Supported Imaging
Clinical concern for transverse myelitis when ordered by a neurologist or any provider in consultation with a neurologist	<ul style="list-style-type: none"> MRI Cervical Spine without and with contrast (CPT® 72156) OR MRI Cervical Spine without contrast (CPT® 72141) <p>AND/OR</p> <ul style="list-style-type: none"> MRI Thoracic Spine without and with contrast (CPT® 72157) OR MRI Thoracic Spine without contrast (CPT® 72146) <p>AND/OR</p> <p>Due to potential for conus involvement,</p> <ul style="list-style-type: none"> MRI Lumbar spine without and with contrast (CPT® 72158) OR MRI Lumbar spine without contrast (CPT® 72148)
<p>Repeat imaging may be supported for ANY of the following:</p> <ul style="list-style-type: none"> Re-establish baseline after starting treatment (typically 3-6 months after last MRI) Changing disease modifying therapy (DMT) As requested when ordered by a neurologist, neuro-ophthalmologist, ophthalmologist or any provider in consultation with a neurologist, neuro-ophthalmologist or ophthalmologist³⁷ 	<ul style="list-style-type: none"> MRI Brain without and with contrast (CPT® 70553) OR MRI Brain without contrast (CPT® 70551) <p>AND/OR</p> <ul style="list-style-type: none"> MRI Orbit without and with contrast (CPT® 70543) OR MRI Orbit without contrast (CPT® 70540) <p>AND/OR</p> <ul style="list-style-type: none"> MRI Cervical Spine without and with contrast (CPT® 72156) OR MRI Cervical Spine without contrast (CPT® 72141) <p>AND/OR</p> <ul style="list-style-type: none"> MRI Thoracic Spine without and with contrast (CPT® 72157) OR MRI Thoracic Spine without contrast (CPT® 72146)

- Quantitative Magnetic Resonance Image (MRI) Analysis of the Brain
 - Volumetric analysis of the temporal lobes and hippocampus or Neuro Quant may be ordered as 3D rendering (CPT® 76376 and CPT® 76377) or quantitative analysis of the brain (CPT® 0865T or CPT® 0866T). These studies lack sufficient

specificity and sensitivity to be clinically useful in the evaluation or follow up of individuals with NMOSD. Their use is limited to research studies and are otherwise considered to be not medically necessary in routine clinical practice.

Background and Supporting Information

- Neuromyelitis optica spectrum disorder (NMOSD, Devic's disease) is a chronic inflammatory autoimmune disease that involves the optic nerves, spinal cord and brain.
- Accrual of disability occurs during acute attacks in patients with NMOSD.
 - Even after a single attack, severe permanent disability can occur, especially if the attack is not treated immediately and appropriately.
 - Unlike multiple sclerosis, it is rare for individuals with NMOSD to develop asymptomatic lesions within the brain, optic nerves and/or spinal cord.³⁴
- Diagnosis is based on the clinical presentation, MRI findings, and the presence of auto-antibodies.
- Core clinical characteristics of NMOSD include⁷
 - Optic neuritis
 - Frequently bilateral optic nerve involvement with severe vision loss
 - Long unilateral and/or bilateral lesion on MRI (more than half of the distance from the orbit to the chiasm and those involving the posterior aspects of the optic chiasm)
 - Longitudinally extensive transverse myelitis
 - ≥ 3 complete, contiguous vertebral segments of the spinal cord are involved
 - More than 70% of the lesion resides within the central gray matter of the spinal cord
 - Area postrema syndrome
 - Otherwise unexplained episode of recurrent hiccups or intractable nausea and vomiting
 - Brainstem or cerebral syndrome with NMOSD typical brain lesions⁷
 - Lesions involve periependymal surfaces of the 3rd and 4th ventricles in the brainstem and cerebellum
 - Hypothalamic or thalamic lesions
 - Large, confluent unilateral or bilateral subcortical or deep white matter lesions⁷
 - Long ($\geq 1/2$ the length of the corpus callosum) with diffuse, heterogeneous or edematous corpus callosum lesions
 - Long corticospinal tract lesions, involving unilateral or bilateral, contiguously involving internal capsule and cerebral peduncle
 - Extensive periependymal lesions, often with gadolinium enhancement
 - Rarely paraneoplastic syndromes occur with NMO spectrum disorder

- Medications used for the treatment of NMO spectrum disorders include (but are not limited to) azathioprine, Encoring[®] (satralizumab), mycophenolate, Soliris[®] (eculizumab), rituximab³⁷, and Uplizna[®] (inebilizumab)
 - Possible adverse reactions associated with treatment include risk of PML and meningococcal infections
- Several medications that are effective in multiple sclerosis, including interferon β , fingolimod, alemtuzumab, and natalizumab are associated with severe outcomes, including catastrophic exacerbations in patients with NMOSD.³⁵

MOG Antibody-Associated Disease (MOGAD) (HD-16.3)

HD.MS.0016.3.A

v2.0.2024

Initial evaluation of MOG (myelin oligodendrocyte glycoprotein) antibody-associated diseases (MOGAD) with any of the following:

Indication	Supported Imaging
Clinical concern for optic neuritis when requested by a neurologist, ophthalmologist or any provider in consultation with a neurologist or ophthalmologist	<ul style="list-style-type: none"> MRI Orbit without and with contrast (CPT® 70543) OR MRI Orbit without contrast (CPT® 70540)

- Acute relapse is considered when an individual with MOGAD develops new neurologic signs or symptoms at least 30 days following the onset of a previous attack.³⁴

Background and Supporting Information

- MOG (myelin oligodendrocyte glycoprotein)-IgG disorders are CNS inflammatory diseases, distinct from multiple sclerosis and NMO-spectrum disorders.
- Unlike multiple sclerosis and neuromyelitis optica spectrum disorder (NMOSD), individuals with MOG antibody-associated disease (MOGAD) can have a monophasic or relapsing course.³⁴
- Diagnosis is based on the clinical presentation, MRI findings, and the presence of auto-antibodies
- Clinical features of individuals with MOGAD include³⁴
 - Optic neuritis
 - Bilateral optic neuritis is common at onset, and seems to be more frequent in individuals with MOGAD than with those with multiple sclerosis or neuromyelitis optica spectrum disorder (NMOSD).³⁴
 - Vision returns quickly with return to normal or near normal visual acuity following treatment with intravenous corticosteroids.³⁴
 - Transverse myelitis
 - May be short segment
 - Longitudinally extensive transverse myelitis (≥ 3 vertebral segments of the spinal cord)
 - Cauda equine and peripheral nerve root involvement can occur (lumbar spine imaging is indicated)⁴⁵
 - Can occur as an isolated episode of transverse myelitis, as a component of ADEM or in conjunction with optic neuritis.³⁴
 - T2 spinal cord lesions often are centrally located and can be restricted to the grey matter producing the “H sign” on MRI
 - 20%-25% of spinal cord lesions in individuals with MOGAD do not involve the grey matter.³⁴
 - Most T2 lesions resolve or reduce in size substantially on follow up MRI
 - Brainstem encephalitis
 - Encephalitis with seizures
 - May be associated with cortical edema and leptomeningeal enhancement⁴⁵
 - Acute disseminated encephalomyelitis (ADEM)
 - Occurs mainly in children but can occur in adults.
 - Tumefactive brain lesions
 - Cranial neuropathies

Relapses are more common in the first six months after the first attack.

- Unlike multiple sclerosis and neuromyelitis optica spectrum disorder (NMOSD), individuals with MOG antibody-associated disease (MOGAD) can have a monophasic or relapsing course.³⁴
- Unlike multiple sclerosis, it is rare for individuals with MOGAD to develop asymptomatic lesions within the brain, optic nerves and/or spinal cord.³⁴

- An acute relapse is considered when an individual with MOGAD develops new neurologic signs or symptoms at least 30 days following the onset of a previous attack.
 - Relapses are more common in the first six months after the first attack.³⁴
 - New symptoms or signs in an individual with known MOGAD may include
 - Blurred vision, vision loss and/or loss of color vision
 - Motor weakness of a limb or limbs, including paraparesis or complete paralysis
 - Motor weakness may include:
 - Loss and/or worsening of manual dexterity
 - New or worsening foot drag
 - Change in sensation in a limb or limbs that may be associated with paresthesias and/or dysesthesias
 - Urinary urgency, incontinence and/or urinary retention
 - Worsening constipation and/or bowel urgency/incontinence
 - Sexual dysfunction
 - Lhermitte's phenomenon
 - New or worsening spasticity
 - New or worsening gait difficulties (i.e. spastic and/or ataxic gait) and/or sexual dysfunction
 - Seizures

Transverse Myelitis (HD-16.4)

HD.MS.0016.4.A

v2.0.2024

An initial assessment, to include a pertinent history and neurologic exam, should be performed prior to imaging requests.

Clinical Concern for Transverse Myelitis

Indication	Supported Imaging
Clinical concern for transverse myelitis when ordered by a neurologist or radiologist or any provider in consultation with a neurologist or radiologist	<ul style="list-style-type: none"> MRI Cervical Spine without and with contrast (CPT® 72156) OR MRI Cervical Spine without contrast (CPT® 72141) <p>AND/OR</p> <ul style="list-style-type: none"> MRI Thoracic Spine without and with contrast (CPT® 72157) OR MRI Thoracic Spine without contrast (CPT® 72146) <p>AND/OR</p> <p>Due to potential for conus involvement,</p> <ul style="list-style-type: none"> MRI Lumbar spine without and with contrast (CPT® 72158) OR MRI Lumbar spine without contrast (CPT® 72148) <p>AND/OR</p> <ul style="list-style-type: none"> MRI Brain without and with contrast (CPT® 70553) OR MRI Brain without contrast (CPT® 70551) <p>If optic neuritis is suspected*, the following imaging is ALSO indicated:</p> <ul style="list-style-type: none"> MRI Orbit without and with contrast (CPT® 70543) OR MRI Orbit without contrast (CPT® 70540) <p>*For additional information related to optic neuritis see <u>Eye Disorders and Visual Loss (HD-32.1)</u></p>

New Neurologic Signs or Symptoms

Indication	Supported Imaging
New neurologic signs or symptoms	<ul style="list-style-type: none"> MRI Cervical Spine without and with contrast (CPT® 72156) OR MRI Cervical Spine without contrast (CPT® 72141) <p>AND/OR</p> <ul style="list-style-type: none"> MRI Thoracic Spine without and with contrast (CPT® 72157) OR MRI Thoracic Spine without contrast (CPT® 72146) <p>AND/OR</p> <ul style="list-style-type: none"> MRI Brain without and with contrast (CPT® 70553) OR MRI Brain without contrast (CPT® 70551) <p>If optic neuritis is suspected*, the following imaging is ALSO indicated:</p> <ul style="list-style-type: none"> MRI Orbit without and with contrast (CPT® 70543) OR MRI Orbit without contrast (CPT® 70540) <p>*For additional information related to optic neuritis, see <u>Eye Disorders and Visual Loss (HD-32.1)</u></p>

History of Transverse Myelitis

Indication	Supported Imaging <i>Annually for 5 years</i> ⁴⁴
Individual with a history of transverse myelitis <ul style="list-style-type: none"> Ordered by a neurologist or any provider in consultation with a neurologist 	<ul style="list-style-type: none"> MRI Cervical Spine without and with contrast (CPT® 72156) OR MRI Cervical Spine without contrast (CPT® 72141) <p>AND/OR</p> <ul style="list-style-type: none"> MRI Thoracic Spine without and with contrast (CPT® 72157) OR MRI Thoracic Spine without contrast (CPT® 72146) <p>AND/OR</p> <ul style="list-style-type: none"> MRI Brain without and with contrast (CPT® 70553) OR MRI Brain without contrast (CPT® 70551)

- Individuals with transverse myelitis present with various symptoms of sensory, motor and/or autonomic dysfunction.
 - Bilateral signs and/or symptoms (although not necessarily symmetrical)⁴²
 - Examination findings may include but are not limited to any of the following:
 - Bilateral limb weakness
 - Loss of manual dexterity
 - New or worsening foot drop
 - Sensory abnormalities
 - Sensory level
 - Hyperreflexia (including upgoing toes, positive Babinski, Hoffman's sign, clonus)
 - Gait abnormality (spastic or ataxic gait)
 - See also: **Background and Supporting Information**
 - If inflammation is identified within the spinal cord suggestive of transverse myelitis, a brain MRI is recommended to evaluate for a multifocal inflammatory process⁴²
- See **Multiple Sclerosis (MS) (HD-16.1)**, **Neuromyelitis Optica and NMO Spectrum Disorders (HD-16.2)**, **MOG Antibody-Associated Diseases (MOGAD) (HD-16.3)**

Background and Supporting Information

- Symptoms may include but are not limited to the following:
 - Motor weakness of a limb or limbs, including paraparesis and/or complete paralysis

- Change in sensation in a limb or limbs that may be associated with paresthesias and/or dyesthesias.
- Urinary urgency, incontinence and/or urinary retention
- Worsening constipation and/or bowel urgency/incontinence
- Sexual dysfunction
- Lhermitte's sign
- New or worsening spasticity
- Acute transverse myelitis is defined as an acute inflammatory syndrome leading to motor and/or sensory impairment, with or without sphincter dysfunction, secondary to a variety of autoimmune or inflammatory diseases.⁴²
- Diagnosed by spinal MRI and/or cerebrospinal fluid.
- Individuals typically progress to maximal neurological deficits within 4 weeks.
- Longitudinally extensive transverse myelitis (≥ 3 vertebral segments) is more commonly associated with neuromyelitis optica spectrum disorders (NMOSD) and/or MOG antibody-associated diseases (MOGAD)^{34,44}
- Transverse myelitis:
 - May be idiopathic
 - Initial event of multiple sclerosis (see **Multiple Sclerosis (MS) (HD-16.1)**)
 - Initial event of neuromyelitis optica spectrum disorder (NMOSD) (see **Neuromyelitis Optica and NMO Spectrum Disorders (HD-16.2)**)
 - Initial event of MOG antibody-associated disease (MOGAD) (see **MOG Antibody-Associated Diseases (MOGAD) (HD-16.3)**)
 - May be associated with connective tissue disease
 - Systemic lupus erythematosus (SLE)
 - Rheumatoid Arthritis (RA)
 - Sjögren's syndrome
 - Systemic sclerosis
 - Manifestation of neurosarcoidosis (see **Autoimmune/Paraneoplastic Encephalitis & Neuroinflammatory Disorders (HD-14.3)**)
 - Post-infectious and/or post-vaccination related
 - COVID-19 and COVID-19 post-vaccination myelitis cases have been reported (see **Neuro-COVID-19 and Sars-COV-2 Vaccines (HD-14.2)**)
 - May have a prodromal syndrome with fever, respiratory and/or gastrointestinal symptoms⁴⁰
 - Neurologic symptoms may be associated with headache, neck stiffness or recurrence of fever⁴⁰

Paresthesias and/or Weakness (HD-18)

Guideline

Sensory/Weakness Complaints (HD-18.1)

References (HD-18)

Sensory/Weakness Complaints (HD-18.1)

HD.PS.0018.1.A
v2.0.2024

Advanced imaging for complaints of sensory loss and/or paresthesias (see **Background and Supporting Information**) and/or weakness that are unaccompanied by other symptoms and not preceded by trauma must have the following: a thorough clinical history and a detailed neurological exam (including the symptomatic area).

Imaging for sensory and weakness complaints may be indicated with the following findings:

Findings Specific to the Brain and/or Spinal Cord	Supported Imaging
<p>ANY of the following:</p> <ul style="list-style-type: none"> Hyperreflexia Babinski/Hoffman sign* Increased tone in affected limb Bladder and/or bowel dysfunction⁴ Motor symptoms in ANY of the following patterns: <ul style="list-style-type: none"> Two limbs on same side of body Face and limb involvement Sensory symptoms in ANY of the following patterns: <ul style="list-style-type: none"> Two limbs on same side of body Face and limb involvement <p>*See Background and Supporting Information</p>	<ul style="list-style-type: none"> MRI Brain without contrast (CPT® 70551) OR MRI Brain without and with contrast (CPT® 70553) <p>AND/OR</p> <ul style="list-style-type: none"> MRI Cervical Spine without contrast (CPT® 72141) OR MRI Cervical Spine without and with contrast (CPT® 72156) <p>AND/OR</p> <ul style="list-style-type: none"> MRI Thoracic Spine without contrast (CPT® 72146) OR MRI Thoracic Spine without and with contrast (CPT® 72157)

Findings Specific to the Spinal Cord	Supported Imaging
<p>ANY of the following:</p> <ul style="list-style-type: none"> Decreased pinprick sensation on one side of the body with weakness and decreased proprioception on the other side Sensory level (also called spinal cord level) on the trunk with sensory loss in both legs Tight band around the trunk or torso⁴ Pure sensory symptoms with proximal and distal involvement and a symmetric pattern Decreased or absent reflexes AND noted concern for spinal cord shock or acute spinal cord injury^{*4} <p>*See <u>Background and Supporting Information</u></p>	<ul style="list-style-type: none"> MRI Cervical Spine without contrast (CPT® 72141) OR MRI Cervical Spine without and with contrast (CPT® 72156) <p>AND/OR</p> <ul style="list-style-type: none"> MRI Thoracic Spine without contrast (CPT® 72146) OR MRI Thoracic Spine without and with contrast (CPT® 72157)

Findings Specific to the Terminal End of the Spinal Cord	Supported Imaging
<p>Concern for conus medullaris syndrome.*</p> <ul style="list-style-type: none"> Symptoms may include, but are not limited to: <ul style="list-style-type: none"> Saddle anesthesia Urinary retention Bowel incontinence Lower limb paresthesias Lower limb weakness <p>*See <u>Background and Supporting Information</u></p>	<ul style="list-style-type: none"> MRI Lumbar Spine without contrast (CPT® 72148) OR MRI Lumbar Spine without and with contrast (CPT® 72158)

- MRI Lumbar Spine is not typically indicated to visualize the spinal cord except in the clinical scenarios noted above. MRI Cervical Spine and MRI Thoracic Spine will image the entire spinal cord.
- Findings NOT consistent with central nervous system localization and NOT supporting brain or spinal cord imaging include:

- Sensory loss that involves the hands and feet and not the trunk
- Limb pain
- For symptoms after trauma, refer to **Head Trauma (HD-13.1)** and/or the appropriate level in the Spine Imaging Guidelines
- For generalized weakness, polyneuropathy, and/or other patterns of sensory and/or motor symptoms not referenced above, refer to the following guidelines:
 - Myopathy or myositis, see **Muscle Diseases (PN-6.2)** and **Gaucher Disease (Storage Disorders) (PN-6.3)**
 - Motor Neuron Disease or Amyotrophic Lateral Sclerosis (ALS), see **Motor Neuron Disease/Amyotrophic Lateral Sclerosis (ALS) (PN-8.1)**
 - Neuromuscular Junction Disorders, see **Neuromuscular Junction Disorders (PN-6.1)**
 - Multifocal Motor Neuropathy (MMN) and Chronic Inflammatory Demyelinating Polyneuropathy (CIDP), see **Polyneuropathy (PN-3.1)**
 - Polyneuropathy, see **Polyneuropathy (PN-3.1)**
 - Neuropathy with concern for malignancy, see **Paraneoplastic Syndromes (ONC-30.3)** in the Oncology Imaging Guidelines
 - Proximal asymmetric and concern for plexopathy, see **Brachial Plexus (PN-4.1)** and/or **Lumbar and Lumbosacral Plexus (PN-5.1)**
 - Sensory and/or motor symptoms localized to a single nerve, see **Focal Neuropathy (PN-2.1)**
 - Thoracic Outlet Syndrome, see **Thoracic Outlet Syndrome (CH-31.1)** in the Chest Imaging Guidelines
 - Radiculopathy, see appropriate level in the Spine Imaging Guidelines
 - Cauda Equina Syndrome, see **Red Flag Indications (SP-1.2)** in the Spine Imaging Guidelines

Background and Supporting Information

- Paresthesia refers to an abnormal sensation that is associated with nervous system dysfunction and may be described as a tingling, pricking, pins and needles, or a burning sensation. The priority is to determine whether the etiology is due to pathology of the peripheral nervous system (PNS) or central nervous system (CNS).
- A thorough clinical history, including symptom location and time course, can be helpful to differentiate PNS pathologies from CNS. For example, paresthesia affecting one side of the face and/or body (i.e. hemisensory deficit) points strongly towards central nervous system dysfunction. Therefore, brain and/or spinal cord imaging may be supported based on the location of symptoms. Typically, lumbar spine imaging is not supported unless there is sphincter involvement, saddle anesthesia, and/or cauda equina syndrome is suspected. In contrast, an insidious course of distal, symmetric limb paresthesia is more commonly associated with peripheral nerve abnormalities. In such cases, NCS/EMG testing results should be

completed prior to advanced imaging. (See **Peripheral Nerve Imaging Guidelines**).

- Upper motor neuron signs (e.g. increased tone, hyperreflexia, presence of Babinski or Hoffman signs) may support a need for central nervous system imaging.
- Lower motor neuron signs (e.g. decreased tone, hypo- or areflexia, muscle atrophy) may support evaluation for peripheral nervous system diseases. Nerve conduction and needle EMG testing should be completed prior to advanced imaging.
- It is important to note that both peripheral and central nervous system disease can co-exist. As a result, if both upper and lower motor neuron signs are observed simultaneously, advanced imaging may be supported regardless of NCS/EMG testing results (see **Polyneuropathy (PN-3.1)** in the Peripheral Nerve Disorders (PND) Imaging Guidelines).
- **Babinski sign** - presence of an upgoing big toe with stimulation of the lateral plantar region of the foot.¹⁴
- **Hoffman sign** - involuntary flexion of the fingers, particularly the thumb and index fingers, triggered by flicking the distal segment of the middle finger.¹⁴
- **Spinal cord shock/acute spinal cord injury** - occurs after hyperacute or acute injury to the cord and presents with flaccid areflexia below the level of injury. May be associated with hypotension and/or bradycardia if loss of sympathetic tone occurs. Signs may last from days to weeks before upper motor neuron findings develop.⁴
- **Conus Medullaris Syndrome** - compressive damage to the spinal cord from T12-L2. Symptoms suggestive of conus medullaris syndrome include saddle anesthesia, urinary retention, bowel incontinence, and/or lower extremity motor or sensory changes.¹³

Pituitary (HD-19)

Guideline

Pituitary (HD-19.1)

Post-Operative and Repeat Imaging Indications (HD-19.2)

Empty Sella Turcica (HD-19.3)

Craniopharyngioma and Other Hypothalamic/Pituitary Region Tumors (HD-19.4)

References (HD-19)

Pituitary (HD-19.1)

HD.PT.0019.1.A

v2.0.2024

- Endocrine laboratory studies should be performed prior to considering advanced imaging, except in the cases of stable, non-functioning microadenomas or macroadenomas, cysts and/or for incidentally found lesions.
- MRI Brain without and with contrast (CPT® 70553) or MRI Brain without contrast (CPT® 70551) with a specific pituitary protocol that includes fine cuts through the sella is the primarily performed pituitary imaging:
 - MRI Orbit/Face/Neck without and with contrast (CPT® 70543) or CT Head without and with contrast (CPT® 70470) are alternatives
 - CT Head without contrast (CPT® 70450) or without and with contrast (CPT® 70470) **AND/OR** CT Maxillofacial without contrast (CPT® 70486) in addition to MRI to visualize perisellar bony structures in the pre-operative evaluation of certain sellar tumors and for pre-operative planning for transphenoidal approaches
 - See **General Guidelines – Anatomic Issues (HD-1.1)** as CT Temporal bone (CPT® 70480) is supported instead of CT Maxillofacial per surgeon's preference and contrast level
 - CTA Head (CPT® 70496) or MRA Head (CPT® 70544, CPT® 70545, or CPT® 70546) for surgical planning
 - MRI Brain without and with contrast (CPT® 70553) covers both brain and dedicated pituitary if performed at the same time; no additional CPT® codes are needed
- Repeat imaging for incidentally found lesions on other studies:
 - MRI Brain without and with contrast (CPT® 70553) or MRI Orbit/Face/Neck without and with contrast (CPT® 70543) follow-up dedicated pituitary study obtained if a pituitary abnormality is reported incidentally on a MRI Brain or CT Head performed for other reasons (MRI Brain without and with contrast [CPT® 70553] covers both brain and dedicated pituitary if performed at the same time; no additional CPT® codes are needed); further evaluation and subsequent imaging dependent on specific imaging and biochemical laboratory evaluation findings.
- Repeat Imaging in the setting of worsening clinical status or new neurologic symptoms
- See **Secondary Amenorrhea (PV-3.1)** in the Pelvic Imaging Guidelines for initial lab and imaging work up to exclude other causes. See Female Hypogonadism or Prolactinoma or other relevant sections in the grid if suspicion for pituitary tumor/disease.

Pituitary Imaging

Indication	Initial Imaging	Repeat Imaging
Microadenoma: Nonfunctioning, unexplained pituitary asymmetries, or incidentally found small tumors (<10 mm)	<ul style="list-style-type: none"> MRI Brain without and with contrast (CPT® 70553) or MRI Brain without contrast (CPT® 70551) 	<ul style="list-style-type: none"> MRI Brain without and with contrast (CPT® 70553) or MRI Brain without contrast (CPT® 70551) at 12 months and then (if stable in size), every 1-2 years for 3 years, and less frequently thereafter based on clinical status
Macroadenoma (≥10 mm): Nonfunctioning and/or not surgically removed including those with a post-operative remnant	<ul style="list-style-type: none"> MRI Brain without and with contrast (CPT® 70553) or MRI Brain without contrast (CPT® 70551) 	<ul style="list-style-type: none"> MRI Brain without and with contrast (CPT® 70553) or MRI Brain without contrast (CPT® 70551) every 6 months for the first year and then (if stable in size), every year for 3 years, and less frequently thereafter based on clinical status (longer if craniopharyngioma)
Acromegaly* (Elevated IGF-1 confirmed by lack of suppression of growth hormone on glucose suppression testing)	<ul style="list-style-type: none"> MRI Brain without and with contrast (CPT® 70553) or MRI Brain without contrast (CPT® 70551) 	<ul style="list-style-type: none"> MRI Brain without and with contrast (CPT® 70553) or MRI Brain without contrast (CPT® 70551) <ul style="list-style-type: none"> At least 12 weeks after surgery to evaluate for residual tumor If treated with Pegvisomant, 6 to 12 months after treatment initiated, then annually if stable Long-term follow-up imaging based on clinical and biochemical status at the request of a specialist or any provider in consultation with a specialist

Indication	Initial Imaging	Repeat Imaging
Cushing's Disease** (Pituitary ACTH excess leading to hypercortisolism)	<ul style="list-style-type: none">• MRI Brain without and with contrast (CPT® 70553) or MRI Brain without contrast (CPT® 70551)	<ul style="list-style-type: none">• MRI Brain without and with contrast (CPT® 70553) or MRI Brain without contrast (CPT® 70551)<ul style="list-style-type: none">• At least 12 weeks after surgery as new baseline• Annually after bilateral adrenalectomy for Cushing's disease or ectopic ACTH production• Long-term follow-up imaging based on clinical and biochemical status at the request of a specialist or any provider in consultation with a specialist
Rathke's cleft cyst/ Simple cyst	<ul style="list-style-type: none">• MRI Brain without and with contrast (CPT® 70553) or MRI Brain without contrast (CPT® 70551)	<ul style="list-style-type: none">• MRI Brain without and with contrast (CPT® 70553) or MRI Brain without contrast (CPT® 70551) in one year; if stable and without mass effect or invasion into surrounding structures, no further imaging is required.

Indication	Imaging
Prolactinomas***	<ul style="list-style-type: none"> • MRI Brain without and with contrast (CPT® 70553) or MRI Brain without contrast (CPT® 70551) with: <ul style="list-style-type: none"> • Diagnosis: <ul style="list-style-type: none"> • Unexplained prolactin level above the normal range • On Dopamine Agonist (DA) therapy with good response: <ul style="list-style-type: none"> • Macroadenomas 3 months after start of DA therapy • Microadenomas 1 year after start of DA therapy • To decide on stoppage of therapy after ~2 years if in “remission” (normal PRL and no visible tumor on MRI) • On Dopamine Agonist therapy with suboptimal response: <ul style="list-style-type: none"> • PRL levels rise • New symptoms develop (galactorrhea, vision changes, headaches, pituitary deficiency) • If on high dose maximal DA and no plans for surgery/radiation therapy use guideline for microadenoma or macroadenoma • After Dopamine Agonist therapy: <ul style="list-style-type: none"> • Rise in PRL level • For DA stoppage at menopause, use guideline for microadenoma or macroadenoma • Galactorrhea/nipple discharge with normal prolactin and thyroid function levels: See <u>Nipple Discharge/Galactorrhea (BR-6.1)</u> in the Breast Imaging Guidelines
Medication-induced Prolactinemia****	<ul style="list-style-type: none"> • To differentiate between medication-induced hyperprolactinemia and hyperprolactinemia due to a pituitary or hypothalamic mass if the medication cannot be discontinued or hyperprolactinemia persists after medication discontinuation²²

Indication	Imaging
TSH, FSH, or LH producing adenomas (inappropriate pituitary hypersecretion of TSH, FSH or LH)*****	<ul style="list-style-type: none"> MRI Brain without and with contrast (CPT® 70553) or MRI Brain without contrast (CPT® 70551) when hormone levels are inappropriately elevated and there is a concern for a pituitary lesion. Refer to appropriate post-operative, or Microadenoma/Macroadenoma guidelines based on the size of the lesion and initial management. <ul style="list-style-type: none"> Long-term follow-up imaging based on clinical and biochemical status at the request of a specialist or any provider in consultation with a specialist
Male Hypogonadism*****	<ul style="list-style-type: none"> MRI Brain without and with contrast (CPT® 70553) or MRI Brain without contrast (CPT® 70551) if ONE of the following: <ul style="list-style-type: none"> Severe secondary hypogonadism (as indicated by morning serum testosterone level <150 ng/dl and low or normal LH and FSH levels) (See Background and Supporting Information) Below normal testosterone level (serum total testosterone, free testosterone and/or bioavailable morning testosterone) AND low or normal LH and FSH levels, in an individual with either: <ul style="list-style-type: none"> Panhypopituitarism Hyperprolactinemia Signs of tumor mass effect (headache, visual impairment, or visual field deficit) Elevated sex hormone binding globulin (SHBG)
Female Hypogonadism (Secondary Amenorrhea may be a feature) ²⁵	<ul style="list-style-type: none"> MRI Brain without and with contrast (CPT® 70553) or MRI Brain without contrast (CPT® 70551) for normal or low FSH with low estradiol (LH may be normal or low also)

Indication	Imaging
Growth Hormone Deficiency (Adult onset) ²⁵	<p>MRI Brain without and with contrast (CPT® 70553) or MRI Brain without contrast (CPT® 70551) for the following:</p> <ul style="list-style-type: none"> • Low Growth Hormone (GH) <p>OR</p> <ul style="list-style-type: none"> • Low IGF-1 <p>AND</p> <ul style="list-style-type: none"> • One abnormal provocative test (likely will be Glucagon Stimulation test as GNRH is unavailable and Insulin Tolerance test poses risks) • If 3 or more pituitary hormones are deficient (including GH), then provocative test is not needed.
Secondary (Central) Adrenal Insufficiency ²⁵	<p>MRI Brain without and with contrast (CPT® 70553) or MRI Brain without contrast (CPT® 70551) for the following:</p> <ul style="list-style-type: none"> • ACTH is low or normal at 10 or lower <p>AND</p> <ul style="list-style-type: none"> • Low baseline cortisol level < 3 µg/dL <p>OR</p> <ul style="list-style-type: none"> • abnormal ACTH stimulation test with suboptimal cortisol stimulation where cortisol does not reach above 18 µg/dL
Central Hypothyroidism ²⁵	<ul style="list-style-type: none"> • MRI Brain without and with contrast (CPT® 70553) or MRI Brain without contrast (CPT® 70551) for the following: <ul style="list-style-type: none"> • Low free T4 with normal, low or mildly elevated TSH
Hypopituitarism (deficiency of one or more pituitary hormones)	<ul style="list-style-type: none"> • MRI Brain without and with contrast (CPT® 70553) or MRI Brain without contrast (CPT® 70551)

Indication	Initial Imaging	Repeat Imaging for Non-Operative Care
Diabetes Insipidus (DI)	<ul style="list-style-type: none"> MRI Brain without and with contrast (CPT® 70553) or MRI Brain without contrast (CPT® 70551) if: <ul style="list-style-type: none"> Laboratory testing consistent with DI (serum osmolality should be high and urine osmolality should be low) and etiology uncertain 	NA
Syndrome of Inappropriate ADH (SIADH)	<ul style="list-style-type: none"> MRI Brain without and with contrast (CPT® 70553)) or MRI Brain without contrast (CPT® 70551) if: <ul style="list-style-type: none"> Etiology remains uncertain or is thought to be in the nervous system; Urine osmolality should be high and serum osmolality low 	NA
Other Pituitary Region Tumors	<ul style="list-style-type: none"> Evaluation may require CT in addition to MRI to evaluate for hyperostosis. 	

Background and Supporting Information

- ***Acromegaly:** A serum level of growth hormone greater than 1ng/mL when measured two hours following an oral glucose load confirms acromegaly.
- ****Cushing's Disease:** It is important to differentiate Cushing's syndrome (hypercortisolism from any source) from Cushing's disease which is ACTH hypersecretion from the pituitary gland. Hypercortisolism is quantified by 24hour urine cortisol collection, low dose dexamethasone suppression test and/or late night salivary cortisol measurement. ACTH is elevated or inappropriately normal in Cushing's disease and ectopic sources of ACTH production, but suppressed in other causes of hypercortisolism²⁶. A high dose dexamethasone suppression test can help determine if the elevated ACTH is from a pituitary or ectopic source. Petrosal sinus sampling may be required for tumor localization pre-operatively in the setting of a normal pituitary MRI or a small adenoma. These tumors may be managed with surgery, medical therapy, radiation and/or bilateral adrenalectomy.
- *****Prolactinoma:** To establish the diagnosis of hyperprolactinemia, a single measurement of serum prolactin is recommended; a level above the upper limit of normal confirms the diagnosis as long as the serum sample was obtained without excessive venipuncture stress. Pregnancy and primary hypothyroidism should be excluded as physiologic causes of prolactin elevation and medications that may be contributing to prolactin elevation should be considered. Dopamine agonist therapy

is typically stopped during pregnancy, monitoring of prolactin levels ceases. Routine imaging surveillance during pregnancy is not recommended due to risk to fetus. Repeat imaging with MRI without gadolinium can be performed however for new or worsening symptoms, such as headaches or visual symptoms.

- **** **Medication-induced prolactin elevation:** Medication induced hyperprolactinemia is seen most commonly with antipsychotics/neuroleptics and antidepressants, but may also be seen with some anti-emetics and antihypertensive agents. In individuals on prolactin elevating drugs, a prolactin level should be repeated after withdrawal of medications for 72 h, however, this approach may not be safe if this treatment is offered for psychiatric indications. If stopping the drug is not feasible, pituitary MRI is advised to rule out a sellar/parasellar tumor.²²
- *******TSH, FSH, or LH producing adenomas:** These are the least common of all hormonally active pituitary tumors. Individuals with TSH secreting adenomas have inappropriate TSH elevation in the setting of hyperthyroidism (elevated thyroid hormone levels). Almost all gonadotroph adenomas are clinically non-functioning. The infrequent presentation of a functioning gonadotroph adenoma should be differentiated clinically from appropriate FSH and LH elevation seen in low estrogen states (including menopause) as well as primary hypogonadism (testicular failure). Functioning TSH, FSH or LH pituitary adenomas may be managed with surgical, radiation and/or medical therapies.
- *******Male Hypogonadism:** Alterations in sex hormone-binding globulin (SHBG) can impact testosterone levels. Free or bioavailable testosterone concentrations should be measured when total testosterone concentrations are close to the lower limit of the normal range and when altered SHBG levels are suspected (e.g. moderate obesity, nephrotic syndrome, hypo- and hyperthyroidism, use of glucocorticoids, progestins, estrogens, and androgenic steroids, anticonvulsants, acromegaly, diabetes mellitus, aging, HIV disease, liver cirrhosis, hepatitis). LH and FSH should be obtained to evaluate for secondary (central) hypogonadism, once low testosterone level is confirmed. Morning testosterone level is drawn anytime before 10 am for a typical sleep-wake cycle.
- Central hypothyroidism is an anatomic or functional disorder of the pituitary gland or the hypothalamus, resulting in altered TSH secretion. Diagnosis is usually made biochemically with low circulating free T4 (FT4) concentrations associated with low/normal serum TSH levels.²⁴

Post-Operative and Repeat Imaging Indications (HD-19.2)

HD.PT.0019.2.A

v2.0.2024

- For imaging in the immediate post-operative period or for acute surgical complications
 - See **Primary Central Nervous System Tumors (ONC-2.1)** in the Oncology Imaging Guidelines.
- A routine post-operative MRI is generally done at 3 months and/or at the discretion of, or in consultation with an Endocrinologist, Neurologist, Neurosurgeon, ENT, Ophthalmologist, Neuro-Ophthalmologist or Radiation Oncologist.
- Frequency of follow-up imaging depends on the post-operative size and/or functional status of the pituitary adenoma. Refer to the grid sections for Microadenoma/Macroadenoma as well as those for disorders of pituitary hormone excess.
- Individuals with hyper-functioning tumors such as acromegaly, Cushing's disease, and excess TSH secretion may be treated with a combination of surgery, medical therapy and radiation. Long-term monitoring of clinical status and repeat imaging at the discretion of, or in consultation with an Endocrinologist, Neurologist, Neurosurgeon, ENT, Ophthalmologist, Neuro-Ophthalmologist or Radiation Oncologist.

Empty Sella Turcica (HD-19.3)

HD.DPT.0019.3.A

v2.0.2024

- Enlarged/Empty Sella Turcica: An enlarged sella turcica without evident tumor is an incidental finding on MRI Brain or CT Head from a defect in the dural diaphragm of the sella (especially if there is elevated intracranial pressure from another cause), pituitary surgery, or as a result of a pituitary tumor which has expanded the sella and then infarcted (pituitary apoplexy).
- MRI Brain with and without contrast (pituitary protocol) (CPT® 70553) with thin sections of pituitary or MRI Brain without contrast (CPT® 70551) is supported. CT Head with and without contrast (CPT® 70470) – If MRI is contraindicated.
 - Primary Empty Sella:
 - Incidentally found on other studies, asymptomatic and no related abnormalities: follow up at 2 years. No further imaging unless clinical symptoms develop (neuro-/ophthalmological symptoms, intracranial hypertension, or endocrine/hormonal abnormalities).
 - Following medical or surgical treatment of related endocrine, neurological, or ophthalmological problems: follow-up imaging every 6 months in the year after treatment and/or at the request of a specialist or any provider in consultation with a specialist (see **Papilledema/Pseudotumor Cerebri (HD-17.1)** for additional imaging recommendations)
 - Secondary Empty Sella
 - Imaging according to the cause or if clinical disease progression (such as adenomas, infiltrative or malignant disorders, hormonal abnormalities, neuro-/ophthalmological symptoms)

Craniopharyngioma and Other Hypothalamic/Pituitary Region Tumors (HD-19.4)

HD.DPT.0019.4.A

v2.0.2024

- See Craniopharyngioma and Other Hypothalamic/Pituitary Region Tumors (PEDONC-4.10)

Scalp and Skull (HD-20)

Guideline

Scalp and Skull Lesions (HD-20.1)

Skull Base Osteomyelitis (SBO) (HD-20.2)

References (HD-20)

Scalp and Skull Lesions (HD-20.1)

HD.SK.0020.1.A

v2.0.2024

The majority of these are benign soft tissue or bony lesions easily defined by physical examination or with skull x-rays or ultrasound.

- Ultrasound is initial imaging of scalp or skull lesions
- CT Head without or without and with contrast (CPT® 70450 or CPT® 70470) is indicated for the following scenarios:
 - Any lesion on physician examination and skull x-ray or ultrasound which is not clearly benign.
 - In cases where surgical planning is in progress, x-rays and/or ultrasound are not required.
 - Langerhans' cell histiocytosis, myeloma, and metastatic cancer, when symptoms suggest bony lesions.
- MRI Brain without contrast (CPT® 70551) or with and without contrast (CPT® 70553) if there is concern for intracranial extension.
- See **Dental/Periodontal/Maxillofacial Imaging (HD-30.2)** for mandibular masses
- The following imaging is indicated for children and adults with Pott Puffy Tumor:
 - MRI Brain without and with contrast (CPT® 70553) or CT Head without and with contrast (CPT® 70470)⁴
 - Repeat imaging is supported if requested by a neurologist, neurosurgeon, otolaryngologist (ENT) and/or oromaxillofacial surgery (OMS) or any provider coordinating care with a neurologist, neurosurgeon, otolaryngologist (ENT) and/or oromaxillofacial surgery (OMS)

Background and Supporting Information

Pott Puffy Tumor is an abscess involving the frontal bone with adjacent osteomyelitis as the result of a frontal sinus infection that spreads contiguously through the wall of the sinus or through hematogenous spread via the veins that drain sinus mucosa.⁴

Skull Base Osteomyelitis (SBO) (HD-20.2)

HD.SK.0020.2.A

v2.0.2024

- Note: SBO may occur from the temporal bones or paranasal sinuses and imaging should be of the region of origin
- Neuroimaging is indicated in the diagnosis and treatment of skull base osteomyelitis and necrotizing external otitis. The following advanced imaging studies for the diagnosis of skull base osteomyelitis and necrotizing external otitis:
 - MRI Brain without and with contrast (CPT® 70553)
 - Will be positive earliest in disease
 - CT Head without contrast (CPT® 70450), CT Temporal bone without contrast (CPT® 70480), CT Temporal bone with contrast (CPT® 70481), CT Maxillofacial without contrast (CPT® 70486), CT Maxillofacial with contrast (CPT® 70487) or CT Neck with (CPT® 70491)
 - Will best define bony destruction, but is positive later in disease
 - Gallium-67 Scan
 - Bone Scan
 - Skull base osteomyelitis: + Gallium and + Bone scan
 - Necrotizing otitis externa: + Gallium and - Bone scan
 - Indium WBC may be substituted for or used in addition to Gallium scanning to evaluate response to therapy and especially in cases that have undergone surgical debridement.
- Treatment response: Gallium-67 Scan every 4-6 weeks till scan is negative
- Surveillance Scanning: Gallium-67 Scan at 4 weeks and 3 months post treatment

Background and Supporting Information

Skull based osteomyelitis is a rare complication of otitis externa. It occurs most commonly among the immunocompromised, older members (greater than 65 years of age) and members with diabetes.⁵

Multisystem Smooth Muscle Syndrome/Smooth Muscle Dysfunction Syndrome	See <u>Multisystem Smooth Muscle Syndrome/Smooth Muscle Dysfunction Syndrome (HD-21.7)</u>

Background and Supporting Information

- Pregnancy is an independent risk factor for stroke. Additional risk factors are not required for assessment of a stroke/TIA with acute focal neurological deficits.
- Additional arterial and venous hypercoaguable states that impose a stroke risk include:
 - Antiphospholipid syndrome
 - Hyperhomocysteinemia
 - Factor V Leiden mutation
 - Prothrombin gene mutation

- Protein S deficiency
- Protein C deficiency
- Anti-thrombin deficiency

Risk Assessment for Extracranial Carotid Disease (HD-21.2)

HD.HL.0021.2.A

v2.0.2024

- Duplex Ultrasound Carotid Arteries (CPT® 93880 or CPT® 93882) for the following:
 - Asymptomatic or symptomatic cervical bruits;
 - Clinical suspicion of extracranial carotid occlusion and the rationale is included
 - Pulsatile neck mass
 - Evaluation of blunt or penetrating neck trauma
 - Amaurosis fugax or ocular microembolism (optic nerve/retinal arterial or Hollenhorst plaques seen on exam)
 - Recent history of focal cerebral or ocular transient ischemic attacks
- Follow-up with CTA or contrast enhanced MRA
 - CTA and contrast enhanced MRA are comparable non-invasive imaging alternatives each with their own advantages and disadvantages
- For additional indications for Duplex Ultrasound Carotid Arteries
 - See **Initial Imaging (PVD-3.1)** in the Peripheral Vascular Disease (PVD) Imaging Guidelines
- For repeat (Surveillance) Duplex Ultrasound Carotid Arteries (CPT® 93880 or CPT® 93882)
 - See **Surveillance Imaging with NO History of Carotid Surgery or Intervention (PVD-3.2)** and **Surveillance Imaging WITH History of Carotid Surgery or Intervention (PVD-3.3)** in the Peripheral Vascular Disease (PVD) Imaging Guidelines.

Cryptogenic Stroke (HD-21.3)

HD.ST.0021.3.A

v2.0.2024

- 25% of individuals with ischemic stroke have no probable cause and is considered cryptogenic after a standard workup including an echocardiogram, inpatient cardiac telemetry or 24-Holter monitoring, CT or MRI Brain and vessel imaging of the brain or neck arteries and hematologic tests.
- A stroke may also be considered cryptogenic after a standard evaluation fails to yield an etiology in a person <50 years of age without risk factors with more extensive testing.
- Most cryptogenic sources are embolic in etiology from venous or arterial sources with investigations from disturbances in coagulation and sources of embolism including patent foramen ovale (PFO) and paroxysmal atrial fibrillation.
- Specialized evaluation with the following documentation:
 - MRI/CT Brain with results of stroke
 - Results of MRA/CTA Head and Neck
 - TTE or TEE
 - 24-Hr Holter monitor or Inpatient cardiac telemetry and 12-Lead ECG
- Hematologic testing to include: CBC, Platelet count, INR, PT, PTT, D-Dimer and Arterial and Venous Hypercoagulability tests
 - MRA or CTA Pelvis for the evaluation of paradoxical venous thromboembolism with PFO
 - See **Acute Limb Swelling (PVD-12)** in the Peripheral Vascular Disease (PVD) Imaging Guidelines.
 - Workup for occult cancer, CT Chest Abdomen and/or Pelvis with contrast after the previously indicated tests with results are provided.
 - See **Paraneoplastic Syndromes (ONC-30.3)** in the Oncology Imaging Guidelines.
 - Cardiac CT (CPT® 75574 or CPT® 75572) instead of TEE if TTE is inconclusive

Transient Global Amnesia (HD-21.4)

HD.ST.0021.4.A

v2.0.2024

- Transient Global Amnesia (TGA) is a clinical diagnosis with the differential diagnosis including, but not exclusive to: ischemic events, migraine headaches, and transient epileptic amnesia.
- Characteristics of TGA may include the following:
 - Inability to retain new information, lasting for several hours with preservation of alertness and all other cognitive functions with repetitive queries and amnesia³⁹
 - Witnessed episode
 - There must be anterograde amnesia during the attack
 - Cognitive impairment is limited to amnesia
 - No clouding of consciousness or loss of personal identity
 - No focal neurological signs/symptoms
 - No epileptic features
 - Attack must resolve within 24 hours
 - No recent head injury or active epilepsy
- Head and vessel imaging for ischemic etiology work-up should follow **Stroke/TIA (HD-21.1)**
- For suspected seizure, see **Epilepsy/Seizures (HD-9.1)**

Moyamoya Syndrome/Disease (HD-21.5)

HD.ST.0021.5.A

v2.0.2024

Initial imaging for Moyamoya Syndrome/Disease

- Below are indicated for initial evaluation of Moyamoya Syndrome/Disease³⁶:
 - MRI Brain without contrast (CPT® 70551) **OR**
 - MRI Brain without and with contrast (CPT® 70553) **AND/OR**
 - MRA Head (CPT® 70544, CPT® 70545, **OR** CPT® 70546) **AND/OR**
 - MRA Neck (CPT® 70547, CPT® 70548 **OR** CPT® 70549)
 - If MRA is contraindicated or not readily available, then CTA Head (CPT® 70496) **AND/OR** CTA Neck (CPT® 70498) is/are supported

Repeat imaging for Moyamoya Syndrome/Disease³⁶

- MRA Head (CPT® 70544, CPT® 70545, or **OR** CPT® 70546) every 12 months **AND/OR**
- MRA Neck (CPT® 70547, CPT® 70548 **OR** CPT® 70549)
 - If MRA is contraindicated or not readily available, then CTA Head (CPT® 70496) **AND/OR** CTA Neck (CPT® 70498) is/are supported
- MRI Brain without contrast (CPT® 70551) **OR** MRI Brain without and with contrast (CPT® 70553) every 12 months^{33,36}
- Radiopharmaceutical Localization Imaging SPECT (CPT® 78803) with vasodilating agent acetazolamide (Diamox) challenge is supported when surgery or other vascular intervention is considered.
- 3D Rendering (CPT® 76377 or CPT® 76376) with cerebral angiography to define the presence, location, and anatomy of intracranial and cervical vascular malformations.²²
 - See **General Guidelines - Other Imaging Situations (HD-1.7)** and **3D Rendering (Preface-4.1)** in the Preface Imaging Guidelines³⁷
- CT Perfusion (CPT® 0042T) **OR** MRI Perfusion (CPT® 70551 **OR** CPT® 70552 **OR** CPT® 70553)⁵¹ indicated:
 - When requested by neurologist and/or neurosurgeon
 - Prior to change in treatment
 - Post-surgical^{33,36}

Screening imaging for Moyamoya Disease^{34,35}

- Screening not indicated for Moyamoya Syndrome
 - See **Background and Supporting Information**
- Screening for Moyamoya Disease is indicated for:

- First degree relatives (biological parent, full sibling, or biological child) of individuals with Moyamoya Disease when requested by, or any provider in consultation with a neurologist, geneticist or neurosurgeon
- Below are indicated for screening evaluation of Moyamoya Disease:
 - MRA Head (CPT® 70544, CPT® 70545, **OR** CPT® 70546) **OR** Transcranial Doppler (TCD) Ultrasound (CPT® 93886 or CPT® 93888) (see **Transcranial Doppler (CPT®93886) (HD-24.8)** in the Head Imaging Guidelines)
 - If MRA is contraindicated or not readily available, then CTA Head (CPT® 70496) is supported

CT Perfusion (CPT® 0042T)

- Is supported if requested by a neurologist, neurosurgeon or any provider coordinating care with a neurologist or neurosurgeon.³⁶

MRI Perfusion

- MRI Perfusion may be obtained with MRI Brain (CPT® 70551 OR CPT® 70552 OR CPT® 70553)
 - No additional CPT® codes are necessary or appropriate to perform MRI perfusion.³³

Background and Supporting Information

Moyamoya disease (MMD) is a rare cerebrovascular disease characterized by progressive spontaneous bilateral occlusion of the intracranial internal carotid arteries (ICA) and their major branches (middle cerebral artery, MCA, and anterior cerebral artery, ACA) with compensatory capillary collaterals as an expression of pathologically increased angiogenic activity resembling a "puff of smoke" (Japanese: Moyamoya) on cerebral angiography.⁴¹ Moyamoya Disease is most prevalent in individuals with East Asian ancestry. Up to 15% of individuals with Moyamoya Disease may have a family history of Moyamoya Disease.^{34,35}

Moyamoya Disease is distinguished from Moyamoya Syndrome (MMS). MMD is a primary disease process. MMS is a secondary process that occurs in response to another underlying pathological process that causes stenosis of intracranial blood vessels.⁴⁰ There are two peaks of incidence with different clinical presentations, at around 10 years and 30-40 years. The peak appears to occur later in women than men. In children, ischemic symptoms, especially transient ischemic attacks, are predominant. Intellectual decline, seizures, and involuntary movements are also more common in this age group. In contrast, adult patients present with intracranial hemorrhage more often than pediatric patients.³⁵

Sickle Cell Disease⁸ (HD-21.6)

HD.ST.0021.6.A

v2.0.2024

- MRI Brain without contrast (CPT® 70551) **OR** MRI Brain without and with contrast (CPT® 70553) indications:
 - Screening to detect silent cerebral infarcts
 - New symptoms or cognitive impairment occurs or a change in academic performance
 - Prior to any change in therapy^{42, 44, 45, 46,52}
- MRA Head (CPT® 70544, CPT® 70545 OR CPT® 70546) **OR** CTA Head (CPT® 70496) indications:
 - Any new, indeterminate or equivocal findings on MRI Brain
 - Prior to any change in therapy^{42, 44, 45, 46,52}

Background and Supporting Information

Individuals with sickle cell disease are at significantly increased risk for stroke and silent infarction, beginning at a very young age. Recent advances allow physicians to identify individuals at high risk for stroke and begin a primary stroke prevention program.

Identification of silent cerebral infarction is important because treatment with prophylactic red cell transfusions to maintain hemoglobin S levels at <30% of total hemoglobin may reduce recurrent stroke and extent of neurologic damage.

- TCD for children aged 17 years old may be appropriate on a case-by-case basis.
- See **Transcranial Doppler (CPT®93886)(HD-24.8)** in the Head Imaging Guidelines for other indications for this modality and **Stroke/TIA (HD-21.1)** in the Head Imaging Guidelines.
- After 17 years old, for individuals with a history of abnormal TCDs, TCDs may be repeated every 3 months.⁴⁷
- TCD is not indicated for individuals with other phenotypes (Hgb SC, Hgb Sβ⁺).⁸

Multisystemic Smooth Muscle Syndrome (MSMS)/Smooth Muscle Dysfunction Syndrome (SMDS)/ACTA2 Mutations⁴⁹ (HD-21.7)

HD.ST.0021.7.A

v2.0.2024

Indications	Supported Imaging
Initial evaluation for confirmed ACTA2 mutation	<ul style="list-style-type: none"> MRI Brain without and with contrast (CPT® 70553) with OR without MRI perfusion <p>AND/OR</p> <ul style="list-style-type: none"> MRA Head (CPT® 70544, CPT® 70545, or CPT® 70546) <p>AND/OR</p> <ul style="list-style-type: none"> MRA Neck (CPT® 70547, CPT® 70548, or CPT® 70549)
Repeat imaging if requested by neurologist and/or neurosurgeon and/or geneticist and/or provider coordinating care with a neurologist and/or neurosurgeon and/or geneticist	<ul style="list-style-type: none"> MRI Brain without and with contrast (CPT® 70553) with OR without MRI perfusion <p>AND/OR</p> <ul style="list-style-type: none"> MRA Head (CPT® 70544, CPT® 70545, or CPT® 70546) <p>AND/OR</p> <ul style="list-style-type: none"> MRA Neck (CPT® 70547, CPT® 70548, or CPT® 70549)

- MRI Perfusion may be obtained with MRI Brain (CPT® 70551 OR CPT® 70552 OR CPT® 70553)
 - No additional CPT® codes are necessary or appropriate to perform MRI perfusion.⁵¹
- Because radiation is a known risk factor for development of moyamoya, MRI/MRA Head is recommended instead of Computed Tomography (CT)/CTA.⁴⁹
 - See **Background and Supporting Information**

- Conventional catheter angiogram 3D rendering (CPT® 76376 or CPT® 76377) should be reserved for patients with focal neurologic symptoms or evidence on MRA or transcranial Doppler (TCD) of critical or progressive narrowing of the cerebral arteries.⁴⁹
 - See **Screening for Suspected Peripheral Artery Disease/Aneurysmal Disease (PVD-2)**

Background and Supporting Information

Smooth muscle dysfunction syndrome (SMDS)/Multisystemic Smooth Muscle Syndrome (MSMS) presents with a recognizable pattern of complications, including congenital mydriasis, patent ductus arteriosus (PDA), pulmonary arterial hypertension, aortic and other arterial aneurysms, moyamoya-like cerebrovascular disease, intestinal hypoperistalsis and malrotation, and hypotonic bladder.⁴⁹

SMDS/MSMS is caused by heterozygous mutations of the ACTA2 altering arginine 179, most commonly p.Arg179His. With a single exception, all cases are due to de novo mutations.⁴⁹

Cerebral Vasculitis (HD-22)

Guideline

Cerebral Vasculitis (HD-22.1)

References (HD-22)

Cerebral Vasculitis (HD-22.1)

HD.CV.0022.1.A

v2.0.2024

- When CNS vasculitis is suspected, MRI Brain without and with contrast (CPT® 70553) is supported
 - MRA Head (CPT® 70544, CPT® 70545, or CPT® 70546) **AND**
 - MRA Neck (CPT® 70547, CPT® 70548, or CPT® 70549); **OR**
 - CTA Head (CPT® 70496) **AND**
 - CTA Neck (CPT® 70498) are supported concurrently with brain imaging
- Primary CNS vasculitis includes Giant Cell Arteritis also known as Temporal Arteritis (see also **New Headache Onset Older than Age 50 (HD-11.7)**)
- If initial vascular imaging is suspicious for vasculitis, 3D rendering (CPT® 76377 or CPT® 76376) with cervicocerebral angiography/arteriography (see also **General Guidelines- Other Imaging Situations (HD-1.7)**)
- Transcranial Doppler Studies for individuals with documented vasculitis or concern for vasospasm (see **Transcranial Doppler (CPT® 93886) (HD-24.8)**)
- FDG-PET is not supported due to lack of peer reviewed literature or expert consensus supporting the study for vasculitis.
- For extra-cranial giant cell arteritis evaluation (see **Giant Cell Arteritis (PVD-6.9.2)**)

Background and Supporting Information

The diagnosis of primary central nervous system vasculitis is challenging because of its nonspecific and varied symptoms. Central nervous system vasculitis typically presents with headache, followed by encephalopathy and behavioral changes. Focal neurologic deficits, including but not limited to, visual loss, unilateral weakness, language impairment, sensory loss, incoordination, occurs in 20% to 30% of individuals. Seizures and intracranial hemorrhage may also occur. With a strong clinical suspicion, brain imaging is important for supporting the diagnostic process and directing biopsy.⁶

Classification of vasculitides based on vessel size adapted from Younger. MRA and CTA are useful for the evaluation of the large proximal arteries; evaluation of a possible small vessel vasculitis may be beyond the resolution of routine MRA and CTA Head. However, other abnormalities, such as atherosclerotic disease, arterial dissection, Moyamoya disease, or reversible cerebral vasoconstriction may be demonstrated. Conventional angiogram is superior to MRA and CTA in demonstrating abnormalities in smaller vessels and is considered the "gold standard" in the evaluation of primary small vessel CNS vasculitis.

Dominant Vessel Involved	Primary	Secondary
Large arteries	<ul style="list-style-type: none"> Giant cell arteritis Takayasu's arteritis 	Aortitis with rheumatoid disease; Infection (e.g. syphilis)

Dominant Vessel Involved	Primary	Secondary

Background and Supporting Information

- Dizziness, a common complaint, with benign and dangerous causes, may be continuous, triggered, or spontaneous.
- For the continuously dizzy individual with nystagmus at the time of evaluation, a head impulse test and a test of skew should be performed to determine if dizziness is due to a peripheral cause or a posterior circulation stroke. Abnormalities on exam may be indications for imaging as detailed below.
- For triggered dizziness, positional testing such as the Dix-Hallpike maneuver, and/or orthostatic blood pressure measurements, should be performed. If

symptoms are reproduced on examination, triggered dizziness is confirmed. Imaging as indicated in the relevant sections below.

- Spontaneous dizziness may be due to vestibular migraine, TIA, or Meniere's disease, among other causes. A detailed neurologic examination should be performed, and imaging as detailed below.
- The Dix-Hallpike maneuver should be performed or the individual should be referred to a clinician who could perform the procedure if Benign Paroxysmal Positional Vertigo (BPPV) is suspected.
- The Head Impulse Test (HIT) is also known as the Head thrust test. It is designed to evaluate the vestibular-ocular reflex in an individual with concern for a peripheral vestibulopathy due to ACUTE spontaneous vertigo. The individual is instructed to look at the examiner during the entire test. The individual's head is then quickly turned or rotated to one side and then the other. If normal, the individual's eyes should remain locked on the examiner. If abnormal, the eyes will move in the direction of the head rotation and then quickly correct. This saccade indicates peripheral vestibular hypofunction on the side of the direction that the head is turned. The HIT test is abnormal in individuals with vestibular neuronitis, and normal in individuals with a posterior circulation stroke.
- Posterior Canal BPPV (85%-95% of BPPV cases) is defined as:
 - Individual reports repeated episodes of vertigo with changes in head position relative to gravity.
 - Each of the following criteria is fulfilled on physical exam:
 - Vertigo associated with torsional (rotatory), upbeat (toward the forehead) nystagmus is provoked by the Dix-Hallpike test.
 - There is a latency period between the completion of the Dix-Hallpike maneuver and the onset of vertigo and nystagmus.
 - The provoked vertigo and nystagmus increase and then resolve within 60 seconds from the onset of the nystagmus.
- Lateral or Horizontal Canal BPPV (5%-15% of BPPV cases) will have horizontal or no nystagmus to which a supine roll test assess for this condition.
- Exclusions for Dix-Hallpike maneuver
 - Individual previously diagnosed with BPPV and who on date of encounter in calendar year does not have positional dizziness or vertigo consistent with active BPPV
 - Individual has declined Dix-Hallpike maneuver
 - Individual has cervical spinal disease (i.e., cervical stenosis, severe kyphoscoliosis, limited cervical range of motion, Down's syndrome, severe rheumatoid arthritis, cervical radiculopathies, Paget's disease, ankylosing spondylitis, low back dysfunction, spinal cord injuries, spinal fractures)
 - Individual unable to lay flat (i.e., severe heart disease)
 - Individual has severe atherosclerotic disease or recent dissection involving the anterior or posterior cerebral circulation Unable to be seated in exam chair (i.e., morbidly obese), or maneuver cannot be safely performed given morbid obesity

- Ehlers Danlos/Marfans/Connective tissue disorder due to risk of cranio spinal instability/dissection
- Triggered episodic vestibular syndrome (t-EVS) usually last seconds to minutes with the most common triggers (vs. exacerbating factors) are head motion or change in body position. In the Emergency Department, benign paroxysmal positional vertigo (BPPV) is the second most common cause of t-EVS after orthostatic hypotension. Far lateral rotation of the neck leads to mechanical occlusion of one or both vertebral arteries causing temporary symptoms of vertigo and nystagmus when this position is maintained and may occur with the individual upright.
- Diagnoses or conditions associated with OH or nOH include: Parkinson Disease (PD), Multiple System Atrophy (MSA), Pure Autonomic Failure (PAF) or Dementia with Lewy Bodies (DLB), unexplained fall or syncope, peripheral neuropathies secondary to diabetes, amyloidosis and HIV), individuals ≥ 70 years of age and frail and on multiple medications and individuals with postural (orthostatic) dizziness or nonspecific symptoms that occur when standing. Symptoms may include: lightheadedness or dizziness, the sensation of blacking out, cognitive dysfunction, mental dulling, generalized weakness, neck pain or discomfort in the suboccipital and paracervical region (coat hanger) or platypnea (dyspnea while standing)
- Secondary or advanced laboratory testing is considered for use in select individuals for paraneoplastic syndromes (paraneoplastic panel) and serum and urine protein electrophoresis for monoclonal gammopathy for peripheral neuropathy.
 - See **Polyneuropathy (PN-3.1)** in the Peripheral Nerve Disorders Imaging Guidelines, **Multiple Myeloma and Plasmacytomas (ONC-25)** in the Oncology Imaging Guidelines, and **Paraneoplastic Syndromes (ONC-30.3)** in the Oncology Imaging Guidelines.
- Semicircular canal dehiscence (SCD) is a rare syndrome caused by dehiscence in the bony covering of the affected superior, posterior or lateral semicircular canal. When present, it can result in vestibular symptoms of vertigo associated with auditory symptoms including oscillopsia evoked by noise and conductive hearing loss. The vestibular symptoms in SCD can be debilitating. Individuals may note that loud noises cause them to see things moving or that they experience a similar sensation when they cough, sneeze, or strain to lift something heavy. The signs of vestibular abnormalities in SCD relate directly to the effect of the dehiscence which has created a third mobile window of the inner ear. Some individuals have a conductive hearing loss for low-frequency sounds that can resemble the pattern in otosclerosis.
- Occlusive carotid artery disease does not cause fainting but rather causes focal neurologic deficits such as unilateral weakness. Thus, carotid imaging will not identify the cause of the fainting and increases cost. Fainting is a frequent complaint, affecting 40% of people during their lifetime.

CT or MRI Perfusion (HD-24.5)
Magnetic Resonance Neurography (MRN) (HD-24.6)
Cone Beam Computed Tomography (CBCT) (HD-24.7)
Transcranial Doppler (CPT® 93886) (HD-24.8)
References (HD-24)

Transcranial Magnetic Stimulation (TMS) (HD-24.1)

HD.OI.0024.1.U

v2.0.2024

In TMS, an electromagnetic coil placed on the surface of the skull overlying the motor cortex depolarizes the motor axons, creating a motor evoked potential (MEP), which is recorded via superficial skin electrodes as it passes through the upper and lower motor pathways to an innervated muscle.

TMS is currently considered not medically necessary.

Functional MRI (fMRI) (HD-24.2)

HD.OI.0024.2.A

v2.0.2024

- fMRI is useful in pre-operative scenarios to define the “eloquent” areas of brain
 - The ordering physician must be a neurologist, neurosurgeon or radiation oncologist or any provider in consultation with one of these specialists.
- Primary indications for fMRI include, but are not limited to, the following:
 - Assessment of intracranial neoplasm and other targeted lesions
 - Presurgical planning and operative risk assessment
 - Assessment of eloquent cortex (e.g., language, sensory, motor, visual centers) in relation to a tumor or another focal lesion
 - Surgical planning (biopsy or resection)
 - Therapeutic follow-up, as a one-time, post-operative, follow up study
 - Evaluation of preserved eloquent cortex
 - Assessment of eloquent cortex for epilepsy surgery
 - Assessment of radiation treatment planning and post-treatment evaluation of eloquent cortex
- fMRI is indicated with PET Brain in epilepsy surgery planning
- Procedure codes for functional MRI:
 - CPT® 70554 MRI Brain, functional MRI, including test selection and administration of repetitive body part movement and/or visual stimulation, not requiring physician or psychologist administration
 - CPT® 70555 MRI Brain, functional MRI; requiring physician or psychologist administration of entire neurofunctional testing
 - If MRA Head (CPT® 70544) is indicated but Functional MRI (CPT® 70554 or CPT® 70555) was erroneously ordered, then CPT® 70544 may be substituted when appropriate
- MRI Brain (CPT® 70551 or CPT® 70553) and/or fMRI (CPT® 70554 or CPT® 70555) are appropriate concurrently.
 - See **Unlisted Procedures/Therapy Treatment Planning (Preface-4.3)** in the Preface Imaging Guidelines if MRI Unlisted is requested for surgical planning

Magnetic Resonance Spectroscopy (MRS) (HD-24.3)

HD.OI.0024.3.A

v2.0.2024

- MRS (CPT® 76390) involves analysis of the levels of certain chemicals in a pre-selected voxels (small regions) on an MRI scan done at the same time.
- When conventional imaging by magnetic resonance imaging (MRI) or computed tomography (CT) provides limited information regarding specific clinical questions, indications for MRS in adults and children include, but are not limited to, the following and is evaluated on a case-by-case basis:
 - Distinguish recurrent brain tumor from radiation necrosis as an alternative to PET (CPT® 78608)
 - Diagnosis of certain rare inborn errors of metabolism affecting the CNS (primarily pediatric individuals)
 - Evidence or suspicion of primary or secondary neoplasm (pretreatment and posttreatment)
 - Grading of primary glial neoplasm, particularly high-grade versus low-grade glioma
 - Evidence or suspicion of brain infection, especially cerebral abscess (pretreatment and posttreatment) and HIV-related infections
 - Seizures, especially temporal lobe epilepsy

Background and Supporting Information

- Evaluation of certain primary brain tumors where diagnostic accuracy has been established in peer-reviewed literature.
 - See **Primary Central Nervous System Tumors – General Considerations (ONC-2.1)**, **Low Grade Gliomas (ONC-2.2)**, and **High Grade Gliomas (ONC-2.3)** in the Oncology Imaging Guidelines

CSF Flow Imaging (HD-24.4)

HD.OI.0024.4.A

v2.0.2024

- Pulse-gated MRI imaging or MRI CINE is generally performed as a part of a MRI Brain study. It is not coded separately for pre-operative evaluation of hydrocephalus, Chiari syndromes, Normal Pressure Hydrocephalus, Idiopathic Intracranial Hypertension (also known as pseudotumor cerebri), and spontaneous intracranial hypotension.
- There is no specific or unique procedure code for this study; it is done as a special sequence of a routine MRI Brain without contrast (CPT® 70551).
- If not previously performed as part of recent study, a second study for the purpose of evaluating CSF flow may be performed.

CT or MRI Perfusion (HD-24.5)

HD.OI.0024.5.A

v2.0.2024

- Performed as part of a CT Head or MRI Brain examination in the evaluation of individuals with very new strokes or brain tumors.
- CT perfusion study, if performed in conjunction with a CT angiogram of the intracranial and/or cervical vessels, can be performed before, after, or concurrent with the CT angiogram.
 - CTA Head and/or Neck is indicated in conjunction with the CT Perfusion study (CPT® 0042T).
- CPT® 0042T - “cerebral perfusion analysis using CT”.
 - To evaluation of acute stroke (<24 hours) to help identify individuals with stroke-like symptoms and to help identify those most likely to benefit from thrombolysis or thrombectomy
 - Follow up fo acute cerebral ischemic or infarction and/or reperfusion in the subacute or chronic phase of recovery
 - To assist in planning and evaluating the effectiveness of therapy for cervical or intracranial arterial occlusive disease (as an isolated test or in combination with a cerebrovascular reserve challenge) and/or chronic cerebral ischemia
 - Identifying cerebral hypoperfusion syndrome following revascularization
 - Evaluation of the vascular status of solid tumors where MRI is degraded due to susceptibility artifact from air-containing spaces, surgical clips, or dental work
 - Follow up of tumor response to therapy
- MRI Perfusion may be obtained with MRI Brain (CPT® 70551 OR CPT® 70552 OR CPT® 70553).
 - No additional CPT® codes are necessary or appropriate to perform MRI perfusion.⁹
- Indications for perfusion magnetic resonance imaging (MRI) MRI Perfusion (CPT® 70551 OR CPT® 70552 OR CPT® 70553)⁹ include the following:
 - Diagnosis and Characterization of Mass Lesions
 - Differential diagnosis (tumor versus tumor mimic)
 - Diagnosis of primary neoplasms (may include grading)
 - Surgical planning (biopsy or resection)
 - Targeting locations for biopsy
 - Guiding resection extent
 - Therapeutic follow-up
 - Radiation necrosis versus recurrent or residual tumor
 - Chemonecrosis versus recurrent or residual tumor
 - Pseudopgression and pseudoresponse

- Monitor potential transformation of non-resectable low grade neoplasms to higher grade
- Assessment of Neurovascular Disease
 - Acute stroke (assessment of ischemic penumbra)
 - Assessment of the hemodynamic significance of cervical or intracranial vascular stenosis
 - Assessment of cervical or intracranial revascularization efficacy
 - Assessment of vasospasm
- Other indications are usually regarded as not medically necessary.

Magnetic Resonance Neurography (MRN) (HD-24.6)

HD.OI.0024.6.A

v2.0.2024

- See **Magnetic Resonance Neurography (MRN) (PN-7.1)** in the Peripheral Nerve Disorders (PND) Imaging Guidelines.

Cone Beam Computed Tomography (CBCT) (HD-24.7)

HD.OI.0024.7.A

v2.0.2024

- CPT® Codes: CPT® 70486, CPT® 70487, CPT® 70488, CPT® 70480, CPT® 70482 (No separate 3-D rendering codes should be reported)
- An alternative to traditional CT imaging is in-office cone beam testing and possible decreased radiation dosage. The indications for office-based CT imaging are the same as for traditional scanners, and they should not be used for diagnosing or managing uncomplicated acute bacterial rhinosinusitis (ABRS).
- See **Temporomandibular Joint Disease (TMJ) (HD-30.1)** and **Dental/Periodontal/Maxillofacial Imaging (HD-30.2)**

Transcranial Doppler (CPT® 93886) (HD-24.8)

HD.OI.0024.8.A

v2.0.2024

- Transcranial Doppler (TCD) is a non-invasive ultrasonic technique that measures local blood flow velocity and direction in the proximal portions of intracranial and extracranial arteries

CPT Code	Description	Additional Notes
93886	Transcranial Doppler study of the intracranial arteries; complete study	
93888	Transcranial Doppler study of the intracranial arteries; limited study	
93890	Transcranial Doppler study of the intracranial arteries; vasoreactivity study	
93892	Transcranial Doppler study of the intracranial arteries; emboli detection without intravenous microbubble injection	
93893	Transcranial Doppler study of the intracranial arteries; emboli detection with intravenous microbubble injection	Report 93893 if the study is performed with intravenous microbubble injection. Transcranial Doppler studies described as “with contrast” are performed with intravenous microbubble injection. The bubbles serve to enhance ultrasound thus enabling better visualization of the intracranial arteries.

- Transcranial Doppler studies are ordered either as a single complete or limited study or as a combination of the complete or limited study with additional studies for further evaluation of the condition being investigated.
- Evaluation of Stroke/TIA usually includes CPT® 93886 and CPT® 93890 (Vasoreactivity study) and either CPT® 93892 or CPT® 93893 (Emboli detection).
 - Examples include:

- Evaluation of right to left cardiac shunts: Detection of microemboli in individuals with stroke or TIA. (CPT® 93892 or CPT® 93893 added to CPT® 93886)
- Evaluation of intracranial occlusive disease in individuals with documented stroke or TIA (CPT® 93890 added to CPT® 93886)
- Evaluation of hemodynamic effects of known severe extra-cranial occlusive disease (CPT® 93890 added to CPT® 93886)
- TCD studies are indicated for the following:
 - Evaluation of severe stenosis or occlusion of the extracranial ($\geq 60\%$ diameter reduction) and major basal intracranial arteries ($\geq 50\%$ diameter reduction)
 - Detection and serial evaluation of cerebral vasospasm in subarachnoid hemorrhage
 - Evaluation of cerebral embolization including in COVID-19 and refractory encephalopathy
 - Assessing the extent of collateral circulation in individuals with known regions of severe stenosis or occlusion
 - To detect residual right to left shunting after repair/closure of an intracardiac or intrapulmonary shunt
 - Evaluation of AVM both pre- and post-surgical intervention.
 - Periprocedural monitoring to detect cerebral thrombosis, embolization, hypoperfusion, and hyperperfusion
 - Assessing the stroke risk in children aged two to sixteen with homozygous sickle cell disease
 - Annual screening for individuals with Sickle Cell Anemia (Hb-SS) and Sickle Beta Thalassemia (S β) (CPT® 93886) up to the age of 16.
- TCD studies are not indicated for evaluation of:
 - Brain tumors
 - Familial and degenerative disease of the brain
 - Psychiatric disorders
 - Epilepsy
 - Migraine or other primary headache disorders
 - Infectious and inflammatory conditions

Background and Supporting Information

- Transcranial Doppler (TCD) ultrasound provides rapid, non-invasive, real time measure of cerebrovascular function.
- TCD can be used to measure flow velocity in the proximal cerebral arteries to assess relative changes in flow, diagnose focal vascular stenosis, or to detect embolic signals within these arteries.
- TCD can be used to measure blood flow responses to changes in blood pressure (cerebral autoregulation), changes in end-tidal CO₂ (cerebral vasoreactivity), or cognitive and motor activation (neurovascular coupling or functional hyperemia).

- A technical limitation of TCD includes inadequate temporal bone acoustic windows due to a thickened skull which limits ultrasound penetration
- Studies are ongoing regarding the use of TCD in the evaluation of dementia and psychiatric conditions such as depression.
- CPT® 93890, CPT® 93892, CPT® 93893 represent add on services that require additional expertise, lab time, and equipment not included in the complete and limited codes. These additional codes may be appropriate during the same encounter if medical necessity is documented.
- CPT® 93890 Vasoreactivity Study: Measures response of cerebral blood flow to increased CO₂ levels (following breath holding or administration of acetazolamide); It is used to evaluate risk of stroke and significance of carotid stenosis; individuals with loss of normal reactive changes are likely to be at increased risk of stroke.
- CPT® 93892/CPT® 93893: Identification of right to left shunts (microembolic signals may be detected during TCD monitoring) and may indicate source of emboli in individuals with stroke or TIA. TCD bubble test is very sensitive and may be superior to transthoracic and transesophageal echocardiography in detection of right to left shunts.
- Transcranial Doppler (TCD) is considered not medically necessary for the following indications:
 - Assessing individuals with migraine;
 - Monitoring during cardiopulmonary bypass and other cerebrovascular and cardiovascular interventions, and surgical procedures (except during carotid endarterectomy, as noted above);
 - Evaluation of individuals with dilated vasculopathies such as fusiform aneurysms;
 - Assessing autoregulation, physiologic, and pharmacological responses of cerebral arteries; and/or
 - Evaluating children with various vasculopathies, such as moyamoya disease and neurofibromatosis.

Epistaxis (HD-25)

Guideline

Epistaxis (HD-25.1)

References (HD-25)

Epistaxis (HD-25.1)

HD.EX.0025.1.A

v2.0.2024

- After initial nasal endoscopy by ENT, if there are findings suspicious for a mass lesion:
 - CT Maxillofacial without or with contrast (CPT® 70486 or CPT® 70487) **AND/OR**
 - MRI Orbit, Face, and/or Neck without and with contrast (CPT® 70543)
- Patients who have failed initial management with cauterization and packing and have persistent or recurrent epistaxis despite primary interventions, should be referred to a clinician who can evaluate for candidacy for surgical ligation or endovascular embolization.³
- Prior to embolization with surgical or endovascular technique, CT Maxillofacial (without contrast CPT® 70486 or without contrast CPT® 70487), is supported when requested by the clinician performing embolization or referring for embolization. If endovascular embolization is planned, CTA Head (CPT® 70496) **AND/OR** CTA Neck (CPT® 70498) may be requested ahead of the interventional radiologic procedure.⁵

Background and Supporting Information

The American Academy of Otolaryngology Head and Neck Surgery recommend, in its most recent 2020 Clinical Practice Guidelines on Epistaxis, that the clinician should perform, or should refer to a clinician who can perform, nasal endoscopy to identify the site of bleeding and guide further management in patients with recurrent nasal bleeding, despite prior treatment with packing or cautery, or with recurrent unilateral nasal bleeding. No recommendations for advanced imaging are outlined in this Guideline without the exam findings (anterior rhinoscopy and/or nasal endoscopy) or the procedural needs of the patient indicating the need for such studies. If anterior rhinoscopy does not reveal the source of bleeding, it is recommended that the clinician perform nasal endoscopy, or refer to a clinician who can perform nasal endoscopy, first.³

Embolization procedures have shown an average nosebleed control rate of 87%, with minor transient complications in 20% (transient nasal ischemia, temporal-facial pain or numbness, headache, swelling, jaw claudication, trismus, and access site complications not requiring additional therapy) and major complications in up to 2.1% to 3.8% (skin/nasal necrosis, permanent facial nerve paralysis, monocular blindness, and stroke).

Detailed angiography, including internal and external carotid angiography, and precise embolization techniques are required. Despite use of meticulous techniques and knowledge of external carotid-internal carotid anastomoses, blindness and stroke are the most feared complications of endovascular embolization. These complications are rare but are more frequent than in patients undergoing surgical arterial ligation. In one

study, similar transient ischemic attacks are demonstrated across all groups but there is increased risk of stroke in the groups who underwent endovascular embolization alone (0.9%) or combined with surgical ligation (1.6%) as compared with surgical ligation alone (0.1%).^{3,4,5}

Mastoid Disease or Ear Pain (HD-26)

Guideline

Mastoid Disease or Ear Pain (HD-26.1)

References (HD-26)

Mastoid Disease or Ear Pain (HD-26.1)

HD.MA.026.1.A

v2.0.2024

A pertinent clinical evaluation including a detailed history, physical examination (including otoscopic examination), must be performed on any individual with ear pain prior to considering advanced imaging. Common causes of ear pain include external and middle ear infections, dental problems, sinus infection, neck problems, tonsillitis, and pharyngitis.

Indications (Any one of the following)	Supported Imaging
<ul style="list-style-type: none"> Persistent ear pain without obvious cause Clinical suspicion for complicated or invasive infection such as mastoiditis Clinical suspicion for complications from otitis media Clinical suspicion of mass lesion causing ear pain Significant trauma with concern for hematoma formation Pre-operative planning 	<ul style="list-style-type: none"> CT Orbits/Temporal Bone without contrast (CPT® 70480) OR CT Orbits/Temporal Bone without and with contrast (CPT® 70482) OR MRI Brain without and with contrast with attention to internal auditory canals (CPT® 70553) OR MRI Orbits/Face/Neck without and with contrast (CPT® 70543)

- Advanced imaging is not indicated in the overwhelming majority of individuals with ear pain.
- Advanced imaging for the diagnosis and management of suspected cholesteatoma, in particular, should be reserved for the otolaryngologist or in consultation with the otolaryngologist
- Imaging indicated for pre-operative evaluation for cholesteatoma surgery:
 - CT Orbits/Temporal Bone without contrast (CPT® 70480) **OR**
 - CT Orbits/Temporal Bone without and with contrast (CPT® 70482) **AND/OR**
 - MRI Brain without and with contrast with attention to internal auditory canals (CPT® 70553) **OR**
 - MRI Orbits/Face/Neck without and with contrast (CPT® 70543)
- Indicated one time post-operatively to exclude residual or regrown cholesteatoma to avoid the need for a second-look surgery:
 - CT Orbits/Temporal Bone without contrast (CPT® 70480) **OR**
 - CT Orbits/Temporal Bone without and with contrast (CPT® 70482) **AND/OR**
 - MRI Brain without and with contrast with attention to internal auditory canals (CPT® 70553), **OR**
 - MRI Orbits/Face/Neck without and with contrast (CPT® 70543)

- Eustachian Tube Dilation:(endoscopic balloon dilatation of the Eustachian Tube, to treat persistent Eustachian tube dysfunction)^{3, 4}
 - CT Orbit/Temporal Bone without contrast (CPT® 70480) can be approved for pre-operative evaluation of possible aberrant carotid
- Concern for Petrous Apex Lesions when requested by the Otolaryngologist or in consultation with the Otolaryngologist, the following are supported⁶:
 - CT Orbit/Temporal bone without contrast (CPT® 70480) **OR**
 - CT Orbit/Temporal bone without and with contrast (CPT® 70482) **AND/OR**
 - MRI Brain without and with contrast (CPT® 70553) **OR**
 - MRI Orbits/Face/Neck without or with contrast (CPT® 70543)
- For concern related to non-resolving otalgia with chronic otorrhea:
 - See **Skull Base Osteomyelitis (SBO) (HD-20.2)**

Background and Supporting Information

- Common causes of ear pain include external and middle ear infections, dental problems, sinus infection, neck problems, and referred pain from the oral pharynx.
- Clinical suspicion for complications from otitis media such as coalescent mastoiditis, resulting in: subperiosteal abscess formation/Bezold's abscess, acute facial nerve paralysis, and intracranial abscess formation.
- Cholesteatomas are expansive cysts of the middle ear filled with cellular debris. They can be congenital or arise from recurrent middle ear infections or trauma to the tympanic membrane. Hearing loss is usually conductive, although if the lesion is large enough combined conductive and sensorineural hearing loss may be present. Otoscopic exam findings and symptoms may include a white mass in the middle ear cleft, painless drainage from the ear or chronic/recurrent ear infections.
- Petrous apex lesions/infections may include: cholesteatoma, cephalocele, mucocoele, and cholesterol granuloma and can present with symptoms of pain, hearing loss, headache, vertigo, and Cranial nerve insults(including CN V VI, VII, IX, X, XI).

Hearing Loss and Tinnitus (HD-27)

Guideline

Hearing Loss (HD-27.1)

Tinnitus (HD-27.2)

References (HD-27)

Hearing Loss (HD-27.1)

HD.HL.0027.1.A

v2.0.2024

- An initial evaluation including hearing tests, by bedside testing or by formal audiology, is necessary to determine whether an individual's hearing loss is conductive (external or middle ear structures) or sensorineural (inner ear structures, such as cochlea or auditory nerve) hearing loss. See **General Guidelines (HD-1.0)**
- CT Orbits/Temporal Bone without (CPT® 70480) **OR** MRI Brain without and with contrast (with IAC views) (CPT® 70553) **OR** MRI Brain without contrast (CPT® 70551):
 - Mixed conductive (MC)/Sensorineural (SN) hearing loss or any sensorineural hearing loss (MRI generally preferred for SN - See **Background and Supporting Information**)
 - Unilateral fluctuating or asymmetric hearing loss
 - Cholesteatoma (see **Mastoid Disease or Ear Pain (HD-26.1)**)
 - Congenital hearing loss
 - Surgical planning, including cochlear implants (both CT Temporal Bone and MRI Brain for surgical planning if requested by surgeon or any provider in consultation with the surgeon)
 - Hearing loss with vertigo (see **Dizziness/Vertigo (HD-23.1)**)
- CT Orbits/Temporal Bone without contrast (CPT® 70480):
 - Conductive hearing loss should have a CT Temporal Bone initially in the absence of an evident mass in the middle ear
- CT Orbits/Temporal Bone with contrast (CPT® 70481):
 - Glomus tumors or other vascular tumors of the middle ear, and/or surgical planning
 - Acquired sensorineural hearing loss if MRI unavailable or contraindicated
- Limited MRI Brain with attention to internal auditory canals (CPT® 70540, CPT® 70542, or CPT® 70543) when requested by the provider in place of a complete MRI Brain. Note: Limited MRI codes should not be used in addition to MRI Brain codes; IAC views are performed as additional sequences as part of the brain study (see **General Guidelines – Anatomic Issues (HD-1.1)**)

Background and Supporting Information

- Sensorineural (SN) hearing loss – MRI is generally preferable to CT. CT Temporal bone is indicated in post-traumatic SN hearing loss, to evaluate for bony remodeling of the IAC due to vestibular schwannoma and labyrinthine ossification resulting from prior infection and for consideration of otospongiosis, a common cause of MC and SN hearing loss.

Tinnitus (HD-27.2)

HD.HL.0027.2.A

v2.0.2024

- A hearing evaluation is not required prior to imaging for tinnitus.
- The history in individuals with tinnitus should include a description of the tinnitus (episodic or constant, pulsatile or non-pulsatile, rhythmicity, pitch, quality of the sound), as well as inciting or alleviating factors. Continuous and pulsatile tinnitus are more concerning for an underlying and significant disorder. Audiometric assessment can be used as initial diagnostic testing particularly in individuals with tinnitus that is unilateral, persistent (>6 months) or associated with hearing difficulties (see **General Guidelines (HD-1.0)**)

Indications (Any one of the following) ^{1,5,6}	Supported Imaging
<ul style="list-style-type: none"> • Clinical suspicion of mass lesion causing tinnitus • Asymmetric or unilateral non-pulsatile tinnitus (i.e tinnitus that localizes to one ear) • Tinnitus associated with focal neurologic abnormalities, including asymmetric hearing loss • Persistent tinnitus after recent significant trauma. • Pulsatile tinnitus with or without concern for vascular lesion 	<ul style="list-style-type: none"> • CT Orbits/Temporal Bone without contrast (CPT® 70480) OR • CT Orbits/Temporal Bone without and with contrast (CPT® 70482) OR • MRI Brain without and with contrast with attention to internal auditory canals (CPT® 70553) OR • MRI Brain without contrast with attention to internal auditory canals (CPT® 70551) OR • MRI Orbits/Face/Neck without contrast (CPT® 70540), with contrast CPT® 70542, or without and with contrast (CPT® 70543)
<ul style="list-style-type: none"> • Pulsatile tinnitus • Suspicion for vascular lesions 	<ul style="list-style-type: none"> • MRA Head (CPT® 70544, CPT® 70545 OR CPT® 70546) OR • CTA Head (CPT® 70496) AND/OR • MRA Neck (CPT® 70547, CPT® 70548 or CPT® 70549) OR • CTA Neck (CPT® 70498)

- Imaging not supported for bilateral non-pulsatile tinnitus without other neurologic signs or symptoms⁶
- Limited MRI Brain with attention to internal auditory canals (CPT® 70540, CPT® 70542, or CPT® 70543) when requested by the provider in place of a complete MRI Brain. Note: Limited MRI codes should not be used in addition to MRI Brain codes;

IAC views are performed as additional sequences as part of the brain study (see **General Guidelines – Anatomic Issues (HD-1.1)**)

- CT and MR Venography (CTV and MRV) are reported with the same codes as the CTA/MRA counterpart. If arterial and venous CT or MR studies are both performed in the same session, only one CPT® code should be used to report both procedures.

Background and Supporting Information

- Non-pulsatile tinnitus may be described as ringing, buzzing, or clicking sensations which is constant and non-synchronous.
- Pulsatile tinnitus is a repetitive sound coinciding with the individual's heartbeat. The symptom may be subjective or objective.

Neurosurgical Imaging (HD-28)

Guideline

Neurosurgical Imaging (HD-28.1)

Neuronavigation (HD-28.2)

Post Operative Imaging (HD-28.3)

References (HD-28)

Neurosurgical Imaging (HD-28.1)

HD.NI.0028.1.A

v2.0.2024

- Typically advanced imaging for monitoring disease for mass lesions occurs after biopsy (histologic) confirmation. This ensures appropriate determination related to phase of oncology imaging and alignment to appropriate diagnosis-specified guideline section.
 - However, repeat imaging by neurosurgeons or others of the management team for areas of the central nervous system (CNS) where permanent neurologic damage would be excessive with even a limited biopsy attempt is supported.
 - Examples would include, but are not exclusive to: medically fragile individual, and tumors of the brainstem, eloquent areas of the brain, deep gray matter areas of the brain (ex. thalamus), and cavernous sinus.
- Repeat diagnostic head imaging:
 - Previous diagnostic head imaging is determined to be inadequate or additional imaging sequences/protocols are required by the neurosurgeon or the treatment team
 - Prior imaging is greater than 6 months old

Neuronavigation (HD-28.2)

HD.NI.0028.2.U

v2.0.2024

- Neurosurgical navigation is "image-based" meaning that the necessary pre-operative CT and MRI images are used for navigation in the operating room (image acquisition). Accurate registration (a process to match the pre-operative images to the individual position) of pre-operative images is necessary to guide surgery regardless of the navigation system that is used. Registration can be point-based or surface matched routines to allow the surgeon to view the overlapping data sets and the current situation to allow navigation.
- The process of registration for neuronavigation via the acquisition of pre-operative CT and MRI images does not require a radiologist interpretation.
 - Diagnostic imaging codes are not indicated for the purpose of registration for neuronavigation.
 - Can be referenced by proprietary brand systems such as Brainlab or Stealth imaging procedures
 - See **Unlisted Procedures/Therapy Treatment Planning (Preface-4.3)** in the Preface Imaging Guidelines and **Unlisted Procedure Codes (ONC-1.5)** in Oncology in the Oncology Imaging Guidelines
- Advanced imaging for neuronavigation (image acquisition for registration for surgery) with one of each of the following as unlisted codes apply:
 - Unlisted MRI procedure code (CPT® 76498)
 - Unlisted CT procedure code (CPT® 76497)
 - Due to variances with techniques currently available for neuronavigation, the following are indicated:
 - CTA Head without and with contrast (CPT® 70496) or MRA Head (CPT® 70544, CPT® 70545 or CPT® 70546) (to avoid arterial and venous structures)
 - 3D (CPT® 76377 or CPT® 76376) (see **General Guidelines - Other Imaging Situations (HD-1.7)**)
 - Diagnostic imaging codes are only indicated if radiological supervision and interpretation of imaging is necessary with supporting documentation
 - MRI Brain without contrast (CPT® 70551), or MRI Brain with contrast (CPT® 70552), or MRI Brain without and with contrast (CPT® 70553) (contrast as requested) **AND/OR** CT Head without contrast (CPT® 70450), or CT Head with contrast (CPT® 70460), or CT Head without and with contrast (CPT® 70470) (contrast as requested)

Post Operative Imaging (HD-28.3)

HD.NI.0028.3.A

v2.0.2024

- Post-operative imaging including MRI Brain without contrast (CPT® 70551), or MRI Brain with contrast (CPT® 70552), or MRI Brain without and with contrast (CPT® 70553) (contrast as request) or CT Head without contrast (CPT® 70450), or CT Head with contrast (CPT® 70460), or CT Head without and with contrast (CPT® 70470) (contrast as request) per neurosurgeon's or in concert with management team's request that includes, but not exclusive to:
 - Within 24-72 hours following brain surgery including to document the need for repeat surgery or if adjuvant intervention is necessary, concern or rule out for complication(s), evaluation if incomplete resection vs. consideration for plan for gross resection
 - Signs or symptoms indicating concern of clinical deterioration
 - Development of new neurological signs or symptoms
 - Follow-up on blood products, edema, and/or concern of cerebrospinal fluid leak
 - Follow up imaging per condition-based guideline
- See additional condition-based guidelines:
 - Pediatric Neurosurgeries
 - See **Special Imaging Studies in Evaluation for Epilepsy Surgery (PEDHD-6.3)** in the Pediatric Head Imaging Guidelines
 - See **Modality General Considerations (PEDONC-1.3)** and **Pediatric CNS Tumors (PEDONC-4)** in the Pediatric Oncology Guidelines
 - Epilepsy.
 - See **Presurgical Work-Up for Drug-Resistant Epilepsy (HD-9.2)**
 - Movement Disorders
 - See **Movement Disorders (HD-15.1)**
 - Pituitary or Sella Surgery.
 - See **Pituitary (HD-19.1)**
 - Acoustic Neuroma and Other Cerebellopontine Angle Tumors
 - See **Acoustic Neuroma and Other Cerebellopontine Angle Tumors (HD-33.1)**
 - Central Nervous System Tumors
 - See **Primary Central Nervous System Tumors (ONC-2)** and **Brain Metastases (ONC-31.3)** in the Oncology Imaging Guidelines

Sinus and Facial Imaging (HD-29)

Guideline

Sinus and Facial Imaging (HD-29.1)

References (HD-29)

Sinus and Facial Imaging (HD-29.1)

HD.SI.0029.1.U

v2.0.2024

- CT Maxillofacial without contrast (CPT® 70486) or limited CT Sinus without contrast (CPT® 76380) is supported for ANY of the following:³
 - Acute sinusitis without resolution of symptoms after a minimum of 4 weeks of treatment (Treatment can include an appropriate course and duration of empiric oral antibiotic, topical intranasal steroid, and/or nasal saline rinses.)
 - Concern for potential or suspected complicated sinusitis, which is sinusitis with actual or threatened orbital or intracranial extension (See **Background and Supporting Information** below)
 - Recurrent sinusitis (4 or more episodes of acute bacterial rhinosinusitis within the past 12 months without symptoms or signs between episodes)
 - In practice, recurrent acute exacerbations of chronic rhinosinusitis are seen as well as recurrent acute rhinosinusitis with disease free intervals between the acute episodes. CT Maxillofacial without contrast (CPT® 70486) may still be indicated under chronic sinusitis definitions.⁶
 - Chronic sinusitis (≥12 weeks sinusitis) with at least two of the following signs and symptoms:
 - Mucopurulent drainage
 - Nasal obstruction or congestion
 - Facial pain, pressure, and/or fullness (may involve the anterior face, periorbital region, or manifest with headache that is localized or diffuse)
 - Decreased sense of smell (see **Taste and Smell Disorders (HD-2.1)** if anosmia, hyposmia, or dysosmia is an isolated symptom)
 - (**Note:** A trial of antibiotic therapy is not required prior to imaging if individual meets criteria for chronic sinusitis)
 - Sinus surgery is being considered (including Balloon Sinus Ostial Dilation or Functional Endoscopic Sinus Surgery)
 - Follow up on incidentally noted sinus pathology (i.e. mucosal thickening, partial opacification of a sinus, or other indeterminate finding in incompletely visualized sinuses) on other studies not performed for the purpose of evaluating sinus pathology, such as MRI Brain for headache, when requested by ENT for clinical correlation.
- Surgical candidate (see **Unlisted Procedures/Therapy Treatment Planning (Preface-4.3)** in the Preface Imaging Guidelines if unlisted code is requested for surgical planning).
- Studies requested for the purpose of navigation for sinus surgery should be coded CPT® 77011 (CT guidance for stereotactic localization).
- It is not appropriate to report both CPT® 70486 and CPT® 77011 for the same CT stereotactic localization imaging session (see **CT-, MR-, or Ultrasound-Guided Procedures (Preface-4.2)** in the Preface Imaging Guidelines).

- For unexplained cough as the main symptom, and suspected Upper Airway Cough Syndrome (UACS) as the etiology, see **Cough (CH-3.1)** in the Chest Imaging Guidelines.
- CT Maxillofacial with contrast (CPT® 70487) if any of the following is present:
 - Orbital or facial cellulitis
 - Proptosis
 - Abnormal visual examination
 - Ophthalmoplegia
 - Immunocompromised individual
 - Fungal or vascular lesions visualized in nasal cavity
- CT Maxillofacial without contrast (CPT® 70486) **OR** CT Maxillofacial with contrast (CPT® 70487) **OR** MRI Orbits/Face/Neck without and with contrast (CPT® 70543):
 - Sinonasal obstruction, polyp, or suspected mass
 - Suspected orbital complication
 - Suspected invasive fungal sinusitis
 - Cystic fibrosis
 - Osteomyelitis (MRI is the preferred modality) and odontogenic infections, see **Skull Base Osteomyelitis (SBO) (HD-20.2)** and **Dental/Periodontal/Maxillofacial Imaging (HD-30.2)** for additional imaging modalities
- MRI Brain with and without contrast (CPT® 70553) for suspected intracranial complication
- CT Orbits/Temporal bone without contrast (CPT® 70480) or CT Orbits/Temporal bone without and with contrast (CPT® 70482) performed alone or added to CT Maxillofacial for:
 - Suspected orbital complications
- For Skull Base Osteomyelitis (SBO), see **Skull Base Osteomyelitis (SBO) (HD-20.2)**
- Repeat imaging for ANY of the following scenarios:
 - An ENT specialist or any provider in consultation with an ENT specialist requests the imaging **and** ONE or more of the following:
 - There has been a follow-up visit since the previous imaging and there is no improvement after an additional 3 weeks of conservative treatment after initial imaging was completed
 - There is a new abnormality on exam such as obstructing mass
 - Planned sinus surgery (including but not limited to Balloon Sinus Ostial Dilation or Functional Endoscopic Sinus Surgery)
 - If the most recent CT maxillofacial scan is greater than 6 months old or there is a change in clinical status as described above, a repeat diagnostic CT Maxillofacial without contrast (CPT® 70486) is supported for surgical planning.

- Repeat CT Maxillofacial solely for the use of navigation during the sinus surgery (i.e. the most recent diagnostic CT Maxillofacial was not adequate due to lacking anatomic landmarks or insufficient thinness of cuts) should be requested with CPT 77011, not the diagnostic CPT code 70486.
- 3D Rendering (CPT® 76376 or CPT® 76377) should not be reported in conjunction with CPT® 77011 (or CPT® 70486 if used). The procedure inherently generates a 3D dataset.
- Complication of ABRS (acute bacterial rhinosinusitis) is suspected based on:
 - Any constellation of symptoms worrisome for intracranial extension of infection or meningitis (i.e. severe headache, photophobia, fever, neck stiffness)
 - Severe headache
 - Facial swelling
 - Cranial nerve palsies
 - Orbital signs (cellulitis, impaired extraocular motility, decrease in vision or proptosis)
- CT findings that correlate with ABRS include opacification, air-fluid level, and moderate to severe mucosal thickening.
 - Complications of ABRS are best assessed using iodine contrast-enhanced CT or gadolinium based MR imaging to identify extra-sinus extension or involvement.
 - Suspected complications are the only indication for MR imaging of the paranasal sinuses in the setting of ABRS.

For Cone Beam Imaging, see **Cone Beam Computed Tomography (CBCT) (HD-24.7)** and **Dental/Peridontal/Maxillofacial Imaging (HD-30.2)**

Background and Supporting Information

- Rhinosinusitis is defined as inflammation of the nasal cavity and adjacent paranasal sinuses. Acute sinusitis refers to symptom duration <4 weeks, subacute 4 to 12 weeks, and chronic >12 weeks. Complicated sinusitis refers to symptoms suggesting spread of disease into adjacent structures, including orbital or intracranial complications.
- There is no evidence to support advanced imaging of acute (<4 weeks) and subacute (4 to 12 weeks) uncomplicated rhinosinusitis.
- There is no evidence to support routine follow-up advanced imaging after treatment with clinical improvement of sinusitis.

Temporomandibular Joint Disease (TMJ) and Dental/Periodontal/Maxillofacial Imaging (HD-30)

Guideline

Temporomandibular Joint Disease (TMJ) (HD-30.1)

Dental/Periodontal/Maxillofacial Imaging (HD-30.2)

References (HD-30)

Temporomandibular Joint Disease (TMJ) (HD-30.1)

HD.TJ.0030.1.A

v2.0.2024

- MRI TMJ (CPT® 70336) is the diagnostic study of choice and should be reserved for those who fail a minimum of 6 weeks of non-surgical treatment **AND** who are actively being considered for TMJ surgery
- CT Maxillofacial without contrast (CPT® 70486) or without and with contrast (CPT® 70488) when there is suspicion of bony involvement based on prior x-ray or MRI
- Ultrasound (CPT® 76536) can be used to look for the presence of a joint effusion and to evaluate cartilage and disk displacement with open and closed mouth imaging and to guide injections
- For TMJ imaging in patients with Juvenile Idiopathic Arthritis (see **Temporomandibular Joint (TMJ) Imaging in Children (PEDHD-25)** in the Pediatric Head Imaging Guidelines)
 - MRI TMJ (CPT® 70336) is indicated annually for detecting silent TMJ arthritis in children and young adults with juvenile idiopathic arthritis as requested by a rheumatologist and/or oral/maxillofacial surgeon (OMS) and/or any provider in consultation with a rheumatologist or OMS.
 - Repeat imaging with MRI TMJ (CPT® 70336) in patients with JIA is indicated for any of the following:
 - Change in signs or symptoms suggesting progression of disease
 - To monitor the effects of treatment¹¹
 - Bone Scintigraphy/Bone Scan 3 Phase Study (CPT® 78315) in individuals over 12 years of age is indicated in anticipation or consideration of surgery.
- Jaw Asymmetry - Unilateral condylar hyperplasia is manifested by slow growth in areas of the mandible causing facial asymmetry. It is usually a self-limiting condition seen predominantly in 12–30 year olds. CPT® 78315 Bone Scan 3 Phase Study is indicated in anticipation or consideration of surgery¹³

Dental/Periodontal/Maxillofacial Imaging (HD-30.2)

HD.TJ.0030.2.U

v2.0.2024

- Cone beam CT for surgical planning when plain x-rays alone are insufficient. Potential indications include but are not limited to:
 - Impacted teeth
 - Supernumerary teeth
 - Dentoalveolar trauma
 - Root resorption
 - Foreign body
 - Odontogenic cysts, tumors, or other jaw pathology
 - Cleft pathology
 - Orthognathic surgery for dentofacial anomalies
 - Osteomyelitis and odontogenic infections (X-ray not required)
 - Bisphosphonate-related osteonecrosis of the jaw (X-ray not required)
 - Salivary gland stones
 - Maxillofacial bone graft planning
 - Dental implants related to tooth loss from injury, trauma, or jaw pathology such as cysts, tumors, or cancer
 - Post-operative imaging, including dental implants^{14,15}
- Cone Beam CT: Report with CPT® Codes: CPT® 70486, CPT® 70487, CPT® 70488, CPT® 70480, CPT® 70482 (see **Cone Beam Computed Tomography (CBCT) (HD-24.7)**)
- 3-D rendering (CPT® 76376 or CPT® 76377) should NOT be reported separately
- Cone beam CT (CBCT) may also be called i-CAT scanner or mini-CAT scanner

Eye Disorders and Visual Loss (HD-32)

Guideline

Eye Disorders and Visual Loss (HD-32.1)

Pupillary Abnormalities Including Horner's Syndrome (HD-32.2)

References (HD-32)

Eye Disorders and Visual Loss (HD-32.1)

HD.VL.0032.1.A

v2.0.2024

- For specific conditions - See **Background and Supporting Information** that include table of abbreviations
- Examination of ocular complaints and visual loss may include evaluation of pupillary responses, extraocular motility, visual acuity, visual field testing, intraocular pressures, external examination, slit lamp examination, and/or fundoscopic exam of retinæ. An exam performed by a Neuro-Ophthalmologist, Neurologist, or an Optometrist meets this requirement.
- MRI Orbits/Face/Neck without contrast (CPT® 70540) **OR** MRI Orbits/Face/Neck without and with contrast (CPT® 70543) **OR** CT Orbits/Temporal bone with contrast (CPT® 70481) **OR** CT Orbits/Temporal bone without contrast (CPT® 70480) **AND/OR** MRI Brain without contrast (CPT® 70551) **OR** MRI Brain with and without contrast (CPT® 70553):¹
 - Unexplained vision loss
 - Optic atrophy (Cranial Nerve II)
 - Optic neuropathy (Cranial Nerve II)
 - Papilledema/optic disc swelling (Cranial Nerve II) (see **Cranial Neuropathies (HD-1.1)** and **Papilledema/Pseudotumor Cerebri (HD-17.1)**)
 - Afferent Pupillary Defect (APD) or Relative Afferent Pupillary Defect (RAPD)
 - Chiasmal symptoms/signs (including bitemporal field deficit)
 - Ophthalmoplegia, Diplopia, and/or Cranial nerve palsy (Specifically CN III, IV, and VI, see **Cranial Neuropathies HD-1.1)**)
 - Nystagmus²¹
- For optic disc edema/papilledema, CT Head without contrast (CPT® 70450) is helpful to assess for space-occupying processes such as intracranial hemorrhage, mass effect and hydrocephalus.¹⁶
- For suspected optic neuritis, MRI is the preferred modality (see **Multiple Sclerosis (MS) (HD-16.1)** and **Neuromyelitis Optica and NMO Spectrum Disorders (HD-16.2)**)
- Visual field defects are associated with retrochiasmal pathology (see **Stroke/TIA (HD-21.1)** or **Primary Central Nervous System Tumors (ONC-2)** in the Oncology Imaging Guidelines or **Brain Metastasis (ONC- 31.3)** in the Oncology Imaging Guidelines)
- MRI Orbits/Face/Neck without contrast (CPT® 70540) or MRI Orbits/Face/Neck without and with contrast (CPT® 70543) or CT Orbits/Temporal bone with contrast (CPT® 70481):
 - Exophthalmos (including thyroid eye disease), enophthalmos or non-traumatic orbital asymmetry

- Suspected orbital cellulitis or atypical pre-septal cellulitis, uveitis or scleritis
- Orbital mass or metastasis
- Orbital inflammatory syndrome (orbital pseudotumor) and dacryocystitis or dacryoadenitis
- CT Orbits/Temporal bone without contrast (CPT® 70480) and/or CT Head without contrast (CPT® 70450):
 - Orbital trauma with visual defect
 - Exophthalmos (including thyroid eye disease)
- CT Maxillofacial without and with contrast (CPT® 70488) or CT Maxillofacial without contrast (CPT® 70486) or CT Maxillofacial with contrast (CPT® 70487)^{22,23}
 - For pre-operative planning for procedures including dacryocystorhinostomy (DCR) to correct nasolacrimal duct obstruction (NLDO)^{22,23}
- When requested by the surgeon or in consultation with surgeon, contrast level as requested. This includes requests from Ophthalmologists and Oculoplastic surgeons. Contrast level preference may vary per institutional protocol.
- MRA Head (CPT® 70544, CPT® 70545, or CPT® 70546) or CTA Head (CPT® 70496) for suspicion of intracranial aneurysm, including Third nerve palsy with pupillary involvement (see **Intracranial Aneurysms (HD-12.1)**)
- MRA Head (CPT® 70544, CPT® 70545, or CPT® 70546) or CTA Head (CPT® 70496) **AND/OR** MRA Neck (CPT® 70547, CPT® 70548, or CPT® 70549) or CTA Neck (CPT® 70498) for evaluation of diplopia due to suspected stroke or TIA (see **Intracranial Aneurysms (HD-12.1)**)
- Amaurosis Fugax (see **Stroke/TIA (HD-21.1)**)
 - Individuals describe a transient darkening or loss of vision, typically monocular
- Central Retinal Artery Occlusion, Branch Retinal Artery Occlusion, and Ophthalmic Artery Occlusion (see **Stroke/TIA (HD-21.1)**)
 - Individuals describe a sudden monocular loss of vision or visual field. Etiology is usually embolic and is considered a stroke to the retina
- There is currently no data to support advanced imaging while on Tepezza® (teprotumumab) unless there are neurologic symptoms or ophthalmologic symptoms.^{19,20} Any one of the following are supported when additional imaging is indicated:
 - MRI Orbits/Face/Neck without contrast (CPT® 70540)
 - MRI Orbits/Face/Neck without and with contrast (CPT® 70543)
 - CT Orbits/Temporal bone with contrast (CPT® 70481)
 - CT Orbits/Temporal bone without contrast (CPT® 70480)
 - CT head without contrast (CPT® 70450)
- Additional imaging indications include:
 - To reassess compressive optic neuropathy (Symptoms/Signs of compressive optic neuropathy include APD, decreased visual acuity, and/ or visual field defects)

- For non-response to Tepezza (Teprotumumab), relapses, worsening proptosis, diplopia, lid retraction, or optic neuropathy
- For surgical planning for orbital decompression, strabismus surgery or lid surgery
- Autoimmune Retinopathy
 - Suspicion for CAR (Cancer associated retinopathy) or MAR (melanoma associated retinopathy) syndromes (see **Paraneoplastic Syndromes (ONC-30.3)** in the Oncology Imaging Guidelines)
- Oncologic conditions
 - Retinoblastoma (see **Retinoblastoma (PEDONC-12)** in the Pediatric Oncology Imaging Guidelines)
 - Uveal (choroidal) melanoma -(see **Ocular Melanoma (ONC-5.9)** in the Oncology Imaging Guidelines)
 - Biopsy results are not required before initial staging
- Vasculitis including Temporal Arteritis (Giant Cell Arteritis) (see **Cerebral Vasculitis (HD-22.1)**)

Background and Supporting Information

- Imaging Non-Indications
 - Imaging is not necessary if visual loss or ocular symptom/sign is due to known intrinsic eye disease, such as refractive errors, amblyopia, pterygium, subconjunctival hemorrhage, conjunctivitis, cataracts, macular degeneration, central serous retinopathy, retinal vein occlusion, retinal detachment, etc. Monocular diplopia is not an indication for imaging. Physiologic anisocoria (difference in pupil diameter between the two eyes of 2 mm or less) and surgically distorted pupils are not indications for imaging.
 - Imaging is not typically necessary in cases of ptosis without concern for Horner's or 3rd nerve palsy
- Advanced imaging of the brain and orbit are not routinely paired.
 - Suspicion for disorders involving both regions is needed to image both regions.
 - Orbital imaging alone may be sufficient unless other signs or symptoms suggest brain involvement.
- Thyroid function and iodine contrast: thyroid dysfunction can occur in susceptible individuals after iodine exposure.

List of Abbreviations and Meanings:

Abbreviation	Meaning
AC	Anterior chamber
APD	Afferent pupillary defect (see RAPD)
BCVA	Best-corrected visual acuity

Abbreviation	Meaning
C3F8	Gas bubble injected into vitreous cavity during retina surgery
cc	With correction (current new or old glasses or contact lenses)
CP	Color plates
C/S	Conjunctiva/sclera
CSME	Clinically significant macular edema
CVF	Confrontation visual field (testing of gross field of view)
D	Disc, optic nerve head
DBH	Dot blot hemorrhages
DCR	Dacryocystorhinostomy
DFE	Dilated fundus exam
E	Esophoria at distance
E'	Esophoria at near
EOM	Extraocular movements
ERM	Epiretinal membrane
ET	Esotropia at distance
E(T)	Intermittent esotropia at distance
ET'	Esotropia at near
E(T)'	Intermittent esotropia at near
GVF	Goldmann visual field test
HT	Hypertropia
HVF	Humphrey visual field test (automated perimetry)
I	Iris
Ishihara	Commonly used color plates
IOP	Intraocular pressure
K	Cornea
LF	Levator function
LFH	Lid fissure height
LLL	Lids, lashes, lacrimal gland
M	Macula
ME	Macular edema
MH	Macular hole

Abbreviation	Meaning
MP	Membrane peel
MRD1	Margin-reflex distance from upper lid margin to pupillary light reflex
MRx	Manifest refraction
NI	No improvement
NLDO	Nasolacrimal duct obstruction
NSC or NS	Nuclear sclerotic cataract
OD	Right eye
OS	Left eye
ortho	Eyes are aligned on the same target
OCT	Optical Coherence Tomography
P	Periphery
PD	Prism diopter
ph or PH	Pinhole (crude assessment of best-corrected visual acuity)
PPV or PPVx	Pars plana vitrectomy
PVD	Posterior vitreous detachment
RAPD	Relative Afferent Pupillary Defect (see APD)
RD	Retinal detachment
RT	Retinal tear
SB	Scleral buckle
sc	Without correction
SF6	Gas bubble injected into vitreous cavity during retina surgery
SLE	Slit lamp examination
SO	Silicone oil
SRF	Subretinal fluid
Ta	Applanation tonometry (intraocular pressure measurement)
Tp	Tonopen tonometry (intraocular pressure measurement)
V	Vessels
Va	Visual acuity
VF	Visual field testing (formal automated perimetry versus confrontation visual field testing)
X	Exophoria at distance
X'	Exophoria at near

Abbreviation	Meaning
XT	Exotropia
X(T)	Intermittent exotropia at distance
XT'	Exotropia at near
X(T)'	Intermittent exotropia at near

Pupillary Abnormalities Including Horner's Syndrome (HD-32.2)

HD.VL.0032.2.A

v2.0.2024

- Anisocoria and Other Pupillary Disorders
 - Physiologic anisocoria (difference in pupil diameter between the two eyes of typically 2 mm or less) and surgically distorted pupils are not indications for advanced imaging.
 - Dilated pupil from suspected Third nerve palsy (see **Eye Disorders and Visual Loss (HD-32.1)**)
 - Horner's Syndrome (See below)
- Horner's Syndrome (anisocoria, ptosis, and ipsilateral anhidrosis) is caused by disruption of sympathetic innervation to the eye and face. Definitive diagnosis may be established by pharmacologic testing of the pupillary response with eye drops. Evaluation and imaging depends on determining whether the cause is a central lesion (brainstem or cervical spinal cord), preganglionic lesion (spinal cord or sympathetic chain in the chest), or postganglionic lesion (neck or carotid artery).
- MRI Brain without contrast (CPT® 70551) or MRI Brain without and with contrast (CPT® 70553) for suspected intracranial or brainstem lesions
- MRI Cervical Spine without contrast (CPT® 72141) or MRI Cervical Spine without and with contrast (CPT® 72156) for suspected spinal cord abnormality
- CT Chest with contrast (CPT® 71260) for suspected chest mass
- CT Neck with contrast (CPT® 70491) for suspected neck mass
- CTA Neck without and with contrast (CPT® 70498) or MRA Neck (CPT® 70547, CPT® 70548, or CPT® 70549) for suspected carotid injury or dissection
- MRI Orbits/Face/Neck without contrast (CPT® 70540), MRI Orbits/Face/Neck without and with contrast (CPT® 70543) or CT Orbits/Temporal bone with contrast (CPT® 70481) for suspected orbital lesion or mass

Acoustic Neuroma and Other Cerebellopontine Angle Tumors (HD-33)

Guideline

Acoustic Neuroma and Other Cerebellopontine Angle Tumors
(HD-33.1)

References (HD-33)

Acoustic Neuroma and Other Cerebellopontine Angle Tumors (HD-33.1)

HD.AC.0033.1.A

v2.0.2024

- Acoustic neuroma and vestibular schwannoma may be used interchangeably
- Initial diagnosis is usually made during evaluation for asymmetric hearing loss and/or vertigo (see **Dizziness, Vertigo and Syncope (HD-23)** and **Hearing Loss and Tinnitus (HD-27)**) for evaluation of those problems
- MRI Brain without and with contrast (CPT® 70553) which should be done with attention to the internal auditory canals for initial diagnosis.
- MRI Brain without contrast (CPT® 70551) if performed with FIESTA protocol
- MRI Orbits/Face/Neck without and with contrast (CPT® 70543) with audiologic or clinical features of retrocochlear hearing loss and a negative MRI Brain and in the rare individual in whom a detailed search is indicated for both a lesion of the cerebellopontine angle **and** lesions of the cerebral hemispheres
- Repeat MRI Brain (contrast as requested) 6 months after diagnosis, then annually for 5 years and thereafter per specialist or any provider in consultation with a specialist.⁷
- MRI Brain without and with contrast with attention to the internal auditory canals (CPT® 70553) is performed after surgical resection and following stereotactic radiation therapy at 6 to 12 months to document the completeness of tumor removal and to serve as a baseline for further follow-up. Additional follow up is done annually for 5 years and every 2 years thereafter.
- See **Primary Central Nervous System Tumors- General Considerations (ONC-2.1)** in the Oncology Imaging Guidelines for additional imaging requests for surgery

Pineal/Colloid Cysts (HD-34)

Guideline

Pineal/Colloid Cysts (HD-34.1)

References (HD-34)

Pineal/Colloid Cysts (HD-34.1)

HD.PT.0034.1.A

v2.0.2024

Pineal cysts are generally discovered incidentally and do not require surgical intervention.

- MRI Brain without contrast (CPT® 70551) or without and with contrast (CPT® 70553) is indicated for initial evaluation of pineal cysts if not already completed.
- Repeat MRI Brain is not indicated for most individuals with pineal cysts, but MRI Brain without contrast (CPT® 70551) or without and with contrast (CPT® 70553) for the following:
 - New or worsening headache or focal neurologic deficits suggesting progression of cyst
 - Pre-operative planning
- Repeat MRI Brain without contrast (CPT® 70551) or without and with contrast (CPT® 70553) for colloid cysts for the following:
 - In the presence of symptoms including syncope
 - Evaluation of CSF flow (CPT® 70551)
 - When requested by a specialist or any provider in consultation with a specialist

Arachnoid Cysts (HD-35)

Guideline

Arachnoid Cysts (HD-35.1)

References (HD-35)

Arachnoid Cysts (HD-35.1)

HD.AR.0035.1.A
v2.0.2024

Arachnoid cysts arise in the middle or posterior fossa, and the majority of lesions are discovered incidentally and do not require surgical intervention.

- MRI Brain without contrast (CPT® 70551) or without and with contrast (CPT® 70553) is indicated for initial evaluation of arachnoid cysts if not already completed.
- Repeat MRI Brain is not indicated for most individuals with arachnoid cysts, except in the following scenarios:
 - New or worsening headache or focal neurologic deficits suggesting progression of cyst
 - Pre-operative planning
 - When requested by a specialist or any provider in consultation with a specialist

Guideline

Nuclear Medicine (HD-36.1)

References (HD-36)

Nuclear Medicine (HD-36.1)

HD.NM.0036.1.A

v2.0.2024

Nuclear medicine studies used in the evaluation of some head/brain disorders, and other rare indications as well.

- Brain Scintigraphy with or without vascular flow (any one of CPT® 78600, CPT® 78601, CPT® 78605, or CPT® 78606)
- Brain Imaging Radiopharmaceutical Localization SPECT (CPT® 78803)¹
 - Immunocompromised individuals with mass lesion detected on CT or MRI for differentiation between lymphoma and infection
 - In distinguishing recurrent brain tumor from radiation necrosis
 - Can be performed with vasodilating agent acetazolamide (Diamox) to assess functional reserve capacity to predict critically reduced perfusion in individuals with chronic cerebrovascular disease (for example, in Moya-Moya disease) and identify individuals who might benefit from an extracranial-to-intracranial (EC-IC) bypass to augment Cerebral Blood Flow, and to assess pre-operatively the potential for ischemia following carotid artery sacrifice.
- Brain Imaging Vascular Flow (CPT® 78610)
 - Cerebral ischemia
 - Establish brain death
- CSF Leakage Detection (CPT® 78650)
 - Evaluation of CSF rhinorrhea, otorrhea, or refractory post-lumbar puncture headache
 - Suspected normal pressure hydrocephalus with gait disturbance and either dementia or urinary incontinence
- Radiopharmaceutical Dacryocystography (CPT® 78660)
 - Suspected obstruction of nasolacrimal duct due to excessive tearing
- Cisternogram (CPT® 78630) for the following:
 - Known hydrocephalus with worsening symptoms
 - Suspected obstructive hydrocephalus
 - CSF Leak⁵ See **Low Pressure Headache and CSF Leak (HD-11.15)** and **Facial Trauma (HD-13.2)**
- Cerebrospinal Ventriculography (CPT® 78635) for the following:
 - Evaluation of internal shunt, porencephalic cyst, or posterior fossa cyst
- Nuclear Medicine Shunt Evaluation (CPT® 78645) and CSF Flow SPECT (CPT® 78803) for the following:
 - Suspected malfunction of ventriculoperitoneal, ventriculopleural, or ventriculovenous shunts.

- Imaging Radiopharmaceutical Localization SPECT with Ioflupane I-23 (CPT® 78803 or CPT® 78830, DAT-SPECT) OR Fluorodopa F (F-DOPA) PET Brain (CPT® 78606)^{7,8,9,10,11} (see **Lewy Body Dementia (LBD) – SPECT Brain Scan (HD-8.3)** and **Movement Disorders (HD-15.1)**)
- Jaw Asymmetry - Unilateral condylar hyperplasia is manifested by slow growth in areas of the mandible causing facial asymmetry. It is usually a self-limiting condition seen predominantly in 12–30 year olds.
 - CPT® 78315 Bone Scan 3 Phase Study is indicated in anticipation or consideration of surgery.⁶

Guideline

General Guidelines Sleep-Related Imaging (HD-37.1)

References (HD-37)

General Guidelines Sleep-Related Imaging (HD-37.1)

HD.SL.0037.1.A

v2.0.2024

- Hypersomnolence:
 - When there are focal neurologic signs or suspicion for an inflammatory neurologic process as the etiology. Recognition and treatment of a comorbid sleep disorders is paramount, and a complete neurologic history and examination should precede any request for advanced imaging.
 - MRI Brain with and without contrast (CPT® 70553) **OR**
 - MRI Brain without contrast (CPT® 70551)
- Central Sleep Apnea:
 - For unexplained central sleep apnea syndrome when a primary CNS etiology is suspected; i.e., unassociated with CHF, COPD or other potential etiology. Specific etiologies should be stated for imaging requests, including but not limited to, suspected Chiari malformation, stroke, CNS demyelinating disease, posterior fossa lesion, anoxia or infection.
 - MRI Brain with and without contrast (CPT® 70553) **OR**
 - MRI Brain without contrast (CPT® 70551)
- Oral Appliance:
 - There is a lack of published case-controlled clinical studies in Sleep literature validating the use of advanced imaging with respect to oral appliance therapy (pretreatment assessment).
 - Previous literature has demonstrated support for cephalometric studies (x-ray)¹ in predicting treatment success.
 - Nasoendoscopy (sedated and non-sedated with provocative maneuvers such as Mueller maneuver) has been helpful as well in this regard.²
 - Routine use of advanced imaging is not supported at this time.
- For suspected sleep-related seizures (see **Epilepsy and Other Seizure Disorders (HD-9)**)

Radiopharmaceutical localization of tumor, inflammatory process or distribution of radiopharmaceutical agent(s) (includes vascular flow and blood pool imaging, when performed); planar, 2 or more areas (eg, abdomen and pelvis, head and chest), 1 or more days imaging or single area imaging over 2 or more days	78801
Radiopharmaceutical localization of tumor, inflammatory process or distribution of radiopharmaceutical agent(s) (includes vascular flow and blood pool imaging, when performed); planar, whole body, single day imaging	78802

Nuclear Medicine	CPT®
Radiopharmaceutical localization of tumor, inflammatory process or distribution of radiopharmaceutical agent(s) (includes vascular flow and blood pool imaging, when performed); tomographic (SPECT), single area (e.g., head, neck, chest, pelvis), single day imaging	78803
Radiopharmaceutical localization of tumor, inflammatory process or distribution of radiopharmaceutical agent(s) (includes vascular flow and blood pool imaging, when performed); tomographic (SPECT) with concurrently acquired computed tomography (CT) transmission scan for anatomical review, localization and determination/detection of pathology, single area (e.g., head, neck, chest, pelvis), single day imaging	78830
Radiopharmaceutical localization of tumor, inflammatory process or distribution of radiopharmaceutical agent(s) (includes vascular flow and blood pool imaging, when performed); tomographic (SPECT), minimum 2 areas (e.g., pelvis and knees, abdomen and pelvis), single day imaging, or single area imaging over 2 or more days	78831
Radiopharmaceutical localization of tumor, inflammatory process or distribution of radiopharmaceutical agent(s) (includes vascular flow and blood pool imaging, when performed); tomographic (SPECT) with concurrently acquired computed tomography (CT) transmission scan for anatomical review, localization and determination/detection of pathology, minimum 2 areas (e.g., pelvis and knees, abdomen and pelvis), single day imaging, or single area imaging over 2 or more days	78832

General Guidelines (MS-1.0)

MS.GG.0001.0.A

v1.0.2024

- Before advanced diagnostic imaging can be considered, there must be an in-person clinical evaluation as well as a clinical re-evaluation after a trial of failed conservative treatment; the clinical re-evaluation may consist of an in-person evaluation or other meaningful contact with the provider's office such as email, web or telephone communications.
- An in-person clinical evaluation for the current episode of the condition is required to have been performed before advanced imaging can be considered. This may have been either the initial clinical evaluation or the clinical re-evaluation.
- The in-person clinical evaluation should include a relevant history and physical examination, appropriate laboratory studies, and non-advanced imaging modalities. Other forms of meaningful contact (e.g., telephone call, electronic mail, telemedicine, or messaging) are not acceptable as an in-person evaluation.
- Prior to advanced imaging consideration, the results of plain x-rays performed after the current episode of symptoms started or changed need to be available to the requesting provider of the advanced imaging study for all musculoskeletal conditions, unless otherwise noted in the guidelines.
 - Initial plain x-ray can rule out those situations that do not often require advanced imaging, such as osteoarthritis, acute/healing fracture, dislocation, osteomyelitis, acquired/congenital deformities, and tumors of bone amenable to biopsy or radiation therapy (in known metastatic disease), etc.
 - X-ray may provide complementary clinical information regarding detailed bony anatomy, and may assist with preoperative planning when surgery is being contemplated.
 - X-ray may provide clinically significant details for soft tissue masses, such as soft tissue calcification, presence or absence of phleboliths, radiographic density, and effect on adjacent bone.
 - X-ray often has a larger field of view than MRI or CT and has the potential to identify more proximal or distal pathology in an extremity.
- Clinical re-evaluation is required prior to consideration of advanced diagnostic imaging to document failure of significant clinical improvement following a recent (within 3 months) six week trial of provider-directed conservative treatment. Clinical re-evaluation can include documentation of an in-person encounter or documentation of other meaningful contact with the requesting provider's office by the individual (e.g. telephone call, electronic mail, telemedicine, or messaging).
- Provider-directed conservative treatment may include rest, ice, compression, and elevation (R.I.C.E.), non-steroidal anti-inflammatories (NSAIDs), narcotic and non-narcotic analgesic medications, oral or injectable corticosteroids, viscosupplementation injections, a provider-directed home exercise program, cross-training, and/or physical/occupational therapy or immobilization by splinting/casting/bracing.

- Orthopedic specialist evaluation can be helpful in determining the need for advanced imaging.
 - The need for repeat advanced imaging should be carefully considered and may not be indicated if prior imaging has been performed.
 - Serial advanced imaging, whether CT or MRI, for surveillance of healing or recovery from musculoskeletal disease is not supported by the medical evidence in the majority of musculoskeletal conditions.

Imaging Techniques (MS-2)

Guideline

Plain X-Ray (MS-2.1)

MRI or CT (MS-2.2)

Ultrasound (MS-2.3)

Contrast Issues (MS-2.4)

Positron Emission Tomography (PET/CT) (MS-2.5)

Nuclear Medicine (MS-2.6)

References (MS-2)

Plain X-Ray (MS-2.1)

MS.IM.0002.1.A

v1.0.2024

- The results of plain x-rays performed after the current episode of symptoms started or changed need to be available to the requesting provider of the advanced imaging study for all musculoskeletal conditions, unless otherwise noted in the guidelines, to rule out those situations that do not often require advanced imaging, such as: osteoarthritis, acute/healing fracture, dislocation, osteomyelitis, acquired/congenital deformities, and tumors of bone amenable to biopsy or radiation therapy (in known metastatic disease), etc.

MRI or CT (MS-2.2)

MS.IM.0002.2.A

v1.0.2024

- Magnetic Resonance Imaging (MRI) is often the preferred advanced imaging modality in musculoskeletal conditions because it is superior in imaging the soft tissues and can also define physiological processes in some instances [e.g. edema, loss of circulation (AVN), and increased vascularity (tumors)].
- Computed Tomography (CT) is preferred for imaging cortical bone anatomy; thus, it is useful for studying complex fractures (particularly of the joints), dislocations, and assessing delayed union or non-union of fractures, if plain X-rays are equivocal. CT may be the procedure of choice in individuals who cannot undergo an MRI, such as those with pacemakers.
- Bilateral Imaging
 - Coding for bilateral imaging may vary from health care plan to health care plan. Not all coding options may be available for all health care plans.

Positional MRI

- Positional MRI is also referred to as dynamic, standing, weight-bearing, or kinetic MRI. Currently, there is inadequate scientific evidence to support the medical necessity of this study. As such, it should be considered experimental or investigational.

Positional CT

- Positional CT, also referred to as weight-bearing or cone beam CT, may be useful in imaging of the foot and ankle.
 - If a request for foot or ankle imaging with positional CT meets medical necessity criteria for standard CT imaging (as defined in the condition-specific guidelines), the request may be approved.
 - Positional CT of anatomic areas other than the foot and ankle are considered experimental or investigational.

dGEMRIC Evaluation of Cartilage

- Delayed gadolinium enhanced Magnetic Resonance Imaging of Cartilage (dGEMRIC) is a technique where an MRI estimates joint cartilage glycosaminoglycan content after penetration of the contrast agent in order to detect cartilage breakdown. Currently, there is inadequate scientific evidence to support the medical necessity of this study. As such, it should be considered experimental or investigational for the diagnosis and surveillance of, or preoperative planning related to chondral pathology.

Ultrasound (MS-2.3)

MS.IM.0002.3.A

v1.0.2024

- Ultrasound (US) uses sound waves to produce images that can be used to evaluate a variety of musculoskeletal disorders. As with US in general, musculoskeletal US is highly operator-dependent, and proper training and experience are required to perform consistent, high quality evaluations.

Contrast Issues (MS-2.4)

MS.IM.0002.4.A**v1.0.2024**

- Most musculoskeletal imaging (MRI or CT) is without contrast; however, the following examples may be considered with contrast:
 - Tumors, osteomyelitis, and soft tissue infection (without and with contrast)
 - MRI arthrography (with contrast only)
 - MRI for rheumatoid arthritis and inflammatory arthritis (contrast as requested)
 - For individuals with a contrast contraindication, if the advanced imaging recommendation specifically includes contrast, the corresponding advanced imaging study without contrast may be approved as an alternative, although the non-contrast study may not provide an adequate evaluation of the condition of concern.

Positron Emission Tomography (PET/CT) (MS-2.5)

MS.IM.0002.5.A**v1.0.2024**

- PET/CT is a nuclear medicine/computed tomography (CT) fusion study that uses a positron emitting radiotracer to create cross-sectional and volumetric images based on tissue metabolism. PET imaging fusion with CT allows for better anatomic localization of the areas of abnormal increased tissue activity seen on PET.
- PET/CT is indicated for imaging of certain musculoskeletal conditions when MRI or CT is equivocal or cannot be performed. See: **Nuclear Medicine (MS-28)** for specific indications.
 - At this time, FDG is the only indicated radiotracer for use with PET/CT in the imaging of musculoskeletal conditions.

Nuclear Medicine (MS-2.6)

MS.IM.0002.6.A

v1.0.2024

- A bone scan is a nuclear medicine imaging study in which an amount of radioactive material is injected and images are obtained at different time intervals, depending on the condition. A bone scan is done to reveal problems with bone metabolism. Areas where bone cells are repairing themselves show the most activity. It can help diagnose a number of bone conditions, including cancer of the bone or metastasis, location of bone inflammation, fracture, and bone infection.
- Nuclear Medicine WBC Scan is performed using radioactive material which is tagged to the white blood cells. When injected into the body, the material attaches to sites of inflammation/infection. Once distributed in these areas, the sites of suspected infection/inflammation can be seen on nuclear imaging equipment. These can be imaged as a planar study, SPECT study, or SPECT/CT study.
- Bone Marrow Imaging is used in combination with a WBC Scan to help differentiate between true infection and physiological marrow uptake. The bone marrow scan provides a map of the normal physiological white cell uptake that is then compared to the white blood cell scan. Any discordance in white cell uptake (e.g., more WBC uptake than marrow uptake) between the two studies indicates a focus of infection.
- See: **Nuclear Medicine (MS-28)** and condition-specific guidelines for specific indications.

3D Rendering (MS-3)

Guideline

3D Rendering (MS-3)

Reference (MS-3)

3D Rendering (MS-3)

MS.TD.0003.U

v1.0.2024

- Indications for musculoskeletal 3-D image post-processing for preoperative planning when conventional imaging is insufficient for:
 - Complex fractures (comminuted or displaced)/dislocations of any joint.
 - Spine fractures, pelvic/acetabulum fractures, intra-articular fractures.
 - Preoperative planning for other complex surgical cases.
- The code assignment for 3-D rendering depends upon whether the 3-D post-processing is performed on the scanner workstation (CPT® 76376) or on an independent workstation (CPT® 76377).
 - 2-D reconstruction (i.e. reformatting axial images into the coronal plane) is considered part of the tomography procedure, is not separately reportable, and does not meet the definition of 3-D rendering.
 - It is not appropriate to report 3-D rendering in conjunction with CTA and MRA because those procedure codes already include the post-processing.
 - In addition to the term "3-D," the following terms may also be used to describe 3-D post-processing:
 - Maximum intensity projection (MIP)
 - Shaded surface rendering
 - Volume rendering
 - Additionally - If multiple CPT codes are performed for the same indication on the same day, one 3D rendering code is required. If they are performed on separate days, 3D rendering codes are required for each study on each day.
- The 3-D rendering codes require concurrent supervision of image post-processing 3-D manipulation of volumetric data set and image rendering.

Reference (MS-3)

1. Bruno MA, Weissman BN, Kransdorf MJ, et al. Expert Panel on Musculoskeletal Imaging. ACR Appropriateness Criteria® acute hand and wrist trauma. Am Coll Radiol (ACR); Date of Origin:1995. Revised: 2018. <https://acsearch.acr.org/docs/69418/Narrative/>.

Avascular Necrosis (AVN)/Osteonecrosis (MS-4)

Guideline

AVN (MS-4.1)

References (MS-4)

AVN (MS-4.1)

MS.AN.0004.1.A

v1.0.2024

- MRI without contrast, MRI without and with contrast, or CT without contrast of the area of interest can be performed when plain x-ray findings are negative or equivocal and clinical symptoms warrant further investigation for suspected avascular necrosis.
- Advanced imaging for AVN confirmed by plain x-ray is appropriate for treatment planning in the following situations:
 - Femoral head:
 - MRI Hip without contrast (CPT® 73721) or CT Hip without contrast (CPT® 73700)
 - Distal Femur:
 - MRI Knee without contrast (CPT® 73721) or CT Knee without contrast (CPT® 73700)
 - Talus:
 - MRI Ankle without contrast (CPT® 73721) or CT Ankle without contrast (CPT® 73700)
 - Tarsal navicular (Kohler Disease):
 - MRI Foot without contrast (CPT® 73718) or CT Foot without contrast (CPT® 73700)
 - Metatarsal head (Frieberg's Infraction):
 - MRI Foot without contrast (CPT® 73718) or CT Foot without contrast (CPT® 73700)
 - Humeral head:
 - MRI Shoulder without contrast (CPT® 73221) or CT Shoulder without contrast (CPT® 73200)
 - Lunate (Kienbock's Disease)/Scaphoid (Preiser's Disease):
 - CT Wrist without contrast (CPT® 73200) or MRI Wrist without contrast (CPT® 73221)
- Individuals with acute lymphoblastic leukemia and known or suspected osteonecrosis should be imaged according to guidelines in **Acute Lymphoblastic Leukemia (PEDONC-3.2)**
- Known or suspected osteonecrosis in long-term cancer survivors should be imaged according to guidelines in **Osteonecrosis in Long Term Cancer Survivors (PEDONC-19.4)**

Background and Supporting Information

- Classification systems use a combination of plain radiographs, MRI, and clinical features to stage avascular necrosis.

Fractures (MS-5)

Guideline

Acute Fracture (MS-5.1)

Suspected Occult/Stress/Insufficiency Fracture/Stress Reaction and Shin Splints (MS-5.2)

Other Indications (MS-5.3)

References (MS-5)

Acute Fracture (MS-5.1)

MS.FX.0005.1.A

v1.0.2024

- CT or MRI without contrast if **ANY** of the following:
 - Complex (comminuted or displaced) fracture with or without dislocation on plain x-ray.
 - CT is preferred unless it is associated with neoplastic disease when MRI without/with contrast is preferred unless MRI contraindicated.
 - Individual presents initially to the requesting provider with a documented history of an acute traumatic event at least two weeks prior with a negative plain x-ray at the time of this face-to-face encounter and a clinical suspicion for an occult/stress/insufficiency fracture see: **Suspected Occult/ Stress/ Insufficiency Fracture/ Stress Reaction and Shin Splints (MS-5.2)**.
- For osteochondral fracture or osteochondral injury, see: **Chondral/Osteochondral Lesions, Including Osteochondritis Dissecans and Fractures (MS-13.1)**

Suspected Occult/Stress/Insufficiency Fracture/Stress Reaction and Shin Splints (MS-5.2)

MS.FX.0005.2.A

v1.0.2024

- MRI without contrast can be performed for suspected hip/femoral neck, tibia, pelvis/sacrum, tarsal navicular, proximal fifth metatarsal, or scaphoid occult/stress/insufficiency fractures, and suspected atypical femoral shaft fractures related to bisphosphonate use if the initial evaluation of history, physical exam and plain x-ray fails to establish a definitive diagnosis.
 - CT without contrast can be performed as an alternative to MRI for suspected occult/insufficiency fractures of the pelvis/hip and suspected atypical femoral shaft fractures related to bisphosphonate see: **Pelvis (MS-23)** and **Hip (MS-24)**, and suspected occult fractures of the scaphoid see: **Wrist (MS-21)**.
 - For suspected fractures, when MRI cannot be performed, any one of the following is indicated:
 - Tc-99m Bone scan whole body (CPT® 78306) with SPECT of the area of interest (CPT® 78803) OR
 - Bone scan (CPT® 78315, 78300) OR
 - SPECT/CT (CPT® 78830)
 - See: **Nuclear Medicine (MS-28)**
- MRI or CT without contrast can be performed for all other suspected occult/stress/insufficiency fractures with either of the following:
 - Repeat plain x-rays remain non-diagnostic for fracture after a minimum of 10 days of provider-directed conservative treatment, or
 - Initial plain x-rays obtained a minimum of 14 days after the onset of symptoms are non-diagnostic for fracture
 - For suspected fractures, when MRI cannot be performed, any one of the following is indicated:
 - Tc-99m Bone scan whole body (CPT® 78306) with SPECT of the area of interest (CPT® 78803) OR
 - Bone scan (CPT® 78315, 78300) OR
 - SPECT/CT (CPT® 78830)
 - See: **Nuclear Medicine (MS-28)**
- MRI of the lower leg without contrast (CPT® 73718) for suspected shin splints when **BOTH** of the following are met:
 - Initial plain x-ray
 - Failure of a 6-week trial of provider-directed conservative treatment

- For stress reaction, advanced imaging is not medically necessary for surveillance or “return to play” decisions regarding a stress reaction identified on an initial imaging study.
- MRI without contrast of the area of interest for stress fracture follow-up imaging for “return to play” evaluation at least 3 months after the initial imaging study for stress fracture.
- For periprosthetic fractures related to joint replacement see: **Post-Operative Joint Replacement Surgery (MS-16.1)**, **Shoulder (MS-19)**, **Elbow (MS-20)**, **Hip (MS-24)**, **Knee (MS-25)**, and **Ankle (MS-26)**.

Other Indications (MS-5.3)

MS.FX.0005.3.A

v1.0.2024

- CT or MRI without contrast after recent (within 30 days) plain x-ray if **ONE** of the following is present:
 - Concern for delayed union or non-union of fracture, osteotomy, or joint fusions.
 - Part of preoperative evaluation for a planned surgery of a complex fracture with or without dislocation.

Foreign Body (MS-6)

Guideline

Foreign Body – General (MS-6.1)

References (MS-6)

Foreign Body – General (MS-6.1)

MS.FB.0006.1.A**v1.0.2024**

- Ultrasound (CPT® 76881 or CPT® 76882) or CT without contrast or MRI without and with contrast or MRI without contrast of the area of interest can be approved after plain x-rays rule out the presence of radiopaque foreign bodies.
 - Ultrasound (CPT® 76881 or CPT® 76882) is the preferred imaging modality for radiolucent (non-radiopaque) foreign bodies (e.g. wood, plastic).
 - CT without contrast is recommended when plain x-rays are negative and a radiopaque foreign body is still suspected, as CT is favored over MRI for the identification of foreign bodies
 - MRI without and with contrast is an alternative to US and CT for assessing the extent of infection associated with a suspected foreign body

Ganglion Cysts (MS-7)

Guideline

Ganglion Cysts – General (MS-7.1)

References (MS-7)

Ganglion Cysts – General (MS-7.1)

MS.GC.0007.1.A

v1.0.2024

- Plain x-ray is the initial imaging study for ganglion cysts.
 - Results of plain x-rays performed after the current episode of symptoms started or changed need to be available to the requesting provider
- MRI without contrast or MRI without and with contrast or US (CPT® 76881 or CPT® 76882) is appropriate for surgical planning.
- Advanced imaging is not indicated for ganglions that can be diagnosed by history and physical examination.

Gout/Calcium Pyrophosphate Deposition Disease (CPPD)/ Pseudogout/Chondrocal- cinosis (MS-8)

Guideline

Gout – General (MS-8.1)

CPPD (Pseudogout/Chondrocalcinosis) – General (MS-8.2)

References (MS-8)

Gout – General (MS-8.1)

MS.GD.0008.1.A

v1.0.2024

- CT without contrast, MRI without contrast, or MRI without and with contrast of the area of interest is indicated when **BOTH** of the following are met:
 - Initial plain x-ray to rule out other potential disease processes
 - Infection or neoplasm is in the differential diagnosis for soft-tissue tophi

Background and Supporting Information

- Early stages of gout can be diagnosed clinically since radiographic findings are not present early in the disease course.

CPPD (Pseudogout/Chondrocalcinosis) – General (MS-8.2)

MS.GD.0008.2.A

v1.0.2024

- Calcium pyrophosphate deposition disease (CPPD), also called pseudogout, can often be diagnosed from plain x-rays; advanced diagnostic imaging is generally not medically necessary.

Infection/Osteomyelitis (MS-9)

Guideline

Infection – General (MS-9.1)

Septic Joint (MS-9.2)

References (MS-9)

Infection – General (MS-9.1)

MS.OI.0009.1.A

v1.0.2024

- MRI without contrast, MRI without and with contrast, CT without contrast, CT with contrast, or Ultrasound (CPT® 76881 or 76882) of the affected area is appropriate after plain x-ray(s) in the following scenarios:
 - Plain x-ray(s) do not demonstrate infection, **AND**
 - Plain x-ray(s) do not suggest alternative diagnoses such as neuropathic arthropathy or fracture, **AND**
 - Soft tissue or bone infection (osteomyelitis) is suspected **OR**
 - Plain x-ray(s) are positive for infection, **AND**
 - The extent of infection into the soft tissues and any skip lesions require evaluation
- Individuals with suspected spinal infections
 - See: **Red Flag Indications (SP-1.2)** for advanced imaging guidelines
- Individuals with diabetic foot infections after plain x-ray(s)
 - See: **Foot (MS-27)** for advanced imaging guidelines
- For nuclear medicine studies appropriate in specific scenarios, see: **Nuclear Medicine (MS-28)**

Septic Joint (MS-9.2)

MS.OI.0009.2.A

v1.0.2024

- MRI without and with contrast, MRI without contrast, CT without contrast, CT with contrast, or Ultrasound (CPT® 76881 or CPT® 76882) of the affected joint is appropriate when standard or image-guided arthrocentesis is contraindicated, unsuccessful, or non-diagnostic, and the clinical documentation satisfies ALL of the following criteria:
 - History and physical examination findings [One of the following]:
 - Development of an acutely hot and swollen joint (< 2 weeks)
 - Decreased range of motion due to pain
 - Documented fever
 - Laboratory tests [One of the following]:
 - Leukocytosis
 - Elevated ESR or C-reactive protein
 - Analysis of the joint fluid is non-diagnostic
 - Plain x-ray of the joint
 - Results of plain x-rays performed after the current episode of symptoms started or changed need to be available to the requesting provider
- MRI without and with contrast, MRI without contrast, CT without contrast, or CT with contrast of the affected joint is appropriate after plain x-rays if the arthrocentesis is diagnostic and if there is a confirmed septic joint, to evaluate the extent of infection into the soft tissues and any skip lesions that would require evaluation.
 - Results of plain x-rays performed after the current episode of symptoms started or changed need to be available to the requesting provider

Background and Supporting Information

- Analysis of joint fluid is most often sufficient to diagnose a septic joint.

Soft Tissue Mass or Lesion of Bone (MS-10)

Guideline

Soft Tissue Mass (MS-10.1)

Lesion of Bone (MS-10.2)

References (MS-10)

Soft Tissue Mass (MS-10.1)

MS.ST.0010.1.A

v1.0.2024

- History and physical exam should include documentation of: location, size, duration, growing or stable, solid/cystic, fixed/not fixed to the bone, discrete or ill-defined, and an association with pain.
- Plain x-ray is indicated as the initial imaging study, with the exception of individuals with cancer predisposition syndrome.
 - Results of plain x-rays performed after the current episode of symptoms started or changed need to be available to the requesting provider
- MRI without and with contrast or without contrast or US of the area of interest (CPT® 76881 or 76882) is appropriate when ANY of the following are met after plain x-ray:
 - Soft tissue mass(es)
 - Surgical planning
- Known or suspected soft tissue mass in an individual with a cancer predisposition syndrome, see **Screening Imaging in Cancer Predisposition Syndromes (PEDONC-2)** in the Pediatric and Special Populations Oncology Imaging Guidelines.
- CT with contrast or CT without and with contrast is appropriate when MRI is contraindicated or after a metal limiting MRI evaluation.
- Advanced imaging is not indicated for:
 - Subcutaneous lipoma with no surgery planned
 - Ganglia, see: **Ganglion Cysts (MS-7)**
 - Sebaceous cyst

Background and Supporting Information

- Plain x-rays can determine if an advanced imaging procedure is indicated, and if so, which modality is most appropriate. If non-diagnostic, these initial plain x-rays can provide complementary information if advanced imaging is indicated.

Lesion of Bone (MS-10.2)

MS.ST.0010.2.A

v1.0.2024

- History and physical exam should include documentation of: location, size, duration, growing or stable, discrete or poorly defined, and an association with pain.
- Complete radiograph of the entire bone containing the lesion of bone is required prior to consideration of advanced imaging. Many benign bone tumors have a characteristic appearance on plain x-ray and advanced imaging is not necessary.
- MRI without and with contrast, MRI without contrast, or CT without contrast may be indicated if ONE of the following applies:
 - Diagnosis uncertain based on plain x-ray appearance
 - Imaging requested for preoperative planning
- MRI without and with contrast or without contrast is appropriate when plain x-ray reveals an osteochondroma with clinical concern of malignant transformation.
- For Paget's Disease:
 - Bone scan (See: **Nuclear Medicine (MS-28)**) OR
 - MRI (contrast as requested) can be considered if the diagnosis (based on plain x-rays and laboratory studies) is in doubt.
 - MRI (contrast as requested) can be considered if malignant degeneration, which occurs in up to 10% of cases, is suspected.

Muscle/Tendon Unit Injuries/Diseases (MS-11)

Guideline

Muscle/Tendon Unit Injuries/Diseases (MS-11.1)

Acute Compartment Syndrome (MS-11.2)

Chronic Exertional Compartment Syndrome (MS-11.3)

References (MS-11)

Muscle/Tendon Unit Injuries/Diseases (MS-11.1)

MS.MI.0011.1.A

v1.0.2024

- Plain x-ray is the initial imaging study for muscle/tendon unit injuries.
 - Results of plain x-rays performed after the current episode of symptoms started or changed need to be available to the requesting provider
- MRI without contrast or US (CPT® 76881 or CPT® 76882) is supported for **EITHER** of the following:
 - Suspected partial tendon rupture of a specific (named) tendon
 - Complete tendon rupture of a specific named tendon for preoperative planning
- MRI is not medically necessary for muscle belly strains/muscle tears
- See: **Shoulder (MS-19)** for clinical suspicion of a partial or complete rotator cuff tear
- See: **Inflammatory Muscle Diseases (PN-6.2)** in the Peripheral Nerve Disorders Imaging Guidelines and **Inflammatory Muscle Diseases (PEDMS-10.3)** in the Pediatric Musculoskeletal Imaging Guidelines

Acute Compartment Syndrome (MS-11.2)

MS.MI.0011.2.A
v1.0.2024

- Advanced imaging is not indicated. Diagnosis is made clinically and by direct measurement of compartment pressure and is a surgical emergency.

Background and Supporting Information

- Noninvasive methods of measuring compartment pressures and diagnosing acute compartment syndrome are under study, but are currently experimental, investigational, and unproven.

Chronic Exertional Compartment Syndrome (MS-11.3)

MS.MI.0011.3.A

v1.0.2024

- Advanced imaging should only be considered when ruling out other potential causes of extremity pain following a plain x-ray and conservative treatment as indicated.
 - Results of plain x-rays performed after the current episode of symptoms started or changed need to be available to the requesting provider

Background and Supporting Information

- Direct measurement of compartment pressure remains the diagnostic standard. Noninvasive methods of measuring compartment pressures and diagnosing chronic exertional compartment syndrome are under study, but are currently experimental, investigational, and unproven.

Osteoarthritis (MS-12)

Guideline

Osteoarthritis (MS-12.1)

Treatment Planning (Non-Surgical and Surgical, Other Than Joint Replacement) (MS-12.2)

Imaging Prior to Non-Customized-to-Patient Joint Replacement Surgery/Not for Intraoperative Navigation (MS-12.3)

Customized-to-Patient Joint Replacement Surgery/Intraoperative Navigation (MS-12.4)

References (MS-12)

Osteoarthritis (MS-12.1)

MS.OT.0012.1.A

v1.0.2024

- Plain x-ray is the initial imaging study for osteoarthritis.
 - Results of plain x-rays performed after the current episode of symptoms started or changed need to be available to the requesting provider

Background and Supporting Information

- Plain x-rays are performed initially and will reveal characteristic joint space narrowing, osteophyte formation, cyst formation, and subchondral sclerosis.

Treatment Planning (Non-Surgical and Surgical, Other Than Joint Replacement) (MS-12.2)

MS.OT.0012.2.A

v1.0.2024

- Results of plain x-rays performed after the current episode of symptoms started or changed need to be available to the requesting provider, unless otherwise specified below.
- CT without contrast is appropriate when ALL of the following apply:
 - Requested for treatment planning, AND
 - Congenital or significant atypical post-traumatic arthritic deformities are identified on plain x-ray, AND
 - The aforementioned deformities require further evaluation of their clinical significance, AND
 - The request is related to the shoulder, elbow, wrist, hip, knee, or ankle
- MRI Knee without contrast (CPT® 73721) is appropriate in an individual with osteoarthritis for clinical suspicion of a symptomatic degenerative meniscus tear following plain x-rays and conservative treatment. See: **Knee (MS-25)**
- MRI arthrogram or CT arthrogram is appropriate when joint sparing/salvage reconstructive surgery is planned for the following:
 - Suspected concomitant rotator cuff tear of the shoulder - See: **Shoulder (MS-19)**
 - Suspected concomitant labral tear of the shoulder - See: **Shoulder (MS-19)**
 - Suspected concomitant labral tear of the hip - See: **Hip (MS-24)**
 - Suspected concomitant internal derangement of the knee - See: **Knee (MS-25)**

Imaging Prior to Non-Customized-to-Patient Joint Replacement Surgery/Not for Intraoperative Navigation (MS-12.3)

MS.OT.0012.3.A

v1.0.2024

- The following imaging studies are appropriate per the listed criteria after plain x-ray has been performed
 - Results of plain x-rays performed after the current episode of symptoms started or changed need to be available to the requesting provider
 - CT without contrast is appropriate when ALL of the following apply:
 - Requested for treatment planning, **AND**
 - Congenital or significant atypical post-traumatic arthritic deformities are identified on plain x-ray, **AND**
 - The aforementioned deformities require further evaluation of their clinical significance, **AND**
 - The request is related to the shoulder, elbow, wrist, hip, knee, or ankle
 - CT Shoulder without contrast (CPT® 73200) and/or MRI Shoulder without contrast (CPT® 73221) are appropriate for preoperative planning prior to shoulder replacement
 - For the clinical imaging criteria regarding preoperative joint replacement surgery for each anatomic area, refer to the anatomic area tables:
 - **Shoulder (MS-19)**
 - **Elbow (MS-20)**
 - **Wrist (MS-21)**
 - **Hip (MS-24)**
 - **Knee (MS-25)**
 - **Ankle (MS-26)**

Customized-to-Patient Joint Replacement Surgery/Intraoperative Navigation (MS-12.4)

MS.OT.0012.4.U

v1.0.2024

- The following imaging studies are appropriate per the listed criteria after plain x-ray has been performed.
 - Results of plain x-rays performed after the current episode of symptoms started or changed need to be available to the requesting provider
- CT without contrast or MRI without contrast of the shoulder, elbow, wrist, hip, knee, or ankle is appropriate* when the request is for:
 - Treatment planning for customized-to-patient joint replacement surgery, OR
 - Surgical planning using intraoperative navigation for joint replacement surgery (e.g. MAKOpasty) AND
 - The joint replacement surgery has been approved or does not require prior authorization
- *The preoperative imaging listed above is considered **not medically necessary** if any of the following are deemed not medically necessary, not a covered benefit, or experimental, investigational, or unproven by the health plan:
 - Joint replacement surgery
 - Customized-to-patient implant
 - Computer assisted surgical navigation (e.g. MAKOpasty)
- See: **Unlisted Procedures/Therapy Treatment Planning (Preface-4.3)** in the Preface Imaging Guidelines

Chondral/Osteochondral Lesions (MS-13)

Guideline

Chondral/Osteochondral Lesions, Including Osteochondritis Dissecans and Fractures (MS-13.1)

References (MS-13)

Chondral/Osteochondral Lesions, Including Osteochondritis Dissecans and Fractures (MS-13.1)

MS.OD.0013.1.A

v1.0.2024

- MRI without contrast, MRI with contrast (arthrogram), or CT with contrast (arthrogram) of the joint or area of interest is indicated when **EITHER** of the following are met:
 - Plain x-rays are negative and an osteochondral fracture is still suspected
 - Plain x-ray and clinical exam suggest an unstable osteochondral injury
- If plain x-rays show a non-displaced osteochondral fragment, follow-up imaging should be with plain x-rays. Advanced imaging is not necessary.
- MRI without contrast or CT without contrast is indicated when healing (including post-operative fixation) cannot be adequately assessed on follow-up plain x-rays.
- See anatomical table sections for recommendations on anatomy-specific osteochondral injuries
 - See: **Ankle (MS-26)** for suspected osteochondral injury of the ankle
 - See: **Elbow (MS-20)** for suspected osteochondral injury of the elbow

Osteoporosis (MS-14)

Guideline

Osteoporosis (MS-14)

References (MS-14)

Osteoporosis (MS-14)

MS.OP.0014.A

v1.0.2024

- Plain x-ray is not required.
- Quantitative CT (CPT® 77078) can be approved for screening when DXA scanner is unavailable or known to be inaccurate for ANY of the following populations:
 - Women age ≥65 years
 - Men age >70 years
 - Women age <65 years who have additional risk factors for osteoporosis based on medical history and other findings:
 - Estrogen deficiency
 - A history of maternal hip fracture that occurred after age 50 years
 - Low body mass (<127 lb. or 57.6 kg)
 - History of amenorrhea (>1 year before age 42 years)
 - Women age <65 years or men age <70 years who have additional risk factors:
 - Current use of cigarettes
 - Loss of height, thoracic kyphosis
 - Individuals of any age with bone mass osteopenia or fragility fractures on imaging studies such as radiographs, CT, or MRI
 - Individuals age 50 years and older who develop a wrist, hip, spine, or proximal humerus fracture with minimal or no trauma, excluding pathologic fractures
 - Individuals of any age who develop 1 or more insufficiency fractures
 - Premenopausal females or males age 20 to 50 years with risk factors:
 - Individuals with medical conditions that could alter bone mineral density
 - Chronic renal failure
 - Rheumatoid arthritis and other inflammatory arthritides
 - Eating disorders, including anorexia nervosa and bulimia
 - Organ transplantation
 - Prolonged immobilization
 - Conditions associated with secondary osteoporosis, such as gastrointestinal malabsorption or malnutrition, sprue, osteomalacia, vitamin D deficiency, endometriosis, acromegaly, chronic alcoholism or established cirrhosis, and multiple myeloma
 - Individuals who have had gastric bypass for obesity
 - Individuals with an endocrine disorder known to adversely affect bone mineral density (e.g., hyperparathyroidism, hyperthyroidism, or Cushing syndrome)
 - Individuals receiving (or expected to receive) glucocorticoid therapy for >3 months
 - Hypogonadal men older than 18 years and men with surgically or chemotherapeutically-induced castration

- Individuals beginning or receiving long-term therapy with medications known to adversely affect BMD (e.g., anti-convulsant drugs, androgen deprivation therapy, aromatase inhibitor therapy, or chronic heparin)

Note: Repeat screening quantitative computed tomography (QCT) can be approved no sooner than every two years.

- Quantitative CT scan (CPT® 77078) can be approved for non-screening/monitoring when DXA scanner is unavailable or known to be inaccurate for ANY of the following circumstances:
 - Follow-up in cases where QCT was the original study
 - Multiple healed vertebral compression fractures
 - Significant scoliosis
 - Advanced arthritis of the spine due to increased cortical sclerosis often with large marginal osteophytes. Obese individual over the weight limit of the dual-energy x-ray absorptiometry (DXA) exam table
 - Severely obese individuals (BMI >35kg/m²)
 - Extremes in body height (i.e. very large and very small individuals)
 - Individuals with extensive degenerative disease of the spine
 - A clinical scenario that requires sensitivity to small changes in trabecular bone density (parathyroid hormone and glucocorticoid treatment monitoring).

Note: Repeat non-screening/monitoring QCT can be approved no earlier than one year following a change in treatment regimen, and only when the results will directly impact a treatment decision.

Rheumatoid Arthritis (RA) and Inflammatory Arthritis (MS-15)

Guideline

Rheumatoid Arthritis (RA) and Inflammatory Arthritis (MS-15.1)

Pigmented Villonodular Synovitis (PVNS) (MS-15.2)

References (MS-15)

Rheumatoid Arthritis (RA) and Inflammatory Arthritis (MS-15.1)

MS.RA.0015.1.A

v1.0.2024

- Plain x-ray, physical exam and appropriate laboratory studies* are required prior to advanced imaging.
 - Results of plain x-rays performed after the current episode of symptoms started or changed need to be available to the requesting provider
- MRI without contrast OR MRI without and with contrast or US (CPT® 76881 or CPT® 76882) is appropriate for the most symptomatic joint, or of the dominant hand or wrist, in **ALL** of the following situations:
 - When diagnosis is uncertain prior to initiation of drug therapy.
 - To study the effects of treatment with disease modifying anti-rheumatic drug (DMARD) therapy.
 - To identify seronegative RA individuals that might benefit from early DMARD therapy.
 - To determine change in treatment, such as:
 - Switching from standard DMARD therapy to tumor necrosis factor (TNF) therapy.
 - Changing to a different TNF drug therapy, then one MRI (contrast as requested) of a single joint can be performed.
 - Addition of other treatments, including joint injections
- MRI or US should NOT be considered for routine follow-up of treatment.

Background and Supporting Information

- * Examples of appropriate laboratory studies may include: Lyme titers, rheumatoid factor (RF), anti-cyclic citrullinated peptide (anti-CCP), sedimentation rate (ESR), C-reactive protein (CRP), and antinuclear antibody (ANA), joint fluid analysis

Pigmented Villonodular Synovitis (PVNS) (MS-15.2)

MS.RA.0015.2.A

v1.0.2024

- MRI of the affected joint without contrast or CT of the affected joint with contrast (arthrogram) if MRI contraindicated is supported following plain x-rays.
 - Results of plain x-rays performed after the current episode of symptoms started or changed need to be available to the requesting provider

References (MS-15)

Post-Operative Joint Replacement Surgery (MS-16)

Guideline

Post-Operative Joint Replacement Surgery – General (MS-16.1)
References (MS-16)

Post-Operative Joint Replacement Surgery – General (MS-16.1)

MS.PS.0016.1.A

v1.0.2024

- CT without contrast, MRI without contrast, or nuclear medicine studies (see: **MS-28** for nuclear medicine studies) with **ALL** of the following:
 - Recent plain x-ray is nondiagnostic
 - Suspected aseptic loosening of orthopaedic joint replacements
 - CT shoulder without contrast (CPT® 73200) can be performed as additional imaging following plain x-rays regardless of plain x-ray findings. See: **Shoulder (MS-19)**
 - Results of plain x-rays performed after the current episode of symptoms started or changed need to be available to the requesting provider
- CT without contrast or MRI without contrast with **ALL** of the following:
 - Negative plain x-ray
 - High suspicion for a periprosthetic fracture
 - CT Shoulder without contrast (CPT® 73200) can be performed as additional imaging following plain x-rays regardless of plain x-ray findings. See: **Shoulder (MS-19)**
 - Results of plain x-rays performed after the current episode of symptoms started or changed need to be available to the requesting provider
- Joint aspiration is the initial evaluation after plain x-ray for a painful joint replacement when periprosthetic infection is suspected.
 - Results of plain x-rays performed after the current episode of symptoms started or changed need to be available to the requesting provider
 - For suspected infection with negative or inconclusive joint aspiration culture see: **Nuclear Medicine (MS-28)**
- MRI Hip without contrast (CPT® 73721) or Ultrasound (CPT® 76881 or CPT® 76882) are both appropriate for **EITHER** of the following:
 - Diagnosis of ALVAL (aseptic lymphocytic-dominated vasculitis-associated lesion) pseudotumors surrounding metal-on-metal (MoM) hip prostheses. One of these two imaging modalities can be approved but not both. See: **Soft Tissue Mass or Lesion of Bone (MS-10)**
 - Metal-On-Metal (MoM) Hip Prostheses that are considered high risk for implant performance issues from THA (Total hip arthroplasty) cup-neck impingement and subsequent ALTR (adverse local tissue reaction) with Co and Cr ion levels greater than 10 ppb.
- CT Hip without contrast (CPT® 73700) **OR** MRI Hip without contrast (CPT® 73721):
 - Evaluate suspected particle disease (aggressive granulomatous disease) of the hip when infection has been excluded.

- For specific joints post-operative from replacement surgery:
 - See: **Shoulder (MS-19)**
 - See: **Elbow (MS-20)**
 - See: **Hip (MS-24)**
 - See: **Knee (MS-25)**
 - See: **Ankle (MS-26)**

Background and Supporting Information

- Complications following joint replacement surgery include (not limited to) periprosthetic fracture, infection, aseptic loosening, failure of fixation/component malposition, and wear.

Limb Length Discrepancy (MS-17)

Guideline

Limb Length Discrepancy (MS-17.1)

Reference (MS-17)

Limb Length Discrepancy (MS-17.1)

MS.LL.0017.1.A

v1.0.2024

- Either plain radiographic or “CT scanogram,” both reported with CPT® 77073, is appropriate to radiographically evaluate limb length discrepancy due to congenital anomalies, acquired deformities, growth plate (physeal injuries or surgery), or inborn errors of metabolism.
 - A diagnostic advanced imaging CPT code (e.g., CPT® 73700, CPT® 73701, or CPT® 73702) is not indicated for evaluation of limb length discrepancy.

Anatomical Area Tables – General Information (MS-18)

Guideline

Anatomical Area Tables – General Information (MS-18)

Anatomical Area Tables – General Information (MS-18)

MS.AA.0018.A

v1.0.2024

The imaging guidelines for each anatomical area are presented in table format. The table below includes a description of how each column header should be utilized for each guideline **Shoulder (MS-19)** through **Foot (MS-27)**.

After an initial plain x-ray has been obtained, and results are available to the provider, the following advanced imaging is indicated (as described in General Guidelines [MS-1.0])

Condition (Individual's condition)	Conservative Treatment (Is failure of 6 weeks of provider-directed conservative treatment within the past 12 weeks with clinical re-evaluation required?) (Yes or No)	Advanced Imaging (The appropriate advanced imaging indicated for this condition. In some scenarios, advanced imaging may not be indicated.)	Comments (Additional comments related to the condition.)

Shoulder (MS-19)

Guideline

Shoulder (MS-19)

References (MS-19)

Shoulder (MS-19)

MS.SH.0019.A

v1.0.2024

After an initial plain x-ray has been obtained, and results are available to the provider, the following advanced imaging is indicated (as described in General Guidelines [MS-1.0])

Condition (Individual's Condition)	Conservative Treatment (Is failure of 6 weeks of provider-directed conservative treatment within the past 12 weeks with clinical re-evaluation required?) (Yes or No)	Advanced Imaging (The appropriate advanced imaging indicated for this condition. In some scenarios, advanced imaging may not be indicated.)	Comments (Additional comments related to the condition.)
General Shoulder Pain	Yes	<ul style="list-style-type: none"> MRI Shoulder without contrast (CPT® 73221) OR US Shoulder (CPT® 76881 or CPT® 76882) OR CT Shoulder with contrast (arthrogram) (CPT® 73201) if MRI contraindicated 	
Symptomatic Loose Bodies	No	<ul style="list-style-type: none"> MRI Shoulder without contrast (CPT® 73221) 	
Impingement	Yes	<ul style="list-style-type: none"> MRI Shoulder without contrast (CPT® 73221) OR MRI Shoulder with contrast (arthrogram) (CPT® 73222) OR US Shoulder (CPT® 76881 or CPT® 76882) CT Shoulder with contrast (CPT® 73201) if MRI is contraindicated 	
Tendonitis/ Bursitis	Yes	<ul style="list-style-type: none"> MRI Shoulder without contrast (CPT® 73221) OR US Shoulder (CPT® 76881 or CPT® 76882) 	

After an initial plain x-ray has been obtained, and results are available to the provider, the following advanced imaging is indicated (as described in General Guidelines [MS-1.0])

Condition (Individual's Condition)	Conservative Treatment (Is failure of 6 weeks of provider-directed conservative treatment within the past 12 weeks with clinical re-evaluation required?) (Yes or No)	Advanced Imaging (The appropriate advanced imaging indicated for this condition. In some scenarios, advanced imaging may not be indicated.)	Comments (Additional comments related to the condition.)
Tendon Rupture (Biceps Long Head)	No	<ul style="list-style-type: none"> When clinical exam is inconclusive due to inability to visualize a "Popeye" sign clinically, or for preoperative planning: <ul style="list-style-type: none"> MRI Shoulder without contrast (CPT® 73221) OR US Shoulder (CPT® 76881 or CPT® 76882) 	
Tendon Rupture (Pectoralis Major/Minor)	No	<ul style="list-style-type: none"> When clinical exam is inconclusive, or for preoperative planning: <ul style="list-style-type: none"> MRI Shoulder without contrast (CPT® 73221) OR MRI Chest without contrast (CPT® 71550) OR US Shoulder (CPT® 76881 or CPT® 76882) 	

After an initial plain x-ray has been obtained, and results are available to the provider, the following advanced imaging is indicated (as described in General Guidelines [MS-1.0])			
Condition (Individual's Condition)	Conservative Treatment (Is failure of 6 weeks of provider-directed conservative treatment within the past 12 weeks with clinical re-evaluation required?) (Yes or No)	Advanced Imaging (The appropriate advanced imaging indicated for this condition. In some scenarios, advanced imaging may not be indicated.)	Comments (Additional comments related to the condition.)
Shoulder Rotator Cuff Tear (Complete and Partial)	Yes*	<ul style="list-style-type: none"> • MRI Shoulder without contrast (CPT® 73221) OR • MRI Shoulder with contrast (arthrogram) (CPT® 73222) OR • US Shoulder (CPT® 76881 or CPT® 76882) OR • CT Shoulder with contrast (arthrogram) (CPT® 73201) if MRI is contraindicated 	<p>*Conservative treatment is not required with an acute shoulder injury prior to the onset of symptoms and consideration of surgery.</p> <p>If surgery is being considered, MRI without contrast, MRI with contrast (arthrogram), or CT arthrogram are required per <u>Shoulder Surgery-Arthroscopic and Open Procedure (CMM-315)</u></p>

After an initial plain x-ray has been obtained, and results are available to the provider, the following advanced imaging is indicated (as described in General Guidelines [MS-1.0])			
Condition (Individual's Condition)	Conservative Treatment (Is failure of 6 weeks of provider-directed conservative treatment within the past 12 weeks with clinical re-evaluation required?) (Yes or No)	Advanced Imaging (The appropriate advanced imaging indicated for this condition. In some scenarios, advanced imaging may not be indicated.)	Comments (Additional comments related to the condition.)
Partial Tendon Rupture (Excluding Partial Rotator Cuff Tears)	No	<ul style="list-style-type: none"> For a suspected partial tendon rupture of a specific named tendon not otherwise specified: <ul style="list-style-type: none"> MRI Shoulder without contrast (CPT® 73221) OR US Shoulder (CPT® 76881 or CPT® 76882) 	MRI is <i>NOT</i> needed for muscle belly strains/ muscle tears.
Complete Rupture – Tear of a Specific Named Tendon	No	<ul style="list-style-type: none"> For preoperative planning: <ul style="list-style-type: none"> MRI Shoulder without contrast (CPT® 73221) OR US Shoulder (CPT® 76881 or CPT® 76882) 	

After an initial plain x-ray has been obtained, and results are available to the provider, the following advanced imaging is indicated (as described in General Guidelines [MS-1.0])			
Condition (Individual's Condition)	Conservative Treatment (Is failure of 6 weeks of provider-directed conservative treatment within the past 12 weeks with clinical re-evaluation required?) (Yes or No)	Advanced Imaging (The appropriate advanced imaging indicated for this condition. In some scenarios, advanced imaging may not be indicated.)	Comments (Additional comments related to the condition.)
Shoulder Labral Tear (e.g., SLAP, ALPSA, HAGL)	Yes	<ul style="list-style-type: none"> • MRI Shoulder with contrast (arthrogram) (CPT® 73222) OR • MRI Shoulder without contrast (CPT® 73221) OR • CT Shoulder with contrast (arthrogram) (CPT® 73201) 	For surgery criteria, see: <u>Shoulder Surgery- Arthroscopic and Open Procedures (CMM-315)</u>

After an initial plain x-ray has been obtained, and results are available to the provider, the following advanced imaging is indicated (as described in General Guidelines [MS-1.0])			
Condition (Individual's Condition)	Conservative Treatment (Is failure of 6 weeks of provider-directed conservative treatment within the past 12 weeks with clinical re-evaluation required?) (Yes or No)	Advanced Imaging (The appropriate advanced imaging indicated for this condition. In some scenarios, advanced imaging may not be indicated.)	Comments (Additional comments related to the condition.)
Shoulder Dislocation/ Subluxation/ Instability, or Bankart/ Hill-Sachs Lesions	Yes*	<ul style="list-style-type: none"> Individuals 40 years of age or younger with a first time dislocation, and in individuals with recurrent dislocations, conservative treatment not required: MRI Shoulder with contrast (arthrogram) (CPT® 73222) or MRI Shoulder without contrast (CPT® 73221) CT Shoulder with contrast (arthrogram) (CPT® 73201) or CT Shoulder without contrast (CPT® 73200) if MRI is contraindicated 	<p>*Conservative treatment is required in individuals over age 40 with a first time dislocation.</p> <p>For surgery criteria, see: <u>Shoulder Surgery- Arthroscopic and Open Procedures (CMM-315)</u></p>

After an initial plain x-ray has been obtained, and results are available to the provider, the following advanced imaging is indicated (as described in General Guidelines [MS-1.0])			
Condition (Individual's Condition)	Conservative Treatment (Is failure of 6 weeks of provider-directed conservative treatment within the past 12 weeks with clinical re-evaluation required?) (Yes or No)	Advanced Imaging (The appropriate advanced imaging indicated for this condition. In some scenarios, advanced imaging may not be indicated.)	Comments (Additional comments related to the condition.)
Frozen Shoulder/ Adhesive Capsulitis	Yes	<ul style="list-style-type: none"> MRI Shoulder without contrast (CPT® 73221) 	For surgery criteria, see: <u>Manipulation Under Anesthesia (CMM-310)</u> and <u>Shoulder Surgery-Arthroscopic (CMM-315)</u>
Avascular Necrosis (AVN) of the Humeral Head	No	<ul style="list-style-type: none"> See: <u>AVN (MS-4.1)</u> 	
Acromio-clavicular (AC) Separation	No	<ul style="list-style-type: none"> MRI Shoulder without contrast (CPT® 73221) to rule out possible rotator cuff tear following AC separation 	
Sterno-clavicular (SC) Dislocation	No	<ul style="list-style-type: none"> CT Chest without contrast (CPT® 71250) if posterior SC dislocation is evident or suspected 	

After an initial plain x-ray has been obtained, and results are available to the provider, the following advanced imaging is indicated (as described in General Guidelines [MS-1.0])

Condition (Individual's Condition)	Conservative Treatment (Is failure of 6 weeks of provider-directed conservative treatment within the past 12 weeks with clinical re-evaluation required?) (Yes or No)	Advanced Imaging (The appropriate advanced imaging indicated for this condition. In some scenarios, advanced imaging may not be indicated.)	Comments (Additional comments related to the condition.)
Post-Operative Shoulder Surgery for Impingement, Rotator Cuff Tear, and/or Labral Tear	Yes	<ul style="list-style-type: none"> In symptomatic individuals: <ul style="list-style-type: none"> MRI Shoulder without contrast (CPT® 73221) OR MRI Shoulder with contrast (arthrogram) (CPT® 73222) US Shoulder (CPT® 76881 or CPT® 76882) is also appropriate in symptomatic individuals following rotator cuff repair CT Shoulder with contrast (arthrogram) (CPT® 73201) if MRI contraindicated 	
Preoperative Shoulder (Glenohumeral) Replacement Surgery	Yes	<ul style="list-style-type: none"> CT Shoulder without contrast (CPT® 73200) and/or MRI Shoulder without contrast (CPT® 73221) for preoperative planning prior to shoulder replacement 	<p>See also:</p> <p><u>Osteoarthritis (MS-12)</u></p> <p>For joint surgery criteria, see: <u>Shoulder Arthroplasty/Arthrodesis (CMM-318)</u></p>

Elbow (MS-20)

MS.EB.0020.A

v1.0.2024

After an initial plain x-ray has been obtained, and results are available to the provider, the following advanced imaging is indicated (as described in General Guidelines [MS-1.0])

Condition (Individual's condition)	Conservative Treatment (Is failure of 6 weeks of provider-directed conservative treatment within the past 12 weeks with clinical re-evaluation required?) (Yes or No)	Advanced Imaging (The appropriate advanced imaging indicated for this condition. In some scenarios, advanced imaging may not be indicated.)	Comments (Additional comments related to the condition.)
General Elbow Pain	Yes	<ul style="list-style-type: none"> MRI Elbow without contrast (CPT® 73221) OR US Elbow (CPT® 76881 or CPT® 76882) 	
Symptomatic Loose Bodies	No	<ul style="list-style-type: none"> MRI Elbow without contrast (CPT® 73221) OR MRI Elbow with contrast (arthrogram) (CPT® 73222) OR CT Elbow without contrast (CPT® 73200) OR CT Elbow with contrast (arthrogram) (CPT® 73201) 	
Tendonitis	Yes	<ul style="list-style-type: none"> MRI Elbow without contrast (CPT® 73221) OR US Elbow (CPT® 76881 or CPT® 76882) 	
Bursitis	Yes	<ul style="list-style-type: none"> MRI Elbow without and with contrast (CPT® 73223) OR MRI Elbow without contrast (CPT® 73221) OR US Elbow (CPT® 76881 or CPT® 76882) 	

After an initial plain x-ray has been obtained, and results are available to the provider, the following advanced imaging is indicated (as described in General Guidelines [MS-1.0])			
Condition (Individual's condition)	Conservative Treatment (Is failure of 6 weeks of provider-directed conservative treatment within the past 12 weeks with clinical re-evaluation required?) (Yes or No)	Advanced Imaging (The appropriate advanced imaging indicated for this condition. In some scenarios, advanced imaging may not be indicated.)	Comments (Additional comments related to the condition.)
Lateral (tennis elbow) or Medial (golfer's elbow) Epicondylitis	Yes	<ul style="list-style-type: none"> To confirm clinical diagnosis of epicondylitis if symptoms persist for longer than 6 months despite at least 6 weeks conservative treatment in the last 3 months: <ul style="list-style-type: none"> MRI Elbow without contrast (CPT® 73221) OR US Elbow (CPT® 76881 or CPT® 76882) 	Epicondylitis, caused by tendon degeneration and tear of the common extensor tendon laterally or of the common flexor tendon medially, is a common clinical diagnosis for which imaging is not medically necessary except as noted.

After an initial plain x-ray has been obtained, and results are available to the provider, the following advanced imaging is indicated (as described in [General Guidelines \[MS-1.0\]](#))

Condition (Individual's condition)	Conservative Treatment (Is failure of 6 weeks of provider-directed conservative treatment within the past 12 weeks with clinical re-evaluation required?) (Yes or No)	Advanced Imaging (The appropriate advanced imaging indicated for this condition. In some scenarios, advanced imaging may not be indicated.)	Comments (Additional comments related to the condition.)
Suspected Osteochondral Injury	No	<ul style="list-style-type: none"> If plain x-rays are negative and an osteochondral fracture is still suspected: <ul style="list-style-type: none"> MRI Elbow without contrast (CPT® 73221) OR MRI Elbow with contrast (arthrogram) (CPT® 73222) OR CT Elbow without contrast (CPT® 73200) OR CT Elbow with contrast (arthrogram) (CPT® 73201) 	See: <u>Chondral/ Osteochondral Lesions (MS-13)</u> for other osteochondral injury scenarios

After an initial plain x-ray has been obtained, and results are available to the provider, the following advanced imaging is indicated (as described in General Guidelines [MS-1.0])			
Condition (Individual's condition)	Conservative Treatment (Is failure of 6 weeks of provider-directed conservative treatment within the past 12 weeks with clinical re-evaluation required?) (Yes or No)	Advanced Imaging (The appropriate advanced imaging indicated for this condition. In some scenarios, advanced imaging may not be indicated.)	Comments (Additional comments related to the condition.)
Ruptured Biceps Insertion at Elbow	No	<ul style="list-style-type: none"> When clinical exam is inconclusive or for preoperative planning: <ul style="list-style-type: none"> MRI Elbow without contrast (CPT® 73221) OR US Elbow (CPT® 76881 or CPT® 76882) 	
Ruptured Triceps Insertion at Elbow	No	<ul style="list-style-type: none"> When clinical exam is inconclusive or for preoperative planning: <ul style="list-style-type: none"> MRI Elbow without contrast (CPT® 73221) OR US Elbow (CPT® 76881 or CPT® 76882) 	
Partial Tendon Rupture	No	<ul style="list-style-type: none"> For a suspected partial tendon rupture of a specific named tendon not otherwise specified: <ul style="list-style-type: none"> MRI Elbow without contrast (CPT® 73221) OR US Elbow (CPT® 76881 or CPT® 76882) 	MRI is <i>NOT</i> needed for muscle belly strains/muscle tears.

After an initial plain x-ray has been obtained, and results are available to the provider, the following advanced imaging is indicated (as described in General Guidelines [MS-1.0])			
Condition (Individual's condition)	Conservative Treatment (Is failure of 6 weeks of provider-directed conservative treatment within the past 12 weeks with clinical re-evaluation required?) (Yes or No)	Advanced Imaging (The appropriate advanced imaging indicated for this condition. In some scenarios, advanced imaging may not be indicated.)	Comments (Additional comments related to the condition.)
Complete Rupture – Tear of a Specific Named Tendon	No	<ul style="list-style-type: none"> For preoperative planning: <ul style="list-style-type: none"> MRI Elbow without contrast (CPT® 73221) OR US Elbow (CPT® 76881 or CPT® 76882) 	
Trauma	No	<ul style="list-style-type: none"> When surgery is being considered: <ul style="list-style-type: none"> MRI Elbow without contrast (CPT® 73221) OR CT Elbow without contrast (CPT® 73200) 	
Ulnar Collateral Ligament (UCL) Tear	No	<ul style="list-style-type: none"> Following acute or repetitive (including overhead throwing athletes) elbow trauma: <ul style="list-style-type: none"> MRI Elbow with contrast (arthrogram) (CPT® 73222) OR MRI Elbow without contrast (CPT® 73221) OR US Elbow (CPT® 76881 or CPT® 76882) OR CT Elbow with contrast (arthrogram) (CPT® 73201) 	
Suspected Nerve Abnormality	NA	<ul style="list-style-type: none"> This condition is imaged according to the criteria found in the Peripheral Nerve Disorder Guidelines. See: Focal Neuropathy (PN-2) in the Peripheral Nerve Disorders Imaging Guidelines 	

After an initial plain x-ray has been obtained, and results are available to the provider, the following advanced imaging is indicated (as described in General Guidelines [MS-1.0])			
Condition (Individual's condition)	Conservative Treatment (Is failure of 6 weeks of provider-directed conservative treatment within the past 12 weeks with clinical re-evaluation required?) (Yes or No)	Advanced Imaging (The appropriate advanced imaging indicated for this condition. In some scenarios, advanced imaging may not be indicated.)	Comments (Additional comments related to the condition.)
Post-Operative	Yes	<ul style="list-style-type: none"> CT Elbow without contrast (CPT® 73200) in symptomatic post-operative individuals following surgical treatment of complex fractures; OR MRI Elbow without contrast (CPT® 73221) in symptomatic post-operative individuals following soft-tissue surgery 	
Preoperative Elbow Replacement Surgery	Yes	<ul style="list-style-type: none"> CT Elbow without contrast (CPT® 73200) for preoperative planning prior to elbow replacement when congenital or post-traumatic deformities exist 	See: <u>Osteoarthritis (MS-12)</u>

After an initial plain x-ray has been obtained, and results are available to the provider, the following advanced imaging is indicated (as described in General Guidelines [MS-1.0])

Condition (Individual's condition)	Conservative Treatment (Is failure of 6 weeks of provider-directed conservative treatment within the past 12 weeks with clinical re-evaluation required?) (Yes or No)	Advanced Imaging (The appropriate advanced imaging indicated for this condition. In some scenarios, advanced imaging may not be indicated.) (Yes or No)	Advanced Imaging (The appropriate advanced imaging indicated for this condition. In some scenarios, advanced imaging may not be indicated.)	Comments (Additional comments related to the condition.)
Post-Operative	Yes	<ul style="list-style-type: none"> In symptomatic individuals following surgery for ligament/tendon injuries, <i>one of the following</i>: <ul style="list-style-type: none"> MRI Ankle without contrast (CPT® 73721) OR US Ankle (CPT® 76881 or CPT® 76882) For symptomatic individuals following surgery for complex fractures: <ul style="list-style-type: none"> CT Ankle without contrast (CPT® 73700) 	
Preoperative Ankle Replacement Surgery	Yes	<ul style="list-style-type: none"> CT Ankle without contrast (CPT® 73700) for preoperative planning prior to ankle replacement when congenital or post-traumatic deformities exist 	See: <u>Osteoarthritis (MS-12)</u>

After an initial plain x-ray has been obtained, and results are available to the provider, the following advanced imaging is indicated (as described in General Guidelines [MS-1.0])			
Condition (Individual's condition)	Conservative Treatment (Is failure of 6 weeks of provider-directed conservative treatment within the past 12 weeks with clinical re-evaluation required?) (Yes or No)	Advanced Imaging (The appropriate advanced imaging indicated for this condition. In some scenarios, advanced imaging may not be indicated.)	Comments (Additional comments related to the condition.)
Post-Operative Ankle Replacement Surgery	No	<ul style="list-style-type: none"> For suspected aseptic loosening or periprosthetic fracture when recent plain x-ray is nondiagnostic: <ul style="list-style-type: none"> CT Ankle without contrast (CPT® 73700) OR Bone scan (CPT® 78315, 78300, or 78306) OR Distribution Of Radiopharmaceutical Agent SPECT (CPT® 78803 or 78831) OR Hybrid SPECT/CT (CPT® 78830) 	See: <u>Post-Operative Joint Replacement Surgery (MS-16)</u>

After an initial plain x-ray has been obtained, and results are available to the provider, the following advanced imaging is indicated (as described in General Guidelines [MS-1.0])			
Condition (Individual's condition)	Conservative Treatment (Is failure of 6 weeks of provider-directed conservative treatment within the past 12 weeks with clinical re-evaluation required?) (Yes or No)	Advanced Imaging (The appropriate advanced imaging indicated for this condition. In some scenarios, advanced imaging may not be indicated.)	Comments (Additional comments related to the condition.)
Post-Operative Ankle Replacement Surgery	No	<ul style="list-style-type: none"> For suspected infection with negative or inconclusive joint aspiration culture: <ul style="list-style-type: none"> MRI ankle without contrast (CPT® 73721) OR MRI ankle without and with contrast (CPT® 73723) OR CT ankle with contrast (CPT® 73701) OR US ankle (CPT® 76881 or CPT® 76882) OR See also: <u>Nuclear Medicine (MS-28)</u> 	See: <u>Post-Operative Joint Replacement Surgery (MS-16)</u>

One Study/Area Only

In foot and ankle advanced imaging, studies are frequently ordered of both areas. This is unnecessary since ankle MRI will image from above the ankle to the mid-metatarsal area. **Only one CPT® code should be reported.**

Nuclear Medicine (MS-28)

Guideline

Nuclear Medicine (MS-28)

References (MS-28)

Nuclear Medicine (MS-28)

MS.NM.0028.A

v1.0.2024

Results of plain x-rays performed after the current episode of symptoms started or changed need to be available to the requesting provider, unless otherwise specified below.

- SPECT scan may be approved for any of the indications for which a bone scan can be approved.
 - If the request is for CPT® 78300 and CPT® 78803, then only CPT® 78803 is to be approved if medical necessity is established.
 - If the request is for CPT® 78305 or CPT® 78306 and CPT® 78803, then two CPT® codes may be approved if medical necessity is established.
- Nuclear Medicine may be used in the evaluation of some musculoskeletal disorders, and other rare indications exist as well.
 - Evaluation of suspected aseptic loosening of orthopedic prostheses when recent plain x-ray is nondiagnostic:
 - Bone scan (CPT® 78315) **OR**
 - Distribution Of Radiopharmaceutical Agent SPECT (CPT® 78803, or 78831) **OR**
 - Hybrid SPECT/CT (CPT® 78830)
 - See also: **Post-Operative Joint Replacement Surgery (MS-16)** and anatomic tables
 - For detection of ischemic or infarcted regions in sickle cell disease:
 - Nuclear medicine bone marrow imaging (CPT® 78102, 78103, 78104) **OR**
 - SPECT (CPT® 78803) **OR**
 - Hybrid SPECT/CT (CPT® 78830)
 - See also: **Modality General Considerations (PEDMS-1.3)**
 - Evaluation of complex regional pain syndrome or reflex sympathetic dystrophy, after failure of six weeks provider-directed conservative treatment (per **General Guidelines [MS-1.0]**):
 - Triple phase bone scan (CPT® 78315)
 - See: **Foot (MS-27)** for imaging criteria of CRPS of the foot
 - For interventional pain criteria see: **Regional Sympathetic Blocks (CMM-209)** and **Spinal Cord Stimulators (CMM-211)**
 - Evaluation of Paget's disease
 - Bone scan (CPT® codes: 78300, 78305, 78306) **OR**
 - Distribution Of Radiopharmaceutical Agent SPECT (CPT® 78803) **OR**
 - Hybrid SPECT/CT (CPT® 78830)
 - See also: **Soft Tissue Mass or Lesion of Bone (MS-10)**
 - Suspected fractures

- If criteria per **Suspected Occult/Stress/Insufficiency Fracture/Stress Reaction and Shin Splints (MS-5.2)** are met, but MRI cannot be performed:
 - Tc-99m bone scan whole body (CPT® 78306) with SPECT of the area of interest (CPT® 78803) **OR**
 - Hybrid SPECT/CT (CPT® 78830) **OR**
 - Bone scan (CPT® 78315, 78305, or 78300)
- Evaluation of suspected bone infection if MRI or CT cannot be done and when infection is multifocal, or when the infection is associated with orthopedic hardware or chronic bone alterations from trauma or surgery
 - FDG PET/CT (CPT® 78815 for multifocal infection, or CPT® 78811 for unifocal/limited area of interest) if MRI or CT is equivocal or cannot be done
 - At this time, FDG is the only indicated radiotracer for use with PET/CT in the imaging of musculoskeletal conditions.
 - Bone scan (CPT® 78315, 78300, 78305, or 78306) **OR**
 - Distribution Of Radiopharmaceutical Agent SPECT (CPT® 78803 or 78831) **OR**
 - Hybrid SPECT/CT (CPT® 78830 or 78832)
 - A labeled leukocyte scan (radiopharmaceutical inflammatory imaging - one of CPT® codes: 78800, 78801, 78802, or 78803) in concert with Tc-99m sulfur colloid marrow imaging (one of CPT® codes: 78102, 78103, or 78104)
 - See also: **Post-Operative Joint Replacement Surgery (MS-16)**
 - For specific joints post-operative from replacement surgery:
 - See: **Shoulder (MS-19)**
 - See: **Elbow (MS-20)**
 - See: **Hip (MS-24)**
 - See: **Knee (MS-25)**
 - See: **Ankle (MS-26)**

General Guidelines (Neck-1.0)

NK.GG.0001.0.A

v1.0.2024

- A pertinent clinical evaluation since the onset or change in symptoms including a detailed history, physical examination, appropriate laboratory studies, and basic imaging such as plain radiography or ultrasound should be performed prior to considering advanced imaging (CT, MR, Nuclear Medicine), unless the individual is undergoing guideline-supported scheduled imaging evaluation. A meaningful technological contact (telehealth visit, telephone call, electronic mail or messaging) since the onset or change in symptoms can serve as a pertinent clinical evaluation.
- Advanced imaging of the neck covers the following areas:
 - Skull base (thus, a separate CPT® code for head imaging in order to visualize the skull base is not necessary)
 - Nasopharynx
 - Upper oral cavity to the head of the clavicle
 - Parotid glands and the supraclavicular region
- Ultrasound of neck soft tissues including thyroid, parathyroid, parotid and other salivary glands, lymph nodes, cysts, etc. is coded as CPT® 76536. This can be helpful in more ill-defined masses or fullness and differentiating adenopathy from mass or cyst, to define further advanced imaging.
- CT Neck
 - CT Neck is usually obtained with contrast only (CPT® 70491).
 - With the exception of 4D CT Neck without and with contrast (CPT® 70492) for parathyroid adenoma localization, little significant information is added by performing a CT Neck without and with contrast (CPT® 70492), and there is the risk of added radiation exposure, especially to the thyroid.
 - CT Neck without contrast (CPT® 70490) can be difficult to interpret due to difficulty identifying the blood vessels.
 - Exceptions include:
 - Contrast is generally not required when evaluating known or suspected tracheal anomalies with CT.
 - Additionally, noncontrast CT may be supported for the evaluation of salivary duct stones in the appropriate clinical circumstance where intravenous contrast may obscure high attenuation stones. Dual-phase CT imaging (without and with IV contrast) is not supported in this situation.⁴
 - Contrast enhanced CT is helpful in the assessment of cervical adenopathy and preoperative planning, including in the setting of thyroid carcinomas.
 - Contrast may cause intense and prolonged enhancement of the thyroid gland which interferes with radioactive iodine nuclear medicine studies.
 - Use of IV contrast is an important adjunct, however, because it helps to delineate the anatomic relationship between the primary tumor and

metastatic disease. Iodine is generally cleared within four to eight weeks in most individuals, so concern about iodine burden from IV contrast causing a clinically significant delay in subsequent whole-body scans (WBSs) or radioactive iodine (RAI) treatment after the imaging followed by surgery is generally unfounded. The benefit gained from improved anatomic imaging generally outweighs any potential risk of a several week delay in RAI imaging or therapy. Where there is concern, a urinary iodine to creatinine ratio can be measured.

- MRI Neck
 - MRI Neck is used less frequently than CT Neck.
 - MRI Neck without and with contrast (CPT® 70543) is appropriate if CT suggests the need for further imaging or if ultrasound or CT suggests any of the following:
 - Neurogenic tumor (schwannoma, neurofibroma, glomus tumor, etc.)
 - Vascular malformations
 - Deep neck masses
 - Angiofibromas
 - Cystic neck mass⁵
 - Concern for malignancy (see **Squamous Cell Carcinomas of the Head and Neck (ONC-3)**, **Salivary Gland Cancers (ONC-4)**, or **Thyroid Cancer (ONC-6)** as appropriate)
 - MRI Neck without and with contrast (CPT® 70543) is also directly supported if the head and neck surgeon or neurosurgeon, or the provider in consultation with the head and neck surgeon or neurosurgeon, has reasonable clinical concern:
 - For a skull base or nasopharyngeal neoplasm, or potential perineural invasion/cranial nerve involvement.²
 - That extensive dental amalgam may obscure the anatomy on CT in individuals with oral cavity neoplasm.

Dysphagia and Esophageal Disorders (Neck-3)

Guideline

Dysphagia and Esophageal Disorders (Neck-3.1)

References (Neck-3)

Dysphagia and Esophageal Disorders (Neck-3.1)

NK.ED.0003.1.A

v1.0.2024

- **General considerations**
 - A detailed history of the dysphagia symptoms is important to distinguish neurogenic, pharyngeal and esophageal disorders.
 - Dysphagia (difficulty swallowing) can be the result of a wide range of benign and malignant processes that affects the body's ability to move food or liquid from the mouth to the pharynx and into the esophagus.
 - A short duration (weeks to months) of rapidly progressive esophageal dysphagia with associated weight loss is highly suggestive of esophageal cancer.
 - Advanced imaging for individuals presenting with isolated globus rarely impacts clinical management. In a study of 148 neck CTs and 104 barium esophagrams done for the evaluation of globus sensation, there were no malignancies detected.²⁰
- **Gastroesophageal reflux disease (GERD)** ^{5,14}
 - Advanced imaging is generally not indicated for the evaluation of GERD, the diagnosis of which is usually made on the basis of clinical history, in conjunction with endoscopy, pH monitoring, Upper GI Barium Studies, and occasionally manometry. Exceptions would include the following:
 - Non-cardiac chest pain suspected of being GERD should be evaluated first to exclude cardiac and other etiologies. See **Non-Cardiac Chest Pain-Imaging (CH-4.1)** in the Chest Imaging Guidelines.
 - Gastric emptying study (CPT® 78264) for individuals with refractory GERD symptoms, and gastroparesis is being considered.
- **Suspected foreign body impaction and ingested foreign bodies** ¹⁻³
 - Plain x-rays initial imaging.
 - If imaging is negative, and there is suspicion of a radiolucent foreign body (such as fish or chicken bones, wood, plastic, thin metal objects, aluminum can pop-ups, etc.):¹⁹
 - CT Neck and/or Chest with or without contrast
 - 3-D reconstruction (CPT® 76377 or CPT® 76376) is indicated in this setting
 - The use of oral contrast is discouraged (to avoid the aspiration of contrast material) for acute dysphagia or foreign body impaction, as the contrast may not pass, may be aspirated, and can interfere with subsequent endoscopic intervention.

- **Oropharyngeal dysphagia** ^{4,10,11}
 - Oropharyngeal dysphagia (difficulty in transferring food from the mouth to the pharynx)
 - Suspected neurologic causes: See appropriate sections in **Head Imaging Guidelines**
 - Initial evaluation is with direct visualization with laryngoscopy and/or upper endoscopy and a swallow study.
 - Video fluoroscopic swallowing study – (Dynamic radiographic evaluation of swallowing during speech pathologist-guided oral intake of various consistencies)
 - Flexible fiberoptic laryngoscopy and/or FEES (Fiberoptic Endoscopic Evaluation of Swallowing. FEES is a dynamic evaluation of swallowing via direct visualization using transnasal laryngoscopy during speech pathologist-guided oral intake of various consistencies.
 - CT Neck with contrast (CPT® 70491) is indicated for any documented anatomic abnormalities suggested by direct visualization—ie, on exam with flexible laryngoscopy or rigid video stroboscopy or FEES.
 - Completion of a radiographic swallow study, though potentially helpful, is NOT necessary prior to the requested advanced imaging in such a case.
- **Esophageal dysphagia** ^{4,6,10,11}
 - Esophageal dysphagia (difficulty in transferring food down the esophagus in the retrosternal region, e.g. food sticking in the neck or chest)
 - Initial evaluation is with barium esophagram or upper gastrointestinal endoscopy
 - Esophageal manometry if indicated, though not required
 - Advanced imaging is supported for the evaluation of structural abnormalities demonstrated on either esophagram or direct visualization (ie, laryngoscopy/ upper GI endoscopy), such as an external compression, tumor, stricture, diverticulum, etc.
 - Contrast CT Neck (CPT® 70491), CT Chest (CPT® 71260), **and/or** CT Abdomen (CPT® 74160) depending on the location of the abnormality identified.
- **Suspected perforation, abscess, or fistula**
 - CT Neck, Chest, **and/or** Abdomen, contrast as requested (preferably with contrast- CPT® 70491, CPT® 71260, CPT® 74160), depending on location
- **Hiatal hernia**
 - See **Hiatal Hernia (AB-12.3)** in the Abdomen Imaging Guidelines
- **Globus sensation** ^{7-9, 20}
 - Globus sensation is a feeling of a lump or foreign body in the throat. In general, laryngoscopy, endoscopy, and physical examination will rule out malignant causes and advanced imaging is usually not needed for evaluation. It is considered a mild form of dysphagia.
 - Direct visualization with laryngoscopy and/or upper endoscopy should be performed prior to advanced imaging.

- Unremarkable laryngoscopy and/or upper endoscopy does not preclude advanced imaging if **red flag** symptoms are also present:
 - weight loss
 - odynophagia/throat pain
 - referred otalgia
 - hoarseness
 - hemoptysis, **AND/OR**
 - other unilateral presentation of concerning symptoms.
- CT Neck with contrast (CPT® 70491) for ANY of the following:
 - Negative or equivocal findings on laryngoscopy and/or upper endoscopy with any **red flag** present
 - Known history of upper aerodigestive or esophageal malignancy
 - Known history of lymphoma
 - History of previous neck, esophageal, or gastric surgery—see below, and see **Background and Supporting Information** for post-operative oropharyngeal dysphagia associated with Anterior Cervical Spine Surgery (ACSS)
 - Palpable abnormality on physical examination such as neck mass
- **Post-operative dysphagia**
 - Dysphagia following surgery on the oropharynx, soft tissues of the neck, cervical spine, esophagus, or stomach:
 - In the immediate post-operative period the concern is for fluid collections, anastomotic leaks, perforations, and abscess. Prior laryngoscopy/upper endoscopy and barium esophagram are not required initially.
 - CT Neck with contrast (CPT® 70491) **AND/OR** CT Chest with contrast (CPT® 71260)
 - In the delayed post-operative period (ie, >3 months)¹⁸ the primary modalities for evaluation are history, physical, endoscopy (laryngoscopy or EGD) and/or barium esophagram/videofluoroscopic swallow study (VFSS) to direct any additional advanced imaging. See also **Background and Supporting Information**.
- **Suspected vascular ring** ^{8,9,12,13,15,16,17} (See **Dysphagia (PEDNECK-5)**)
 - Advanced imaging can be performed if a vascular ring is suspected by, or in consultation with, the treating specialty, i.e., cardiothoracic surgery, cardiology, otolaryngology, and/or pulmonology. More commonly, this congenital pathology would be suspected in a much younger population, however, dysphagia lusoria is a relatively rare condition involving a vascular ring (usually an aberrant right subclavian artery). As children these individuals are asymptomatic but develop worsening dysphagia later in adulthood, presumably secondary to increasing calcification and blood pressure.
 - CTA Chest (CPT® 71275) **OR** MRA Chest (CPT® 71555) are the preferred imaging studies in the evaluation of a suspected vascular ring.

- CT Chest with contrast (CPT® 71260) **OR** MRI Chest without contrast (CPT® 71550) **OR** MRI Chest without and with contrast (CPT® 71552) can be performed as alternative exams in the evaluation of suspected vascular ring.

Background and Supporting Information

- Postoperative oropharyngeal dysphagia is one of the most common complications following anterior cervical spine surgery (ACSS), and is considered by some to be an inevitable result of this surgery, rather than a surgical complication.¹⁸
- Severe dysphagia after ACSS should prompt immediate evaluation to exclude any potentially reversible surgical complication such as bone graft dislodgement, hematoma or retropharyngeal abscess.¹⁸
- In general, history, exam, plain films, laryngoscopy, and videofluoroscopic swallow studies are considered the primary modalities for evaluation. The videofluoroscopic swallow study, in fact, is the gold standard in evaluation, and is very sensitive in patients post-ACSS, and should be considered the initial evaluation in patients who are status post ACSS with globus sensation, or mild dysphagia.¹⁸

Neck Mass/Swelling/ Adenopathy (Neck-5)

Guideline

Neck Mass/Swelling/Adenopathy (Neck-5.1)

References (Neck-5)

Neck Mass/Swelling/Adenopathy (Neck-5.1)

NK.NM.0005.1.A

v1.0.2024

- Cervical lymphadenitis is common and follows most viral or bacterial infections of the ears, nose and throat. Painful acute lymphadenopathy should be treated with a trial of conservative therapy for 2-weeks, including antibiotics if appropriate. If there is improvement with conservative treatment, advanced imaging is not indicated. If the adenopathy persists, it can be imaged as per below.^{1,2,4}
- Ultrasound (CPT® 76536) can be considered for **ANY** of the following:^{1,2,4}
 - Cervical adenopathy/lymphadenitis or an inflammatory, infective, or reactive mass that has failed a 2-week trial of treatment (including antibiotics if appropriate) or observation^{1,2}
 - Anterior neck masses²
 - Any ill-defined mass, fullness or asymmetry²
- CT Neck with contrast (CPT® 70491) can be initially considered if:^{2,4}
 - Neck mass with any ONE of the following:
 - Size $\geq 1.5\text{cm}$ ⁴
 - Mass present ≥ 2 weeks or of uncertain duration⁴
 - Non-tender neck masses⁴
 - Firm texture or fixation of the mass⁴
 - Suspected peritonsillar, retropharyngeal or other cervical space abscess²
 - Ulceration of skin overlying the neck mass^{4,7}
 - Ear pain ipsilateral to the neck mass⁴
 - Associated onset of hoarseness persistent for greater than 3-weeks¹⁰
 - Associated onset of throat pain, tonsil asymmetry, oral or oropharyngeal ulceration, weight loss, or hemoptysis^{4,7}
 - History of malignancy that would be primary or metastatic to the neck⁴
 - Prior ultrasound results, if performed, are suspicious or indeterminate for malignancy²
 - Carcinoma found in a lymph node or other neck mass²
 - Suspected or known sarcoidosis⁵
 - Preoperative evaluation of any neck mass²
- MRI Orbit/Face/Neck without and with contrast (CPT® 70543) is supported if:²
 - CT suggests the need for further imaging²
 - Ultrasound or CT suggests neurogenic tumor (schwannoma, neurofibroma, glomus tumor, etc.), vascular malformations, cystic neck mass^{7,9}, deep neck masses², or angiofibroma².
- MRI Orbit/Face/Neck without and with contrast (CPT® 70543) is also directly supported without prior CT Neck or ultrasound requirement, if the head and neck

specialist, or the provider in consultation with the head and neck specialist, has reasonable clinical concern for:

- Skull base or nasopharyngeal neoplasm, **OR**
- Potential perineural invasion/cranial nerve involvement, **AND/OR**
- Extensive dental amalgam which may obscure the anatomy on CT in individuals with oral cavity neoplasm.

Background and Supporting Information

- Inflammatory neck adenopathy is often associated with upper respiratory infection, pharyngitis, dental infection, HIV and toxoplasmosis. Occasionally it is associated with sarcoidosis and tuberculosis.
- Malignancy is a greater possibility in adults that are heavy drinkers and smokers, but HPV associated disease is on the rise and there can be a high suspicion for malignancy even without these traditional risk factors.
- ENT evaluation can be helpful in determining the need for advanced imaging.
- Although CT and MRI can have characteristic appearances for certain entities, biopsy and histological diagnosis are the only way to obtain a definitive diagnosis. The preferred initial method of biopsy is Ultrasound guided core needle biopsy of the mass.^{5,6}
- The most common causes of neoplastic cervical adenopathy are metastasis from head and neck tumors or lymphoma.
- MRI has great specificity for determining the boundaries and prevalence of developmental neck cysts. It may thus be considered optimal to use only MRI, which leads to a correct diagnosis in more than 90% of cases.⁹

Recurrent Laryngeal Nerve Palsy (Neck-7)

Guideline

Recurrent Laryngeal Nerve Palsy (Neck-7.1)

References (Neck-7)

Recurrent Laryngeal Nerve Palsy (Neck-7.1)

NK.PA.0007.1.A

v1.0.2024

- The following are supported with new diagnosis⁶ of idiopathic unilateral vocal fold paralysis/immobility or weakness, as identified on videostroboscopy or laryngoscopy by an Otolaryngologist—Head and Neck surgeon, or a clinician in consultation with such a specialist^{1,4,8,9}:
 - MRI Brain without and with contrast (CPT[®] 70553) **OR** MRI Brain without contrast (CPT[®] 70551) **AND**
 - MRI Orbit/Face/Neck with and without contrast (CPT[®] 70543) **OR** CT Neck with contrast (CPT[®] 70491) **AND**
 - CT Chest with contrast (CPT[®] 71260) (Strongly recommended for left vocal fold paralysis, and may be indicated for right vocal fold paralysis, if requested, see [Background and Supporting Information](#))^{1,2,3,4,7,8,9,10}

Background and Supporting Information¹⁻¹⁰

- The right and left recurrent laryngeal nerves supply the motor innervation of the right and left vocal folds/cords, respectively. They are branches off of the Vagus Nerve, CN X. The entire pathway from origin to endpoint of this nerve must be visualized in cases of presumed idiopathic vocal fold paralysis, newly identified by laryngoscopy, to search for a possible cause. From the origin of the vagus at the medulla oblongata to the looping down into the superior mediastinum and back to the neck of its branching nerve (the recurrent laryngeal nerve)—advanced imaging is required to screen for a cause for otherwise idiopathic vocal fold paralysis/paresis. The greater the degree of motion impairment, the more likely it is to find a cause on imaging.
- The superior mediastinum is most noteworthy for containing the take-off point of the three great branches of the aortic arch: the brachiocephalic trunk (also known as the innominate artery), the left common carotid artery, and the left subclavian artery.
- The extent of the CT Neck with contrast, to be inclusive of the entirety of the course of the recurrent laryngeal nerve in question, would have to extend to the "thoracic inlet" portion of the superior mediastinum on the right, and the "aortic triangle" portion of the superior mediastinum on the left.
- Contrast CT Chest is strongly supported with left vocal cord palsy due to the lower course of the recurrent laryngeal nerve branch on the left side of the body. It curves inferior to the aortic arch and ascends in the groove between the trachea and the esophagus. However, the course of the recurrent laryngeal nerve on the right side may be as low as the level at which the brachiocephalic artery meets the subclavian artery, and this area of the thoracic inlet may or may not be contained within the anatomic extent of a CT neck at all institutions.

- Repeat imaging for a pre-existing diagnosis of idiopathic unilateral vocal cord paralysis may be considered on a case by case basis. Recommendations include possibly repeating advanced imaging as above within 5 years after initial diagnosis and workup, or performing regular (annual) clinical evaluations with imaging reserved for the development of new symptoms or exam findings.⁶

Thyroid and Parathyroid (Neck-8)

Guideline

Thyroid Nodule (Neck-8.1)

Hyperthyroidism and Hypothyroidism (Neck-8.2)

Parathyroid Imaging (Neck-8.3)

Parathyroid Incidentaloma (Neck-8.4)

References (Neck-8)

Thyroid Nodule (Neck-8.1)

NK.PT.0008.1.A

v1.0.2024

- Serum thyrotropin (TSH) should be measured in the initial evaluation of thyroid nodule/mass/asymmetry/goiter but is not required for follow-up imaging.^{1,3,6,8}
- Nuclear scan (CPT® 78013 or CPT® 78014) is indicated if the serum TSH is subnormal and ANY of the following:
 - Single or multiple thyroid nodules^{1,3,6,8}
 - Suspicion of ectopic thyroid tissue³
 - Presence of thyroid nodule in the setting of Grave's disease.^{3,8}
- Ultrasound (US) Neck (CPT® 76536) is indicated for evaluation of a palpable thyroid nodule/mass/asymmetry/goiter regardless of TSH level:^{3,5}
 - Incidentally found on CT, MRI, or PET (focal activity)^{2,3,6}
 - Nodules ≤1 cm with very low suspicion US pattern including spongiform pattern (>50% small cystic spaces) and pure cysts do not require repeat US.^{6,10}
- ACR Thyroid Imaging, Reporting, and Data System (TI-RADS), consisting of five levels, is utilized for recommendations in determining US follow-up vs FNA of thyroid nodule(s).¹⁰
 - TI-RADS 1 (Benign) and TI-RADS 2 (Not Suspicious): Follow-up US is not indicated
 - Additional sonograms are indicated for more suspicious thyroid nodules that do not meet size criteria for FNA, such as TI-RADS 3 (Mildly Suspicious), TI-RADS 4 (Moderately Suspicious and TI-RADS 5 (Highly Suspicious) as follows:

ACR TI-RADS Levels for Thyroid Nodule Follow-Up Ultrasound or FNA			
TI-RADS 3 Mildly Suspicious	≥1.5 to 2.4 cm - US at 1, 3, and 5 years ≥2.5 cm - FNA	No further imaging if stable and no increase at 5 years*	TI-Rads level increases but is still below FNA range: Re-image with US in 1 year.
TI-RADS 4 Moderately Suspicious	≥1.0 to 1.4 cm - US at 1, 2, 3, and 5 years ≥1.5 cm - FNA	No further imaging if stable and no increase at 5 years*	TI-Rads level increases but is still below FNA range: Re-image with US in 1 year.
TI-RADS 5 Highly Suspicious	≥0.5 to 0.9 cm – US annually for 5 years ≥1.0 cm - FNA	No further imaging if stable and no increase at 5 years*	

- *If nodule enlarges on follow-up US but remains below the FNA size threshold for their ACR TI-RADS level at 5 years, additional follow-up US

imaging at the discretion of Thyroid Specialist, Endocrinologist, Neck/Thyroid Surgeon.

- If a TIRADS classification is not stated on a thyroid US report, clinical judgment should be used to determine appropriateness of follow-up imaging interval.
- The American Thyroid Association (ATA) guidelines from 2015 also use imaging characteristics and size for thyroid nodule risk stratification however size cutoffs are slightly more generous when compared to ACR-TIRADs. Sonographic imaging and/or biopsy requests in accordance with ATA criteria are appropriate³. See below for ATA's criteria:
 - **FNA requirements based on thyroid ultrasound pattern:**
 - Nodules ≥ 1 cm with high or intermediate suspicion pattern
 - Nodules ≥ 1.5 cm with low suspicion pattern
 - Nodules ≥ 2 cm with very low suspicion pattern
 - Benign pattern: FNA not required
 - **Nodules with previously benign FNA:**
 - Nodules with high suspicion US pattern: repeat US and US-guided FNA within 12 months.
 - Nodules with low to intermediate suspicion US pattern: repeat US at 12–24 months; if 20% growth or new suspicious features, can repeat FNA or continue to observe with repeat US.
 - Nodules with very low suspicion US pattern (including spongiform nodules):
 - The utility of surveillance US and assessment of nodule growth as an indicator for repeat FNA to detect a missed malignancy is limited. If US is repeated, it should be done at 24 months.
 - **Nodules which do not meet FNA criteria:**
 - Nodules with high suspicion US pattern: repeat US in 6–12 months.
 - Nodules with low to intermediate suspicion US pattern: consider repeat US at 12–24 months.
 - Nodules >1 cm with very low suspicion US pattern (including spongiform nodules) and pure cysts which do not meet FNA criteria: the utility and time interval of surveillance US for risk of malignancy is not known. If US is repeated, it should be at ≥ 24 months.
 - Nodules ≤ 1 cm with very low suspicion US pattern (including spongiform nodules) and pure cysts do not require routine sonographic follow-up.
 - See **Background and Supporting Information** section below for links to a diagram of ATA's thyroid nodule risk related to ultrasound appearance and also a link to a diagram of ATA's FNA criteria.
- See **Thyroid Cancer-Surveillance/Follow-up (ONC-6.4)** for thyroid nodules that are biopsy proven thyroid cancer but are being monitored on active surveillance.
- Nuclear medicine thyroid scan (CPT® 78013 or CPT® 78014) is considered for ANY of the following (TSH is not required prior to imaging in the below settings):

- Evaluate eligibility for radioiodine therapy³
- Select nodules to biopsy in multinodular goiter even if TSH not low^{1,6,8}
- Substernal goiter with compressive symptoms (e.g. dyspnea, stridor, cough, dysphonia, dysphagia)
- Non-diagnostic or indeterminate FNA of thyroid nodule, (e.g. follicular lesion of undetermined significance) to see if hot (functioning) nodule that may be benign vs cold nodule.
- CT Neck with contrast (CPT® 70491), or CT Neck without contrast (CPT® 70490), or MRI Orbit/Face/Neck without contrast (CPT® 70540), or MRI Orbit/Face/Neck without and with contrast (CPT® 70543). CT is preferred since there is less motion artifact than with MRI. MRI and CT **are not** indicated for routine thyroid nodule evaluation and should only be considered for:⁵
 - Evaluation of extent of known substernal goiter^{3,8}
 - Suspected airway compression, ie, subjective sense of dyspnea or choking sensation in the clinical history with known multinodular goiter.^{3,8}
 - Presence of pathologic lymph nodes in cervical regions not visualized on ultrasound³
 - Clinically suspected advanced thyroid disease, including invasive primary tumor^{3,6,8}
 - Any preoperative planning for thyroid disease^{3,5,9,10}
- CT Chest without contrast (CPT® 71250) or with contrast (CPT® 71260) is also indicated for:
 - Preoperative planning for individuals with substernal extension of the thyroid, pulmonary symptoms, or abnormalities on recent chest x-ray, and should be ordered by a surgeon or in consultation with a surgeon.¹⁰
- A thyroid nodule detected for the first time during pregnancy should be managed in the same way as in non-pregnant individuals, except for avoiding the use of radioactive agents for diagnostic and therapeutic purposes.³
- Thyroglossal duct cysts (TGDC) are the most common type of congenital neck cyst of the midline neck, and may be first diagnosed in adulthood, though more commonly in early childhood.^{8,9}
 - A physical exam feature includes the rise and fall of the midline mass with protrusion and retraction of the tongue, due to its embryonal connection to the foramen cecum.^{8,9}
 - There is a small risk (about 1%) of incidental malignant degeneration within the TGDC, particularly within adults, and therefore, it is uniformly managed surgically. The Sistrunk procedure, which involves resection of the TGDC and its complete tract within the surrounding midline tissues—to include the middle third of the hyoid bone, is considered the gold standard in surgical management with a less than 5% risk of recurrence.^{8,9}
 - Advanced imaging, per surgeon's request—or a provider in consultation with the head and neck surgeon, to include Neck Ultrasound (CPT® 76536) or CT Neck with contrast (CPT® 70491) or MRI Neck with and without contrast (CPT®

70543), is generally supported pre-operatively, or for the evaluation of a suspected recurrence.^{8,9}

Background and Supporting Information

- TI-RADS levels are determined based on the ultrasound appearance of the nodule. Grading criteria are available at <https://www.acr.org/-/media/ACR/Files/RADS/TI-RADS/TI-RADS-chart.pdf?la=en>.
- Link to ATA's thyroid nodule risk related to ultrasound appearance:³
 - <https://www.liebertpub.com/cms/10.1089/thy.2015.0020/asset/images/large/figure2.jpeg>
- Link to ATA's FNA criteria:³
 - https://www.ncbi.nlm.nih.gov/core/lw/2.0/html/tileshop_pmc/tileshop_pmc_inline.html?title=Click%20on%20image%20to%20zoom&p=PMC3&id=4739132_fig-1.jpg
- Ultrasonography (US) is preferred over CT and MRI^{1,2,3,6,8} for thyroid nodule assessment. Thyroid nodule management relies on ultrasound characteristics, TSH level and FNA biopsy, together with clinical findings.
- Fine-Needle Aspiration (FNA) biopsy is indicated for suspicious and/or large thyroid nodules prior to CT or MRI imaging³
- A thyroid nodule is distinct either on palpation or radiologically (incidentaloma). Nonpalpable nodules have the same risk of cancer as palpable. Nodules >1 cm are evaluated, while smaller nodules are generally evaluated if there are suspicious sonographic features, co-existing adenopathy or a history of radiation or cancer exists.
- Ultrasound is not used to screen: 1) the general population, 2) individuals with normal thyroid on palpation with a low risk of thyroid cancer, 3) individuals with hyperthyroidism, 4) individuals with hypothyroidism or 5) individuals with thyroiditis. Conversely, US can be considered in individuals who have no symptoms but are high-risk as a result of: history of head and neck irradiation, total body irradiation for bone marrow transplant, exposure to fallout from radiation during childhood or adolescence, as well as family history of thyroid cancer syndromes such as MEN2, medullary or papillary thyroid cancer, Cowden's disease, familial adenomatous polyposis, Carney complex, Werner syndrome/progeria.
- There is insufficient evidence supporting the use of PET to distinguish indeterminate thyroid nodules that are benign from those that are malignant.
- 18FDG-PET imaging is not routinely recommended for the evaluation of thyroid nodules with indeterminate cytology. Routine preoperative 18FDG-PET scanning is not recommended.
- Incidental focal FDG-PET uptake often corresponds to a clinically relevant thyroid nodule and ultrasound is recommended in individuals with a normal life expectancy¹. Incidentally noted diffuse thyroid FDG-PET uptake most often corresponds to inflammatory uptake, however, ultrasound should be done to ensure that there is no evidence of clinically relevant nodularity.

- Elastography provides information about nodule stiffness that is complementary to gray scale ultrasound findings in nodules with indeterminate cytology or ultrasound findings. It should not be used as a substitute for gray scale ultrasound.
- Use of ultrasound contrast medium is not recommended for the diagnostic evaluation of thyroid nodules and its current use is restricted to definition of size and limits of necrotic zones after minimally invasive nodule ablation techniques.

Hyperthyroidism and Hypothyroidism (Neck-8.2)

NK.PT.0008.2.A

v1.0.2024

- Hyperthyroidism suspected^{4,7}
 - Thyroid Uptake Study (CPT® 78012 or CPT® 78014) if ONE of the following:
 - TSH below normal range and elevated free T4 and/or free T3, OR
 - Subclinical hyperthyroidism with TSH <0.1 mU/L and normal free T4 and free T3, OR
 - Subclinical hyperthyroidism with TSH below the lower limit of normal but ≥0.1 and normal free T4 and free T3 in the setting of any of the following:
 - Age ≥65
 - Symptoms of hyperthyroidism
 - Presence of cardiac disease or osteoporosis
 - Ultrasound (US) Neck (CPT® 76536) if any of the following:
 - Palpable nodule on examination
 - Nuclear scanning is suggestive of thyroid nodular disease
 - Diagnostic uncertainty regarding the etiology of hyperthyroidism based on clinical presentation and initial biochemical evaluation.
 - To evaluate thyroid dimensions for planning RAI treatment
 - Nuclear scanning is contraindicated (ie. pregnancy, breastfeeding etc).
- Hyperthyroidism on therapy---For individuals with thyroid hormone levels (TSH, free T4 and free T3) within the normal, hypothyroid, or hyperthyroid range while receiving treatment with an anti-thyroid medication (methimazole or propylthiouracil/PTU)⁹
 - Nuclear Scan (CPT® 78013 or CPT® 78014) if ONE of the following:
 - To determine the cause of hyperthyroidism if there was no diagnostic scan prior to the start of medical therapy.
 - To characterize the uptake in a thyroid nodule(s) to properly triage the nodule for FNA if there was no diagnostic scan prior to the start of medical therapy.
 - Thyroid Uptake Study (CPT® 78012 or CPT® 78014) if:
 - Plan is for radioactive iodine therapy as definitive hyperthyroidism treatment.
- Hypothyroidism: There is no role for thyroid imaging in the workup of hypothyroidism in adults. Imaging for thyroid morphology does not help differentiate among causes of hypothyroidism, and all causes of hypothyroidism will have decreased radioiodine uptake.

Parathyroid Imaging (Neck-8.3)

NK.PT.0008.3.A

v1.0.2024

- Classic primary hyperparathyroidism
 - Parathyroid Planar Imaging (CPT® 78070), Parathyroid Planar Imaging with SPECT (CPT® 78071), or Parathyroid Planar Imaging with SPECT/CT (preferred study) (CPT® 78072)^{2,3,5} AND/OR Ultrasound (CPT® 76536)^{1,2} AND/OR 4D CT Neck without and with contrast (CPT® 70492) are appropriate if BOTH of the following conditions are met:^{1,2,3}
 - PTH and Calcium levels are elevated (See **Background and Supporting Information**).
 - Intention of the study is preoperative localization.
 - All parathyroid nuclear scan codes (CPT® 78070, CPT® 78071, CPT® 78072) include thyroid subtraction when performed and no additional thyroid nuclear scan CPT codes are required unless otherwise indicated in **Thyroid Nodule (Neck-8.1)** or **Hyperthyroidism and Hypothyroidism (Neck 8.2)**.
 - Reporting or billing CPT® 78800 for the purpose of intraoperative parathyroid localization using a gamma probe is not supported if performed along with a parathyroid nuclear scan (CPT® 78070, CPT® 78071, CPT® 78072)
 - Ultrasound (CPT® 76536) can be ordered independently to evaluate the thyroid per criteria in **Thyroid Nodule (Neck-8.1)** or **Hyperthyroidism and Hypothyroidism (Neck 8.2)**
 - 3D Imaging (CPT® 76376 or CPT® 76377) is indicated with a 4D CT Neck
 - MRI Neck without and with contrast (CPT® 70543) for cases of re-operation, difficult localization or ionizing radiation contraindication^{1,6} as ordered by an Endocrinologist, Parathyroid surgeon, or Radiologist or any provider in consultation with one of these specialists.
 - CT Chest with contrast (CPT® 71260) in rare circumstances in the evaluation of ectopic mediastinal parathyroid adenomas¹⁴ as ordered by an Endocrinologist, Parathyroid surgeon, or Radiologist or any provider in consultation with one of these specialists.
 - Choline PET/CT (CPT® 78815 or CPT® 78816) is considered experimental and investigational for preoperative localization in cases of primary hyperparathyroidism.¹⁵⁻¹⁷
 - Repeat imaging is supported both in individuals with prior non-localizing imaging who have not yet undergone parathyroid exploration OR in cases of hyperparathyroidism that recurs or persists after parathyroid surgery if reimaging is being ordered by a surgeon or any provider after consultation with a surgeon with expertise in parathyroidectomy¹.
- Primary hyperparathyroidism variants

- Primary hyperparathyroidism with non-elevated serum calcium. (Serum Calcium level normal and PTH elevated).
 - Confirmatory study is elevated ionized calcium, elevated albumin corrected calcium or elevated historic calcium levels.^{1,4}
- Hypercalcemia with inappropriately non-suppressed PTH (Calcium level elevated and PTH normal).
 - PTH level ≥ 25 pg/mL is consistent with primary hyperparathyroidism.
 - See **Background and Supporting Information** for more information.
- Intention of parathyroid imaging should be for pre-operative localization.
- Use the same guidance on imaging modalities as described in “classic” primary hyperparathyroidism.

Primary Hyperparathyroidism variants:

	Calcium	PTH	Confirms/strongly suggests primary hyperparathyroidism
Classic primary hyperparathyroidism	High	High	Yes
Primary hyperparathyroidism with non-elevated serum calcium	Normal	High	Elevated ionized albumin corrected or historic calcium levels*
Hypercalcemia with inappropriately non-suppressed PTH	High	Normal	PTH ≥ 25 pg/ml

- Normocalcemic hyperparathyroidism
 - Serum calcium levels (including ionized calcium levels) are always normal and PTH levels are elevated.
 - Secondary causes of PTH elevation are excluded. See **Background and Supporting Information** for differential diagnosis of secondary hyperparathyroidism.
 - Calcium, PTH and clinical status should be monitored annually.
 - In the event of laboratory progression to hypercalcemia, refer to “classic” primary hyperparathyroidism for imaging guidance.
 - In the event of clinical progression (decline in bone mineral density or new fracture/renal stone/nephrocalcinosis), imaging for the intent of preoperative localization is as requested by or after consultation with a specialist or any provider in consultation with a specialist¹⁸.
- Secondary renal hyperparathyroidism
 - Serum calcium levels are low or normal (but may also be elevated in more advanced disease) and PTH levels are very elevated.

- Imaging for the intent of preoperative localization as requested by or after consultation with a specialist if all of the following are met:
 - Individuals has stage 3a-stage 5 chronic kidney disease (GFR<60).
 - PTH level is >9x upper limit of normal reference range for the lab testing facility (~585 pg/mL) despite standard medical or pharmacologic therapy (calcimimetics, calcitriol and/or vitamin D analogs)¹⁹.
 - Tertiary hyperparathyroidism
 - Serum calcium and PTH levels are elevated as a result of long standing secondary hyperparathyroidism in individuals on renal replacement therapy or after renal transplant.
 - Imaging for the intent of preoperative localization as requested by or in consultation with a specialist.
- Hyperparathyroidism subtypes:

	Calcium	PTH	Clinical Hallmarks
Normocalcemic Hyperparathyroidism	Normal	High	Calcium never elevated
Secondary renal Hyperparathyroidism	Low/Normal/High	Very High	Stage 3a-5 CKD, PTH >9x ULN
Tertiary Hyperparathyroidism	High	High	ESRD/renal transplant

Background and Supporting Information

- Hypercalcemia in individuals with primary hyperparathyroidism may be determined by elevated serum calcium, elevated serum ionized calcium, elevated serum calcium level corrected for albumin, or historic calcium elevation. A comparison of serial measurements of calcium is helpful in determining the presence of true hypercalcemia as calcium levels may be variable over time.
- Parathyroidectomy candidacy should be determined by the provider, however national guidelines recognize the following criteria for surgery^{1,4}
 - All individuals <50 years of age, regardless of whether objective features are present or absent.
 - All symptomatic individuals, including those with kidney stones, hypercalcemic crises, pathologic fractures or other associated symptoms.
 - Individuals with findings concerning for parathyroid cancer (very high calcium >13).
 - All asymptomatic individuals with the following:
 - Serum calcium >1.0 mg/dl (0.25 mmol/l) above the normal range
 - BMD by DEXA: T-score ≤2.5 at the lumbar spine, total hip femoral neck or distal 1/3 radius. (The forearm i.e. distal 1/3 radius is preferentially impacted by primary hyperparathyroidism as this area is rich in cortical bone.)

- Vertebral fracture by x-ray, CT, MRI and vertebral fracture assessment
- Estimated glomerular filtration rate of less than 60 ml/min
- Urinary calcium excretion >400 mg in 24 hours
- Nephrolithiasis or nephrocalcinosis by x-ray, ultrasound or CT
- Asymptomatic individuals who cannot participate in appropriate medical surveillance
- Asymptomatic individuals desiring definitive surgical management
- For cases of “normocalcemic hyperparathyroidism” in which primary hyperparathyroidism is not confirmed, additional investigation for secondary causes of hyperparathyroidism (renal insufficiency, hypercalciuria as a primary renal abnormality, vitamin D deficiency and gastrointestinal malabsorption problems such as short gut syndrome, celiac disease, Crohn's disease or a prior Roux-en-Y bypass surgery) is indicated^{1,18}.
- For cases of hypercalcemia in which primary hyperparathyroidism is not confirmed, additional consideration for other causes of hypercalcemia (malignancy including PTH-RP mediated and myeloma, granulomatous disease, FHH, medications including thiazide diuretics, excessive calcium/vitamin D supplementation and the history of or present lithium use) is indicated¹.

Parathyroid Incidentaloma (Neck-8.4)

NK.PT.0008.4.A

v1.0.2024

- A mass incidentally found on neck imaging that may represent an enlarged parathyroid gland, should prompt laboratory testing including calcium and PTH levels.^{1,2,3,4,5}
 - If laboratory abnormalities suggest hyperparathyroidism, i.e. "functioning parathyroid incidentaloma," see **Hyperparathyroidism (NECK- 8.3)** for imaging recommendations.
 - If there are no laboratory abnormalities and diagnoses other than parathyroid incidentaloma are suspected, see **Neck Mass/Swelling/Adenopathy (NECK- 5.1)** for imaging recommendations.
 - Parathyroid nuclear scans are commonly requested for an evaluation of a PTI however the sensitivity of these scans are low in individuals with normal calcium/PTH and no clinical symptoms of primary hyperparathyroidism.^{5,6} Reliance on either a positive scan or negative scan to decide if surgery is indicated is not supported by current literature.
- If a parathyroid incidentaloma is suspected on imaging prior to planned thyroid surgery or other head/neck surgery⁴, the following studies are indicated if ordered by the surgical team or any provider in consultation with the surgical team:
 - Parathyroid Planar Imaging (CPT® 78070), Parathyroid Planar Imaging with SPECT (CPT® 78071), or Parathyroid Planar Imaging with SPECT/CT (CPT® 78072) AND/OR Ultrasound (CPT® 76536) AND/OR 4D CT Neck without and with contrast (CPT® 70492)
- Ultrasound (US) Neck (CPT® 76536) annually if the mass was not removed surgically.³

Background and Supporting Information

- "Parathyroid incidentalomas" include parathyroid adenomas found unexpectedly at the time of surgery or seen on ultrasound.^{1,2,3,4,5,6}
- Normal sized parathyroid glands (~6mm) are not usually identified by most imaging modalities, so enlargement warrants laboratory evaluation to rule out pathologic causes such as primary hyperparathyroidism or rarely parathyroid carcinoma.^{1,2,3,4}
- Sonographic imaging features of a parathyroid incidentaloma (ovoid, hypoechoic, well circumscribed and adjacent to but separate from the thyroid either posteriorly or inferiorly) may have overlap with perithyroidal lymph nodes and exophytic thyroid nodules in a multinodular goiter.^{1,2,3,4}
- The literature does report cases of pathologically confirmed parathyroid adenomas/hyperplasia in individuals with normal serum calcium and PTH levels, so these enlarged parathyroid glands, may represent an early stage of hyperparathyroidism. It is unclear what percentage of non-functioning PTIs become hyper-secreting over time, but many of these masses are surgically managed.^{2,3,4,6}

- Normally sized and normally functioning parathyroid glands do not take up sestamibi or tetrofosmin.⁷ The likelihood of a positive parathyroid nuclear scan is low in the setting of normal calcium and PTH levels.^{5,6}
- Parathyroid fine needle aspiration biopsy has been used historically however its diagnostic use is limited, due to the potential for hemorrhage and fibrosis which make eventual surgical dissection and pathologic interpretation more difficult.^{1,4}

Trachea and Bronchus (Neck-9)

Guideline

Trachea and Bronchus – Imaging (Neck-9.1)

References (Neck-9)

Trachea and Bronchus – Imaging (Neck-9.1)

NK.TR.0009.1.A

v1.0.2024

- Initial evaluation for suspected laryngotracheal pathology:
 - Direct visualization of the upper airway (via laryngoscopy, with or without bronchoscopy), and can also include
 - Plain x-rays of the neck with or without chest x-ray
- To further evaluate definite abnormalities found on either of the above, including laryngotracheal, tracheal, or bronchial anomalies, foreign bodies or persistent segmental or lobar lung collapse:
 - CT Neck with contrast (CPT® 70491) **OR** CT Neck without contrast (CPT® 70490) **AND/OR**
 - CT Chest with contrast (CPT® 71260) **OR** CT Chest without contrast (CPT® 71250), depending on the anatomic level of the lesion
 - See **Squamous Cell Carcinomas of the Head and Neck—Suspected/Diagnosis (ONC-3.1)** for suspected laryngotracheal tumor
- For suspected subglottic stenosis (SGS) after evaluation by a specialist or in consultation with a specialist who has directly visualized the upper airway:
 - CT Neck with contrast (CPT® 70491) **OR** CT Neck without contrast (CPT® 70490) is supported
- For obstructive physiology in the setting of tracheomalacia:
 - Expiratory HRCT (CPT® 71250) is supported¹

Background and Supporting Information

- Bronchoscopy can further evaluate the distal endobronchial tree.
- Suspected laryngotracheal disease can be identified by inspiratory or biphasic stridor and a characteristic flow-volume loop of PFTs.¹
- The visualization of tracheal or bronchial "inspissation" or thickening of secretions without an abnormality, is not a risk for malignancy.³
- CT with multiplanar reformatting has proven comparable to rigid bronchoscopy with a 100% sensitivity and specificity of detecting SGS and for measuring length and grade of stenosis.⁵

Neck Pain (Neck-10)

Guideline

Neck Pain (Cervical) (Neck-10.1)

Torticollis and Dystonia (Neck-10.2)

Eagle's Syndrome (Neck-10.3)

References (Neck-10)

Neck Pain (Cervical) (Neck-10.1)

NK.NP.0010.1.A

v1.0.2024

- Neck pain is usually related to a specific process including pharyngitis, radiculopathy, adenopathy, mass, carotid dissection and torticollis, and therefore found elsewhere in these guidelines.¹
- For the evaluation of neck pain or other symptoms which may involve the cervical spine, including myelopathy and cervical radiculopathy¹, see **Spine Imaging Guidelines**.

Torticollis and Dystonia (Neck-10.2)

NK.NP.0010.2.A

v1.0.2024

Older Child (beyond infancy) or Adult¹

- To identify fracture or malalignment in cases of trauma:
 - Initial evaluation with recent trauma (without a high-risk mechanism of injury—see **SP-3.2 Neck (Cervical Spine) Trauma**) is by plain radiographs of the cervical spine.^{10,11,12} If inconclusive:
 - CT Neck with contrast (CPT® 70491) **AND/OR**
 - CT Cervical Spine without contrast (CPT® 72125)
- In the clinical setting of cervical spine trauma with an associated neurologic deficit:
 - MRI Cervical Spine without contrast (CPT® 72141) is supported
- To evaluate for soft tissue or neurological cause in cases with no trauma history:
 - CT Neck with contrast (CPT® 70491), **AND/OR**
 - MRI Cervical Spine without contrast (CPT® 72141), **OR**
 - CT Cervical Spine without contrast (CPT® 72125)
 - Positive→ Further advanced imaging is not required if CT Neck or CT/MRI Cervical Spine has identified local cause.
 - Negative→ MRI Brain without and with contrast (CPT® 70553) to exclude CNS cause.

Eagle's Syndrome (Neck-10.3)

NK.NP.0010.3.A

v1.0.2024

Also known as "Calcified stylohyoid ligament," "elongation of styloid process," or "stylocarotid artery syndrome."

- **"Classic Eagle Syndrome"**
 - Typically seen in individuals after pharyngeal trauma or tonsillectomy^{4,5}
 - Characterized by ipsilateral dull, persistent pharyngeal pain, centered in the ipsilateral tonsillar fossa, that can be referred to the ear, and exacerbated by rotation of the head
 - Other symptoms may include dysphagia, sensation of foreign body in the throat, tinnitus, or cervicofacial pain
 - If Eagle Syndrome is suspected on exam and/or lateral neck x-ray:^{4,5}
 - CT Maxillofacial with contrast (CPT® 70487) **OR** CT Maxillofacial without contrast (CPT® 70486) **AND/OR**
 - CT Neck with contrast (CPT® 70491) **OR** CT Neck without contrast (CPT® 70490)
- **"Stylocarotid Artery Syndrome"** (ie, the anterior circulation equivalent of "bow hunter syndrome"—rotational vertebral artery occlusion syndrome, see also **General Guidelines - CT and MR Angiography (CTA and MRA) (HD-1.5)⁹**)
 - Characterized by the compression of the internal or external carotid artery (with their peri-vascular sympathetic fibers) by a laterally or medially deviated styloid process
 - It is related to a pain along the distribution of the artery, which is provoked and exacerbated by rotation and compression of the neck
 - Not correlated with tonsillectomy
 - In cases of impingement of the internal carotid artery, there may be referred supraorbital pain and parietal headache. In cases of external carotid artery irritation, the pain radiates to the infraorbital region.
 - Dynamic/Positional CTA (CPT® 70498) is supported to assess for vascular compression (see also **General Guidelines - CT and MR Angiography (CTA and MRA) (HD-1.5)⁹** and **General Guidelines - Other Imaging Situations (HD-1.7)⁶**)
- CT scanning (and in particular, 3-D CT scanning) represents an extremely valuable imaging tool in patients with Eagle syndrome. 3-D rendering (CPT® 76376 or CPT® 76377) is supported as an add on to CT Neck (CPT® 70491 **or** CPT® 70490), if requested, for accurate evaluation of the styloid process in relation to its anatomic relationship with the other head and neck structures, in surgical planning.⁷ See **3D Rendering (Preface-4.1)**.

Background and Supporting Information

- Torticollis or cervical dystonia is an abnormal twisting of the neck resulting in head rotation. Its causes are many and may be congenital or acquired and caused by trauma, infection/inflammation, neoplasm and/or idiopathic. It occurs more frequently in children and on the right side (75%).
- Eagle syndrome is characterized by recurrent pain in the oropharynx and face due to an elongated styloid process or calcified stylohyoid ligament. The styloid process is a slender outgrowth at the base of the temporal bone, immediately posterior to the mastoid apex.^{4,8}

Salivary Gland Disorders (Neck-11)

Guideline

Salivary Gland Disorders (Neck-11.1)

References (Neck-11)

Salivary Gland Disorders (Neck-11.1)

NK.SG.0011.1.A

v1.0.2024

- **Xerostomia (Dry Mouth)**
 - Salivary Gland Nuclear Imaging (one of CPT® 78230, CPT® 78231, or CPT® 78232) can be considered for any one of the following:
 - Dry mouth and either:
 - Sjögren's syndrome
 - Sialadenitis
 - History of head or neck radiation therapy
 - History of cerebral palsy
 - Parotid mass to allow preoperative diagnosis of Warthin's tumor
- **Salivary Gland Stones, Sialadenitis or Stenosis:**¹
 - Sialography (contrast dye injection) under fluoroscopy, can be performed to rule out a salivary duct stone or stricture, using
 - Post-sialography CT (CT Maxillofacial without contrast [CPT® 70486] for Stensen's duct of the parotid gland, which would be most common; **or** CT Neck without contrast [CPT® 70490] for the level of the Wharton's Duct); **or** post-sialography MRI (MRI Orbit/Face/Neck without contrast [CPT® 70540])
OR
 - CT Maxillofacial area with contrast (CPT® 70487) **OR**
 - CT Neck with contrast (CPT® 70491)
 - CT performed only without IV contrast (CPT® 70490) may be helpful in a small minority of cases, such as cases of follow-up for known salivary stones, or for post-sialography imaging, as described above **OR**
 - MRI Orbit/Face/Neck without and with contrast (CPT® 70543)
- **Parotid or Other Salivary Gland Mass**
 - The following are appropriate:²
 - Ultrasound (CPT® 76536) is supported as initial or additional imaging and does not need to be completed prior to the performance of advanced imaging.
 - MRI Orbit/Face/Neck without and with contrast preferred (CPT® 70543) **or** MRI Orbit/Face/Neck without contrast (CPT® 70540) **OR**
 - CT Neck with contrast (CPT® 70491) preferred **or** CT Maxillofacial area with contrast (CPT® 70487)
- **Repeat Imaging (CT or MRI, as above)** ⁴
 - There is currently no standard timeframe for repeat advanced imaging to follow known benign pathology of the salivary gland that has been resected—partially or completely, or only observed. This holds true even if the salivary lesion has the potential for recurrence or malignant transformation (i.e., pleomorphic adenoma).

- Repeat advanced imaging, as requested by the surgeon or those in consultation with the surgical team, is indicated if recent history and exam demonstrate signs:
 - Concerning for complications of surgery, or
 - Recurrence or progression of neoplasm/lesion

Background and Supporting Information

- CT Neck
 - CT should be performed with IV contrast to distinguish vessels from lymph nodes and to confirm if a mass is hypervascular. *Dual-phase CT imaging (without and with IV contrast) is not supported.* CT performed only without IV contrast may be helpful in a small minority of cases including cases of follow-up for known salivary stones or post-sialography studies.
 - A recent study in the American Journal of Neuroradiology comparing contrast enhanced and non-contrast enhanced CT in the evaluation of sialolithiasis demonstrated excellent sensitivity and specificity with no false-positive results using contrast-enhanced CT alone (without the addition of non-contrasted images for comparison). Benefits of initial only contrast-enhanced CT include better evaluation of the ductal system, improved soft tissue contrast in assessing salivary masses and decreased radiation dose (compared to dual phase CT imaging (without and with IV contrast)).³

Sore Throat, Odynophagia, and Hoarseness (Neck-12)

Guideline

Definitions (Neck-12.0)

Sore Throat/Throat Pain/Odynophagia (Neck-12.1)

Hoarseness (Neck-12.2)

References (Neck-12)

Definitions (Neck-12.0)

NK.ST.0012.0.A

v1.0.2024

- Hoarseness – Altered voice quality reported by the individual
- Dysphagia – Disordered or impaired swallowing ie. food impactions, globus sensation, choking/aspiration, regurgitation (See **Dysphagia and Esophageal Disorders (Neck-3.1)**)
- Odynophagia – Painful swallowing

Sore Throat/Throat Pain/Odynophagia (Neck-12.1)

NK.ST.0012.1.A

v1.0.2024

- See **Dysphagia and Esophageal Disorders (Neck-3.1)** for dysphagia as the primary symptom.
- Sore Throat/Throat Pain/Odynophagia
 - Uncomplicated viral or streptococcal pharyngitis with sore throat³
 - Imaging studies are not indicated. See **Neck Mass/Swelling/Adenopathy (Neck-5.1)** for suspected complications of pharyngitis/tonsillitis, such as a cervical space abscess.
 - Postoperative throat pain or odynophagia after head and neck procedure with suspected complication of procedure.⁴
 - CT Neck with contrast (CPT® 70491)
 - Sore throat/throat pain/odynophagia that is persistent or progressive for two or more weeks, in spite of any treatment measures or observation:
 - Initial evaluation is laryngoscopy
 - If the initial laryngoscopy is abnormal, or if it is negative, and if there is a continued suspicion of submucosal lesion of the pharynx^{2,4} due to any red flag symptoms (weight loss, referred otalgia, hoarseness, hemoptysis, and/or unilateral presentation of symptoms):
 - CT Neck with contrast (CPT® 70491) **OR**
 - MRI Orbit/Face/Neck without and with contrast (CPT® 70543)
 - Alarm symptoms of persistent unilateral throat pain or odynophagia with ipsilateral referred otalgia is especially suspicious for a submucosal tumor of the head and neck (versus more distal esophageal pathology).⁵
 - If subjective dysphagia AND odynophagia are both present and the initial laryngoscopy and neck exam are normal (i.e. no cervical space abscess or post-surgical complication is suspected), and no red flag symptoms are present, then barium esophagram (or GI upper endoscopy) is indicated prior to the advanced imaging studies of the neck listed above.^{5,6}

Hoarseness (Neck-12.2)

NK.ST.0012.2.A

v1.0.2024

- Laryngoscopy is the primary diagnostic modality for evaluating individuals with hoarseness. Imaging studies, including CT and MRI, are unnecessary in most individuals with hoarseness because most hoarseness is self-limited or caused by pathology that can be identified by laryngoscopy alone.
- The need for advanced imaging is based upon abnormal findings upon laryngoscopy,¹ such as:
 - Immobile or partially mobile vocal cord [See [Recurrent Laryngeal Nerve Palsy \(NECK-7.1\)](#)]
 - Any growth, asymmetry, ulceration, or other suspected neoplasm of the glottis or supraglottis [See [Neck Mass/Swelling/Adenopathy \(Neck 5.1\)](#). See also [ONC-3.0-3.4](#)].

Obstetrical Ultrasound Imaging General Guidelines (OB-1)

Abbreviations and Glossary for OB Ultrasound Imaging Guidelines

OB.GG.0001.00.A
v1.0.2024

Abbreviations and Glossary for OB Ultrasound Imaging Guidelines	
ACOG	American College of Obstetricians and Gynecologists
AFI	amniotic fluid index
AFP	alpha-fetoprotein
ART	Assisted Reproductive Technology
B-mode (brightness)	two dimensional imaging procedure, B-mode ultrasound is the basis for all static and real time B-scan images
BPP	Biophysical Profile includes the ultrasound variables: fetal breathing, muscle tone, and movement as well as amniotic fluid volume. BPP can be performed with or without a non-stress test (NST) which involves fetal heart rate (FHR) monitoring.
CST	contraction stress test
D & C/D & E	dilatation and curettage/ Dilation and Evacuation
Dichorionic twins	twins having distinct chorions (membrane that forms the fetal part of the placenta), including monozygotic twins (from one oocyte [egg]) separated within 72 hours of fertilization and all dizygotic twins (from two oocytes fertilized at the same time
Doppler	involves measuring a change in frequency when the motion of vascular flow is measured
EDC	Estimated Date of Confinement; determined from the first day of the last menstrual cycle
EDD	Estimated Date of Delivery

Abbreviations and Glossary for OB Ultrasound Imaging Guidelines

FGR	Fetal growth restriction; an estimated weight of the fetus at or below 10th percentile for gestational age; and/or abdominal circumference of the fetus at or below 10th percentile for gestational age
FHR	fetal heart rate
hCG	human chorionic gonadotropin
IDDM	insulin-dependent diabetes mellitus
M-mode	ultrasound imaging technique in which structure movement can be depicted in a wave-like manner; primarily used in cardiac and fetal cardiac imaging
Macrosomia	estimated fetal weight of greater than 4000 or 4500 grams
Monochorionic twins	twins developed from one oocyte (egg) developing with a single chorions (membrane that forms the fetal part of the placenta)
NICU	Neonatal Intensive Care Unit
NST	fetal non-stress test
Oligohydramnios	diminished amniotic fluid volume (AFV) for gestational age; definitions include: maximum deepest pocket of ≤ 2 cm and/or AFI of ≤ 5 cm or $<$ the 5 th percentile for gestational age if < 30 weeks.
PACS	Picture Archiving and Communications System
Polyhydramnios	AFI ≥ 24 cm or maximum vertical pocket of ≥ 8 cm
PROM	preterm rupture of membranes
Quad screen	alpha-fetoprotein (AFP), estriol, human chorionic gonadotropin (hCG), inhibin A

Abbreviations and Glossary for OB Ultrasound Imaging Guidelines**Real time scan**

considered the most common type of ultrasound; a 2-dimensional scan that reflects structure and motion over time, scanning and display of images are run at a sufficiently rapid rate so that moving structures can be viewed moving at their natural rate; frame rates ≥ 15 frames per second are considered “real time”

General Guidelines (OB-1.0)

OB.GG.0001.0.A

v1.0.2024

- This document offers an in-depth, indication driven guide to obstetrical imaging
- The use of an obstetrical CPT code is only indicated with a positive pregnancy test or an otherwise confirmed pregnancy. It is not appropriate to report non-obstetrical, pelvic ultrasound procedure codes (CPT® 76830, CPT® 76856, and CPT® 76857) with a positive pregnancy test or a confirmed pregnancy
- An evaluation of pregnancy with a history and physical exam (an initial office visit) is necessary prior to obstetric ultrasound imaging requests
 - The following information must be submitted with each request:
 - Expected date of delivery
 - Gestational age at date of service
 - Results of prior ultrasound studies if available
- Ultrasound assessment is an accurate method of determining gestational age, fetal number, viability, and placental location, and it is recommended for all pregnant patients
 - Though fetal anatomy survey (CPT® 76805/CPT® 76811 if high-risk) can be performed as early as 14 weeks gestation, per ACOG, in the absence of other specific indications, the optimal time for a single ultrasound examination is at 18 to 22 weeks of gestation. This timing allows for a survey of fetal anatomy in most females and an accurate estimation of gestational age.²
 - For a Normal (Low Risk) Pregnancy report a fetal anatomy ultrasound CPT® 76805 if ≥16 weeks
 - If pregnancy is **High Risk** can report:
 - A detailed first-trimester obstetric ultrasound^{3,15} [requested as CPT® 76801 plus CPT® 76813 (and CPT® 76802 plus CPT® 76814 for each additional fetus)] between 12 weeks 0 days and 13 weeks 6 days (if indicated), See **Detailed First Trimester Fetal Anatomic Scan (OB-9.12)**, and
 - A detailed fetal anatomy ultrasound (CPT® 76811) if ≥16 weeks
 - These high risk scans are indication driven and are generally performed by a Maternal Fetal Medicine (MFM) specialist/Perinatologist, or a Radiologist at an AIUM or ACR accredited facility. See **High Risk Pregnancy (OB-9)**
 - Current ACOG and SMFM guidelines state that cervical length (CL) screening in singleton gestations without a prior spontaneous preterm birth (PTB) cannot yet be universally mandated.
 - Transvaginal ultrasound (CPT® 76817) can be performed if the transabdominal CL is ≤3.6 cm
 - Fetal Nuchal Translucency (CPT® 76813) can be performed if Cell-Free DNA (cfDNA) is not planned or has not already been performed, as they are both screening tools for fetal aneuploidy

Inappropriate Use of OB Ultrasound (OB-1.2)

OB.GG.0001.2.A

v1.0.2024

Obstetrical ultrasound studies cannot be authorized for payment for individuals who do not have a positive pregnancy test or clinical evidence of a pregnancy (fetal heart tones)

- Obstetrical ultrasound is **not** medically indicated for the following:
 - Sex determination only
 - To provide a keepsake or souvenir picture

Ultrasound Code Selection (OB-1.3)

OB.GG.0001.3.A

v1.0.2024

- See **Procedure Coding Basics for Established Pregnancy (OB-28)**
 - It is not appropriate to report non-obstetrical pelvic ultrasound procedure codes (CPT® 76830, CPT® 76856, and CPT® 76857) with a positive pregnancy test or confirmed pregnancy

CPT® Code Guidance

CPT® 76801 and CPT® 76802 (for each additional fetus) are reported for complete studies performed during the first trimester (<14 weeks). These codes should only be used once per pregnancy unless the mother changes to a new medical caregiver at a new office and there is a new medical indication for ultrasound.

CPT® 76813 and CPT® 76814 (each additional fetus) are used to report nuchal translucency screening: an ultrasound measurement of the clear (translucent) space at the back of the fetal neck to assess risk for Down Syndrome (Trisomy 21), Trisomy 18, and other genetic disorders.

CPT® 76801 plus CPT® 76813 (and CPT® 76802 **plus** CPT® 76814 for each additional fetus) when billed together, are used to report a detailed first-trimester obstetric ultrasound examination between 12 weeks 0 days and 13 weeks 6 days.^{3,15}

- This indication-driven detailed first trimester fetal anatomic evaluation is generally performed by those with special skills to perform this study, such as a Maternal Fetal Medicine specialist (Perinatologist), or a Radiologist with advanced training in fetal imaging.
- These codes should only be used once per pregnancy unless the mother changes to a new medical caregiver at a new office and there is a new medical indication for ultrasound. See **Detailed First Trimester Fetal Anatomic Scan (OB-9.12)**

CPT® 76805 and CPT® 76810 (for each additional fetus) are used to report complete studies (anatomy scan) performed during the second and third trimester, in a normal (low risk) pregnancy. These studies should only be used once per pregnancy unless the mother changes to a new medical caregiver at a new office and there is a new medical indication for ultrasound.

CPT® 76811 and CPT® 76812 (for each additional fetus) describe a detailed fetal anatomic survey and are used only when the study includes this service. These studies should only be used once per pregnancy unless the mother changes to a new medical caregiver at a new office and there is a new medical indication for ultrasound.

This detailed fetal anatomic evaluation is generally performed by those with special skills to perform this study, such as a Maternal Fetal Medicine specialist (Perinatologist), or a Radiologist with advanced training in fetal imaging.

In circumstances where a detailed fetal anatomy (CPT® 76811) is indicated but access is limited due to geographic or other constraints, a standard fetal anatomy survey (CPT® 76805) can be authorized instead at the appropriate gestational age.

CPT® Code Guidance

CPT® 76817 is used to report a transvaginal ultrasound. The other OB ultrasound codes are used for transabdominal studies.

CPT® 76816 is used to report a follow up study, such as a growth scan or follow up on anatomy when more than one area requires reexamination.

- CPT® 76816 [should not be performed prior to a CPT® 76801 or an anatomy scan CPT® 76805 (normal pregnancy) or Detailed anatomy scan CPT® 76811 (high risk pregnancy)]
- CPT® 76816 should not be done on same date of service as CPT® 76815

CPT® 76815 describes a limited or 'quick look' study

- It can be used at any gestational age for various indications, including quick look for AFI assessment, fetal heart-beat, fetal position, placental location etc.
- It can be used specifically for 'dating' (when indicated) in those that don't meet gestational age criteria for dating with CPT® 76801 or are too early for anatomy scan (i.e. >14 weeks but <16 weeks)
- It is also used to report a modified BPP.
- Note: CPT® 76815 should never be reported with complete studies CPT® 76801/CPT® 76802, CPT® 76805/CPT® 76810, CPT® 76811/CPT® 76812, or with CPT® 76816 or BPP (CPT® 76818 and CPT® 76819).

CPT® 76818 (includes non-stress test) and CPT® 76819: are used to report a Biophysical profile (BPP), a test for antepartum fetal surveillance (A BPP is not typically performed before 26 weeks due to lack of fetal brain stem maturity prior to this gestational age).

CPT® 76820 describes Doppler velocimetry of the umbilical artery.

CPT® 76821 describes Doppler velocimetry of the middle cerebral artery.

CPT® 76825 describes fetal echocardiography and CPT® 76827 describes the Doppler portion of the echocardiogram. These codes should only be used once per pregnancy unless the mother changes to a new medical caregiver at a new office or there is a new medical indication for ultrasound.

CPT® 76826 describes a follow up fetal echocardiography and CPT® 76828 describes a follow up Doppler portion of the echocardiogram.

CPT® 93325 can be added for color mapping in conjunction with fetal echocardiography procedures.

CPT® 93976 describes a limited duplex scan and is used during pregnancy for characterizing the pattern and direction of blood flow in arteries and veins. It can be used to report fetal umbilical-placental flow evaluation (accreta or other placental or cord abnormalities).

CPT® 74712 and CPT® 74713 (for each additional fetus) are used to report a fetal MRI (indicated for more in depth imaging of certain fetal abnormalities).

Background and Supporting Information

- ACOG recommendations for imaging during pregnancy and lactation:
 - Ultrasonography and magnetic resonance imaging (MRI) are not associated with risk and are the imaging techniques of choice for the pregnant patient, but they should be used prudently and only when use is expected to answer a relevant clinical question or otherwise provide medical benefit to the patient.
 - With few exceptions, radiation exposure through radiography (Xrays), computed tomography (CT) scan, or nuclear medicine imaging techniques is at a dose much lower than the exposure associated with fetal harm. If these techniques are necessary in addition to ultrasound or MRI or are more readily available for the diagnosis in question, they should not be withheld from a pregnant patient.
 - The use of gadolinium contrast with MRI should be limited; it should be used as a contrast agent in a pregnant female only if it significantly improves diagnostic performance and is expected to improve fetal or maternal outcome.
 - With regards to iodinated IV contrast media, "it is generally recommended that contrast only be used if absolutely required to obtain additional diagnostic information that will affect the care of the fetus or female during pregnancy."
- In circumstances where the individual is deemed to have an increased risk for a fetal abnormality and does not have access to a provider who can perform a fetal anatomic ultrasound examination (CPT® 76811) **due to geographic or other constraints**, a standard (after first trimester) fetal anatomic ultrasound examination (CPT® 76805) can be authorized instead.
- CPT® 76816 [should not be performed prior to a CPT® 76801 or an anatomy scan CPT® 76805 (normal pregnancy) or Detailed anatomy scan CPT® 76811 (high risk pregnancy)], and is typically not performed prior to 14 weeks gestation.
- Typically all components of the BPP (CPT® 76818 and CPT® 76819), such as breathing, are not present until ≥ 26 weeks gestation. However, a modified BPP (CPT® 76815) can be utilized sooner in certain high risk cases but should not be done prior to 22 weeks.
- SMFM suggest that ductus venosus, middle cerebral artery, or uterine artery Doppler use for routine clinical management of early- or late-onset FGR *is not recommended*
- The minimal use of color Doppler alone (CPT® 93976), when performed for anatomical structure identification, during a standard ultrasound procedure, is not separately reimbursable.

Uncertain Dates (OB-2)

Uncertain Dates/Unknown Last Menstrual Period (LMP) (OB-2.1)

OB.UD.0002.1.A

v1.0.2024

- If there is a difference in the clinical size of the uterus on pelvic exam and the estimated gestational age calculated by the LMP **or** there is an uncertain/unknown LMP **or** there have been irregular periods in the last year, one of the following can be performed:
 - If <14 weeks by pelvic exam CPT® 76801 one time (plus CPT® 76802 for each additional fetus) and/or CPT® 76817 one time if a complete ultrasound has not yet been performed
 - CPT® 76801 is preferred for dating, but if this is unable to be completed then CPT® 76815 **and/or** CPT® 76817 for a transvaginal ultrasound is indicated
 - If ≥14 weeks by abdominal exam CPT® 76815 or CPT® 76805 (CPT® 76811 if high risk) if complete fetal anatomic scan has not yet been performed

Background and Supporting Information

- CPT® 76815 should never be reported with complete studies CPT® 76801/CPT® 76802, CPT® 76805/CPT® 76810 or CPT® 76811/CPT® 76812 or with CPT® 76816 or BPP (CPT® 76818 and CPT® 76819).
- Though a fetal anatomy survey (CPT® 76805/CPT® 76811) can be performed as early as 14 weeks gestation, per ACOG, in the absence of other specific indications, it is optimally performed at 18 to 22 weeks of gestation.¹

Intrauterine Device (IUD) (OB-3)

Locate an Intrauterine Device (IUD) (OB-3.1)

OB.ID.0003.1.A

v1.0.2024

- CPT® 76801 and/or CPT® 76817 if <14 weeks and a complete ultrasound has not yet been performed or
- CPT® 76815 and/or CPT® 76817 if complete ultrasound has already been performed or if ≥14 weeks.
- CPT® 76805 (CPT® 76811 if otherwise indicated), if ≥16 weeks when an anatomy ultrasound (CPT® 76805/CPT® 76811) has not yet been performed, and
- 3-D Rendering (CPT® 76376/CPT® 76377) can be added for suspected retained IUD
- For continued pregnancy with retained IUD⁴ image as per **High Risk Group One – Risk Factors (OB 9.1)**

Background and Supporting Information

- CPT® 76815 should never be reported with complete studies CPT® 76801/CPT® 76802, CPT® 76805/CPT® 76810 or CPT® 76811/CPT® 76812 or with CPT® 76816 or BPP (CPT® 76818 and CPT® 76819).
- Though fetal anatomy survey (CPT® 76805/CPT® 76811) can be performed as early as 14 weeks gestation, per ACOG, in the absence of other specific indications, it is optimally performed at 18 to 22 weeks of gestation.

Infertility (OB-4)

History of Infertility (OB-4.1)

OB.IF.0004.1.A

v1.0.2024

- If the current or a prior pregnancy was conceived using an ovulation induction agent (for example Clomid) and/or by intrauterine insemination (IUI), **or**
- If there is a history of infertility or history of IVF in a **prior** pregnancy
- Report:
 - Complete first trimester ultrasound CPT® 76801 [plus CPT® 76802 for each additional fetus] if <14 weeks and a complete ultrasound has not yet been performed, **and/or** CPT® 76817 for a transvaginal ultrasound
 - CPT® 76801 is preferred for dating, but if this is unable to be completed then CPT® 76815 **and/or** CPT® 76817 for a transvaginal ultrasound is indicated
 - CPT® 76805 if ≥16 weeks, when complete fetal anatomic scan has not yet been performed
 - Then, follow normal/low risk imaging See **Fetal Anatomic Scan (OB-7.1)**
- Repeat ultrasound is not usually necessary unless there are new clinical indications

Background and Supporting Information

- CPT® 76815 should never be reported with complete studies CPT® 76801/CPT® 76802, CPT® 76805/CPT® 76810 or CPT® 76811/CPT® 76812 or with CPT® 76816 or BPP (CPT® 76818 and CPT® 76819).
- Though fetal anatomy survey (CPT® 76805/CPT® 76811) can be performed as early as 14 weeks gestation, per ACOG, in the absence of other specific indications, it is optimally performed at 18 to 22 weeks of gestation.

Present Pregnancy with ART Treatment (IVF) (OB-4.2)

OB.IF.0004.2.A

v1.0.2024

- If the **current** pregnancy was conceived by IVF, can perform
 - Complete first trimester ultrasound CPT® 76801 [plus CPT® 76802 for each additional fetus] if <14 weeks and a complete ultrasound has not yet been performed, **and/or** CPT® 76817 for a transvaginal ultrasound
 - CPT® 76801 is preferred for dating, but if this is unable to be completed then CPT® 76815 **and/or** CPT® 76817 for a transvaginal ultrasound is indicated
 - A detailed first-trimester obstetric ultrasound [requested as CPT® 76801 plus CPT® 76813 (and CPT® 76802 plus CPT® 76814 for each additional fetus)] between 12 weeks 0 days and 13 weeks 6 days⁶
 - Detailed Fetal Anatomic Scan CPT® 76811 ≥16 weeks
 - Initial Fetal echo CPT® 76825 **and/or** CPT® 76827 +/- CPT® 93325 at ≥16 weeks
 - A growth scan (CPT® 76816) is indicated in the third trimester (≥28 weeks)
 - If additional high risk factors are noted, imaging as per high risk factor (OB 9.0)
 - Starting at 36 weeks, weekly BPP (CPT® 76818 or CPT® 76819) or modified BPP (CPT® 76815)

Background and Supporting Information

- CPT® 76815 should never be reported with complete studies CPT® 76801/CPT® 76802, CPT® 76805/CPT® 76810 or CPT® 76811/CPT® 76812 or with CPT® 76816 or BPP (CPT® 76818 and CPT® 76819).
- Though fetal anatomy survey (CPT® 76805/CPT® 76811) can be performed as early as 14 weeks gestation, per ACOG, in the absence of other specific indications, it is optimally performed at 18 to 22 weeks of gestation.

Recurrent Pregnancy Loss (OB-4.3)

OB.IF.0004.3.A

v1.0.2024

- If there is a history of at least 2 consecutive or 3 non-consecutive clinical miscarriages/losses at <20 weeks gestation
 - Complete first trimester ultrasound CPT® 76801 [plus CPT® 76802 for each additional fetus] if <14 weeks and a complete ultrasound has not yet been performed, and/or CPT® 76817
 - CPT® 76801 is preferred for dating, but if this is unable to be completed then CPT® 76815 **and/or** CPT® 76817 for a transvaginal ultrasound is indicated
 - Detailed Fetal Anatomic Scan CPT® 76811 ≥16 weeks
 - Starting at 22 weeks follow-up growth scans (CPT® 76816) every 3 to 6 weeks
 - Starting at 36 weeks, weekly BPP (CPT® 76818 or CPT® 76819) or modified BPP (CPT® 76815)
- If history of one or more 2nd trimester loss (14 to 24 weeks gestation)
 - CPT® 76815 **and/or** CPT® 76817 every 2 weeks from 16 to 24 weeks.⁵ See **Cervical Insufficiency (OB 18.1)**

Background and Supporting Information

- CPT® 76815 should never be reported with complete studies CPT® 76801/CPT® 76802, CPT® 76805/CPT® 76810 or CPT® 76811/CPT® 76812 or with CPT® 76816 or BPP (CPT® 76818 and CPT® 76819).
- Though fetal anatomy survey (CPT® 76805/CPT® 76811) can be performed as early as 14 weeks gestation, per ACOG, in the absence of other specific indications, it is optimally performed at 18 to 22 weeks of gestation.

Vaginal Bleeding and/or Abdominal/Pelvic Pain/Cramping (OB-5)

Acute Abdominal/Pelvic Pain (OB-5.1)

OB.AP.0005.1.A

v1.0.2024

For acute abdominal/pelvic pain:

At the time of complaint, can perform:

- Complete first trimester ultrasound CPT® 76801 and/or CPT® 76817 if complete ultrasound has not yet been performed, and <14 weeks **or**
- CPT® 76815 and/or CPT® 76817 **or**
- CPT® 76805 (CPT® 76811 if otherwise indicated), if ≥14 weeks when an anatomy ultrasound (CPT® 76805/CPT® 76811) has not yet been performed **or**
- CPT® 76816 (if an anatomy ultrasound CPT® 76805 or CPT® 76811 has previously been performed and at least 2 weeks since anatomy ultrasound)
- Repeat ultrasound is not usually necessary unless there are new indications.
- Note: Above imaging for acute onset abdominal-pelvic pain, NOT for contraction pain/rule out labor. See **Current Preterm Labor (OB-18.3)**

Background and Supporting Information

- CPT® 76815 should never be reported with complete studies CPT® 76801/CPT® 76802, CPT® 76805/CPT® 76810 or CPT® 76811/CPT® 76812 or with CPT® 76816 or BPP (CPT® 76818 and CPT® 76819).
- Though fetal anatomy survey (CPT® 76805/CPT® 76811) can be performed as early as 14 weeks gestation, per ACOG, in the absence of other specific indications, it is optimally performed at 18 to 22 weeks of gestation.

Vaginal Bleeding (OB-5.2)

OB.AP.0005.2.A

v1.0.2024

First Trimester

At the time of complaint, can perform:

- Complete first trimester ultrasound CPT® 76801 and/or CPT® 76817 if complete ultrasound has not yet been performed, and <14 weeks **or**
- CPT® 76815 and/or CPT® 76817
- Repeat ultrasound is not usually necessary unless there are new indications.

Second and Third Trimesters

At the time of complaint, can perform:

- CPT® 76815 and/or CPT® 76817 **or**
- CPT® 76805/CPT® 76811 if indicated (plus CPT® 76812 for each additional fetus) if ≥14 weeks, if fetal anatomic scan has not yet been performed, and/or CPT® 76817 **or**
- CPT® 76816 and/or CPT® 76817 if fetal anatomy scan CPT® 76805/CPT® 76811 has been performed
- Plus CPT® 93976 (limited duplex scan) if requested [See **Placental and Cord Abnormalities (OB-21)**].
- BPP (CPT® 76818 or CPT® 76819) can be considered starting at 26 weeks.
- Repeat ultrasound is not usually necessary unless there are new indications
- For suspected placental abruption, See **Suspected Abruption Placentae (OB-21.5)**
- CPT® 76821 if vaginal bleeding with +KB (Kleihauer-Betke) (if feto-maternal hemorrhage – at risk for fetal anemia and hydrops)

Background and Supporting Information

- CPT® 76815 should never be reported with complete studies CPT® 76801/CPT® 76802, CPT® 76805/CPT® 76810 or CPT® 76811/CPT® 76812 or with CPT® 76816 or BPP (CPT® 76818 and CPT® 76819).
- Though fetal anatomy survey (CPT® 76805/CPT® 76811) can be performed as early as 14 weeks gestation, per ACOG, in the absence of other specific indications, it is optimally performed at 18 to 22 weeks of gestation.

Ectopic Pregnancy (OB-5.3)

OB.AP.0005.3.A

v1.0.2024

Ectopic Pregnancy

First Trimester

- If there is a history of an ectopic pregnancy or
- If there are abnormally rising hCG titers (non-doubling hCG), or
- If there are signs or symptoms of ectopic pregnancy, e.g. pain and/or bleeding.
- Report:
 - Complete first trimester ultrasound CPT® 76801 and/or CPT® 76817 if complete ultrasound has not yet been performed, and is <14 weeks **or**
 - CPT® 76815 and/or CPT® 76817
 - Plus Color Doppler ultrasonography (CPT® 93976) if an adnexal mass is confirmed
 - If a cornual (interstitial) ectopic or C-section scar ectopic pregnancy is suspected^{5,6}
 - CPT® 76376 or CPT® 76377, and/or CPT® 93976 as add-on codes
 - MRI Pelvis without contrast (CPT® 72195) if ultrasound is inconclusive.
 - See **3D and 4D Rendering (OB 28.12)** and **Previous C-section or History of Uterine Scar (OB 24.1)**
- If ectopic pregnancy is being treated non-surgically with Methotrexate:
 - If symptomatic, see **Vaginal Bleeding (OB-5.2)** and/or **Acute Abdominal/Pelvic Pain (OB-5.1)** or the imaging guidelines above for ectopic pregnancy
 - If bHCG is not declining appropriately with treatment, see the imaging guidelines above for ectopic pregnancy

Background and Supporting Information

- Cornual (interstitial) pregnancies pose a significant high morbidity/mortality risk due to massive intraperitoneal bleeding, and are often difficult to diagnose. Conventional sonography still remains the primary diagnostic tool, but 3D US and MRI are being utilized more frequently to aid in earlier detection and treatment.
- CPT® 76815 should never be reported with complete studies CPT® 76801/CPT® 76802, CPT® 76805/CPT® 76810 or CPT® 76811/CPT® 76812 or with CPT® 76816 or BPP (CPT® 76818 and CPT® 76819).
- Though fetal anatomy survey (CPT® 76805/CPT® 76811) can be performed as early as 14 weeks gestation, per ACOG, in the absence of other specific indications, it is optimally performed at 18 to 22 weeks of gestation

Spontaneous Abortion/Threatened/Missed Abortion (OB-5.4)

OB.AP.0005.4.A

v1.0.2024

Spontaneous Abortion/Threatened/Missed Abortion

- To evaluate for threatened or missed abortion:
 - Complete first trimester ultrasound CPT® 76801 and/or CPT® 76817 if complete ultrasound has not yet been performed, and is <14 weeks **or**
 - CPT® 76815 and/or CPT® 76817 **or**
 - CPT® 76805/CPT® 76811 if indicated (plus CPT® 76812 for each additional fetus), if ≥14 weeks when complete fetal anatomic scan has not yet been performed, and/or CPT® 76817
 - Repeat ultrasound (CPT® 76815 and/or CPT® 76817) can be repeated weekly if hCG is rising or not falling, or if unable to confirm a viable IUP (fetal pole with cardiac activity)
 - Ultrasound imaging can be repeated earlier than seven days if there are new symptoms
- For complete spontaneous abortion, ultrasound is generally not indicated if there is no pain, or ongoing bleeding, and hCG levels are decreasing.

Background and Supporting Information

- CPT® 76815 should never be reported with complete studies CPT® 76801/CPT® 76802, CPT® 76805/CPT® 76810 or CPT® 76811/CPT® 76812 or with CPT® 76816 or BPP (CPT® 76818 and CPT® 76819).
- Though fetal anatomy survey (CPT® 76805/CPT® 76811) can be performed as early as 14 weeks gestation, per ACOG, in the absence of other specific indications, it is optimally performed at 18 to 22 weeks of gestation

Hydatidiform Mole (OB-5.5)

OB.AP.0005.5.A

v1.0.2024

Hydatidiform Mole

First, Second and Third Trimester

- Ultrasound can be performed for diagnosis of hydatidiform mole
 - Complete first trimester ultrasound CPT® 76801 and/or CPT® 76817 if complete ultrasound has not yet been performed, and is <14 weeks, **or**
 - CPT® 76815 and/or CPT® 76817 **or**
 - CPT® 76805/CPT® 76811 if indicated (plus CPT® 76812 for each additional fetus) if ≥14 weeks, when complete fetal anatomic scan has not yet been performed, and/or CPT® 76817
 - CPT® 76830 and CPT® 76856 or CPT® 76857 if hCG titers are not decreasing as expected, or are increasing following treatment, or if there is onset of pain despite falling hCG titers. See **Molar Pregnancy and GTN (PV-16.1)** in the Pelvis Imaging Guidelines
- History of a molar pregnancy, can perform:
 - Complete first trimester ultrasound CPT® 76801 if <14 weeks, **or**
 - CPT® 76815 and/or CPT® 76817 **or**
 - CPT® 76805/CPT® 76811 if indicated (plus CPT® 76812 for each additional fetus) if ≥14 weeks, when complete fetal anatomic scan has not yet been performed, and/or CPT® 76817

Background and Supporting Information

- CPT® 76815 should never be reported with complete studies CPT® 76801/CPT® 76802, CPT® 76805/CPT® 76810 or CPT® 76811/CPT® 76812 or with CPT® 76816 or BPP (CPT® 76818 and CPT® 76819).
- Though fetal anatomy survey (CPT® 76805/CPT® 76811) can be performed as early as 14 weeks gestation, per ACOG, in the absence of other specific indications, it is optimally performed at 18 to 22 weeks of gestation.

Fetal Aneuploidy and Anomaly Screening (OB-6)

First Trimester Screening (OB-6.1)

OB.FA.0006.1.A

v1.0.2024

- First trimester screening includes the assessment of biochemical markers and fetal nuchal translucency (NT) (CPT® 76813). An increased Fetal Nuchal Translucency, defined as a NT ≥ 3.0 mm, or $>95^{\text{th}}$ percentile for the crown rump length (CRL), may indicate a fetus with aneuploidy (e.g. Down's syndrome, Trisomy 18) but may also indicate an increased risk for cardiac defects or other structural defects or genetic syndromes in euploid fetuses.
- Nuchal translucency can be performed if CRL 44-83 mm (typically between 10 4/7 and 14 weeks' gestation).
- Indications for a detailed first-trimester fetal anatomic ultrasound [requested as CPT® 76801 plus CPT® 76813 (and CPT® 76802 plus CPT® 76814 for each additional fetus)] See **Detailed First Trimester Fetal Anatomic Scan (OB-9.12)**

First Trimester Screening:

- Ultrasound CPT® 76813 (plus CPT® 76814 for each additional fetus) is the initial imaging for first trimester screening, to evaluate fetal nuchal translucency
- If increased Fetal Nuchal Translucency (NT ≥ 3.0 mm or $>95^{\text{th}}$ percentile for the CRL), perform:
 - A detailed first-trimester obstetric ultrasound [requested as CPT® 76801 **plus** CPT® 76813 (and CPT® 76802 **plus** CPT® 76814 for each additional fetus)] between 12 weeks 0 days and 13 weeks 6 days,⁹ **and/or**
 - Fetal anatomic ultrasound (CPT® 76811) at ≥ 16 weeks
 - Fetal echo (CPT® 76825 and/or CPT® 76827 and/or CPT® 93325) at ≥ 16 weeks
 - Cell-Free DNA (cfDNA), Amniocentesis or CVS can be performed
 - See **High Risk Pregnancy (OB-9)** and **Fetal Echocardiography - Indications for Fetal Conditions (OB-12.2)**
- Fetal NT (CPT® 76813) is NOT recommended if cfDNA has already been planned or performed, as they are both screening tools for fetal aneuploidy.
 - Twins and higher order multiples are an exception to this since the sensitivity of cfDNA screening may not be as accurate in this group.¹⁰
 - Fetal NT (CPT® 76813) can be performed in twins and higher order multiples even if cfDNA has already been planned or performed. See **Known Dichorionic Multiple Gestations (OB-11.2)** and **Known Monochorionic-Diamniotic or Monochorionic-Monoamniotic Multiple Gestations (OB-11.3)**
- Cell-Free DNA (cfDNA) can be performed any time after 10 weeks gestation and is currently the most sensitive screening test for Down's syndrome per the American College of Medical Genetics and Genomics (99% accurate).
- Those with a positive cfDNA should be offered diagnostic testing (amniocentesis or CVS) and a detailed first-trimester obstetric ultrasound [requested as CPT® 76801

plus CPT® 76813 (and CPT® 76802 **plus** CPT® 76814 for each additional fetus)] between 12 weeks 0 days and 13 weeks 6 days,⁹ and a detailed anatomy scan (CPT® 76811) at ≥16 weeks. See **High Risk Group One – Risk Factors (OB-9.1)**.

- A “no call” or indeterminate result can occur (risk is higher with maternal obesity), which also has a higher risk of aneuploidy. These individuals should be managed as if positive.

Background and Supporting Information

- CPT® 76801 **plus** CPT® 76813 [and CPT® 76802 **plus** CPT® 76814 for each additional fetus)] when billed together, can also be used to report a detailed late first-trimester obstetric ultrasound examination – performed between 12 weeks 0 days and 13 weeks 6 days
 - This indication-driven detailed first trimester fetal anatomic evaluation is generally performed by those with special skills to perform this study, such as a Maternal Fetal Medicine specialist (Perinatologist), or a Radiologist with advanced training in fetal imaging. It can be performed even if cfDNA has been planned or performed.
- CPT® 76813/CPT® 76814 for first trimester screening alone, can be performed once per pregnancy, and should be performed only by those certified by the Fetal Medicine Foundation or Nuchal Translucency Quality Review Program (NTQR).
- The use of ultrasound codes (CPT® 76801/CPT® 76802) should be indication driven and should NOT be routinely done whenever an ultrasound for nuchal translucency (CPT® 76813/CPT® 76814) is requested. In cases where there is either a maternal and/or fetal indication, then the CPT® 76801/CPT® 76802 code can indeed be billed along with the nuchal translucency screening (CPT® 76813/CPT® 76814).
- CPT® 76815 should never be reported with complete studies CPT® 76801/CPT® 76802, CPT® 76805/CPT® 76810 or CPT® 76811/CPT® 76812 or with CPT® 76816 or BPP (CPT® 76818 and CPT® 76819).
- Though fetal anatomy survey (CPT® 76805/CPT® 76811) can be performed as early as 14 weeks gestation, per ACOG, in the absence of other specific indications, it is optimally performed at 18 to 22 weeks of gestation.

Second Trimester Screening (OB-6.2)

OB.FA.0006.2.A

v1.0.2024

Second Trimester Screening:

- A fetal anatomy ultrasound (CPT® 76805) and/or QUAD screen can be performed during the second trimester to detect fetal aneuploidy, neural tube defects, and other anatomical defects.
 - See **Fetal Anatomic Scan (OB-7.1)**
- If the quad screening is abnormal, a detailed anatomy ultrasound (CPT® 76811) can be performed.

Background and Supporting Information

Multiple marker screening is used in the second trimester (15 to 22 6/7 weeks) to screen for aneuploidy as well as open neural tube defects (ONTD).

- Maternal serum alpha-fetoprotein (MSAFP) can be done at 15 to 20 weeks to screen for neural tube defects in those that have had cfDNA or NT screen.
- The “quad” screen (AFP (alpha-fetoprotein), hCG (human chorionic gonadotropin), uE (Unconjugated estriol), dimeric inhibin-A) is the most commonly used test for the second trimester.
- A penta screen (quad screen markers + hyperglycosylated hCG) may be done in lieu of a quad screen.
- Combined, integrated or sequential screening (first and second trimester screening) may also be used and provides a higher detection rate than a single screening.
- Providers often wait for the results of the quad screen before ordering CPT® 76805. If the quad screen is abnormal, they may request CPT® 76811 in lieu of CPT® 76805.

Fetal Anatomic Scan/Cervical Length Screening (OB-7)

Fetal Anatomic Scan (OB-7.1)

OB.AS.0007.1.A

v1.0.2024

- Though fetal anatomy survey (CPT® 76805/CPT® 76811) can be performed as early as 14 weeks gestation, per ACOG, in the absence of other specific indications, it is optimally performed at 18 to 22 weeks of gestation. This timing allows for a survey of fetal anatomy and an accurate estimation of gestational age.
 - For a **normal/low risk** pregnancy, report a fetal anatomy ultrasound CPT® 76805 if ≥16 weeks.
 - If **high risk** indication is met can report:
 - A detailed fetal anatomy ultrasound (CPT® 76811) if ≥16 weeks^{15,16}
 - These high risk scans indication driven and generally performed by a Maternal Fetal Medicine (MFM) specialist/Perinatologist, or a Radiologist at an AIUM or ACR accredited facility.
 - See **High Risk Pregnancy (OB-9)**
 - For a detailed first-trimester fetal anatomy ultrasound [requested as CPT® 76801 plus CPT® 76813 (and CPT® 76802 plus CPT® 76814 for each additional fetus)] between 12 weeks 0 days and 13 weeks 6 days See **Detailed First Trimester Fetal Anatomic Scan (OB-9.12)**

Fetal Anatomic Scan – Follow-up (OB-7.2)

OB.AS.0007.2.A

v1.0.2024

- Follow-up ultrasounds (CPT® 76815 to assess a single item or CPT® 76816 if multiple areas to be assessed) can be performed once for incomplete or equivocal finding on initial fetal anatomic scan. This can be performed at any time after incomplete anatomy scan.
- CPT® 76816 (should not be performed prior to a CPT® 76801 or an anatomy scan CPT® 76805 (normal pregnancy) or Detailed anatomy scan CPT® 76811 (high risk pregnancy))
- If pregnancy is high risk See **High Risk Pregnancy (OB-9)** or other applicable high risk guideline.
- Detailed anatomy ultrasound CPT® 76811 can be performed (if not previously performed) when initial fetal anatomic scan CPT® 76805 is abnormal. See **High Risk Pregnancy (OB-9)**
- CPT® 76815 should never be reported with complete studies CPT® 76801/CPT® 76802, CPT® 76805/CPT® 76810 or CPT® 76811/CPT® 76812 or with CPT® 76816 or BPP (CPT® 76818 and CPT® 76819).

Cervical Length Screening (OB-7.3)

OB.AS.0007.3.A

v1.0.2024

- Current ACOG and SMFM guidelines state that CL screening in singleton gestations without a prior spontaneous PTB cannot yet be universally mandated.
 - Transvaginal ultrasound (CPT® 76817) can be performed if the transabdominal cervical length (CL) is ≤ 3.6 cm. If documented transabdominal attempt fails to visualize cervix, then CPT® 76817 may be performed on a case by case basis.
 - If cervical shortening is identified – See **Cervical Insufficiency (OB-18.1)**

Third Trimester Imaging (OB-8)

Third Trimester Imaging – Ultrasound (OB-8.1)

OB.TI.0008.1.A

v1.0.2024

- Imaging in the third trimester is indicated for bleeding, pain, absent fetal heart tones, decreased fetal movement and/or other high-risk indications
 - See specific guidelines based on indication
- For suspected breech position, See **Abnormal Fetal Position/Presentation (OB-14)**

Reference (OB-8)

v1.0.2024

1. Practice Bulletin No. 175: Ultrasound in Pregnancy. *Obstetrics & Gynecology*. 2016;128(6):e241-e256. Reaffirmed 2022 doi:10.1097/AOG.0000000000001815

High Risk Pregnancy (OB-9)

High Risk General Information (OB-9.0)

OB.HR.0009.0.A

v1.0.2024

High Risk Pregnancy General Information:

- Though CPT® 76811 can be performed as early as 14 weeks gestation, per ACOG, in the absence of other specific indications, it is optimally performed at 18 to 22 weeks of gestation.
- The detailed first trimester ultrasound and the detailed fetal anatomic evaluation are indication driven and generally performed by those with special skills to perform this study, such as a Maternal Fetal Medicine specialist (Perinatologist), or a Radiologist with advanced training in fetal imaging. See **Detailed First Trimester Fetal Anatomic Scan (OB-9.12)**
- In circumstances where the individual is deemed to have an increased risk for a fetal abnormality and does not have access to a provider who can perform the a fetal anatomic ultrasound examination (CPT® 76811) **due to geographic or other constraints**, a standard (after first trimester) fetal anatomic ultrasound examination (CPT® 76805) can be authorized instead.
- CPT® 76805, CPT® 76810, CPT® 76811, and CPT® 76812 should only be used once per pregnancy unless the mother changes to a new medical caregiver at a new office and there is a new medical indication and/or change in condition.
- Current ACOG and SMFM guidelines state that CL screening in singleton gestations without a prior spontaneous PTB cannot yet be universally mandated
 - Transvaginal ultrasound (CPT® 76817) can be performed if the transabdominal cervical length (CL) is ≤ 3.6 cm. If documented transabdominal attempt fails to visualize cervix, then CPT® 76817 may be performed on a case by case basis. See **Cervical Length Screening (OB-7.3)**. If cervical shortening is identified – See **Cervical Insufficiency (OB-18.1)**
- CPT® 76816 (should not be performed prior to a CPT® 76801 or an anatomy scan CPT® 76805 (normal pregnancy) or Detailed anatomy scan CPT® 76811 (high risk pregnancy)
- Typically all components of the BPP (CPT® 76818 and CPT® 76819), such as breathing, are not present until ≥ 26 weeks gestation. However, a modified BPP (CPT® 76815) can be utilized sooner in certain high risk cases but should not be done prior to 22 weeks. .
- CPT® 76815 should never be reported with complete studies CPT® 76801/CPT® 76802, CPT® 76805/CPT® 76810 or CPT® 76811/CPT® 76812 or with CPT® 76816 or BPP (CPT® 76818 and CPT® 76819).
- SMFM suggest that ductus venosus, middle cerebral artery, or uterine artery Doppler use for routine clinical management of early- or late-onset FGR *is not recommended*

High Risk Group One – Risk Factors (OB-9.1)

OB.HR.0009.1.A

v1.0.2024

High Risk Pregnancy – Risk Factors:

Socio-Demographic Risk Factors (maternal age)

- Age ≥ 35 years of age at the estimated date of confinement (EDC)

Lifestyle Related Risk Factors (legal or illicit drug/alcohol use)

- Recreational drug (e.g. cocaine, amphetamines, opiates) or excessive alcohol use (≥ 5 drinks per week) during current pregnancy, or excessive (at least weekly) Marijuana/Cannabinoids/THC use in 2nd and/or 3rd trimesters
 - For 1st trimester marijuana exposure – See **Potentially Teratogenic Medications/ Substances (OB-10.1)**
- Nicotine (≥ 10 cigarettes a day)
- Other nicotine exposure in pregnancy (e-cigs, vaping, chewing, patch) are also high risk
- Current Maternal IV drug use
- Current use of Suboxone, Subutex, Methadone
- Other polysubstance use

See **Medications/ Exposures Associated with Poor Pregnancy Outcome (OB 10.2)** for imaging recommendations for other high-risk medication or substances not listed above

Health Condition Related Risk Factors (maternal diseases or conditions)

- Anemia severe, < 8 grams Hgb or 24% HCT
- Antiphospholipid Syndrome
- Asthma (poorly controlled or steroid dependent)
- Autoimmune disease (e.g. Multiple Sclerosis, Immune Thrombocytopenic Purpura)
- Bariatric surgery
- Connective tissue disorders (lupus, RA, scleroderma, Sjogren's, etc.)
- DVT/PE or Maternal thrombophilia (Antiphospholipid Syndrome, Factor V Leiden mutation, Antithrombin III deficiency, Protein C/Protein S deficiency, Prothrombin gene mutation etc.)

Health Condition Related Risk Factors (maternal diseases or conditions)

- Heart disease (Maternal) – World Health Organization (WHO) Class II or greater
- Hemoglobinopathies (e.g. sickle cell disease, Alpha and Beta thalassemia minor (trait) or major)
- History of endometrial ablation or Uterine Artery embolization
- Inflammatory Bowel Disease (Ulcerative colitis, Crohn's Disease)
- Liver disease e.g. Hepatitis, Cholestasis of pregnancy (see imaging below)
- Malignancy complicating pregnancy
- Maternal malnutrition (BMI <18.5) or poor weight gain in pregnancy (1 lb per week in 2nd or 3rd trimester if BMI ≤24.9)
- PKU
- Renal disease e.g. glomerulonephritis, persistent protein in the urine, renal insufficiency
- Seizure disorders – on antiepileptic medication
- Thyroid disorder (e.g. hyperthyroidism, poorly controlled hypothyroidism)

Previous pregnancy related risk factors

- Prior pregnancy with adverse outcome (e.g. severe or early onset preeclampsia ≤34 weeks, abruption, accreta, previous uterine dehiscence or rupture, nonimmune hydrops).
- Prior pregnancy with SGA (baby weighing <2500 grams (5.5 pounds/5 lbs 8 oz) at term or less than the 10th percentile of expected weight) or FGR at any gestational age.
- For stillbirth See: **History of Stillbirth (OB-9.10)**

Current pregnancy related risk factors

- Abnormal 1st or 2nd trimester screen (e.g. Abnormal MSAFP; Low PAPP_A; Elevated inhibin A, elevated hCG³¹)
- Known chromosomal abnormalities or abnormal cfDNA
- Genetic Carrier status e.g., Cystic Fibrosis/Known carrier of Spinal Muscular Atrophy (SMA), CF, Tay-Sachs genetic diseases

Current pregnancy related risk factors

- Major Fetal anomaly such as gastroschisis, fetal ventriculomegaly, moderate or severe fetal urinary tract dilation defined as $\geq 7\text{mm}$ at <28 weeks or $>9\text{ mm}$ at ≥ 28 weeks³², achondroplasias, fetal congenital heart disease, neural tube defect, etc. For sustained fetal arrhythmias. See **Other Causes of Fetal Anemia (OB-16.5)** For Persistent Right Umbilical Vein (PRUV) - See **Persistent Right Umbilical Vein (PRUV) (OB-21.2)**.
- Grand multiparity: must have completed 5 or more pregnancies of greater than 20 weeks gestation, living or stillbirth (does not include current pregnancy; twins count as 1 pregnancy)
- Abnormal Fetal Nuchal Translucency $\geq 3.0\text{mm}$ or above the 95th percentile for the CRL
- No prenatal care prior to the third trimester
- Short inter-pregnancy interval ≤ 6 months from delivery to conception.^{33,34} [For inter-pregnancy interval >6 to 18 months – See **Short Interval Pregnancy (≤ 18 months between last delivery and conception of current pregnancy) (OB-9.11)**]
- Pregnancy with retained IUD

Maternal Infections (not exposure)

- Acquired Immune Deficiency Syndrome/HIV Positive
- Chicken Pox/Varicella
- Cytomegalovirus (CMV)
- Malaria
- Known parvovirus in current pregnancy post fetal treatment. See **Exposure to Parvovirus B-19 (OB-16.2)**
- Rubella
- Syphilis, untreated
- Toxoplasmosis
- Tuberculosis
- For Zika Virus and COVID-19 Virus See **High Risk Group Five: Zika and COVID-19 Virus (OB-9.5)**

Imaging For Above Conditions

- Complete first trimester ultrasound CPT® 76801 [plus CPT® 76802 for each additional fetus] if <14 weeks and a complete ultrasound has not yet been performed, **and/or** CPT® 76817 for a transvaginal ultrasound
 - CPT® 76801 is preferred for dating, but if this is unable to be completed then CPT® 76815 **and/or** CPT® 76817 for a transvaginal ultrasound is indicated
 - See **Detailed First Trimester Fetal Anatomic Scan (OB-9.12)** for indications for detailed first trimester fetal anatomic evaluation^{5,6}
- Detailed Fetal Anatomic Scan CPT® 76811 if ≥16 weeks
 - Though CPT® 76811 can be performed as early as 14 weeks gestation, per ACOG, in the absence of other specific indications, it is optimally performed at 18 to 22 weeks of gestation
- Starting at 22 weeks follow-up growth scans (CPT® 76816) every 3 to 6 weeks
- BPP (CPT® 76818 or CPT® 76819) or modified BPP (CPT® 76815), weekly starting at 32 weeks
- More frequent antepartum fetal surveillance can be performed as stipulated below:
 - Starting at 32 weeks, perform BPP (CPT® 76818 or CPT® 76819) or modified BPP (CPT® 76815) **up to 2x weekly** for the conditions below:
 - Antiphospholipid Syndrome
 - Maternal Renal Disease (moderate to severe with creatinine >1.4mg/dl)
 - Sickle cell disease
 - Starting **at diagnosis** perform BPP (CPT® 76818 or CPT® 76819) if ≥26 weeks, or modified BPP (CPT® 76815) if ≥22 weeks, **up to 2x weekly**:
 - Intra-hepatic cholestasis of pregnancy (IHCP)
 - Complicated Sickle cell disease (e.g. co-existing hypertension, vaso-occlusive crisis, fetal growth restriction)
 - Complicated SLE (e.g. active lupus nephritis, or recent flares)
 - Major fetal anomaly in the current pregnancy (e.g. gastroschisis, fetal ventriculomegaly, fetal hydronephrosis (>10mm), achondroplasias, fetal congenital heart disease, neural tube defect, sustained fetal arrhythmias)

Background and Supporting Information

Studies that note lower birth weights among offspring exposed to marijuana have noted that these findings were more pronounced among females who used more marijuana, particularly during the first and second trimesters (at least weekly during the pregnancy). CPT® 76811 can be performed, however, given the limited evidence for antenatally detected abnormal growth, serial growth ultrasounds is not indicated in the absence of other findings concerning for growth restriction.

Modified WHO Classification of Heart Disease in Pregnancy

WHO I: Uncomplicated pulmonary stenosis (PS), mitral valve prolapse (MVP), well repaired patent ductus arteriosus (PDA) or persistent anomalous pulmonary venous return (PAPVR)

WHO II: Unrepaired ASD/VSD, repaired tetralogy of fallot (TOF), most arrhythmias

WHO II-II: Mild LV impairment, hypertrophic cardiomyopathy (HCM), valvular heart disease, Marfan without aortic dilation, bicuspid aortic valve (BAV) with Ao <4.5 cm, repaired coarctation of the aorta

WHO III: Mechanical valves, systemic right ventricle (RV), Fontan, cyanotic heart disease, Marfan Aorta 4.0-4.5 cm, Bicuspid Aortic Valve Aorta 4.5-5.0 cm

WHO IV: **Pregnancy Contraindicated** – native severe coarctation of the aorta, Pulmonary Hypertension, LVEF <30%, NYHA III-IV, severe symptomatic mitral stenosis (MS), Marfan Aorta >4.5; Bicuspid aortic valves Ao >5.0; prior peripartum cardiomyopathy with residual LV impairment.

Recommended Weight Gain During Pregnancy

Pre-pregnancy weight Category	BMI	Total Wt Gain (lbs)	Recommended Rate of gain in 2 nd and 3 rd trimester (lb/wk)
Underweight	<18.5	28-40	1
Normal weight	18.5-24.9	25-35	1
Overweight	25-29.99	15-25	0.6
Obese	>30	11-20	0.5

Modified from. ACOG Practice Bulletin No 230. Obesity in Pregnancy, *Obstetrics & Gynecology*: June 2021

High Risk Group Two - Ultrasound Findings (OB-9.2)

OB.HR.0009.2.A

v1.0.2024

Soft Markers for Aneuploidy (OB-9.2.1)

- If the following ‘soft markers’ are found in fetus of current pregnancy on routine imaging:
 - Shortened long bones (femur and/or humerus),
 - Mild Pyelectasis^{28,32} (4 mm to <7 mm at 16 to 27 weeks; or 7 mm to <9 mm at ≥28 weeks)
 - For moderate or severe fetal urinary tract dilation (≥7mm at <28 weeks or >9 mm at ≥28 weeks) See **High Risk Group One - Risk factors (OB-9.1)**
 - Echogenic bowel
 - See **Other Ultrasound Findings (OB-9.2.2)** for Fetal Echogenic intra-cardiac focus and/or choroid plexus cyst
- Detailed Fetal anatomic scan ≥16 weeks (CPT® 76811).
- One follow-up scan (CPT® 76816) in third trimester

Other Ultrasound Findings (OB-9.2.2)

- If an isolated soft marker²⁸ is found in fetus of current pregnancy on routine imaging, including:
 - Choroid plexus cyst, or
 - Echogenic intra-cardiac foci, or
 - Thickened nuchal fold (≥6mm at 15 to 20 weeks), or
 - Absent or hypoplastic nasal bone
 - Report:
 - Detailed fetal anatomic scan (CPT® 76811) at ≥16 weeks
- If a Major fetal anomaly is found, or if abnormal cfDNA or amniocentesis results - See **High Risk Group One - Risk factors (OB-9.1)**
- If negative cfDNA or negative amniocentesis – Fetal echo or follow-up ultrasound are not warranted for these isolated findings

- If history of a prior pregnancy with a chromosomal and/or structural congenital anomaly, or
- Current pregnancy with suspected fetal anomaly on initial imaging
- Report:
 - A detailed first-trimester obstetric ultrasound^{5,6} [requested as CPT® 76801 **plus** CPT® 76813 (and CPT® 76802 **plus** CPT® 76814 for each additional fetus)] between 12 weeks 0 days and 13 weeks 6 days, **and/or**
 - Detailed fetal anatomic scan (CPT® 76811) at ≥16 weeks
- If a Major fetal anomaly is found - See High Risk Group One - Risk factors (OB-9.1) and/or **Fetal Echocardiography - Indications for Fetal Conditions (OB 12.2)**

High Risk Group Three – Pre-pregnancy BMI ≥ 30 kg/m² (OB-9.3)

OB.HR.0009.3.A

v1.0.2024

Pre-pregnancy BMI ≥ 30 kg/m²

- Complete first trimester anatomy ultrasound CPT® 76801 [plus CPT® 76802 for each additional fetus] if <14 weeks and a complete ultrasound has not yet been performed, **and/or** CPT® 76817 for a transvaginal ultrasound
 - CPT® 76801 is preferred for dating, but if this is unable to be completed then CPT® 76815 and/or CPT® 76817 for a transvaginal ultrasound is indicated
- A detailed first trimester fetal anatomic evaluation^{5,6} can be performed between 12 weeks 0 days and 13 weeks 6 days. (See **Detailed First Trimester Fetal Anatomic Scan (OB-9.12)** for indications)
 - Report: CPT® 76801 plus CPT® 76813 (and CPT® 76802 plus CPT® 76814 for each additional fetus) for a detailed first trimester fetal anatomy ultrasound.
 - A detailed first trimester fetal anatomic evaluation can be performed if indicated, even if cfDNA has been planned or performed
- A detailed fetal anatomic scan at ≥ 16 weeks (CPT® 76811)
 - Though CPT® 76811 can be performed as early as 14 weeks gestation, per ACOG, in the absence of other specific indications, it is optimally performed at 18 to 22 weeks of gestation

Class I Obesity - Pre-pregnancy BMI 30 to 34.9 (OB-9.3.1)

Class I Obesity (BMI 30-34.9)

- After first and second trimester imaging as outlined above, Report **One** follow-up scan (CPT® 76816) between 32 to 36 weeks
 - If unable to clinically assess fundal height due to body habitus a growth scan (CPT® 76816) can be considered in the early third trimester with follow up in 4 weeks

Class II Obesity - Pre-pregnancy BMI 35-39.9 (OB-9.3.2)**Class II Obesity (BMI 35-39.9)**

- After first and second trimester imaging as outlined above, Report:
 - Growth scans (CPT® 76816) every 4 weeks starting in the third trimester (≥28 weeks)
 - BPP (CPT® 76818 or CPT® 76819) or a modified BPP (CPT® 76815) weekly starting at 36 weeks

Class III Obesity - Pre-pregnancy BMI ≥40 (OB-9.3.3)**Class III Obesity (BMI ≥40)**

- After first and second trimester imaging as outlined above, Report:
 - Growth scans (CPT® 76816) every 4 weeks starting in the third trimester (>28 weeks)
 - BPP (CPT® 76818 or CPT® 76819) or modified BPP (CPT® 76815) weekly starting at 32 weeks

Background and Supporting Information

If pre-pregnancy or early pregnancy weight is over 200 pounds, it can be presumed that BMI is ≥ 30 kg/m².

Recommended Weight Gain During Pregnancy

Pre-pregnancy weight Category	BMI	Total Wt Gain (lbs)	Recommended Rate of gain in 2 nd and 3 rd trimester (lb/wk)
Underweight	<18.5	28-40	1
Normal weight	18.5-24.9	25-35	1
Overweight	25-29.99	15-25	0.6
Obese	>30	11-20	0.5

Modified from ACOG Practice Bulletin No 230. Obesity in Pregnancy, *Obstetrics & Gynecology*: June 2021

High Risk Group Four – Macrosomia (OB-9.4)

OB.HR.0009.4.A

v1.0.2024

Prior Pregnancy with Macrosomia (OB-9.4.1)

Prior pregnancy with macrosomia (baby weighing >4000 grams at term or greater than the 90th percentile of expected weight)

- Report one of the following in the first trimester to establish dates:
 - Complete first trimester ultrasound CPT® 76801 [plus CPT® 76802 for each additional fetus] if <14 weeks and a complete ultrasound has not yet been performed, **and/or** CPT® 76817 for a transvaginal ultrasound
 - CPT® 76801 is preferred for dating, but if this is unable to be completed then CPT® 76815 and/or CPT® 76817 for a transvaginal ultrasound is indicated
 - Detailed Fetal Anatomic Scan CPT® 76811 if ≥16 weeks
 - Though CPT® 76811 can be performed as early as 14 weeks gestation, per ACOG, in the absence of other specific indications, it is optimally performed at 18 to 22 weeks of gestation
- Follow-up scan (CPT® 76816) in the third trimester (28-32 weeks) and at ≥35 weeks to plan for delivery^{35,36}

Current Pregnancy with Suspected or Known Macrosomia (OB-9.4.2)

- See Macrosomia – Large for Dates Current Pregnancy (OB-20.2)
- See Unequal Fundal Size and Dates (OB-27)

High Risk Group Five – Zika and COVID-19 Virus (OB-9.5)

OB.HR.0009.5.A

v1.0.2024

Zika Virus (OB-9.5.1)

Zika Virus

Suspected exposure without symptoms³⁷

- Report one of the following:
 - Complete first trimester ultrasound CPT® 76801 [plus CPT® 76802 for each additional fetus] if <14 weeks and a complete ultrasound has not yet been performed, **and/or** CPT® 76817 for a transvaginal ultrasound
 - CPT® 76801 is preferred for dating, but if this is unable to be completed then CPT® 76815 and/or CPT® 76817 for a transvaginal ultrasound is indicated
 - CPT® 76805/CPT® 76811 if otherwise indicated (plus CPT® 76810/CPT® 76812 for each additional fetus) if anatomy ultrasound has not yet been performed, **or**
 - CPT® 76816 if anatomy ultrasound (CPT® 76805/CPT® 76811) previously performed
 - Though a fetal anatomy scan can be performed as early as 14 weeks gestation, per ACOG, in the absence of other specific indications, it is optimally performed at 18 to 22 weeks of gestation
- If test positive or if symptoms developed, See below

Zika Virus

Suspected exposure with symptoms or known infection³⁷

- Report one of the following:
 - Complete first trimester ultrasound CPT® 76801 [plus CPT® 76802 for each additional fetus] if <14 weeks and a complete ultrasound has not yet been performed, **and/or** CPT® 76817 for a transvaginal ultrasound
 - CPT® 76801 is preferred for dating, but if this is unable to be completed then CPT® 76815 and/or CPT® 76817 for a transvaginal ultrasound is indicated
 - CPT® 76811 if ≥16 weeks when an anatomy ultrasound (CPT® 76811) has not yet been performed
 - Though CPT® 76811 can be performed as early as 14 weeks gestation, per ACOG, in the absence of other specific indications, it is optimally performed at 18 to 22 weeks of gestation
 - Growth scan, (CPT® 76816) every 3 to 4 weeks to monitor for findings such as intracranial calcifications and microcephaly, starting at 16 weeks.
 - CPT® 76816 if anatomy ultrasound (CPT® 76805/CPT® 76811) previously performed
 - Though a fetal anatomy scan can be performed as early as 14 weeks gestation, per ACOG, in the absence of other specific indications, it is optimally performed at 18 to 22 weeks of gestation
 - If fetal anomaly suspected or diagnosed See **High Risk Group One – Risk Factors (OB-9.1)**, if FGR diagnosed, See **Fetal Growth Restriction Current Pregnancy (OB-20.1)**

COVID-19 Virus (OB-9.5.2)**COVID-19 Virus**

COVID-19 infection in the current pregnancy³⁹

- Report one of the following:
 - Complete first trimester ultrasound CPT® 76801 [plus CPT® 76802 for each additional fetus] if <14 weeks and a complete ultrasound has not yet been performed, **and/or** CPT® 76817 for a transvaginal ultrasound
 - CPT® 76801 is preferred for dating, but if this is unable to be completed then CPT® 76815 and/or CPT® 76817 for a transvaginal ultrasound is indicated
 - CPT® 76805 (CPT® 76811 if otherwise indicated), if ≥16 weeks when an anatomy ultrasound (CPT® 76805/CPT® 76811) has not yet been performed
 - Though fetal anatomy survey (CPT® 76805/CPT® 76811) can be performed as early as 14 weeks gestation, per ACOG, in the absence of other specific indications, it is optimally performed at 18 to 22 weeks of gestation.
 - Growth scan (CPT® 76816) every 3 to 4 weeks starting at 22 weeks [See **High Risk Group One - Risk factors (OB-9.1)**]
 - Starting **at diagnosis** perform weekly BPP (CPT® 76818 or CPT® 76819) if ≥26 weeks, or modified BPP (CPT® 76815) if ≥22 weeks. (See **High Risk Group One - Risk factors (OB-9.1)**)
 - If FGR diagnosed then follow **FGR imaging Fetal Growth Restriction Current Pregnancy (OB-20.1)**

High Risk Group Six - Pre-Gestational or Early Diagnosed (≤ 20 weeks) Diabetes (OB-9.6)

OB.HR.0009.6.A

v1.0.2024

- If diabetes is diagnosed prior to pregnancy or in the first or early second trimester (typically before 20 weeks gestation) with standard diagnostic criteria of: HbA1C $\geq 6.5\%$, fasting plasma glucose ≥ 126 mg/dL, or 2-hour glucose ≥ 200 mg/dL on a 75-g oral glucose tolerance test, then image as below.

Test	When	Frequency	Codes
First Trimester (Dating) Ultrasound	<14 weeks	Once	CPT® 76801 is preferred for dating, but if this is unable to be completed then CPT® 76815 and/or CPT® 76817 for a transvaginal ultrasound is indicated
Detailed first-trimester obstetric ultrasound ^{5,6}	12 to 13+6 weeks	Once	CPT® 76801 plus CPT® 76813 (and CPT® 76802 plus CPT® 76814 for each additional fetus)
Fetal anatomic scan	≥ 16 weeks	Once	CPT® 76811
Initial Fetal echo	Starting at ≥ 16 weeks	Once	CPT® 76825 and/or CPT® 76827 and/or CPT® 93325
Ultrasound (for fetal growth)	Starting at 22 weeks	Every 2 to 4 weeks	CPT® 76816
Biophysical Profile (BPP) or modified BPP	Starting at 32 weeks (can start at ≥ 26 weeks if complicated by additional risk factors (e.g., FGR Oligohydramnios, HTN)	Up to twice weekly	CPT® 76818 (BPP) or CPT® 76819 (BPP) or CPT® 76815 (modified BPP)
Umbilical artery Doppler (if FGR diagnosed)	Upon diagnosis of FGR if ≥ 22 weeks	Weekly	CPT® 76820

High Risk Group Seven Gestational Diabetes (OB-9.7)

OB.HR.0009.7.A

v1.0.2024

Gestational Diabetes - Diet-Controlled (GDM-A1) (OB-9.7.1)

If patient has gestational diabetes and it is diet controlled:			
Test	When	Frequency	Codes
Fetal anatomic scan	≥16 weeks	Once	CPT® 76805
Ultrasound (for fetal growth)	Once at the time of diagnosis, then starting at 32 weeks	Every 4 weeks	CPT® 76816
Biophysical Profile (BPP) or modified BPP	Starting at 34 weeks	Once weekly if diet controlled.	CPT® 76818 (BPP) or CPT® 76819 (BPP) or CPT® 76815 (modified BPP)

Gestational Diabetes on Medications (GDM-A2) (OB-9.7.2)

If patient has gestational diabetes and is on oral medication or insulin:			
Test	When	Frequency	Codes
Fetal anatomic scan	≥16 weeks	Once	CPT® 76811
Fetal echo (if HbA1C >6%)	Once in the third trimester (≥32 weeks)	Once	CPT® 76825 and/or CPT® 76827 and/or CPT® 93325
Ultrasound (for fetal growth)	Starting at 22 weeks	Every 2 to 4 weeks	CPT® 76816
Biophysical Profile (BPP) or modified BPP	Starting at 32 weeks (can start at ≥26 if complicated by additional risk factors (e.g., FGR Oligohydramnios))	Up to twice weekly	CPT® 76818 (BPP) or CPT® 76819 (BPP) or CPT® 76815 (modified BPP)

If patient has gestational diabetes and is on oral medication or insulin:			
Test	When	Frequency	Codes
Umbilical artery Doppler (if FGR diagnosed)	Upon diagnosis of FGR if ≥ 22 weeks	Weekly	CPT® 76820

Background and Supporting Information

- If HbA1c levels are $>6\%$, in those with GDM-A2, fetal echocardiogram in the third trimester to assess for ventricular hypertrophy can be performed.

Hypertensive Disorders in Pregnancy (OB-9.8)

OB.HR.0009.8.A

v1.0.2024

Screening in High Risk Groups (OB-9.8.1)

Screening in High Risk Groups

- SMFM state that uterine artery Doppler has limited diagnostic accuracy and clinical utility in predicting FGR, SGA birth, and perinatal mortality. As such, its use for screening in high risk groups *is not recommended*.

Current Chronic Hypertension not on Medication (OB-9.8.2)

Test	When	Frequency	Codes
First Trimester (Dating) Ultrasound	<14 weeks	Once	CPT® 76801 is preferred for dating, but if this is unable to be completed then CPT® 76815 and/or CPT® 76817 for a transvaginal ultrasound is indicated
Fetal anatomic scan	≥16 weeks	Once	CPT® 76811
Ultrasound (for fetal growth)	In the third trimester (≥28 weeks)	Every 4-6 weeks	CPT® 76816
If blood pressure is elevated from baseline, See Gestational Hypertension (GH, preeclampsia, toxemia) (OB-9.8.4) below			

Current Chronic Hypertension on Medication (OB-9.8.3)

Test	When	Frequency	Codes
First Trimester (Dating) Ultrasounds	<14 weeks	Once	CPT® 76801 is preferred for dating, but if this is unable to be completed then CPT® 76815 and/or CPT® 76817 for a transvaginal ultrasound is indicated
Detailed Fetal Anatomic Scan	≥16 weeks	Once	CPT® 76811
Ultrasound (for fetal growth)	Starting at 22 weeks gestation	Every 3 to 4 weeks	CPT® 76816
Biophysical profile (BPP) or modified BPP	Starting at 32 weeks If complicated by other risk factors (e.g. DM, FGR Oligohydramnios) can start at ≥26 weeks)	Once weekly If complicated by other risk factors (e.g., FGR Oligohydramnios) twice weekly	CPT® 76818 (BPP) or CPT® 76819 (BPP) or CPT® 76815 (AFI)
Umbilical artery Doppler (if FGR diagnosed) See <u>Fetal Growth Restriction Current Pregnancy (OB-20.1)</u>	Upon diagnosis of FGR if ≥22 weeks	Twice weekly	CPT® 76820

Gestational Hypertension (GH, preeclampsia, toxemia) (OB-9.8.4)

Test	When	Frequency	Codes
Fetal anatomic scan	≥16 weeks	Once	CPT® 76805 or CPT 76811 if other high risk issues and if not previously completed

Test	When	Frequency	Codes
Growth US	Starting at time of diagnosis	Every 3 to 4 weeks If FGR, Oligohydramnios or severe preeclampsia (every 2 to 4 weeks)	CPT® 76816
BPP	Starting at time of diagnosis if ≥26 weeks	Up to twice weekly Hypertension/ pre-eclampsia with severe features - Daily	CPT® 76818 or CPT® 76819
Modified BPP	Starting at time of diagnosis if ≥22 weeks	Up to twice weekly Hypertension/ pre-eclampsia with severe features - Daily	CPT® 76815
Umbilical artery Doppler <u>Fetal Growth Restriction Current Pregnancy (OB-20.1)</u>	Starting at time of diagnosis of FGR or Oligohydramnios if ≥22 weeks	Twice weekly	CPT® 76820

Background and Supporting Information

Disorder	Definition
Hypertension in pregnancy	Systolic blood pressure ≥140 mm Hg or diastolic BP ≥90 mm Hg, or both, measured on two occasions at least 4 hours apart
Severe-range hypertension	Systolic blood pressure ≥160 mm Hg or diastolic BP ≥110 mm Hg, or both, measured on two occasions at least 4 hours apart

Disorder	Definition
Chronic hypertension	Hypertension diagnosed or present before pregnancy or before 20 weeks of gestation; or hypertension that is diagnosed for the first time during pregnancy and that does not resolve in the postpartum period
Chronic hypertension with superimposed preeclampsia	Preeclampsia in a female with a history of hypertension before pregnancy or before 20 weeks of gestation
Gestational hypertension	Hypertension diagnosed after 20 weeks of gestation, in a female with a previously normal blood pressure.
Preeclampsia	Disorder of pregnancy associated with new-onset hypertension, which occurs most often after 20 weeks of gestation and frequently near term. Although often accompanied by new-onset proteinuria, hypertension and other signs or symptoms of preeclampsia may present in some females in the absence of proteinuria.
Eclampsia	Convulsive manifestation of the hypertensive disorders of pregnancy and is among the more severe manifestations of the disease.

History of Spontaneous Pre-Term Delivery/History of PPROM (OB-9.9)

OB.HR.0009.9.A

v1.0.2024

Spontaneous Preterm Delivery <37 0/7 Weeks; History of PPROM <37 0/7 weeks (OB-9.9.1)

Initial Imaging

- For initial imaging:
 - Complete first trimester ultrasound CPT® 76801 [plus CPT® 76802 for each additional fetus] if <14 weeks and a complete ultrasound has not yet been performed, **and/or** CPT® 76817 for a transvaginal ultrasound
 - CPT® 76801 is preferred for dating, but if this is unable to be completed then CPT® 76815 and/or CPT® 76817 for a transvaginal ultrasound is indicated
- Fetal Anatomy Ultrasound CPT® 76811 [plus CPT® 76812 for each additional fetus] if ≥16 weeks and a complete fetal anatomic scan has not yet been performed during this pregnancy
 - Though fetal anatomy survey (CPT® 76805/CPT® 76811) can be performed as early as 14 weeks gestation, per ACOG, in the absence of other specific indications, it is optimally performed at 18 to 22 weeks of gestation.
- CPT® 76817 and/or CPT® 76815 every 1 to 4 weeks, starting at ≥16 0/7 weeks until 24 0/7 weeks
- Starting after the fetal anatomic scan at ≥22 weeks, ultrasound (CPT® 76816) can be performed every 3 to 6 weeks until delivery
- If history of Preterm Delivery or PPROM below 37 0/7 weeks in immediately preceding pregnancy starting at 32 weeks, weekly BBP CPT® 76818 or CPT® 76819 or modified BPP CPT® 76815
- If funneling or short cervix ≤25 mm (2.5 cm) is found on a transvaginal ultrasound in a singleton pregnancy See **Cervical Insufficiency (OB-18.1)**
- For current preterm labor See **Current Preterm Labor (OB-18.3)**
- **If additional risk factors present see OB 9.1 for indications for fetal monitoring**

History of Stillbirth (OB-9.10)

OB.HR.0009.10.A

v1.0.2024

Initial Imaging

- For initial imaging:
 - Complete first trimester ultrasound CPT® 76801 [plus CPT® 76802 for each additional fetus] if <14 weeks and a complete ultrasound has not yet been performed, and/or CPT® 76817 for a transvaginal ultrasound
 - CPT® 76801 is preferred for dating, but if this is unable to be completed then CPT® 76815 and/or CPT® 76817 for a transvaginal ultrasound is indicated
 - A detailed first trimester fetal anatomic evaluation^{5,6} can be performed between 12 weeks 0 days and 13 weeks 6 days. (See **Detailed First Trimester Fetal Anatomic Scan (OB-9.12)** for indications)
 - Report: CPT® 76801 **plus** CPT® 76813 (and CPT® 76802 **plus** CPT® 76814 for each additional fetus) for a detailed first trimester fetal anatomy ultrasound
 - A detailed first trimester fetal anatomic evaluation can be performed if indicated, even if cfDNA has been planned or performed
- Fetal anatomic scan at ≥16 weeks (CPT® 76811)
 - Though fetal anatomy survey (CPT® 76805/CPT® 76811) can be performed as early as 14 weeks gestation, per ACOG, in the absence of other specific indications, it is optimally performed at 18 to 22 weeks of gestation
- Follow up ultrasound (CPT® 76816) every 2 to 4 weeks to assess fetal growth starting at 22 weeks or two weeks before prior pregnancy loss.
- Twice weekly BPP (CPT® 76818 or CPT® 76819, if ≥26 weeks) **or** modified BPP CPT® 76815 (not to be performed prior to 22 weeks) starting at 32 weeks or two weeks before prior pregnancy loss

Background and Supporting Information

- A history of stillbirth is not an indication for fetal echo. Per 2020 ACOG bulletin – there is no mention of recommendation for echo – just a detailed anatomy US. If demised fetus had a confirmed cardiac anomaly on autopsy, or if the detailed anatomy scan on either the demised fetus or the current pregnancy had findings suspicious for cardiac anomaly, then echo may be indicated. See **Fetal Echocardiography - Indications for Fetal Conditions (OB 12.2)**

Short Interval Pregnancy (≤ 18 months between last delivery and conception of current pregnancy) (OB-9.11)

OB.HR.0009.11.A

v1.0.2024

If Inter-Pregnancy interval ≤ 6 months^{33,34}

- Follow imaging as per High Risk Group One – Risk Factors (OB 9.1)

If Inter-Pregnancy interval > 6 months but ≤ 18 months^{33,34}

- Report one of the following to establish dates:
 - Complete first trimester ultrasound CPT® 76801 [plus CPT® 76802 for each additional fetus] if < 14 weeks and a complete ultrasound has not yet been performed, **and/or** CPT® 76817 for a transvaginal ultrasound
 - CPT® 76801 is preferred for dating, but if this is unable to be completed then CPT® 76815 and/or CPT® 76817 for a transvaginal ultrasound is indicated
- For fetal anatomy scan report CPT® 76805 (CPT® 76811 if otherwise indicated), if ≥ 16 weeks
 - Though fetal anatomy survey (CPT® 76805/CPT® 76811) can be performed as early as 14 weeks gestation, per ACOG, in the absence of other specific indications, it is optimally performed at 18 to 22 weeks of gestation.
- One follow-up scan, CPT® 76816 in the third trimester (28-32 weeks) to assess fetal growth.

Background and Supporting Information

Inter-pregnancy intervals shorter than 18 months are associated with higher risks of adverse pregnancy outcomes, including preterm delivery, small-for-gestational-age (SGA) birth, and infant mortality. Per ACOG, females should be advised to avoid inter-pregnancy intervals shorter than 6 months due to even more significant risks.³³

Detailed First Trimester Fetal Anatomic Scan (OB-9.12)

OB.HR.0009.12.A

v1.0.2024

- A detailed first trimester fetal anatomic evaluation^{5,6} can be performed, if indicated, between 12 weeks 0 days and 13 weeks 6 days.
 - If indicated report: CPT® 76801 **plus** CPT® 76813 (and CPT® 76802 **plus** CPT® 76814 for each additional fetus) [requested together] for a detailed first trimester fetal anatomy ultrasound.
 - A detailed first trimester fetal anatomic scan can be requested even if cfDNA has been planned or performed.
- Indications for a detailed first trimester fetal anatomic ultrasound include but are not limited to conditions below

Detailed First-Trimester Fetal Anatomy Scan Indications

- Previous fetus or child with a congenital, genetic, or chromosomal anomaly
- Known or suspected fetal abnormality detected by ultrasound in the current pregnancy
- Fetus at increased risk for a congenital anomaly based on the following:
 - 35 years or older at delivery
 - Maternal pre-gestational diabetes
 - Pregnancy conceived via in vitro fertilization
 - Multiple gestation
 - Teratogen exposure
 - Enlarged nuchal translucency
 - Positive screening test results for aneuploidy, including cell-free DNA screening and serum-only or combined first-trimester screening
- Other conditions possibly affecting the pregnancy/fetus, including:
 - Maternal body mass index of 30 kg/m or higher
 - Placental implantation covering the internal cervical os under a cesarean scar site or cesarean scar pregnancy diagnosed in index gestation

High Risk Medications and Substances (OB-10)

Potentially Teratogenic Medications/Substances (OB-10.1)

OB.MS.0010.1.A

v1.0.2024

- If maternal exposure to any of the below Potentially Teratogenic Medications/Substances report:
 - Complete first trimester anatomy ultrasound CPT® 76801 [plus CPT® 76802 for each additional fetus] if <14 weeks and a complete ultrasound has not yet been performed, **and/or** CPT® 76817 for a transvaginal ultrasound
 - CPT® 76801 is preferred for dating, but if this is unable to be completed then CPT® 76815 and/or CPT® 76817 for a transvaginal ultrasound is indicated
 - A detailed first trimester fetal anatomic evaluation can be performed between 12 weeks 0 days and 13 weeks 6 days. (See **Detailed First Trimester Fetal Anatomic Scan (OB-9.12)** for indications)
 - Report: CPT® 76801 **plus** CPT® 76813 (and CPT® 76802 **plus** CPT® 76814 for each additional fetus) for a detailed first trimester fetal anatomy ultrasound
 - A detailed first trimester fetal anatomic evaluation can be performed if indicated, even if cfDNA has been planned or performed
 - CPT® 76811 (detailed fetal anatomy) if ≥16 weeks
 - Though fetal anatomy survey (CPT® 76805/CPT® 76811) can be performed as early as 14 weeks gestation, per ACOG, in the absence of other specific indications, it is optimally performed at 18 to 22 weeks of gestation

Potentially Teratogenic Medications/Substances
Aminoglycosides (amikacin, gentamycin, kanamycin, tobramycin, and other mycins)
Aspirin – only if exposed less than 10 weeks gestation
Benzodiazepines [e.g., Diazepam (valium), Lorazepam (Ativan), Alprazolam (Xanax) etc.]
Codeine
Ergotamine (e.g. Methergine)
Fluconazole (Diflucan)
Lead (Exposure in early pregnancy)
Leflunomide (first trimester exposure)
Marijuana/Cannabinoids/THC Exposure
Methyl mercury
Oral contraceptives (combined and/or progestin only exposure in the first trimester)

Potentially Teratogenic Medications/Substances

Selective serotonin reuptake inhibitors (SSRI) (e.g., Sertraline (Zoloft), Citalopram (Celexa), Fluoxetine (Prozac) etc.)

Serotonin norepinephrine receptor inhibitors (SNRIs) SNRIs (e.g., Venlafexine (Effexor), Duloxetine (Cymbalta), etc.)

Serotonin modulators e.g. Trazadone, etc.

Tricyclics (e.g., Amitriptyline (Elavil), Imipramine (Tofranil) etc.)

Tetracyclines (e.g., Chlortetracycline, Doxycycline, Methacycline, Sumycin, etc.)

- This is ***not*** an all-inclusive list.
 - See **High Risk Group One – Risk Factors (OB 9.1)** Health Condition Related Risk Factors (maternal diseases or conditions) or other appropriate guideline for indicated imaging based on disease process being treated.
 - See **Medications/Exposures Associated with Poor Pregnancy Outcome (OB 10.2)**
- If documented excessive use (at least weekly) of Marijuana/Cannabinoids/THC in 2nd and/ or 3rd trimesters - See **High Risk Group One – Risk Factors (OB 9.1)**
- Other atypical antidepressants like Bupropion, Mirtazapine, Nefazodone and Duloxetine have **not** been linked to an increased risk of fetal anomalies or poor pregnancy outcomes.

Medications/ Exposures Associated with Poor Pregnancy Outcome (OB-10.2)

OB.MS.0010.2.A

v1.0.2024

- If maternal exposure to any of the Medications or Exposures noted below:
 - Complete first trimester anatomy ultrasound CPT® 76801 [plus CPT® 76802 for each additional fetus] if <14 weeks and a complete ultrasound has not yet been performed, **and/or** CPT® 76817 for a transvaginal ultrasound
 - CPT® 76801 is preferred for dating, but if this is unable to be completed then CPT® 76815 **and/or** CPT® 76817 for a transvaginal ultrasound is indicated
 - A detailed first trimester fetal anatomic evaluation can be performed between 12 weeks 0 days and 13 weeks 6 days. (See **Detailed First Trimester Fetal Anatomic Scan (OB-9.12)** for indications)
 - Report: CPT® 76801 **plus** CPT® 76813 (and CPT® 76802 **plus** CPT® 76814 for each additional fetus) for a detailed first trimester fetal anatomy ultrasound
 - A detailed first trimester fetal anatomic evaluation can be performed if indicated, even if cfDNA has been planned or performed
 - Further imaging as per **High Risk Group One – Risk Factors (OB 9.1)**

Medications/Substances associated with poor pregnancy outcome

Anti-convulsants (e.g., Dilantin, Lamictal, Phenobarbital, Tegretol, Valproate etc.)

Anti-hypertensive Agents (e.g. ACE inhibitors, Angiotensin II Antagonists, Beta Blockers, etc.)

Anti-neoplastic agents (e.g. Daunorubicin etc.)

Anti-psychotics (e.g. Abilify, Haldol, Latuda, Seroquel, Stelazine Thorazine Zyprexa, etc.)

Carbon monoxide

Corticosteroids (e.g. Prednisone, Cortisone, etc.)

Coumadin/ warfarin

Heparin/ Low Molecular Weight Heparin (ongoing use during pregnancy)

Immune Modulating Drugs (e.g. Azathioprine, Cyclophosphamide, Cyclosporin A, Hydroxychloroquine, Leflunomide, Mycophenolate mofetil, etc.)

Lithium

Methimazole

Methotrexate

Medications/Substances associated with poor pregnancy outcome
Mifepristone (RU486)
Misoprostol
Monoamine oxidase inhibitors e.g. Phenelzine (Nardil)
Penicillamine
Pregabalin/Lyrica
Quinine
Retinoic acid/retinoid medications
Stimulants (e.g. Ritalin, adderal, etc. and other stimulants used to treat ADHD)
Thalidomide

- This is **not** an all-inclusive list. See **High Risk Group One – Risk Factors (OB 9.1)** Health Condition Related (maternal diseases or conditions) or other appropriate guideline for indicated imaging based on disease process being treated.

Background and Supporting Information

- Studies that note lower birth weights among offspring exposed to marijuana have noted that these findings were more pronounced among females who used more marijuana, particularly during the first and second trimesters (at least weekly during the pregnancy). CPT® 76811 can be performed, however, given the limited evidence for antenatally detected abnormal growth, serial growth ultrasounds is not indicated in the absence of other findings concerning for growth restriction.
- In circumstances where the individual is deemed to have an increased risk for a fetal abnormality and does not have access to a provider who can perform a fetal anatomic ultrasound examination (CPT® 76811) due to geographic or other constraints, a standard (after first trimester) fetal anatomic ultrasound examination (CPT® 76805) can be authorized instead.
- CPT® 76815 should never be reported with complete studies CPT® 76801/CPT® 76802, CPT® 76805/CPT® 76810 or CPT® 76811/CPT® 76812 or with CPT® 76816 or BPP (CPT® 76818 and CPT® 76819)
- Though fetal anatomy survey (CPT® 76805/CPT® 76811) can be performed as early as 14 weeks gestation, per ACOG, in the absence of other specific indications, it is optimally performed at 18 to 22 weeks of gestation

Multiple Gestations (OB-11)

Suspected Multiple Gestations (OB-11.1)

OB.MG.0011.1.A

v1.0.2024

For Suspected multiple pregnancies:

- Complete first trimester ultrasound CPT® 76801 [plus CPT® 76802 for each additional fetus] if <14 weeks and a complete ultrasound has not yet been performed, **and/or** CPT® 76817 for a transvaginal ultrasound
 - CPT® 76801 is preferred for dating, but if this is unable to be completed then CPT® 76815 and/or CPT® 76817 for a transvaginal ultrasound is indicated
- CPT® 76805 and CPT® 76810 for each additional fetus if ≥14 weeks if a dating ultrasound or a complete anatomy ultrasound has not yet been performed during this pregnancy

Known Dichorionic Multiple Gestations (OB-11.2)

OB.MG.0011.2.A

v1.0.2024

For Known dichorionic multiple pregnancies:

- Complete first trimester anatomy ultrasound CPT® 76801 [plus CPT® 76802 for each additional fetus] if <14 weeks and a complete ultrasound has not yet been performed, **and/or** CPT® 76817 for a transvaginal ultrasound
 - CPT® 76801 is preferred for dating, but if this is unable to be completed then CPT® 76815 and/or CPT® 76817 for a transvaginal ultrasound is indicated
- A detailed first trimester fetal anatomic evaluation^{3,4} can be performed between 12 weeks 0 days and 13 weeks 6 days. (See **Detailed First Trimester Fetal Anatomic Scan (OB-9.12)** for indications)
 - Report: CPT® 76801 **plus** CPT® 76813 (and CPT® 76802 **plus** CPT® 76814 for each additional fetus) for a detailed first trimester fetal anatomy ultrasound
 - A detailed first trimester fetal anatomic evaluation can be performed if indicated, even if cfDNA has been planned or performed
- Fetal NT (CPT® 76813) can be performed in twins and higher order multiples even if cfDNA has already been planned or performed.¹ See **First Trimester Screening (OB-6.1)**
- CPT® 76811 and CPT® 76812 for each additional fetus at ≥16 weeks if a complete detailed anatomic scan (CPT® 76811) has not yet been performed
 - Though fetal anatomy survey (CPT® 76805/CPT® 76811) can be performed as early as 14 weeks gestation, per ACOG, in the absence of other specific indications, it is optimally performed at 18 to 22 weeks of gestation
- Transvaginal ultrasound (CPT® 76817) can be performed if the transabdominal cervical length (CL) is ≤3.6 cm. If documented transabdominal attempt fails to visualize cervix, then CPT® 76817 may be performed on a case by case basis. See **Cervical Length Screening (OB-7.3)**. If cervical shortening is identified – See **Cervical Insufficiency (OB-18.1)**
- Growth ultrasound (CPT® 76816) can be done every 4 to 6 weeks at ≥14 weeks.
- If otherwise uncomplicated dichorionic twins, perform BPP (CPT® 76818 or CPT® 76819) **or** modified BPP (CPT® 76815) weekly starting at 36 weeks
- If additional risk factors (e.g. diabetes, or hypertensive disease), BPP (CPT® 76818 or CPT® 76819) **or** modified BPP (CPT® 76815) can be performed weekly starting at 32 weeks or sooner (See **High Risk Pregnancy (OB-9)**)

For Known dichorionic multiple pregnancies:

- Fetal loss of one twin during the first trimester does not appear to increase the risk of FGR or preterm delivery in the surviving twin, however, loss of one or more fetus(es) after the first trimester is associated with increased risk for FGR and PTB
 - Dichorionic twin gestations with loss of one fetus after the first trimester (≥ 14 weeks) should be imaged according to **High Risk Group (OB-9.1)**
- If FGR or growth discordance $\geq 20\%$ is diagnosed, can perform:
 - CPT® 76816 (growth ultrasound) every 2 to 4 weeks
 - Modified BPP (CPT® 76815) up to twice weekly starting at ≥ 22 weeks, or BPP (CPT® 76818 or CPT® 76819) up to twice weekly starting at ≥ 26 weeks
 - UA Doppler (CPT® 76820) weekly (starting at ≥ 22 weeks)
- If Severe FGR (EFW $\leq 3\%$, AC $\leq 3\%$), **OR** Abnormal UA Doppler studies (defined as a PI, RI, or S/D ratio greater than the 95th percentile for gestational age **OR** absent or reversed end-diastolic velocity (AEDV or REDV), **OR** confirmed oligohydramnios:
 - BPP (CPT® 76818 or CPT® 76819 or CPT® 76815) and/or umbilical artery (UA) Doppler (CPT® 76820) may be needed more frequently (2-3 times per week, or even daily).
- If IVF dichorionic twins, report an initial fetal echo as CPT® 76825 and/or CPT® 76827 with or without CPT® 93325. Trans-abdominal fetal echo is usually not performed prior to 16 weeks. See **Indications for Maternal Conditions (OB-12.3)**
- If other high risk factors, See **High Risk Pregnancy (OB-9)**

Known Monochorionic-Diamniotic or Monochorionic-Monoamniotic Multiple Gestations (OB-11.3)

OB.MG.0011.3.A

v1.0.2024

For Known monochorionic-diamniotic or monochorionic-monoamniotic multiple pregnancies

- Complete first trimester anatomy ultrasound CPT® 76801 [plus CPT® 76802 for each additional fetus] if <14 weeks and a complete ultrasound has not yet been performed, **and/or** CPT® 76817 for a transvaginal ultrasound
 - CPT® 76801 is preferred for dating, but if this is unable to be completed then CPT® 76815 and/or CPT® 76817 for a transvaginal ultrasound is indicated
- A detailed first trimester fetal anatomic evaluation^{3,4} can be performed between 12 weeks 0 days and 13 weeks 6 days. (See **Detailed First Trimester Fetal Anatomic Scan (OB-9.12)** for indications).
 - Report: CPT® 76801 **plus** CPT® 76813 (and CPT® 76802 **plus** CPT® 76814 for each additional fetus) for a detailed first trimester fetal anatomy ultrasound
 - A detailed first trimester fetal anatomic evaluation can be performed if indicated, even if cfDNA has been planned or performed
- Fetal NT (CPT® 76813) can be performed in twins and higher order multiples even if cfDNA has already been planned or performed.¹
- CPT® 76811 and CPT® 76812 for each additional fetus at ≥16 weeks if a complete detailed anatomic scan (CPT® 76811) has not yet been performed
 - Though fetal anatomy survey (CPT® 76805/CPT® 76811) can be performed as early as 14 weeks gestation, per ACOG, in the absence of other specific indications, it is optimally performed at 18 to 22 weeks of gestation
- Universal cervical length (CL) screening with transvaginal ultrasound (CPT® 76817) is NOT recommended in monochorionic twin gestations.
 - Transvaginal ultrasound (CPT® 76817) can be performed if the transabdominal cervical length (CL) is ≤3.6 cm. If documented transabdominal attempt fails to visualize cervix, then CPT® 76817 may be performed on a case by case basis. See **Cervical Length Screening (OB-7.3)**. If cervical shortening is identified – See **Cervical Insufficiency (OB-18.1)**

For Known monochorionic-diamniotic or monochorionic-monoamniotic multiple pregnancies

- CPT® 76816 (growth ultrasound) every 2 to 4 weeks starting at 14 weeks
- Initial Fetal Echo (CPT® 76825 and/or CPT® 76827) with or without color Doppler (CPT® 93325) (usually not performed <16 weeks).
- MCA Doppler (CPT® 76821) is indicated every 2 weeks starting at 16 weeks until delivery to monitor for Twin-Twin Transfusions Syndrome (TTTS) and/or Twin Anemia Polycythemia Sequence (TAPS). This can be performed with a limited ultrasound (CPT® 76815) or growth ultrasound (CPT® 76816).
- Perform BPP (CPT® 76818 or CPT® 76819) or modified BPP (CPT® 76815) weekly starting at 32 weeks or sooner if additional risk factors (eg. diabetes, or hypertensive disease - See **High Risk Pregnancy (OB-9)**)
- If TTTS is suspected or diagnosed, or if FGR or growth discordance $\geq 20\%$ is diagnosed perform:
 - BPP (CPT® 76818 or CPT® 76819 (≥ 26 weeks) or CPT® 76815) and/or umbilical artery (UA) Doppler (CPT® 76820) and/or MCA Doppler (CPT® 76821) 2 to 3 times per week (May be needed more frequently on a case-by-case basis)
 - TTTS is diagnosed by the ultrasound findings of polyhydramnios in one twin (the recipient) and oligohydramnios in the other twin (the donor). If AFI is discordant between the twins (low but not < 2 cm in one and/or high but not > 8 cm in the other); weekly imaging (MCA and/or limited US) can be performed
 - If TTTS is diagnosed, follow-up fetal echo (CPT® 76826 and/or CPT® 76828) with or without color Doppler (CPT® 93325) can also be performed as requested. See **Fetal Echocardiography - Coding (OB-12.1)** and **Fetal Echocardiography - Indications for Fetal Conditions (OB-12.2)**
- Fetal loss of one twin during the first trimester does not appear to increase the risk of FGR or preterm delivery in the surviving twin, however, loss of one or more fetus(es) after the first trimester is associated with increased risk for FGR and PTB.
- Monochorionic gestations or higher order Multiple pregnancy with loss of one or more fetus(es) after the first trimester (≥ 14 weeks) should be imaged according to **Multiple Gestations (OB-11.3)**.
- If other high risk factors, See **High Risk Pregnancy (OB-9)**
- Triplets or higher order Multiple Pregnancy receive same imaging as monochorionic-diamniotic twins.

Background and Supporting Information

- The sensitivity of cfDNA screening may not be as accurate in twins and higher order multiples. First trimester screening in twins has a similar detection rate to singleton gestation.
- Birth weight discordance = (larger twin weight minus smaller twin weight) divided larger twin weight × 100.
- Universal CL screening with transvaginal ultrasound (CPT® 76817) is NOT recommended in twin gestations. In addition, Per ACOG - Cerclage placement (prophylactic or rescue) should be avoided in multifetal pregnancies. However, because several studies have shown that a one-time CL measurement ≤20 mm at 18-24 weeks may be an accurate predictor of preterm birth in multiple gestation, and because progesterone therapy might reduce the risk of neonatal morbidity and mortality associated with PTB, then a one-time transvaginal CL assessment can be performed if trans-abdominal CL measures ≤3.6 cm (as with singleton gestation- See **Cervical Length Screening (OB-7.3)**).
- TTTS is diagnosed by the ultrasound findings of polyhydramnios in one twin (the recipient) and oligohydramnios in the other twin (the donor). If AFI is discordant between the twins (low but not <2 cm in one and/or high but not >8 cm in the other); weekly imaging (MCA and/or limited US) can be performed to rule-out developing TTTS.
- There is no evidence that routine assessment with UA Doppler is beneficial in the absence of growth or fluid discordance.¹
- Fetal loss of one twin during the first trimester does not appear to increase the risk of FGR or preterm delivery in the surviving twin, however, loss of one or more fetus(es) after 17 weeks gestation is associated with increased risk for FGR and PTB and should be imaged according to **Multiple Gestations (OB-11)**. Monochorionic twin pregnancies with demise of one twin after 17 weeks have up to an 18% chance of major morbidity or mortality for the remaining fetus.
- Typically all components of the BPP (CPT® 76818 and CPT® 76819), such as breathing, are not present until ≥26 weeks gestation. However, a modified BPP (CPT® 76815) can be performed sooner in certain high risk cases but should not be done prior to 22 weeks.
- CPT® 76815 should never be reported with complete studies CPT® 76801/CPT® 76802, CPT® 76805/CPT® 76810 or CPT® 76811/CPT® 76812 or with CPT® 76816 or BPP (CPT® 76818 and CPT® 76819)
- Though fetal anatomy survey (CPT® 76805/CPT® 76811) can be performed as early as 14 weeks gestation, per ACOG, in the absence of other specific indications, it is optimally performed at 18 to 22 weeks of gestation
- In circumstances where CPT® 76811 cannot be performed See **Ultrasound Code Selection (OB-1.3)**

Fetal Echocardiography (ECHO) (OB-12)

Fetal Echocardiography – Coding (OB-12.1)

OB.FE.0012.1.A
v1.0.2024

- Supported fetal echocardiography (echo) codes include:
 - Initial Fetal Echo, CPT® 76825 and Doppler Echo CPT® 76827 are performed only once per fetus/per facility (i.e. Maternal Fetal Medicine versus Pediatric Cardiology request)
 - Follow-up-Fetal echo and/or Follow-up Doppler echo (CPT® 76826/CPT® 76828)
 - CPT® 93325 for Doppler color flow velocity mapping
- An initial fetal echo is usually not performed prior to 16 weeks.
- Doppler echo procedure codes (CPT® 76827 or CPT® 76828) include the evaluation of veins, arteries, and valves. Guidelines do not support the billing of additional codes (CPT® 76820 and/or CPT® 76821)

Background and Supporting Information

- The minimal use of color Doppler (CPT® 93325) alone, when performed for anatomical structure identification during a standard ultrasound procedure, is not separately reimbursable

Fetal Echocardiography - Indications for Fetal Conditions (OB-12.2)

OB.FE.0012.2.A

v1.0.2024

Initial Fetal echocardiography (CPT® 76825) and/or Doppler echocardiography (CPT® 76827) with or without Doppler color flow velocity mapping (CPT® 93325) can be performed if ≥16 weeks, for the indications listed below (See **Fetal Echocardiography – Coding (OB-12.1)**):

Fetal Echocardiography - Indications for Fetal Conditions

- Known or suspected abnormal fetal cardiac evaluation on fetal anatomic scan.
 - Known or suspected abnormality must be documented as hard copy or acknowledged verbally by provider of known or suspected fetal cardiac evaluation
 - Suboptimal cardiac evaluation alone is not an indication for fetal echogram. If the 4-chamber view is adequate and there is no other suspicion of a cardiac abnormality, a fetal echocardiogram is not considered medically necessary. A follow up ultrasound (CPT® 76815 or CPT® 76816) is indicated for suboptimal visualization. If the follow-up ultrasound fails to show a 4-chamber view or there is suspicion of a cardiac abnormality, fetal echocardiogram is indicated.
- Fetal cardiac arrhythmia; persistent fetal tachycardia or bradycardia
- Major fetal extra-cardiac anomaly
- Fetal Echo is NOT indicated for an isolated soft marker found on routine imaging including:
 - Choroid plexus cyst, or
 - Echogenic intra-cardiac foci, or
 - Thickened nuchal fold (≥6mm at 15 to 20 weeks), or
 - Absent or hypoplastic nasal bone, or
 - Echogenic bowel, or
 - Shortened long bones, or
 - Pyelectasis
- Congenital heart disease (CHD) in a 1st degree relative of the fetus (i.e. CHD in the mother, father, or sibling of the fetus) or a half-sibling of the fetus
- Known fetal chromosomal abnormalities (fetal aneuploidy) or ultrasound findings of a suspected chromosomal abnormality (excluding soft markers as only ultrasound findings)
 - Early onset FGR (<32 weeks) may be a sign of fetal aneuploidy^{11,12}

Fetal Echocardiography - Indications for Fetal Conditions

- Single umbilical artery
- Chorioangioma or Umbilical cord varix (if suspicion of fetal hydrops)
- Fetal intra-abdominal venous anomaly (persistent right umbilical vein)
- Fetal effusion (pericardial, pleural effusion, ascites, etc.)
- Fetal hydrops, See **Alloimmunization/Rh Isoimmunization/Other Causes of Fetal Anemia/Parvo/Hydrops (OB-16)**
- Monochorionic twins/TTTS
- Abnormal Fetal Nuchal Translucency scan (NT ≥ 3.0 mm or above the 95th percentile for the CRL) during current pregnancy.
- Abnormal ductus venosus waveform⁵
- Fetal echocardiography may be indicated with severe or unexplained polyhydramnios, or if there are also other suspicious findings on an anatomy scan

Fetal Echocardiography - Indications for Maternal Conditions (OB-12.3)

OB.FE.0012.3.A

v1.0.2024

Initial Fetal echocardiography (CPT® 76825) and/or Doppler echocardiography (CPT® 76827) with or without Doppler color flow velocity mapping (CPT® 93325) can be performed if ≥16 weeks, for the indications listed below (See **Fetal Echocardiography – Coding (OB-12.1)**):

Maternal Conditions:

- Maternal pre-gestational DM or early diagnosed GDM (1st or early 2nd trimester)
- Maternal gestational diabetes mellitus, if HbA1C >6% [in the third trimester (≥32 weeks)]
- Maternal connective tissue disease (SLE, RA, Sjogrens) with Anti-Ro/SSA or anti-La/SSB antibodies present
 - Weekly follow-up Fetal echocardiography (CPT® 76826) and/or Doppler fetal echocardiography (CPT® 76828) or CPT® 76815 from the 18th through the 26th week of pregnancy and then every other week until 30 weeks
- Phenylketonuria
- Infections associated with cardiac anomalies (such as parvovirus, Rubella, Coxsackie virus)
- Genetic conditions associated with CHD in a first degree relative of the fetus (e.g. Marfan syndrome, 22q11.2 deletion syndrome (DiGeorge Syndrome) or Noonan syndrome)
- Prior child with CHD born to mother and/or father of the fetus⁵
- Pregnancy conceived by assisted reproductive technology:¹
 - In Vitro Fertilization (IVF)
 - Intracytoplasmic sperm injection (ICSI)¹

Background and Supporting Information

- If diabetes is diagnosed prior to pregnancy or in the first or early second trimester (typically before 20 weeks gestation) with standard diagnostic criteria of: HbA1C ≥6.5%, fasting plasma glucose ≥126 mg/dL, or 2-hour glucose ≥200 mg/dL on a 75-g oral glucose tolerance test, then image as above
- For those with GDM on medication, if HbA1c levels are >6%, fetal echocardiogram in the third trimester to assess for ventricular hypertrophy can be performed.
- With positive SSA/SSB antibodies, the most vulnerable period for the fetus is during the period from 18 to 24 weeks gestation. Normal sinus rhythm can progress to complete block in seven days during this high-risk period. New onset of heart block

is less likely during the 26th through the 30th week, and it rarely develops after 30 weeks of pregnancy.

Fetal Echocardiography - Indications for Medication or Drug Exposure (OB-12.4)

OB.FE.0012.4.A

v1.0.2024

Initial Fetal echocardiography (CPT® 76825) and/or Doppler echocardiography (CPT® 76827) with or without Doppler color flow velocity mapping (CPT® 93325) can be performed if ≥16 weeks, for the indications listed below (See **Fetal Echocardiography – Coding (OB-12.1)**):

- Ace inhibitors
- Alcohol (excessive quantities)
- Anti-seizure medication, e.g. carbamazepine, hydantoin, valproate
- Folate antagonists (methotrexate)
- Lithium
- NSAIDS (Ibuprofen, Indomethacin) 2nd and 3rd trimester
- Paroxetine (Paxil)
- Retinoids (e.g Isotretinoin, Retinoic acid, Vitamin A -over 10,000 IU per day, etc.)
- Thalidomide
- Venlafaxine (Effexor)
- This may not be an all-inclusive list, however, exposure to other potential teratogens associated with cardiac anomalies in the fetus are typically adequately assessed with a detailed fetal anatomy ultrasound. (CPT® 76811) (See **Potentially Teratogenic Medications/Substances (OB 10.1)**)

Fetal MRI (OB-13)

Indications for Fetal MRI (OB-13.1)

OB.MR.0013.1.A

v1.0.2024

ACOG recommendations for imaging during pregnancy and lactation:

- Ultrasonography and magnetic resonance imaging (MRI) are not associated with risk and are the imaging techniques of choice for the pregnant patient, but they should be used prudently and only when use is expected to answer a relevant clinical question or otherwise provide medical benefit to the patient.
- The use of gadolinium contrast with MRI should be limited; it should be used as a contrast agent in a pregnant female only if it significantly improves diagnostic performance and is expected to improve fetal or maternal outcome.

CPT® Code Guidance

- Fetal MRI (CPT® 74712); for each additional fetus (CPT® 74713)
- Do not report CPT® 74712 and CPT® 74713 in conjunction with CPT® 72195, CPT® 72196, CPT® 72197
- If only placenta or maternal pelvis is imaged without fetal imaging, use MRI Pelvis (CPT® 72195)

- Fetal MRI (CPT® 74712) [plus CPT® 74713 for each additional fetus] optimally performed after 18 to 22 weeks gestation, for assessment of known or suspected fetal abnormalities for counseling, surgical, or delivery planning.
 - There are cases when surgical planning may necessitate imaging earlier than 18 weeks. For those cases where surgery is to be performed prior to 18 weeks and they otherwise meet indications for imaging per this criteria, Fetal MRI may be approved.
- 3D-4D (CPT® 76376 or CPT® 76377) rendering can be added for surgical planning with diagnosis of complex CHD in the fetus or for surgical planning of other complex fetal malformations⁶.
- Repeat fetal MRI (CPT® 74712) [plus CPT® 74713 for each additional fetus] later in pregnancy for:
 - Delivery or perinatal surgical planning
- Fetal MRI indications include but may not be limited to the following:
 - Brain
 - Congenital anomalies
 - Ventriculomegaly
 - Agenesis of the corpus callosum
 - Abnormalities of the cavum septum pellucidum
 - Holoprosencephaly
 - Posterior fossa anomalies

- Malformations of cerebral cortical development
 - Microcephaly
 - Solid or cystic masses
 - Cephalocele
- Screening fetuses with a family risk for brain anomalies
 - Tuberous sclerosis
 - Corpus callosal dysgenesis
 - Malformations of cerebral cortical development
- Vascular abnormalities
 - Vascular malformations
 - Hydranencephaly
 - Intra-uterine cerebrovascular accident (CVA)
- Spine
 - Congenital anomalies
 - Neural tube defects
 - Sacrococcygeal teratomas
 - Caudal regression/sacral agenesis
 - Syringomyelia
 - Vertebral anomalies
- Skull, face, and neck
 - Masses of the face and neck
 - Vascular or lymphatic malformations
 - Hemangiomas
 - Goiter
 - Teratomas
 - Facial clefts
 - Airway obstruction
 - Conditions that may impact parental counseling, prenatal management, delivery planning, and postnatal therapy
- Thorax
 - Masses
 - Congenital pulmonary airway malformations (congenital cystic adenomatoid malformation; sequestration, and congenital lobar emphysema);
 - Congenital diaphragmatic hernia
 - Effusion
 - Mediastinal masses
 - Assessment for esophageal atresia
 - Volumetric assessment of lung

- Cases at risk for pulmonary hypoplasia secondary to oligohydramnios, chest mass, or skeletal dysplasias
- Abdomen, retroperitoneal and pelvis
 - Bowel anomalies such as anorectal malformations, or complex bowel obstructions such as with megacystis microcolon hypoperistalsis syndrome
 - Abdominal wall defect
 - Mass
 - Abdominal–pelvic cyst
 - Tumors (e.g. hemangiomas, neuroblastomas, sacrococcygeal teratomas, and suprarenal or renal masses)
 - Complex genitourinary anomalies (e.g. cloaca, prune belly syndrome)
- Congenital Heart Disease (CHD)
- Skeletal dysplasia
- Multiple malformations
- Complications of monochorionic twins/TTTS (eg. Laser treatment of twins, demise of one twin, conjoined twins)
- Any suspected fetal anomaly associated with severe oligohydramnios or anhydramnios

Abnormal Fetal Position/ Presentation and Pelvimetry (OB-14)

Abnormal Fetal Position or Presentation (OB-14.1)

OB.FP.0014.1.A

v1.0.2024

- To confirm suspected abnormal fetal position or presentation (transverse or breech presentation) at ≥ 36 weeks gestation, report one of the following:
 - CPT® 76805 (plus CPT® 76810 for each additional fetus) when complete anatomy scan has not yet been performed in the pregnancy **or**
 - CPT® 76815 for limited ultrasound to check fetal position **or**
 - CPT® 76816 if version is being considered and/or for delivery planning

Background and Supporting Information

- Fetal presentation should be assessed by abdominal palpation (Leopold's) at 36 weeks or later, when presentation is likely to influence the plans for the birth. Routine assessment of presentation by abdominal palpation before 36 weeks is not always accurate. Suspected fetal malpresentation should be confirmed by an ultrasound assessment. An ultrasound can be performed at ≥ 36 weeks gestation to determine fetal position to allow for external cephalic version. Ultrasound to determine fetal position is not necessary prior to 36 weeks gestation unless delivery is imminent.
- CPT® 76815 should never be reported with complete studies CPT® 76801/CPT® 76802, CPT® 76805/CPT® 76810 or CPT® 76811/CPT® 76812 or with CPT® 76816 or BPP (CPT® 76818 and CPT® 76819).

Pelvimetry (OB-14.2)

OB.FP.0014.2.A

v1.0.2024

- Pelvimetry (CT or MRI Pelvimetry CPT® 72192 or CPT® 72195) lacks sufficient evidence to be clinically useful. Current recommendations are that further randomized control studies be performed before it is adapted into routine clinical practice.^{3,4}

Adnexal Mass/Uterine Fibroids and Uterine Anomalies (OB-15)

Adnexal Mass (OB-15.1)

OB.AM.0015.1.A

v1.0.2024

Adnexal Mass

- For a known or suspected adnexal/pelvic mass, perform:
 - Complete first trimester ultrasound CPT® 76801 [plus CPT® 76802 for each additional fetus] if <14 weeks and a complete ultrasound has not yet been performed, **and/or** CPT® 76817 for a transvaginal ultrasound
 - CPT® 76801 is preferred for dating, but if this is unable to be completed then CPT® 76815 and/or CPT® 76817 for a transvaginal ultrasound is indicated
 - CPT® 76805 [plus CPT® 76810 if more than one fetus] if a complete fetal anatomic scan has not yet been performed and ≥14 weeks, **or**
 - CPT® 76816 if a complete anatomy scan was done previously and/or CPT® 76817 if poor visualization of the adnexal mass.
- Following the initial ultrasound, follow up can be done once in each trimester
 - CPT® 76805 [plus CPT® 76810 for each additional fetus] if a complete fetal anatomic scan has not yet been performed, **or**
 - CPT® 76815 or CPT® 76816 if a complete ultrasound was previously performed.
 - CPT® 76817 if poor visualization of the adnexal mass
- MRI Pelvis (CPT® 72195) without contrast can be done for indeterminate findings on ultrasound; for surgical planning and/or for suspected malignancy.
- See **Adnexal Mass/Ovarian Cysts (PV-5)** in the Pelvis Imaging Guidelines

Background and Supporting Information

- The majority of adnexal masses in pregnancy are benign, the most common diagnoses are mature teratomas and corpus luteum or paraovarian cysts. Malignancy is reported in only 1.2-6.8% of pregnant patients with persistent mass.
- Levels of CA-125 are elevated in pregnancy, a low-level elevation in pregnancy is not typically associated with malignancy.
- ACOG recommendations for imaging during pregnancy and lactation:
 - Ultrasonography and magnetic resonance imaging (MRI) are not associated with risk and are the imaging techniques of choice for the pregnant patient, but they should be used prudently and only when use is expected to answer a relevant clinical question or otherwise provide medical benefit to the patient.
 - The use of gadolinium contrast with MRI should be limited; it should be used as a contrast agent in a pregnant female only if it significantly improves diagnostic performance and is expected to improve fetal or maternal outcome.

Uterine Fibroids in Pregnancy (OB-15.2)

OB.AM.0015.2.A

v1.0.2024

- If more than one fibroid, total size of all fibroids should be used, i.e. one fibroid at 2 cm and one 3 cm is total of 5 cm and imaging would be indicated as below:
 - Moderate (>5 cm) and large (>10 cm) fibroid(s):
 - Complete first trimester ultrasound CPT® 76801 [plus CPT® 76802 for each additional fetus] if <14 weeks and a complete ultrasound has not yet been performed, **and/or** CPT® 76817 for a transvaginal ultrasound
 - CPT® 76801 is preferred for dating, but if this is unable to be completed then CPT® 76815 and/or CPT® 76817 for a transvaginal ultrasound is indicated
 - Fetal anatomic scan (CPT® 76805 or CPT® 76811 if other high risk indication. See **High Risk Pregnancy (OB-9)**) if ≥16 weeks.
 - Though fetal anatomy survey (CPT® 76805/CPT® 76811) can be performed as early as 14 weeks gestation, per ACOG, in the absence of other specific indications, it is optimally performed at 18 to 22 weeks of gestation.
 - If the fibroid is in the lower uterine segment or the cervix (cervical fibroid), can perform ultrasound (CPT® 76815) and/or transvaginal ultrasound (CPT® 76817) every 2 weeks between 16 to 24 weeks, and
 - Follow up ultrasound (CPT® 76816) every 3 to 6 weeks, starting at 22 weeks.
 - Submucosal fibroid(s) of any size:
 - Complete first trimester ultrasound CPT® 76801 [plus CPT® 76802 for each additional fetus] if <14 weeks and a complete ultrasound has not yet been performed, **and/or** CPT® 76817 for a transvaginal ultrasound
 - CPT® 76801 is preferred for dating, but if this is unable to be completed then CPT® 76815 and/or CPT® 76817 for a transvaginal ultrasound is indicated
 - Fetal anatomic scan [CPT® 76805 or CPT® 76811 if other high risk indication. See **High Risk Pregnancy (OB-9)** if ≥16 weeks
 - If placentation is over a submucosal fibroid:
 - Follow up ultrasound (CPT® 76816) every 3 to 6 weeks, starting at 22 weeks

Background and Supporting Information

- Though pregnancy seems to have little or no effect on the overall size of fibroids, Fibroids affect pregnancy and delivery in several ways, with abdominal pain, miscarriage, fetal malpresentation, and difficult delivery being the most frequent complications. These complications relate to preterm labor, placental abruption, fetal growth restriction, and fetal compression syndromes. The risk of preterm labor appears to correlate with the size of the fibroid (over 600 cm³) and/or the presence

of multiple fibroids. Placental abruption has been reported to occur frequently in pregnancies complicated by fibroids, especially with placentation over a fibroid. Fibroid volumes $>200 \text{ cm}^3$ are more commonly associated with fetal growth restriction. Fetal compression syndrome is a direct result of large fibroids and is not commonly found with small fibroids. Finally, malposition or obstructed labor may be associated with fibroids of the lower uterine segment.

Uterine Anomalies in Pregnancy (OB-15.3)

OB.AM.0015.3.A

v1.0.2024

- For uterine septum, uterine didelphys, unicornuate uterus, bicornuate uterus:
 - Complete first trimester ultrasound CPT® 76801 [plus CPT® 76802 for each additional fetus] if <14 weeks and a complete ultrasound has not yet been performed, **and/or** CPT® 76817 for a transvaginal ultrasound
 - CPT® 76801 is preferred for dating, but if this is unable to be completed then CPT® 76815 and/or CPT® 76817 for a transvaginal ultrasound is indicated
 - CPT® 76805 or CPT® 76811 and/or CPT® 76817 at ≥16 weeks
 - Though fetal anatomy survey (CPT® 76805/CPT® 76811) can be performed as early as 14 weeks gestation, per ACOG, in the absence of other specific indications, it is optimally performed at 18 to 22 weeks of gestation.
 - CPT® 76817 and/or CPT® 76815 every 2 weeks at 16 to 24 weeks (See **Cervical Insufficiency (OB-18.1)**)
 - CPT® 76816 every 3 to 6 weeks starting at ≥22 weeks
 - Starting at 32 weeks, weekly BPP (CPT® 76818 or CPT® 76819) or modified BPP (CPT® 76815)

Background and Supporting Information

- CPT® 76815 should never be reported with complete studies CPT® 76801/CPT® 76802, CPT® 76805/CPT® 76810 or CPT® 76811/CPT® 76812 or with CPT® 76816 or BPP (CPT® 76818 and CPT® 76819).
- Though fetal anatomy survey (CPT® 76805/CPT® 76811) can be performed as early as 14 weeks gestation, per ACOG, in the absence of other specific indications, it is optimally performed at 18 to 22 weeks of gestation.
- In circumstances where the individual is deemed to have an increased risk for a fetal abnormality and does not have access to a provider who can perform a detailed fetal anatomic ultrasound examination (CPT® 76811) due to geographic or other constraints, a standard (after first trimester) fetal ultrasound examination (CPT® 76805) can be authorized instead.
- CPT® 76811 and CPT® 76812 should only be used once per pregnancy unless the mother changes to a new medical caregiver at a new office and there is a new medical indication and/or change in condition.

Alloimmunization/Rh Isoimmunization/Other Causes of Fetal Anemia/ Parvo/Hydrops (OB-16)

Alloimmunization/Rh Isoimmunization (OB-16.1)

OB.AR.0016.1.A

v1.0.2024

Imaging for Alloimmunization/Rh Isoimmunization for any of the following indications:

- When any one of the following maternal antibody titers are $\geq 1:8$ (critical titer):
 - Rhesus antibodies (Cc/Dd/Ee)
 - Anti-Duffy (anti-fya) antibody
 - Anti-Kidd antibody
- If maternal antibody titers are $\geq 1:8$ for other atypical antigens that may be associated with hemolytic disease of the fetus and newborn, e.g. p antigen, MNS series, MSSsMT, Diego, Public antigens, Private antigens.
- Anti-Kell antibody (any antibody titer warrants additional evaluation)
- If evidence of fetal hydrops on previous imaging
- Prior pregnancy associated with HDFN (hemolytic disease of the fetus and newborn)

The following imaging is indicated:

- Complete first trimester ultrasound CPT® 76801 [plus CPT® 76802 for each additional fetus] if <14 weeks and a complete ultrasound has not yet been performed, **and/or** CPT® 76817 for a transvaginal ultrasound
 - CPT® 76801 is preferred for dating, but if this is unable to be completed then CPT® 76815 and/or CPT® 76817 for a transvaginal ultrasound is indicated
- Detailed Fetal Anatomic Scan (CPT® 76811) ≥ 16 weeks
 - Though fetal anatomy survey (CPT® 76805/CPT® 76811) can be performed as early as 14 weeks gestation, per ACOG, in the absence of other specific indications, it is optimally performed at 18 to 22 weeks of gestation.
- CPT® 76816 every 2 to 4 weeks to assess fetal growth starting after fetal anatomic scan (CPT® 76811)
- Fetal middle cerebral artery (MCA) Doppler (CPT® 76821) and CPT® 76815 every 1 to 2 weeks starting at 16 weeks
- BPP (CPT® 76818 or CPT® 76819) or modified BPP (CPT® 76815) weekly, starting at 32 weeks or sooner if suspected worsening fetal condition (≥ 26 weeks), e.g. abnormally trending MCA dopplers, suspected hydrops, or polyhydramnios.
- More frequent imaging (MCA Doppler and/or BPP) can be performed if suspected worsening fetal condition (up to 2x weekly), e.g. abnormally trending MCA dopplers, suspected hydrops, or polyhydramnios.

Background and Supporting Information

- Fetal anemia and hydrops may be a result of immune conditions, such as red-cell or Kell alloimmunization, non-immune hydrops caused by parvovirus B19 infection or any other known acquired or congenital causes of fetal anemia.
- Rhesus isoimmunization/alloimmunization is the process through which fetal Rh+ red blood cells enter the circulation of an Rh negative mother causing her to produce antibodies which can cross the placenta and destroy the red blood cells of the current Rh+ fetus and/or in subsequent Rh+ pregnancies.
- Atypical antigens not listed above, may be associated with hemolytic disease of the fetus and newborn and may require fetal assessment as in Alloimmunization/Rh Isoimmunization (OB-16.1) if maternal antibody titers are $\geq 1:8$. Atypical antigens include: MNSs series (M, N, S, s, U, Mi), MSSs-Mta, Diego (Di^a, Di^b), P- PPTj, Public antigen (Yt, En, Co2). Private antigens (Biles, Good, Heibel, Radin, Wright^a, and Z^d). PP1Pk, Far, Good, Lan, LW.
- Peak systolic velocity (PSV) of the fetal middle cerebral artery can be used as a substitute for amniocentesis to evaluate a fetus at risk for anemia due to Rhesus isoimmunization/alloimmunization. Measurements can be initiated as early as 16 weeks of gestation if there is a past history of early severe fetal anemia or very high titers. Because MCA-PSV increases across gestation, results are adjusted for gestational age.
- In circumstances where the individual is deemed to have an increased risk for a fetal abnormality and does not have access to a provider who can perform a detailed fetal anatomic ultrasound examination (CPT[®] 76811) due to geographic or other constraints, a standard (after first trimester) fetal ultrasound examination (CPT[®] 76805) can be authorized instead.
- CPT[®] 76811 and CPT[®] 76812 should only be used once per pregnancy unless the mother changes to a new medical caregiver at a new office **and** there is a new medical indication and/or change in condition.

Exposure to Parvovirus B-19 (OB-16.2)

OB.AR.0016.2.A

v1.0.2024

- Parvovirus B-19 Exposure (Fifth Disease):
 - Complete first trimester ultrasound CPT® 76801 [plus CPT® 76802 for each additional fetus] if <14 weeks and a complete ultrasound has not yet been performed, **and/or** CPT® 76817 for a transvaginal ultrasound
 - CPT® 76801 is preferred for dating, but if this is unable to be completed then CPT® 76815 and/or CPT® 76817 for a transvaginal ultrasound is indicated
 - CPT® 76811 if not yet performed and ≥16 weeks
 - Though fetal anatomy survey (CPT® 76805/CPT® 76811) can be performed as early as 14 weeks gestation, per ACOG, in the absence of other specific indications, it is optimally performed at 18 to 22 weeks of gestation.
 - CPT® 76816 if >2 weeks since performance of the fetal anatomic scan (CPT® 76811)
- Confirmed Parvovirus B-19 Infection (+IgM):
 - Ultrasound (CPT® 76816) every 2 to 4 weeks to assess fetal growth starting after performance of the fetal anatomic scan (CPT® 76811) and
 - Starting at time of confirmed infection weekly limited ultrasound (CPT® 76815) if >22 weeks or weekly BPP (CPT® 76818 or CPT® 76819) if ≥26 weeks gestation and
 - Fetal middle cerebral artery (MCA) Doppler (CPT® 76821) every 1 to 2 weeks, starting at time of confirmed infection (if ≥16 weeks)
 - Continue above imaging for 8 to 12 weeks after initial date of exposure

Twin Anemia Polycythemia Sequence (OB-16.3)

OB.AR.0016.3.A

v1.0.2024

- See Known Monochorionic-Diamniotic or Monochorionic-Monoamniotic Multiple Gestations (OB-11.3)

Other Fetal Hydrops/Nonimmune Hydrops (OB-16.4)

OB.AR.0016.4.A

v1.0.2024

- Suspected or known hydrops from any cause should be imaged according to **Alloimmunization/Rh Isoimmunization (OB-16.1)**

Other Causes of Fetal Anemia (OB-16.5)

OB.AR.0016.5.A

v1.0.2024

- MCA Doppler (CPT® 76821) assessment can be performed if there is suspected fetal anemia (e.g. fetus with heart failure, hydrops, alloimmunization), in a fetus at high risk for fetal anemia due to other pregnancy complications, e.g. chorioangioma, umbilical vein varix, or finding of sustained fetal tachyarrhythmia or bradyarrhythmia - See **Indications for Fetal Conditions (OB-12.2)**, **Alloimmunization/Rh Isoimmunization (OB-16.1)**, and **Placental and Cord Abnormalities (OB-21)**

Background and Supporting Information

- In circumstances where the individual is deemed to have an increased risk for a fetal abnormality and does not have access to a provider who can perform a fetal anatomic ultrasound examination (CPT® 76811) due to geographic or other constraints, a standard (after first trimester) fetal anatomic ultrasound examination (CPT® 76805) can be authorized instead.
- CPT® 76811 and CPT® 76812 should only be used once per pregnancy unless the mother changes to a new medical caregiver at a new office and there is a new medical indication and/or change in condition.
- Typically all components of the BPP (CPT® 76818 and CPT® 76819), such as breathing, are not present until ≥ 26 weeks gestation. However, a modified BPP (CPT® 76815) can be utilized sooner in certain high risk cases but should not be done prior to 22 weeks. .

Amniotic Fluid Abnormalities/ Oligohydramnios/Polyhy dramnios (OB-17)

Amniotic Fluid Abnormalities (OB-17.1)

OB.AF.0017.1.A

v1.0.2024

For suspected polyhydramnios or oligohydramnios:

- For example, unequal size and dates or suspected preterm/prelabor rupture of membranes. See **Unequal Fundal Size and Dates (OB-27)** and/or **Preterm/Prelabor Rupture of Membranes (OB-23)**
 - CPT® 76815 for quick look for AFI check

For **confirmed** diagnosis of **polyhydramnios**: AFI ≥ 24 cm or maximum vertical pocket (MVP) ≥ 8 cm.

- CPT® 76811 (Detailed Fetal Anatomy) at diagnosis, if not previously performed
- CPT® 76816 starting at ≥ 22 weeks
 - Every 3 - 4 weeks for mild polyhydramnios (AFI 24 - 29.9 cm or MVP 8 - 9.9 cm)
 - Every 2 weeks for severe polyhydramnios (AFI ≥ 30 cm or MVP ≥ 10 cm)
- CPT® 76815 weekly for antepartum fetal surveillance starting at ≥ 22 weeks
- BPP (CPT® 76818 or CPT® 76819) or modified BPP (CPT® 76815) for AFI with NST starting at 26 weeks
 - Weekly for mild polyhydramnios
 - Twice weekly for severe polyhydramnios

For **confirmed** diagnosis of **oligohydramnios**: AFI ≤ 5 cm or maximum vertical pocket ≤ 2 cm

- CPT® 76811 if not already performed; or
- CPT® 76816 every 2 to 4 weeks starting at ≥ 22 weeks
- CPT® 76815 weekly for antepartum fetal surveillance from 22 - 26 weeks
- CPT® 76818 or CPT® 76819 or a modified BPP (CPT® 76815), weekly, starting at 26 weeks
- CPT® 76820 weekly starting at time of diagnosis if ≥ 22 weeks

Background and Supporting Information

- Polyhydramnios can be an early presenting finding of fetal hydrops associated with fetal anemia. Middle cerebral artery Doppler is commonly used to diagnose whether this fetal anemia is present or not. See **Alloimmunization/Rh Isoimmunization (OB-16.1)**
- Polyhydramnios may also present as a finding of cardiac dysfunction, fetal arrhythmias or cardiac malformation. Fetal echocardiography may be indicated if

there are abnormal findings on an anatomy scan. See **Fetal Echocardiography (ECHO) (OB-12)**

- In circumstances where the individual is deemed to have an increased risk for a fetal abnormality and does not have access to a provider who can perform a fetal anatomic ultrasound examination (CPT® 76811) due to geographic or other constraints, a standard (after first trimester) fetal anatomic ultrasound examination (CPT® 76805) can be authorized instead.
- CPT® 76811 and CPT® 76812 should only be used once per pregnancy unless the mother changes to a new medical caregiver at a new office and there is a new medical indication and/or change in condition.
- Typically all components of the BPP (CPT® 76818 and CPT® 76819), such as breathing, are not present until ≥ 26 weeks gestation. However, a modified BPP (CPT® 76815) can be utilized sooner in certain high risk cases but should not be done prior to viability (22 weeks).
- CPT® 76815 should never be reported with complete studies CPT® 76801/CPT® 76802, CPT® 76805/CPT® 76810 or CPT® 76811/CPT® 76812 or with CPT® 76816 or BPP (CPT® 76818 and CPT® 76819).
- Though fetal anatomy survey (CPT® 76805/CPT® 76811) can be performed as early as 14 weeks gestation, per ACOG, in the absence of other specific indications, it is optimally performed at 18 to 22 weeks of gestation.

Cervical Insufficiency/Current Preterm Labor (OB-18)

Cervical Insufficiency (OB-18.1)

OB.CI.0018.1.A

v1.0.2024

- For any of the following:
 - History of cervical insufficiency (defined as one or more 2nd trimester loss (14 to 24 weeks gestation) related to painless cervical dilation.)
 - History of cerclage in prior pregnancy
 - History of prior precipitous delivery
 - Surgical trauma to cervix, e.g.
 - Over dilation of cervix during a termination of pregnancy
 - Cervical obstetrical laceration from a previous delivery
 - History of extensive or multiple prior cold-knife conization or Loop Electrosurgical Excision Procedures (LEEP)
 - Complete first trimester ultrasound CPT® 76801 [plus CPT® 76802 for each additional fetus] if <14 weeks and a complete ultrasound has not yet been performed, **and/or** CPT® 76817 for a transvaginal ultrasound
 - CPT® 76801 is preferred for dating, but if this is unable to be completed then CPT® 76815 and/or CPT® 76817 for a transvaginal ultrasound is indicated
 - CPT® 76805 or CPT® 76811 if other high risk factors [plus CPT® 76810/CPT® 76812 for each additional fetus] **and/or** CPT® 76817 at ≥16 weeks if a complete fetal anatomic scan has not yet been performed during this pregnancy.
 - Though fetal anatomy survey (CPT® 76805/CPT® 76811) can be performed as early as 14 weeks gestation, per ACOG, in the absence of other specific indications, it is optimally performed at 18 to 22 weeks of gestation.
 - CPT® 76815 **and/or** CPT® 76817 every 1 to 4 weeks from 16 0/7 to 24 0/7 weeks
 - CPT® 76816 can be performed every 3 to 6 weeks starting after the fetal anatomic scan at 16 weeks
 - Note: Lower uterine segment or cervical fibroid may also require CL screening with (CPT® 76815) and/or transvaginal ultrasound (CPT® 76817) every 2 weeks between 16 to 24 weeks (See **Uterine Fibroids in Pregnancy (OB-15.2)**)
-
- If funneling or short cervix ≤25 mm (2.5 cm) is found on a transvaginal ultrasound
 - CPT® 76816 can be performed after a complete ultrasound every 3 to 4 weeks **and/or**
 - CPT® 76817 and/or CPT® 76815 every 1 to 2 weeks until 32 weeks
 - Note: CPT® 76815 should not be done on same date of service as CPT® 76816
 - Starting at 32 weeks, BPP (CPT® 76818 or CPT® 76819) or a modified BPP (CPT® 76815) can be performed once weekly.

Cerclage in Place in Current Pregnancy (OB-18.2)

OB.CI.0018.2.A

v1.0.2024

- Complete first trimester ultrasound CPT® 76801 [plus CPT® 76802 for each additional fetus] if <14 weeks and a complete ultrasound has not yet been performed, **and/or** CPT® 76817 for a transvaginal ultrasound
 - CPT® 76801 is preferred for dating, but if this is unable to be completed then CPT® 76815 and/or CPT® 76817 for a transvaginal ultrasound is indicated
- CPT® 76805 or CPT® 76811 if other high risk factors [plus CPT® 76810/CPT® 76812 for each additional fetus] and/or CPT® 76817 once if a complete detailed fetal anatomic scan has not been performed
- CPT® 76816 can be performed every 3 to 6 weeks starting after the fetal anatomic scan at 16 weeks.
- If a **prophylactic** (history-indicated) cerclage is placed in the current pregnancy (usually done early in the second trimester due to a prior 2nd trimester loss after painless cervical dilation at ≤24 weeks gestation)
 - CPT® 76815 **and/or** CPT® 76817 can be performed once between 16 to 24 weeks to determine if cervical shortening is present
 - If cervical shortening or funneling is noted See **Cervical Insufficiency (OB-18.1)**.
 - Further CL surveillance CPT® 76815 **and/or** CPT® 76817 every 2 weeks is not indicated.
- If a **rescue** cerclage (exam indicated) was placed due to cervical shortening or dilation found by ultrasound or physical exam in the current pregnancy
 - Transvaginal (CPT® 76817 and/or CPT® 76815) every 2 weeks, starting at ≥16 weeks until 32 weeks.
- If funneling or further shortening of the cervix is found See **Cervical Insufficiency (OB 18.1)**

Current Preterm Labor (OB-18.3)

OB.CI.0018.3.A

v1.0.2024

- Preterm labor in current pregnancy (contractions **PLUS** cervical change at <37 weeks gestation), can perform once when symptomatic
 - CPT® 76805 or CPT® 76811 if other high risk factors [plus CPT® 76810/CPT® 76812 for each additional fetus] if a complete fetal anatomic scan has not yet been performed during this pregnancy; **or**
 - CPT® 76815 **or** CPT® 76816, if a complete fetal anatomic scan was performed previously, (CPT® 76816 if more than 2 weeks since last growth), **and/or** CPT® 76817
- Biophysical profile (BPP) (CPT® 76818 **or** CPT® 76819) **or** modified BPP (CPT® 76815), once when symptomatic if ≥26 weeks.
- For history of pre-term labor, See **History of Spontaneous Pre-Term Delivery/History of PPRM (OB-9.9)**

Background and Supporting Information

- In circumstances where the individual is deemed to have an increased risk for a fetal abnormality and does not have access to a provider who can perform a fetal anatomic ultrasound examination (CPT® 76811) due to geographic or other constraints, a standard (after first trimester) fetal anatomic ultrasound examination (CPT® 76805) can be authorized instead.
- CPT® 76811 and CPT® 76812 should only be used once per pregnancy unless the mother changes to a new medical caregiver at a new office and there is a new medical indication and/or change in condition.
- Typically all components of the BPP (CPT® 76818 and CPT® 76819), such as breathing, are not present until ≥26 weeks gestation. However, a modified BPP (CPT® 76815) can be utilized sooner in certain high risk cases but should not be done prior to 22 weeks.
- CPT® 76815 should never be reported with complete studies CPT® 76801/CPT® 76802, CPT® 76805/CPT® 76810 or CPT® 76811/CPT® 76812 or with CPT® 76816 or BPP (CPT® 76818 and CPT® 76819).
- Though fetal anatomy survey (CPT® 76805/CPT® 76811) can be performed as early as 14 weeks gestation, per ACOG, in the absence of other specific indications, it is optimally performed at 18 to 22 weeks of gestation.

No Fetal Heart Tones/Decreased Fetal Movement (OB-19)

No Fetal Heart Tones (OB-19.1)

OB.FT.0019.1.A

v1.0.2024

- Prior to considering ultrasound, fetal heart tones (FHT) should be assessed with a hand-held doppler device.

First Trimester

- If ≥ 12 weeks gestation and unable to obtain FHT using a hand-held doppler, **or**
- If < 12 weeks gestation, in the setting of absent fetal heart tones, only if accompanied by other maternal signs or symptoms (such as cramping, vaginal bleeding, etc.) **or**
- If < 12 weeks and FHT had previously been heard using a fetal hand-held doppler, but now are unable to be heard by this method, regardless of symptoms
- Report **one** of the following:
 - Complete first trimester anatomy ultrasound CPT® 76801 (plus CPT® 76802 for each additional fetus) and/or CPT® 76817 if a complete ultrasound has not yet been performed; **or**
 - CPT® 76815 and/or CPT® 76817

Second and Third Trimester

Report **one** of the following:

- CPT® 76815 for limited ultrasound **or**
- CPT® 76805 (plus CPT® 76810 for each additional fetus) if ≥ 14 weeks, when complete fetal anatomic scan CPT® 76805 has not yet been performed **or**
- CPT® 76816 if ≥ 14 weeks and an anatomy ultrasound (CPT® 76801 or CPT® 76805/CPT® 76811) was performed previously

Decreased Fetal Movement (OB-19.2)

OB.FT.0019.2.A

v1.0.2024

- One of the following can be performed at the time of the complaint of decreased fetal movement:
 - Limited ultrasound or modified BPP (CPT® 76815) or
 - If ≥ 26 weeks BPP (CPT® 76818 or CPT® 76819) or a modified BPP (CPT® 76815) can be performed. See **Biophysical Profile (BPP) (OB-28.8)**
 - CPT® 76816 for delivery planning, e.g. if BPP/Modified BPP is abnormal.
 - Subsequent/repeat ultrasound is not usually necessary unless there are new indications or if BPP is abnormal.

Background and Supporting Information

- CPT® 76815 should never be reported with complete studies CPT® 76801/CPT® 76802, CPT® 76805/CPT® 76810 or CPT® 76811/CPT® 76812 or with CPT® 76816 or BPP (CPT® 76818 and CPT® 76819).

Fetal Growth Problems (FGR and Macrosomia) (OB-20)

Fetal Growth Restriction Current Pregnancy (OB-20.1)

OB.FG.0020.1.A

v1.0.2024

- The ACOG definition of Fetal Growth Restriction (FGR): Estimated or actual weight of the fetus $\leq 10^{\text{th}}$ percentile for gestational age, and/or Abdominal Circumference $\leq 10^{\text{th}}$ percentile.

For Suspected FGR:

- If there is a $\geq 3\text{cm}$ difference in fundal height measurement and gestational age, **or**
- FGR is suspected based on reduced fetal growth velocity, defined as a fall in the EFW or AC of 50% or more (e.g. from 70% to 20% ect.).¹²
- Report **one** of the following:
 - CPT® 76805/CPT® 76811 if otherwise indicated (plus CPT® 76810/CPT® 76812 for each additional fetus) if anatomy ultrasound has not yet been performed **or**
 - CPT® 76816 if anatomy ultrasound (CPT® 76805/CPT® 76811) previously performed
- For clinical situations that have a higher probability of FGR such as maternal hypertension, maternal diabetes, previous stillbirth, etc. See **High Risk Pregnancy (OB-9)**, or the specific guidelines for these clinical entities for guidance regarding follow-up ultrasounds to assess fetal growth

For Known FGR:

- Detailed Fetal Anatomic Scan (CPT® 76811) at diagnosis if not already performed
- Starting at diagnosis, if ≥ 16 weeks gestation, follow up ultrasound (CPT® 76816) can be performed every 2 to 4 weeks if complete anatomy ultrasound previously performed
- Starting at 22 weeks, a modified BPP (CPT® 76815) can be performed once or twice weekly, **or**
- Starting at 26 weeks, BPP (CPT® 76818 or CPT® 76819) **or** a modified BPP (CPT® 76815) can be performed once or twice weekly, **and**
- Starting at 22 weeks Umbilical artery (UA) Doppler (CPT® 76820) can be performed weekly.
- If FGR is diagnosed in the current ultrasound, BPP (CPT® 76818 or CPT® 76819) can be performed if ≥ 26 weeks, and/or UA Doppler (CPT® 76820) if ≥ 22 weeks.

For Known FGR:

- If Severe FGR (EFW $\leq 3\%$, AC $\leq 3\%$), **OR** Abnormal UA Doppler studies (defined as a PI, RI, or S/D ratio greater than the 95th percentile for gestational age **OR** absent or reversed end-diastolic velocity (AEDV or REDV), **OR** confirmed oligohydramnios:
 - BPP (CPT® 76818 or CPT® 76819 or CPT® 76815) and/or umbilical artery (UA) Doppler (CPT® 76820) can be performed twice weekly.⁵
- Per SMFM guidelines: Ductus venosus, middle cerebral artery, or uterine artery Doppler use for routine clinical management of early- or late-onset FGR is not recommended

Background and Supporting Information

- An abnormal umbilical artery Doppler is defined as a PI, RI, or S/D ratio greater than the 95th percentile for gestational age or an absent or reversed end-diastolic velocity (AEDV or REDV). Those with REDV are usually hospitalized for closer surveillance and delivery planning.
- Fetuses with early onset FGR are at significant risk for Intrauterine Fetal Demise (IUFD) and the rate of fetal growth prior to 23 weeks and Umbilical Artery (UA) Doppler findings may aid in counseling patients in this peri-viability period (Termination of Pregnancy (TOP) versus attempt at prolonging pregnancy till viability).
- In circumstances where CPT® 76811 cannot be performed See **Ultrasound Code Selection (OB-1.3)**
- Typically all components of the BPP (CPT® 76818 and CPT® 76819), such as breathing, are not present until ≥ 26 weeks gestation. However, a modified BPP (CPT® 76815) can be utilized sooner in certain high risk cases but should not be done prior to 22 weeks.
- CPT® 76815 should never be reported with complete studies CPT® 76801/CPT® 76802, CPT® 76805/CPT® 76810 or CPT® 76811/CPT® 76812 or with CPT® 76816 or BPP (CPT® 76818 and CPT® 76819).
- Though fetal anatomy survey (CPT® 76805/CPT® 76811) can be performed as early as 14 weeks gestation, per ACOG, in the absence of other specific indications, it is optimally performed at 18 to 22 weeks of gestation.

Macrosomia – Large for Dates Current Pregnancy (OB-20.2)

OB.FG.0020.2.A

v1.0.2024

- The ACOG definition of macrosomia: Estimated fetal weight of greater than 4000 grams (DM) or 4500 grams (non-DM); $\geq 90^{\text{th}}$ percentile for gestational age.
- For history of a macrosomia See **Prior Pregnancy with Macrosomia (OB-9.4.1)**

For Suspected Macrosomia

- At ≥ 22 weeks gestation, if there is a ≥ 3 week difference in fundal height and gestational age, or if the estimated fetal weight is $\geq 90^{\text{th}}$ percentile for gestational age¹¹, report **one** of the following:
 - CPT® 76805 [plus CPT® 76810 for each additional fetus] if a complete fetal anatomic scan has not yet been performed **or**
 - CPT® 76816 if a complete ultrasound was done previously
- See **Unequal Fundal Size and Dates (OB-27.1)**

For Known Macrosomia $\geq 90^{\text{th}}$ percentile

Report:

- CPT® 76816 at ≥ 35 weeks for delivery planning (if more than 2 weeks since last growth).¹¹
- In a low risk pregnancy, ultrasound is generally not indicated to estimate fetal weight before 30 weeks gestation. As such, repeat imaging is generally not necessary unless needed to plan for delivery or if there are other high risk indications.
- Additional imaging recommendations are usually guided by the cause of the fetal macrosomia (obesity, DM, etc.) See appropriate guideline for indication
- Per SMFM guidelines: Ductus venosus, middle cerebral artery, or uterine artery Doppler use for routine clinical management of early- or late-onset FGR is not recommended

Placental and Cord Abnormalities (OB-21)

Single Umbilical Artery (Two Vessel Cord) (OB-21.1)

OB.UA.0021.1.A

v1.0.2024

If a single umbilical artery is found on initial imaging:	
<ul style="list-style-type: none"> Detailed anatomic ultrasound at ≥ 16 weeks <ul style="list-style-type: none"> Though fetal anatomy survey (CPT® 76805/CPT® 76811) can be performed as early as 14 weeks gestation, per ACOG, in the absence of other specific indications, it is optimally performed at 18 to 22 weeks of gestation. 	CPT® 76811
<ul style="list-style-type: none"> Fetal echocardiogram (if ≥ 16 weeks) 	CPT® 76825 and/or CPT® 76827 and/or CPT® 93325
<ul style="list-style-type: none"> Follow-up ultrasound to evaluate fetal growth at ≥ 28 weeks and then every 3 to 6 weeks if more than one clinical high-risk factors are documented 	CPT® 76816
<ul style="list-style-type: none"> Weekly BPP or modified BPP starting at 36 weeks 	CPT® 76818 or CPT® 76819 (BPP) or modified BPP CPT® 76815

Background and Supporting Information

- In circumstances where the individual is deemed to have an increased risk for a fetal abnormality and does not have access to a provider who can perform a fetal anatomic ultrasound examination (CPT® 76811) due to geographic or other constraints, a standard (after first trimester) fetal anatomic ultrasound examination (CPT® 76805) can be authorized instead.
- CPT® 76811 and CPT® 76812 should only be used once per pregnancy unless the mother changes to a new medical caregiver at a new office and there is a new medical indication and/or change in condition.

Persistent Right Umbilical Vein (PRUV) (OB-21.2)

OB.UA.0021.2.A

v1.0.2024

PRUV – is a variant of the usual intra-abdominal umbilical venous connection. It may be associated with other fetal defects.

If a PRUV is found on initial imaging:	
<ul style="list-style-type: none"> Detailed anatomic ultrasound at ≥ 16 weeks <ul style="list-style-type: none"> Though fetal anatomy survey (CPT® 76805/CPT® 76811) can be performed as early as 14 weeks gestation, per ACOG, in the absence of other specific indications, it is optimally performed at 18 to 22 weeks of gestation. 	CPT® 76811
<ul style="list-style-type: none"> Fetal echocardiogram (if ≥ 16 weeks) 	CPT® 76825 and/or CPT® 76827 and/or CPT® 93325
<ul style="list-style-type: none"> Follow-up ultrasound to evaluate fetal growth at ≥ 22 weeks and then every 3 to 6 weeks if more than one clinical high-risk factors are documented 	CPT® 76816
<ul style="list-style-type: none"> Weekly BPP or modified BPP starting at 32 weeks 	CPT® 76818 or CPT® 76819 (BPP) or modified BPP CPT® 76815

Placental/Cord Abnormalities (OB-21.3)

OB.UA.0021.3.A

v1.0.2024

Placental/Cord Abnormalities (OB-21.3.1)

Circumvallate Placenta

Placental hemangioma

Succenturiate placenta or accessory lobe

Hypo/Hyper-coiled Umbilical Cord

Marginal Cord Insertion

Umbilical cord cyst

Velamentous Cord Insertion

- Fetal anatomic scan can be performed after 16 weeks (CPT® 76805/CPT® 76811) with or without CPT® 93976 (limited duplex scan of arterial and venous)
 - Though fetal anatomy survey (CPT® 76805/CPT® 76811) can be performed as early as 14 weeks gestation, per ACOG, in the absence of other specific indications, it is optimally performed at 18 to 22 weeks of gestation.
- Ultrasound CPT® 76817 can be performed to evaluate the placenta and/or cord in relation to the cervix
- Ultrasound (CPT® 76816) with or without CPT® 93976 (limited duplex scan) every 3-6 weeks starting at 28 weeks until delivery
- Weekly BPP or modified BPP (CPT® 76818/CPT® 76819 or CPT® 76815) starting at 32 weeks

Background and Supporting Information

- **Hypo/Hyper-coiled umbilical cord** - Several studies have reported an increased frequency of adverse pregnancy outcome, including congenital anomalies, growth restriction, fetal heart rate abnormalities, preterm birth, and intrauterine death in pregnancies with both hypocoiled and hypercoiled umbilical cord.

Other Placental/Cord Abnormalities (OB-21.3.2)

Amniotic Sheet/ Amniotic Band (Uterine Synechiae)

- Fetal anatomic scan can be performed after 16 weeks (CPT® 76805)
 - Though fetal anatomy survey (CPT® 76805/CPT® 76811) can be performed as early as 14 weeks gestation, per ACOG, in the absence of other specific indications, it is optimally performed at 18 to 22 weeks of gestation.

- One follow-up Ultrasound (CPT® 76816) can be performed in the 3rd trimester to ensure that the band is not restricting fetal growth or movement.
- **Amniotic Band Syndrome** is a completely different entity, associated with an increased risk of fetal anomalies and poor outcome. If Amniotic band syndrome is suspected or diagnosed, image as in **High Risk Pregnancy (OB-9)**.

Chorioangioma

Umbilical cord varix

- Detailed fetal anatomic scan can be performed after 16 weeks (CPT® 76811) with or without CPT® 93976 (limited duplex scan).
 - Though fetal anatomy survey (CPT® 76805/CPT® 76811) can be performed as early as 14 weeks gestation, per ACOG, in the absence of other specific indications, it is optimally performed at 18 to 22 weeks of gestation.
- Ultrasound (CPT® 76816) with or without CPT® 93976 (limited duplex scan) every 3-6 weeks starting at the time of diagnosis until delivery
- Weekly BPP (CPT® 76818 or CPT® 76819) or a modified BPP (CPT® 76815) starting at 32 weeks
- Both chorioangioma and UVV can be associated with fetal anemia and/or low output heart failure. As such, MCA Dopplers (CPT® 76821) may be indicated on a case-by-case basis, e.g. If turbulence develops within the UVV
- If suspected or known hydrops, Fetal ECHO (CPT® 76825, CPT® 76827, CPT® 93325) may be indicated. See **Fetal Echocardiography - Indications for Fetal Conditions (OB-12.2)**. If fetal hydrops develops then image as per **Alloimmunization/Rh Isoimmunization (OB-16.1)**

Background and Supporting Information

- Amniotic Bands visualized on ultrasound are often due to uterine synechiae (intrauterine adhesions), residual gestation sac of a demised twin, fibrin strands s/p bleeding, chorioamniotic separation or may be noted with a circumvallate placenta. In general, they are benign entities and are not associated with adverse pregnancy outcome.
- In circumstances where the individual is deemed to have an increased risk for a fetal abnormality and does not have access to a provider who can perform the more desirable fetal and maternal ultrasound with detailed fetal anatomic examination (CPT® 76811) due to geographic or other constraints, a standard (after first trimester) fetal and maternal ultrasound (CPT® 76805) can be authorized instead.
- CPT® 76811 and CPT® 76812 should only be used once per pregnancy unless the mother changes to a new medical caregiver at a new office and there is a new medical indication and/or change in condition

Subchorionic Hematoma/Hemorrhage (Placental Hematoma) (OB-21.4)

OB.UA.0021.4.A

v1.0.2024

Subchorionic Hematoma/Hemorrhage (Placental Hematoma)

- Ultrasound can be performed for follow-up of a known subchorionic hematoma or placental hematoma
 - CPT® 76815 and/or CPT® 76817 if the last ultrasound was performed ≥ 7 days ago or
 - CPT® 76816 and/or CPT® 76817 if a complete ultrasound scan was performed ≥ 2 weeks ago
- Imaging can be repeated earlier than seven days if there are new or worsening symptoms such as an increasing amount of vaginal bleeding or increasing cramping or pain.
- No further imaging is needed if the follow-up ultrasound shows that the hemorrhage has resolved.
- If pregnancy is in second or third trimester follow **Suspected Abruption Placentae (OB-21.5)**

Suspected Abruptio Placentae (OB-21.5)

OB.UA.0021.5.A

v1.0.2024

Suspected Abruptio Placentae

Second and Third Trimesters

- For **suspected** abruptio placentae:
 - CPT® 76805 [plus CPT® 76810 for each additional fetus] or CPT® 76811 if confirmed,¹⁶ and/or CPT® 76817 if a complete fetal anatomic scan has not yet been performed during this pregnancy, with or without CPT® 93976 (limited duplex scan)
 - CPT® 76815 for limited ultrasound and/or CPT® 76817, or
 - CPT® 76816 if anatomy ultrasound was done previously, and/or CPT® 76817
 - Vaginal bleeding with +KB (Kleihauer-Betke) – feto-maternal hemorrhage – at risk for fetal anemia and hydrops CPT® 76821 can be performed.
- Ultrasound is appropriate to follow-up a **known** abruption:
 - CPT® 76815 or CPT® 76816 if a complete ultrasound was done previously and/or CPT® 76817.
 - The number and frequency of follow-up ultrasounds will depend on the degree of abruption and the presence or absence of ongoing signs and symptoms.

Previa (Placenta Previa and Vasa Previa) (OB-21.6)

OB.UA.0021.6.A

v1.0.2024

Placenta Previa (OB-21.6.1)

Placenta Previa
Second and Third Trimesters
<ul style="list-style-type: none"> For suspected placenta previa (placental edge covers the internal cervical os) one of the following ultrasound can be performed: <ul style="list-style-type: none"> CPT® 76805 [plus CPT® 76810 for each additional fetus] and/or CPT® 76817 if a complete fetal anatomic scan has not yet been performed during this pregnancy with or without CPT® 93976 (limited duplex scan) or CPT® 76815 for limited ultrasound and/or CPT® 76817 with or without CPT® 93976 (limited duplex scan) or CPT® 76816 if a complete ultrasound was done previously and/or CPT® 76817 for a transvaginal ultrasound with or without CPT® 93976 (limited duplex scan) For known placenta previa (placental edge covers the internal cervical os) or low lying placenta (placental edge <2 cm from internal os): <ul style="list-style-type: none"> One routine follow-up ultrasound can be performed in the 3rd trimester (CPT® 76815 or CPT® 76816 and/or CPT® 76817) <ul style="list-style-type: none"> If placenta previa or low lying placenta is still present, one follow-up ultrasound (CPT® 76815 or CPT® 76816 and/or CPT® 76817) can be performed in 3-4 weeks If persistent placenta previa (placental edge covers the internal cervical os), BPP (CPT® 76818/CPT® 76819 or modified BPP (CPT® 76815) weekly, starting at 32 weeks Follow-up ultrasound can be performed at any time if bleeding occurs BPP (CPT® 76818 or CPT® 76819) or CPT® 76815 or CPT® 76816 if a complete ultrasound was done previously and/or CPT® 76817)

Background and Supporting Information

- For pregnancies beyond 16 weeks, if the placental edge is ≥ 2 cm away from the internal os, the placental location should be reported as normal.
- If the placental edge is <2 cm from the internal os but not covering the internal os, it should be labeled as low lying.
- If the placental edge covers the internal cervical os, the placenta should be labeled as a placenta previa.
- "There is no evidence to guide the optimal time of subsequent imaging in pregnancies thought to have placenta previa. In stable patients it is reasonable to

perform a follow-up ultrasonogram at approximately 32 weeks of gestation and an additional study at 36 weeks of gestation (if the previa persists) to determine the optimal route and timing of delivery. There is no clear benefit from more frequent ultrasonograms (eg, every 4 weeks) in stable cases."¹⁷

Vasa Previa (OB-21.6.2)

- Vasa previa occurs when fetal blood vessels that are unprotected by the umbilical cord or placenta run through the amniotic membranes and cross over the internal cervical os.

If a Vasa Previa is found on initial imaging:	
<p>Detailed anatomic ultrasound at ≥16 weeks</p> <ul style="list-style-type: none"> Though fetal anatomy survey (CPT® 76805/CPT® 76811) can be performed as early as 14 weeks gestation, per ACOG, in the absence of other specific indications, it is optimally performed at 18 to 22 weeks of gestation. 	CPT® 76811 and/or ¹⁹ CPT® 76817
Follow-up growth ultrasound every 2 to 4 weeks starting at ≥22 weeks	CPT® 76816 and/or ¹⁹ CPT® 76817
Once vasa previa is confirmed cervical length screening every 2 to 4 weeks starting at 28 weeks	CPT® 76817 and CPT® 76816 or CPT® 76815
BPP or modified BPP weekly starting at 32 weeks (can be performed earlier and/or more frequently if worsening fetal condition suspected)	CPT® 76818 or CPT® 76819 (BPP) or CPT® 76815

Placenta Accreta Spectrum (PAS): Accreta, Increta, Percreta (OB-21.7)

OB.UA.0021.7.A

v1.0.2024

- PAS includes placenta accreta, placenta increta or placenta percreta.

Suspected PAS (OB-21.7.1)

- For **suspected** PAS:
 - CPT® 76811 or CPT® 76805 and/or CPT® 76817 if a complete fetal anatomic scan has not yet been performed. Can be performed with or without CPT® 93976 (limited duplex scan) **or**
 - CPT® 76816 (if a complete ultrasound was done previously) or CPT® 76815 and/or CPT® 76817 with or without CPT® 93976 (limited duplex scan)
 - MRI Pelvis without contrast (CPT® 72195) if inconclusive or equivocal ultrasound

Known PAS (OB-21.7.2)

- For **known** PAS:
 - Follow up growth ultrasounds can be performed every 2 to 4 weeks (CPT® 76816 if a complete ultrasound was done previously and/or CPT® 76817)
 - BPP (CPT® 76818 or CPT® 76819) or a modified BPP (CPT® 76815) weekly, starting at 32 weeks or sooner if indicated (other high-risk concerns)
 - Follow-up ultrasound can be performed at any time if bleeding occurs (CPT® 76815 and/or CPT® 76817)
 - MRI Pelvis without contrast (CPT® 72195) if the ultrasound is indeterminate or advanced imaging is needed for surgical planning. MRI Pelvis without contrast (CPT® 72195) is the appropriate code if only placenta or maternal pelvis is imaged without fetal imaging
 - The uterus, tubes and ovaries arise out of the pelvis and are considered pelvic organs. If the uterus rises out of the pelvic cavity, the imaging field can be determined on scout films. Imaging of the abdomen is not supported for problems suspected to arise from the pelvis.
 - The scout images (CT) and localizer images (MRI) are used to define the imaging field that is relevant to anatomical structures of clinical interest. The imaging field is defined by this clinical question, not by the imaging procedure code. The imaging code indicates the general anatomical region but does not define the specific imaging protocol or sequences.

Background and Supporting Information

- ACOG recommendations for imaging during pregnancy and lactation:

- Ultrasonography and magnetic resonance imaging (MRI) are not associated with risk and are the imaging techniques of choice for the pregnant patient, but they should be used prudently and only when use is expected to answer a relevant clinical question or otherwise provide medical benefit to the patient.
- The use of gadolinium contrast with MRI should be limited; it should be used as a contrast agent in a pregnant female only if it significantly improves diagnostic performance and is expected to improve fetal or maternal outcome.

Late-term/Post-term Pregnancy (OB-22)

Late-term/Post-term Pregnancy (OB-22.1)

OB.LT.0022.1.A

v1.0.2024

- Ultrasound is supported at ≥ 41 weeks gestation
 - CPT® 76816 (if ≥ 2 weeks since last follow up ultrasound).
 - Twice weekly BPP (CPT® 76818 or CPT® 76819) or modified BPP CPT® 76815

Background and Supporting Information

- In late-term/post-term pregnancies, uterine artery Doppler velocimetry (CPT® 93976) has not been found to be useful. Per SMFM - uterine artery Doppler has limited diagnostic accuracy and clinical utility in predicting FGR, SGA birth, and perinatal mortality.

Preterm/Prelabor Rupture of Membranes (OB-23)

Current Preterm/Prelabor Rupture of Membranes (PPROM) (OB-23.1)

OB.RM.0023.1.A

v1.0.2024

- If suspected preterm/prehospital rupture of membranes (<37 weeks) perform:
 - One time CPT® 76815 for quick look for AFI check, **OR**
 - If confirmed oligohydramnios or PPRM CPT® 76816 or CPT® 76811 if detailed anatomy scan not previously performed¹ for delivery planning
 - This will likely result in a hospital admission for evaluation and monitoring until delivery. Only in rare cases is outpatient monitoring performed.
- See **Amniotic Fluid Abnormalities (OB-17.1)**

Current Prelabor Rupture of Membranes (PROM) (OB-23.2)

OB.RM.0023.2.A

v1.0.2024

- If ≥ 37 weeks and PROM is suspected
 - One time CPT® 76815 for quick look for AFI check, **OR**
 - CPT® 76816 (If confirmed oligohydramnios or PROM), for delivery planning
 - This will likely result in a hospital admission for delivery

Background and Supporting Information

- CPT® 76815 should never be reported with complete studies CPT® 76801/CPT® 76802, CPT® 76805/CPT® 76810 or CPT® 76811/CPT® 76812 or with CPT® 76816 or BPP (CPT® 76818 and CPT® 76819).

Previous C-section or History of Uterine Scar (OB-24)

Previous C-section or History of Uterine Scar (OB-24.1)

OB.CS.0024.1.A

v1.0.2024

Previous Cesarean section and/or uterine scar

- Report one of the following:
 - Complete first trimester ultrasound CPT® 76801 [plus CPT® 76802 for each additional fetus] if <14 weeks and a complete ultrasound has not yet been performed, and/or CPT® 76817 for a transvaginal ultrasound
 - CPT® 76801 is preferred for dating, but if this is unable to be completed then CPT® 76815 and/or CPT® 76817 for a transvaginal ultrasound is indicated
- For a normal/low risk pregnancy report a fetal anatomy ultrasound CPT® 76805 if ≥16 weeks. If pregnancy is high risk report a detailed fetal anatomy ultrasound CPT® 76811 if ≥16 weeks – See **High Risk Pregnancy (OB-9)**
- Growth scan (CPT® 76816) in the early third trimester (between 28-32 weeks) **and**
- CPT® 76816 once in the late third trimester for delivery planning (36-38 weeks)
- Transvaginal ultrasound, CPT® 76817 if poor visualization of the lower uterine segment or if uterine wall thinning (dehiscence) is suspected.
- If a cesarean scar pregnancy⁵ is suspected, can perform:
 - CPT® 76817 with or without CPT® 93976 (limited duplex scan) and/or
 - CPT® 76376 or CPT® 76377
 - MRI Pelvis without contrast (CPT® 72195) if inconclusive or equivocal ultrasound
- See **3D and 4D Rendering (OB 28.12)** and **Suspected PAS (OB-21.7.1)**

Background and Supporting Information

- Cesarean scar pregnancy (CSP) is a complication in which an early pregnancy implants in the fibrous tissue of a prior uterine scar. Because of the fibrous nature of scar tissue, a CSP is at risk for dehiscence, placenta accreta and hemorrhage. Females who consider pregnancy after a CSP are at significant risk of recurrence.
- A combination of transvaginal and transabdominal, combined with color Doppler ultrasound imaging are recommended for diagnosis.
- CPT® 76815 should never be reported with complete studies CPT® 76801/CPT® 76802, CPT® 76805/CPT® 76810 or CPT® 76811/CPT® 76812 or with CPT® 76816 or BPP (CPT® 76818 and CPT® 76819).
- Though fetal anatomy survey (CPT® 76805/CPT® 76811) can be performed as early as 14 weeks gestation, per ACOG, in the absence of other specific indications, it is optimally performed at 18 to 22 weeks of gestation.

Termination of Pregnancy – Imaging (OB-25)

Imaging for Planned Pregnancy Termination (OB-25.1)

OB.PT.0025.1.A

v1.0.2024

- State and Federal legislation supersede these guidelines, see individual state regulations. For states in which pregnancy termination is supported by law, imaging as follows:
- For a planned pregnancy termination, ultrasound can be performed to determine intrauterine pregnancy and gestational age.
 - Complete first trimester anatomy ultrasound CPT® 76801 if <14 weeks and/or CPT® 76817, or
 - CPT® 76815 and/or CPT® 76817, or
 - If ≥14 weeks, CPT® 76805 (or CPT® 76811 if otherwise indicated, e.g. termination planned for chromosomal or structural fetal anomaly) can be performed (there may be State mandated imaging prior to termination).
- Routine follow-up is not usually necessary after uncomplicated medical abortion.
- For suspected medical abortion complication See **Spontaneous Abortion/Threatened/Missed Abortion (OB 5.4)**

Background and Supporting Information

- In general, most ultrasounds are indicated for planned pregnancy termination regardless of clinical information provided. Imaging may be indicated to confirm EGA, placenta location, and/or fetal anomalies.
- Though routine follow-up is not usually necessary after uncomplicated medical abortion, if otherwise medically indicated or preferred by the patient, follow-up ultrasound assessment after a medically induced termination can be considered
- CPT® 76815 should never be reported with complete studies CPT® 76801/CPT® 76802, CPT® 76805/CPT® 76810 or CPT® 76811/CPT® 76812 or with CPT® 76816 or BPP (CPT® 76818 and CPT® 76819).
- Though fetal anatomy survey (CPT® 76805/CPT® 76811) can be performed as early as 14 weeks gestation, per ACOG, in the absence of other specific indications, it is optimally performed at 18 to 22 weeks of gestation

References (OB-25)

v1.0.2024

Trauma (OB-26)

Trauma – Imaging (OB-26.1)

OB.TR.0026.1.A

v1.0.2024

Prior to 13 weeks:

- Blunt trauma in the first trimester (prior to 13 weeks) generally does not cause pregnancy loss with the exception of profound hypotension:
 - No imaging is indicated unless there is cramping and/or bleeding.

Between 13-20 weeks gestation:

- CPT® 76815 and/or CPT® 76817 can be performed, **or**
- Complete first trimester anatomy ultrasound CPT® 76801 and/or CPT® 76817 if complete ultrasound has not yet been performed, and is <14 weeks **or**
- CPT® 76805 (plus CPT® 76810 for each additional fetus) (or CPT® 76811/CPT® 76812 if otherwise indicated) if ≥14 weeks, when complete fetal anatomic scan has not yet been performed

After 20 weeks:

- CPT® 76805 (or CPT® 76811 plus CPT® 76812 for each additional fetus if otherwise indicated) when a fetal anatomic scan has not yet been performed, or
- CPT® 76815 and/or CPT® 76817 or
- CPT® 76816
- Additionally, starting at 26 weeks, BPP (CPT® 76818 or CPT® 76819) or modified BPP (CPT® 76815) can be considered
- CPT® 76821 if vaginal bleeding with +KB (Kleihauer-Betke) (if fetomaternal hemorrhage - at risk for fetal anemia and hydrops)
- Other advanced imaging may be indicated. See **Blunt Abdominal Trauma (AB-10.1)**

Background and Supporting Information

- Typically all components of the BPP (CPT® 76818 and CPT® 76819), such as breathing, are not present until ≥26 weeks gestation. However, a modified BPP (CPT® 76815) can be utilized sooner in certain high risk cases but should not be done prior to 22 weeks.
- CPT® 76815 should never be reported with complete studies CPT® 76801/CPT® 76802, CPT® 76805/CPT® 76810 or CPT® 76811/CPT® 76812 or with CPT® 76816 or BPP (CPT® 76818 and CPT® 76819).
- Though fetal anatomy survey (CPT® 76805/CPT® 76811) can be performed as early as 14 weeks gestation, per ACOG, in the absence of other specific indications, it is optimally performed at 18 to 22 weeks of gestation.
- ACOG recommendations for imaging during pregnancy and lactation:

- Ultrasonography and magnetic resonance imaging (MRI) are not associated with risk and are the imaging techniques of choice for the pregnant patient, but they should be used prudently and only when use is expected to answer a relevant clinical question or otherwise provide medical benefit to the patient.
- With few exceptions, radiation exposure through radiography (Xrays), computed tomography (CT) scan, or nuclear medicine imaging techniques is at a dose much lower than the exposure associated with fetal harm. If these techniques are necessary in addition to ultrasound or MRI or are more readily available for the diagnosis in question, they should not be withheld from a pregnant patient.
- The use of gadolinium contrast with MRI should be limited; it should be used as a contrast agent in a pregnant female only if it significantly improves diagnostic performance and is expected to improve fetal or maternal outcome.
- With regards to iodinated IV contrast media, "it is generally recommended that contrast only be used if absolutely required to obtain additional diagnostic information that will affect the care of the fetus or woman during pregnancy".

Unequal Fundal Size and Dates (OB-27)

Unequal Fundal Size and Dates (OB-27.1)

OB.US.0027.1.A

v1.0.2024

Unequal fundal size is defined as ≥ 3 cm difference between fundal height measurement and gestational age (weeks), at ≥ 22 weeks gestation

- One ultrasound can be performed (CPT® 76805) if complete fetal anatomic scan is planned and has not been performed **or**
- CPT® 76816 if complete anatomy scan or detailed anatomy ultrasound (CPT® 76805/CPT® 76811) has been done previously
- Where fundus cannot be adequately palpated such as in obesity, leiomyomas, multiple gestations, See appropriate chapter

Background and Supporting Information

- CPT® 76815 should never be reported with complete studies CPT® 76801/CPT® 76802, CPT® 76805/CPT® 76810 or CPT® 76811/CPT® 76812 or with CPT® 76816 or BPP (CPT® 76818 and CPT® 76819).
- Though fetal anatomy survey (CPT® 76805/CPT® 76811) can be performed as early as 14 weeks gestation, per ACOG, in the absence of other specific indications, it is optimally performed at 18 to 22 weeks of gestation

Procedure Coding Basics for Established Pregnancy (OB-28)

Procedure Coding Basics for Established Pregnancy General Considerations (OB-28.1)

OB.PC.0028.1.A**v1.0.2024**

- All obstetric ultrasound studies require permanently recorded images which may be stored on film or in a Picture Archiving and Communication System (PACS). Obstetric ultrasound services may not be billed without image recording.
- Ultrasound procedure codes include the preparation of a required final written report which should be included in the patient's medical record.
 - Each procedure code has specific required elements which are described in this section.
 - The report should document the results of the evaluation of each element or the reason any element is non-visualized.
 - Documentation of less than the required elements requires the billing of the "limited" code for that anatomic region.
 - Only one (1) limited exam should be billed per encounter.
- The use of a hand-held or any Doppler device that does not create a hard-copy output is considered part of the physical examination and is not separately billable.

Required Elements for Complete First Trimester Ultrasound (OB-28.2)

OB.PC.0028.2.A

v1.0.2024

CPT® Code Guidance

- Complete First Trimester Ultrasound [CPT® 76801 and CPT® 76802 (for each additional fetus)] can be performed up to and including 13 6/7 weeks gestation and is defined in CPT® as including the following elements:
 - Number and size of gestational sacs and fetuses
 - Survey of visible fetal anatomic structures and placental evaluation when possible
 - Qualitative assessment of amniotic fluid volume/gestational sac shape
 - Examination of maternal uterus and adnexa
- Complete First Trimester Ultrasound (CPT® 76801 and CPT® 76802) should only be reported once per pregnancy/per practice/facility unless the mother changes to a new medical caregiver at a new practice/facility and there is a new medical indication for ultrasound.

Required Elements for Second or Third Trimester Fetal Anatomic Evaluation Ultrasound (OB-28.3)

OB.PC.0028.3.A

v1.0.2024

CPT® Code Guidance

- A complete second or third trimester fetal anatomic evaluation ultrasound (CPT® 76805 and CPT® 76810 for each additional fetus) is defined in CPT® as including the following elements:
 - Head, face, and neck:** Lateral cerebral ventricles; Choroid plexus; Midline falx; Cavum septum pellucidum; Cerebellum; Cistern magna; Upper lip: A measurement of the nuchal fold may be helpful during a specific age interval to assess the risk of aneuploidy
 - Chest/Heart:** Four-chamber view; Left and Right ventricular outflow tracts
 - Abdomen:** Stomach (presence, size, and situs); Kidneys; Urinary bladder; Umbilical cord insertion site into the fetal abdomen and number of vessels
 - Spine:** Cervical, thoracic, lumbar, and sacral spine
 - Extremities:** Legs and arms
 - Genitalia:** (In multiple gestations and when medically indicated)
 - Placenta:** Location; Relationship to internal os; Appearance; Placental cord insertion (when possible) and overall standard evaluation
 - Fetal number and Presentation
 - Qualitative or semi-qualitative estimate of amniotic fluid
 - Maternal anatomy:** Cervix (transvaginal if cervical length is ≤ 3.6 cm on transabdominal ultrasound), Uterus, and Adnexa See [Cervical Length Screening \(OB-7.3\)](#)
 - Fetal Biometry:** Biparietal diameter, Head circumference, Femur length, Abdominal circumference, and Fetal weight estimate.
- CPT® 76805 and CPT® 76810 **should only be used once per pregnancy per practice/facility** unless the mother changes to a new medical caregiver at a new practice/facility and there is a new medical indication for ultrasound.
- Though fetal anatomy survey (CPT® 76805/CPT® 76811) can be performed as early as 14 weeks gestation, per ACOG, in the absence of other specific indications, it is optimally performed at 18 to 22 weeks of gestation. This timing allows for a survey of fetal anatomy and an accurate estimation of gestational age
- Follow-up studies to CPT® 76805/CPT® 76810 should be coded as CPT® 76815 or CPT® 76816.

Required Elements for a Detailed Fetal Anatomic Evaluation Ultrasound (OB-28.4)

OB.PC.0028.4.A

v1.0.2024

CPT® Code Guidance

- Detailed fetal anatomy scan (CPT® 76811 and CPT® 76812 for each additional fetus) is generally performed by those with special skills to perform this study, such as Maternal Fetal Medicine specialists (Perinatologists), or Radiologists **with advanced training in fetal imaging**.
- CPT® 76811 and CPT® 76812 are defined in CPT® as including all of the requirements listed for CPT® 76805 and CPT® 76810. In addition, the report must document detailed anatomic evaluation of the following elements:
 - Head, face, and neck:** 3rd and 4th ventricles; Lateral ventricles; Cerebellar lobes, vermis, and cisterna magna; Corpus callosum; Integrity and shape of cranial vault; Brain parenchyma; Neck; Profile; Coronal face (nose/lips/lenses); Palate, maxilla, mandible, and tongue; Ear position and size; Orbits
 - Chest/Heart:** Aortic arch; Superior and inferior vena cava; 3-vessel view; 3-vessel and trachea view; Lungs; Integrity of diaphragm; Ribs
 - Abdomen:** Small and large bowel; Adrenal glands; Gallbladder; Liver; Renal arteries; Spleen; Integrity of abdominal wall
 - Spine:** Integrity of spine and overlying soft tissue; Shape and curvature
 - Extremities:** Number: architecture and position; Hands; Feet; Digits: number and position
 - Genitalia: Gender
 - Placenta:** Masses; Placental cord insertion; Accessory/succenturiate lobe with location of connecting vascular supply to primary placenta
 - Biometry:** Cerebellum; Inner and outer orbital diameters; Nuchal thickness (16 to 20 wk); Nasal bone measurement (15 to 22 wk); Humerus; Ulna/radius; Tibia/fibula
 - Maternal Anatomy:** Cervix (transvaginal if cervical length is ≤ 3.6 cm on transabdominal ultrasound); Uterus; Adnexa See **Cervical Length Screening (OB-7.3)**

CPT® Code Guidance

- CPT® 76811 and CPT® 76812 **should only be used once per pregnancy per practice/ facility** unless the mother changes to a new medical caregiver at a new facility and there is a new medical indication for ultrasound.
- Though fetal anatomy survey (CPT® 76805/CPT® 76811) can be performed as early as 14 weeks gestation, per ACOG, in the absence of other specific indications, it is optimally performed at 18 to 22 weeks of gestation. This timing allows for a survey of fetal anatomy and an accurate estimation of gestational age
- Follow-up studies to CPT® 76811/CPT® 76812 should be coded as CPT® 76815 or CPT® 76816.
- In circumstances where the individual is deemed to have an increased risk for a fetal abnormality and does not have access to a provider who can perform a fetal anatomic ultrasound examination (CPT® 76811) due to geographic or other constraints, a standard (after first trimester) fetal anatomic ultrasound examination (CPT® 76805) can be authorized instead.

Fetal Nuchal Translucency (OB-28.5)

OB.PC.0028.5.A

v1.0.2024

CPT® Code Guidance

- CPT® 76813 and CPT® 76814 (for each additional fetus) describe ultrasound measurement of the clear (translucent) space at the back of the fetal neck.
 - The first trimester screening can be performed if CRL measures 44-83 mm (typically between 10 4/7 and 14 weeks' gestation).
 - Abnormal Fetal Nuchal Translucency scan (NT ≥3 mm or above the 95th percentile for the CRL) suggests an increased risk for aneuploidy, or may be a marker for cardiac defects, abdominal wall defects, diaphragmatic hernia, and genetic syndromes in euploid fetuses during current pregnancy.
 - The sonographer performing the study and/or the physician interpreting the study must be credentialed by the Maternal Fetal Medicine Foundation or Nuchal Translucency Quality Review Program (NTQR)
-
- The use of ultrasound codes (CPT® 76801/CPT® 76802) should be indication driven and should not be routinely done whenever an ultrasound for nuchal translucency (CPT® 76813/CPT® 76814) is requested. In cases where there is either a maternal and/or fetal indication, then the CPT® 76801 code can be billed along with the nuchal translucency screening (CPT® 76813/CPT® 76814).
 - Fetal Nuchal Translucency (CPT® 76813 and CPT® 76814) should only be reported once per pregnancy

Background and Supporting Information

- The first trimester screening is typically done between 11 and 13 6/7 weeks but can be performed if the crown rump length (CRL) measures between 44-83 mm (typically at gestational age range 10 4/7 to 14 weeks)
- **Required elements of the CPT® 76813 ultrasound code include:**
 - Fetal crown-rump measurement
 - Observation of fetal cardiac activity
 - Observation of the embryo at high magnification until the embryonic neck is in a neutral position and spontaneous embryonic movement allows for differentiation between the outer edge of the nuchal skin and the amnion
 - Measurement of the largest distance between the inner borders of the fetal nuchal translucency

Limited and Follow-up Studies (OB-28.6)

OB.PC.0028.6.A

v1.0.2024

CPT® Code Guidance

- **CPT® 76815** describes a **limited** or “quick look” study used when medically indicated to report one or more of the elements listed in the code definition, i.e. “fetal heartbeat”, placental location, for viability/dating (when indicated), or fluid check (re: modified BPP which is NST with CPT® 76815)
 - Reported only once, regardless of the number of fetuses, and only once per date of service
 - CPT® 76815 should never be reported with complete studies CPT® 76801/CPT® 76802, CPT® 76805/CPT® 76810 or CPT® 76811/CPT® 76812 or with CPT® 76816 or BPP (CPT® 76818 and CPT® 76819).
- **CPT® 76816** describes a **follow-up** ultrasound (eg, re-evaluation of fetal size by measuring standard growth parameters and amniotic fluid volume, re-evaluation of organ system(s) suspected or confirmed to be abnormal on a previous scan), trans-abdominal approach, per fetus.
 - The use of this CPT code is reserved for subsequent follow up ultrasound only; i.e. complete ultrasound (CPT® 76801, or CPT® 76805/CPT® 76811) must have been performed previously.
 - Components include: Focused assessment of fetal biometry, amniotic fluid volume and/or a detailed re-examination of a specific organ or system known or suspected to be abnormal on prior ultrasound.
 - CPT® 76816 should be reported once per fetus evaluated in follow-up.
 - CPT® 76816 should never be reported with complete studies (CPT® 76801, CPT® 76802, CPT® 76805/CPT® 76810, or CPT® 76811/CPT® 76810) or with a limited study (CPT® 76815).
 - CPT® 76816 should not be performed prior to a CPT® 76801 and/or an anatomy scan CPT® 76805 (normal pregnancy) or Detailed anatomy scan CPT® 76811 (high risk pregnancy), and is typically not performed before 14 weeks gestation.

Obstetric Transvaginal Ultrasound (OB-28.7)

OB.PC.0028.7.A

v1.0.2024

CPT® Code Guidance

- **CPT® 76817** is used to report an obstetrical transvaginal ultrasound for cervical length assessment (when indicated), or in certain circumstances with poor visualization by transabdominal US assessment.
- **CPT® 76817** is reported only once regardless of the number of fetuses.

Biophysical Profile (BPP) (OB-28.8)

OB.PC.0028.8.A

v1.0.2024

CPT® Code Guidance

- CPT® 76818 includes non-stress testing. Supported ≥ 26 weeks.
- CPT® 76819 does not include the non-stress testing portion. Supported ≥ 26 weeks
- CPT® 76815 is a modified BPP – includes NST and AFI. Supported ≥ 22 weeks
- BPPs performed on more than one fetus, should be reported separately.
- Modified BPP (CPT® 76815) should be reported only once, regardless of the number of fetuses, and only once per date of service.
- Modified BPP (CPT® 76815) should never be reported with complete studies, CPT® 76805/CPT® 76810 or CPT® 76811/CPT® 76812 or with CPT® 76816 or BPP (CPT® 76818 and CPT® 76819).

Background and Supporting Information

- The BPP is designed to predict the presence or absence of fetal asphyxia and, ultimately the risk of fetal death. A BPP is scored out of 10 with each parameter given a score of 0 or 2. A score ≥ 8 is considered normal. The following parameters are evaluated:
 - Fetal breathing movements
 - Gross fetal body movements
 - Fetal tone
 - Amniotic fluid volume, at least one vertical pocket 2 x 2 cm
 - Reactive FHR (non-stress testing portion)
- CPT® 76815 is used to assess the AFI portion of a modified BPP (NST + AFI)
- Typically all components of the BPP (CPT® 76818 and CPT® 76819), such as breathing, are not present until ≥ 26 weeks gestation. However, a modified BPP (CPT® 76815) can be utilized sooner in certain high risk cases but should not be done prior to 22.
- If BPP ≤ 6 , repeat BPP in ≤ 24 hours

Fetal Doppler (OB-28.9)

OB.PC.0028.9.A

v1.0.2024

CPT® Code Guidance

- CPT® 76820 describes Doppler velocimetry of the umbilical artery (UA Doppler)
 - Utilized for known FGR; See **Fetal Growth Restriction Current Pregnancy (OB-20.1)** and known oligohydramnios See **Amniotic Fluid Abnormalities (OB-17.1)**, and is typically performed ≥22 weeks gestation.
 - Can be performed with known twin to twin transfusion or known discordant twins (See **Multiple Gestations (OB-11)**)
 - Its use to predict preeclampsia, and stillbirth is considered investigational.
- CPT® 76821 describes Doppler velocimetry of the middle cerebral artery (MCA Doppler).
 - Performed to evaluate a fetus at risk for anemia due to Rhesus isoimmunization/alloimmunization (as a substitute for amniocentesis), Twin anemia polycythemia sequence and non-immune hydrops caused by parvovirus B19 infection or any other known acquired or congenital cause of fetal anemia. See **Alloimmunization/Rh Isoimmunization (OB-16.1)**, **Other Causes of Fetal Anemia (OB-16.5)**, and **Multiple Gestations (OB-11)**
 - MCA Doppler (CPT® 76821) assessment can be performed if the fetus is at high risk for fetal anemia due to other pregnancy complications, e.g. chorioangioma, umbilical vein varix, or finding of sustained fetal tachyarrhythmia or bradyarrhythmia or a known congenital heart defect with suspected heart failure in the fetus - See **Indications for Fetal Conditions (OB-12.2)**, **Alloimmunization/Rh Isoimmunization (OB-16.1)**, and **Placental and Cord Abnormalities (OB-21)**
 - SMFM suggest that ductus venosus, middle cerebral artery, or uterine artery Doppler use for routine clinical management of early- or late-onset FGR *is not recommended*

Duplex Scan (OB-28.10)

OB.PC.0028.10.A

v1.0.2024

- A Duplex scan describes an ultrasonic scanning procedure for characterizing the pattern and direction of blood flow in arteries and veins. It produces real-time images integrating a B-mode two dimensional vascular structure, Doppler spectral analysis, and color flow Doppler imaging.
- **CPT® 93976** describes a limited duplex scan and is used during pregnancy to report uterine artery Doppler studies (done to report fetal umbilical-placental flow evaluation, accreta or other placental or cord abnormalities).
 - **CPT® 93975** describes a complete duplex scan. This code is **NOT** used in obstetrical imaging.
- The minimal use of color Doppler alone, when performed for anatomical structure identification, during a standard ultrasound procedure, is not separately reimbursable.
- SMFM state that uterine artery Doppler has limited diagnostic accuracy and clinical utility in predicting FGR, SGA birth, and perinatal mortality. As such, its use for screening in high risk groups is not recommended

Fetal Echocardiography (OB-28.11)

OB.PC.0028.11.A

v1.0.2024

CPT® Code Guidance

- CPT® 76825 describes a complete fetal echocardiography.
- CPT® 76827 describes a complete Doppler echocardiography, fetal, pulsed wave and/or continuous wave with spectral display
 - It is usually billed along with CPT® 76825
- CPT® 76826 describes a follow-up or repeat fetal echocardiogram
 - It should never be billed with CPT® 76825 or more than once per fetus on any date of service
- CPT® 76828 is a follow-up or repeat Doppler fetal echocardiogram
- Procedure code (CPT® 76827 or CPT® 76828) includes the evaluation of veins, arteries, and valves, and covers Doppler evaluation of the ductus venosus, ductus arteriosus, and PR Interval measurement as well as other vessels. Guidelines do not support the additional billing of CPT® 76820 and/or CPT® 76821.
- It is inappropriate to report codes CPT® 76825 – CPT® 76828 for the routine monitoring of fetal heart tones using a hand-held or any Doppler device that does not create a hard-copy output. Such fetal heart tone monitoring is considered part of the physical examination and is not separately billable.
- CPT® 93325 is used to report color mapping in conjunction with fetal echocardiography procedures CPT® 76825 – CPT® 76828.
 - The use of color Doppler (CPT® 93325) alone, when performed for anatomical structure identification, during a standard ultrasound procedure, is not separately reimbursable.

3D and 4D Rendering (OB-28.12)

OB.PC.0028.12.A

v1.0.2024

- There is currently insufficient data to generate appropriateness criteria for the use of 3D and 4D rendering in conjunction with Obstetrical ultrasound imaging.
 - Per ACOG, despite the technical advantages of 3-dimensional ultrasonography, proof of a clinical advantage of 3-dimensional ultrasonography in prenatal diagnosis, in general, is still lacking.
- However, 3D-4D (CPT® 76376 or CPT® 76377) rendering can be considered in certain situations of abnormal pregnancy implantation like suspected C-section scar pregnancies or suspected cornual (interstitial) ectopic pregnancy, or to locate an IUD. See **Locate an Intrauterine Device (IUD) (OB-3.1)**, **Previous C-section or History of Uterine Scar (OB 24.1)**, **Ectopic Pregnancy (OB 5.3)**, and **Uterine Anomalies (PV-14.1)** in the Pelvis Imaging Guidelines
- 3D-4D (CPT® 76376 or CPT® 76377) rendering can be used for surgical planning with diagnosis of complex CHD in the fetus or for surgical planning of other complex fetal malformations.¹⁶

Required Elements for a Detailed First Trimester Fetal Anatomic Evaluation Ultrasound (OB-28.13)

OB.PC.0028.13.A

v1.0.2024

CPT® Code Guidance

- Detailed first trimester fetal anatomy scan, CPT® 76801 **plus** CPT® 76813 (and CPT® 76802 **plus** CPT® 76814 for each additional fetus) can be performed between 12 weeks 0 days and 13 weeks 6 days when indicated (See **Detailed First Trimester Fetal Anatomic Scan (OB-9.12)** for indications).

A Detailed first trimester fetal anatomy scan must document detailed anatomic evaluation of the following elements:

- General:** Cardiac activity; Number of fetuses and gestational sacs
- Head, face, and neck:** Cranial bones (calvarium); falx cerebri; choroid plexus; transthalamic flax cerebri; Thalami; Posterior fossa; brain stem; 4th ventricles; cisterns magna; Corpus callosum; nasal bone; profile; maxilla; mandible; evaluation for cystic hygroma, dilated jugular; lymphatic sacs; nuchal translucency evaluation
- Chest/Heart:** Cardiac position and axis; 4-chamber view; 3- vessel and trachea view; Lungs; Integrity of diaphragm; Ribs
- Abdomen:** Stomach; Liver; Cord insertion into abdominal wall; Bladder; Umbilical arteries; Integrity of abdominal wall
- Spine:** Integrity of spine and overlying soft tissue; Shape and curvature
- Extremities:** Number: architecture and position; Hands; Feet: number and position
- Placenta:** Position; Umbilical cord insertion; Echo texture
- Biometry:** Crown-rump length
- Maternal Anatomy:** Myometrial masses; Mullerian duct anomalies; Uterus; Ovaries; Adnexa and cul-de-sac

- A Detailed first trimester fetal anatomy scan, CPT® 76811 (and CPT® 76812 for each additional fetus) should only be reported once per pregnancy/per practice/facility unless the mother changes to a new medical caregiver at a new practice/facility and there is a new medical indication for ultrasound.
- It is generally performed by those with special skills to perform this study, such as Maternal Fetal Medicine specialists (Perinatologists), or Radiologists **with advanced training in fetal imaging**.

MWA	microwave ablation
NaF	sodium fluoride
NET	neuroendocrine tumor
NCCN®	National Comprehensive Cancer Network

Abbreviations for Oncology Imaging Guidelines

NHL	non-Hodgkin's lymphoma
NPC	nasopharyngeal carcinoma
NSABP	National Surgical Adjuvant Breast and Bowel Project
NSAIDS	nonsteroidal anti-inflammatory drugs
NSCLC	non-small cell lung cancer
NSGCT	non-seminomatous germ cell tumor
PA	posteroanterior
PCI	prophylactic cranial irradiation
PET	positron emission tomography
COG	Children's Oncology Group
PSA	prostate specific antigen
RFA	radiofrequency ablation
RPLND	retroperitoneal lymph node dissection
SqCCa	squamous cell carcinoma
SCLC	small cell lung cancer
SIADH	syndrome of inappropriate secretion of antidiuretic hormone
TCC	transitional cell carcinoma
TLH	total laparoscopic hysterectomy
TNM	tumor node metastasis staging system
TSH	thyroid-stimulating hormone
TURBT	trans-urethral resection of bladder tumor
VIPoma	vasoactive intestinal polypeptide
WLE	wide local incision
WB-MRI	whole body MRI
WM	Waldenstrom's macroglobulinemia
WBXRT	whole brain radiation therapy

General Guidelines (ONC-1.0)

ON.GG.0001.0.A

v2.0.2024

- A recent clinical evaluation (within 60 days) or meaningful contact (telephone call, electronic mail or messaging) should be performed prior to considering advanced imaging, unless the individual is undergoing guideline-supported scheduled off therapy surveillance evaluation or cancer screening. The clinical evaluation may include a relevant history and physical examination, including biopsy, appropriate laboratory studies, and results of non-advanced or advanced imaging modalities.
- Unless otherwise stated in the disease-specific guideline, a histological confirmation of malignancy (or recurrence) and the stage of disease is required to perform a medical necessity review of the requested imaging.
- Generally, the studies listed in the disease-specific sections reflect the studies supported by current literature and research for that condition. If a study is not listed, then it is not supported.
- Routine imaging of brain, spine, neck, chest, abdomen, pelvis, bones, or other body areas is not indicated except where explicitly stated in a diagnosis-specific guideline section, or if one of the following applies:
 - Known prior disease involving the requested body area
 - New or worsening symptoms or physical exam findings involving the requested body area (including non-specific findings such as ascites or pleural effusion)
 - New finding on basic imaging study such as plain x-ray or ultrasound
 - New finding on adjacent body area CT/MRI study (i.e., pleural effusion observed on CT abdomen)
- Unless otherwise stated in the disease-specific guideline, advanced imaging of asymptomatic individuals is not routinely supported without signs or symptoms of systemic involvement of cancer.
- Repeat imaging studies are not generally necessary unless there is evidence of disease progression, recurrence of disease, and/or the repeat imaging will affect an individual's clinical management.
- Conventional imaging performed prior to diagnosis should not be repeated unless there is a delay of at least 6 weeks since previous imaging and treatment initiation or there are new or significantly worsening clinical signs or symptoms

Phase	Imaging Timeframe
After definitive local therapy of primary tumor (surgery or radiation therapy)	<ul style="list-style-type: none"> • Follow surveillance guidelines
During adjuvant chemotherapy	<ul style="list-style-type: none"> • Follow surveillance guidelines
After ablative therapy	<ul style="list-style-type: none"> • See disease-specific guidelines
During chemotherapy or immunotherapy for measurable disease	<ul style="list-style-type: none"> • Every 2 cycles (generally every 6 to 8 weeks)

Phase	Imaging Timeframe
During endocrine/hormonal therapy for measurable disease	<ul style="list-style-type: none"> Every 3 months (12 weeks)
Measurable metastatic disease being monitored off therapy	<ul style="list-style-type: none"> Every 3 months (12 weeks)
Minimal metastatic disease on maintenance therapy	<ul style="list-style-type: none"> Every 3 months (12 weeks)
Surveillance for history of metastatic disease with complete response and being observed off-therapy	<ul style="list-style-type: none"> Imaging typically not indicated beyond 5 years from completion of treatment for metastatic disease

- Advanced imaging is not indicated for evaluation of in situ or non-invasive cancers or cancer surveillance after complete surgical removal of primary disease unless otherwise stated in the cancer-specific guidelines.
- Advanced imaging is not indicated for monitoring disease in individuals who choose to not receive standard oncologic therapy, but may be receiving alternative therapies or palliative care and/or hospice. All advanced imaging indicated for initial staging of the specific cancer type can be approved once when the individual is considering initiation of a standard therapeutic approach (surgery, chemotherapy, or radiation therapy).
- Brain imaging is performed for signs or symptoms of brain disease
 - MRI Brain without and with contrast (CPT® 70553) is the recommended study for evaluation of suspected or known brain metastases. If a non-contrast CT head shows suspicious lesion, MRI brain may be obtained to further characterize the lesion
 - CT without and with contrast (CPT® 70470) can be approved when MRI is contraindicated or not available, or if there is skull bone involvement
 - Certain malignancies including, but not limited to melanoma and lung cancer have indications for brain imaging for asymptomatic individuals
 - If stage IV disease is demonstrated elsewhere or if systemic disease progression is noted, refer to disease specific guidelines
 - Initiation of angiogenesis therapy is not an indication for advanced imaging of the brain in asymptomatic individuals (Avastin/Bevacizumab; < 3% risk of bleeding and < 1% risk of serious bleeding)
- Bone Scan:
 - Primarily used for evaluation of bone metastases in individuals with solid malignancies.
 - Indications for bone scan in individuals with history of malignancy include – bone pain, rising tumor markers, elevated alkaline phosphatase or in individuals with primary bone tumor.
 - For evaluation of suspected or known bony metastases, CPT® 78306 (Nuclear bone scan whole body), may be approved.

- Radiopharmaceutical Localization scan SPECT (CPT® 78803 or CPT® 78831) or SPECT/CT (CPT® 78830 or CPT® 78832) may be approved as an add-on test for further evaluation of a specific area of interest.
- CPT® codes 78300 (Nuclear bone scan limited), 78305 (Nuclear bone scan multiple areas) or 78315 do not have any indications in oncology nuclear medicine imaging.
- Bone scan supplemented by plain x-rays are the initial imaging modalities for suspected malignant bone pain. For specific imaging indications, see also:
 - **Nuclear Medicine (NM) Imaging in Oncology (ONC-1.3)**
 - **Bone (Non-Vertebral) Metastases (ONC-31.5)**
 - **Spinal/Vertebral Metastases (ONC-31.6)**
 - **Carcinoma of Unknown Primary Site (ONC-31.7)**
- Advanced imaging used for radiation therapy treatment planning should not be authorized using any of the diagnostic imaging codes for CT, MRI, or PET.
 - In the absence of written payor guidelines, advanced imaging performed in support of radiation therapy treatment planning should be reported with CPT® 76498 for Unlisted MRI or CPT® 76497 for Unlisted CT scan
- Delay PET/CT for at least 12 weeks after completion of radiation treatment, unless required sooner for imminent surgical resection.
- PET/CT may be considered prior to biopsy in order to determine a more favorable site for biopsy when a prior biopsy was nondiagnostic or a relatively inaccessible site is contemplated which would require invasive surgical intervention for biopsy attempt.
- PET/CT may be indicated if:
 - Conventional imaging (CT, MRI or bone scan) reveals findings that are inconclusive or negative, with continued suspicion for recurrence
- Unless specified in diagnosis-specific guideline section PET/CT Imaging is NOT indicated for:
 - Infection, inflammation, trauma, post-operative healing, granulomatous disease, rheumatological conditions
 - Concomitantly with separate diagnostic CT studies
 - Conclusive evidence of distant or diffuse metastatic disease on recent conventional imaging studies
 - Metastatic disease in the central nervous system (CNS)
 - Lesions less than 8 mm in size
 - Follow up after localized therapy (i.e. radiofrequency ablation, embolization, stereotactic radiation, etc.)
 - Rare malignancies, due to lack of available evidence regarding the diagnostic accuracy of PET in rare cancers
 - Surveillance

- Serial monitoring of individuals who are not currently receiving anti-tumor treatment or are receiving maintenance treatment
- Serial monitoring of FDG avidity until resolution.
- PET/CT avidity in a residual mass at the end of planned therapy is not an indication for PET/CT imaging during surveillance.
- Residual mass that has not changed in size since the last conventional imaging does not justify PET imaging
- Unless otherwise specified for a specific cancer type, once PET has been documented to be negative for a given individual's cancer or all PET-avid disease has been surgically resected, PET should not be used for continued disease monitoring or surveillance.
- PET/MRI is generally not supported by eviCore for imaging adults with a vast majority of oncologic conditions due to lack of standardization in imaging technique and interpretation.
 - However, it may be indicated in certain pediatric oncologic conditions. See: **PET Imaging in Pediatric Oncology (PEDONC-1.4)** for indications.
- The specific radiotracer planned to be used with PET/CT imaging is required to perform a medical necessity review. Indications for PET/CT imaging using non-FDG radiotracers are listed in diagnosis-specific guidelines.
 - Supported radiotracers:
 - ^{18}F -FDG
 - ^{68}Ga Gallium DOTATATE (NETSPOT[®]) for low-grade neuroendocrine tumors and medullary thyroid cancer
 - ^{64}Cu -DOTATATE (DETECTNET[®]) for low-grade neuroendocrine tumors
 - ^{68}Ga -DOTA-TOC for low-grade neuroendocrine tumors
 - ^{11}C Choline for prostate cancer
 - ^{18}F -Fluciclovine (AXUMIN[®]) for prostate cancer
 - ^{68}Ga PSMA-11 for prostate cancer
 - ^{18}F Piflufolastat (Pylarify[®]) for prostate cancer
 - ^{68}Ga Gozetotide (Illuccix[®] and Locametz[®]) for prostate cancer
 - ^{18}F Flotufolastat (Posluma[®]) for prostate cancer
 - ^{18}F Fluoroestradiol (Cerianna[®]) for breast cancer
 - Unsupported radiotracers:
 - ^{18}F -Na Fluoride PET bone scan
 - PET/CT imaging using isotopes other than those specified above
- Octreotide scan:
 - Specific for low and intermediate grade neuroendocrine tumors which express specific cell surface somatostatin receptors. See cancer specific guidelines for recommended use.
 - One of the following codes may be approved when Octreotide scan is requested:

- CPT® 78802 (Radiopharmaceutical localization of tumor whole-body single day study)
- CPT® 78804 (Radiopharmaceutical localization of tumor whole-body two or more days)
- In addition to one of the above CPT codes, CPT® 78803 (Radiopharmaceutical localization of tumor SPECT), SPECT CPT® 78831, or hybrid SPECT/CT (CPT® 78830 or 78832) may be approved as an add-on test for further evaluation of a specific area of interest.

Clinical Trials

- Similar to investigational and experimental studies, clinical trial imaging requests will be considered to determine whether they meet Health Plan coverage and eviCore's evidence-based guidelines.
- Imaging studies which are inconsistent with established clinical standards, or are requested for data collection and not used in direct clinical management are not supported.

Key Principles (ONC-1.1)

ON.GG.0001.1.A

v2.0.2024

AGE APPROPRIATE GUIDELINES	
Age of Individual	Appropriate Imaging Guidelines
≥18 years old at initial diagnosis	<ul style="list-style-type: none">General Oncology Imaging Guidelines, except where directed otherwise by a specific guideline section
<18 years old at initial diagnosis	<ul style="list-style-type: none">Pediatric and Special Populations Oncology Imaging Guidelines, except where directed otherwise by a specific guideline section
15 to 39 years old at initial diagnosis (defined as Adolescent and Young Adult (AYA) oncology individuals)	<ul style="list-style-type: none">When unique guidelines for a specific cancer type exist only in either General Oncology or Pediatric and Special Populations Oncology, AYA individuals should be imaged according to the guideline section for their specific cancer type, regardless of the individual's ageWhen unique guidelines for a specific cancer type exist in both General Oncology and Pediatric and Special Populations Oncology, AYA individuals should be imaged according to the age rule in the previous bullet

- Conventional Imaging (mostly CT, sometimes MRI or bone scan) of the affected area(s) drives much of initial and re-staging and surveillance. PET is not indicated for surveillance imaging unless specifically stated in the diagnosis-specific guideline sections
- Brain imaging is performed for signs or symptoms of brain disease
 - MRI Brain without and with contrast (CPT® 70553) is the recommended study for evaluation of suspected or known brain metastases.
 - MRI Brain without and with contrast (CPT® 70553) may be obtained if a non-contrast CT Head shows suspicious lesion.
 - CT Head without and with contrast (CPT® 70470) can be approved when MRI is contraindicated or not available, or if there is skull bone involvement.
 - Initiation of angiogenesis therapy is not an indication for advanced imaging of the brain in asymptomatic individuals (Avastin/Bevacizumab; <3% risk of bleeding and <1% risk of serious bleeding)

- Individuals receiving cardiotoxic chemotherapy (such as doxorubicin, trastuzumab, pertuzumab, mitoxantrone, etc.) may undergo cardiac evaluation – at baseline and for monitoring while on active therapy.
 - Echocardiography (CPT® 93306, CPT® 93307, or CPT® 93308) rather than MUGA scan for determination of LVEF and/or wall motion.
 - MUGA Scan may be performed instead of ECHO in individuals who have a low LV ejection fraction of <50% on a prior ECHO or MUGA, pre-existing left ventricular wall motion abnormalities from ischemic or non-ischemic cardiomyopathies, congestive heart failure or when ECHO is technically limited and prevents accurate assessment of LV function.
 - A prior MUGA is not a reason to approve another MUGA (it is not necessary to compare LVEF by the same modality)
 - The timeframe for monitoring the ejection fraction should be determined by the provider, but no more often than baseline and at every 6 weeks.
 - May repeat every 4 weeks if cardiotoxic chemotherapeutic drug is withheld for significant left ventricular cardiac dysfunction.
 - See: **Oncologic Indications for Cancer Therapeutics-Related Cardiac Dysfunction (CTRCD) (CD-12.1)** in the Cardiology Imaging Guidelines
- CTA or MRA of a specific anatomic region is indicated when requested for surgical planning when there is suspected vascular proximity to proposed resection margin.
- Adults (≥18 years) with a diagnosis of Li-Fraumeni Syndrome (LFS) may be screened for malignancy with a Whole-Body MRI (CPT® 76498) on an annual basis. Annual Brain MRI (CPT® 70553) may be performed as part of Whole-Body MRI or as a separate exam. Due to lack of standardization of technique, interpretation, and availability of Whole-Body MRI, individuals with LFS are encouraged to participate in clinical trials.

Use of Contrast

- CT imaging should be performed with contrast for known or suspected body regions, unless contraindicated.
 - Shellfish allergy is not a contraindication to contrast. Individuals with known shellfish allergy do not have contrast reaction any more often than other atopic individuals or individuals with other food allergies.
 - For iodinated contrast dye allergy, either CT scans without contrast or MRI scans without and with contrast are indicated.
 - If CT scanning is considered strongly indicated in an individual with known contrast allergy, CT with contrast may be considered to be safely performed following prednisone premedication over a 24-hour period prior to the study.
- For individuals with renal insufficiency which precludes contrast use, CT without contrast appropriate disease-specific areas should be offered. Further imaging (such as MRI) may be indicated if noncontrast CT results are inconclusive.
- Severe renal insufficiency, i.e. an eGFR less than 30, is a contraindication for an MRI using a gadolinium-based contrast agent (GBCA) as well. In individuals with eGFR greater than 40, GBCA administration can be safely performed. GBCA

administered to individuals with acute kidney injury or severe chronic kidney disease can result in a syndrome of nephrogenic systemic fibrosis (NSF), but GBCAs are not considered nephrotoxic at dosages approved for MRI.

- Gadolinium deposition has been found in individuals with normal renal function following the use of gadolinium based contrast agents (GBCAs).
 - The U.S. Food and Drug Administration (FDA) is investigating the risk of brain deposits following repeated use of GBCAs.
 - The FDA has noted that, “It is unknown whether these gadolinium deposits are harmful or can lead to adverse health effects.” and have recommended:
 - To reduce the potential for gadolinium accumulation, health care professionals should consider limiting GBCA use to clinical circumstances in which the additional information provided by the contrast is necessary.
 - Health care professionals are also urged to reassess the necessity of repetitive GBCA MRIs in established treatment protocols.

Radiation Exposure

- The use of MRI in place of CT scans to reduce risk of secondary malignancy from radiation exposure during CT is not supported by the peer-reviewed literature. Unless otherwise specified in the Guidelines, MRI in place of CT scans for this purpose alone is not indicated. In some instances (i.e., testicular cancer surveillance), MRI may be considered inferior to CT scans.

Phases of Oncology Imaging and General Phase-Related Considerations (ONC-1.2)

ON.GG.0001.2.A
v2.0.2024

Phases of Oncology Imaging	Definition
Screening	Imaging requested for individuals at increased risk for a particular cancer in the absence of known clinical signs or symptoms
Suspected Diagnosis	Imaging requested to evaluate a suspicion of cancer, prior to histological confirmation
Initial work-up and Staging	Imaging requested after biopsy confirmation and prior to starting specific treatment
Treatment response or Interim Restaging	Imaging performed during active treatment with chemotherapy, targeted therapy, immunotherapy, or endocrine therapy
Restaging of locally treated lesions	Imaging performed to evaluate primary or metastatic lesions with ablation using cryoablation, radiofrequency, radioactive isotope, microwave or chemotherapy
Restaging / Suspected Recurrence	Imaging requested when there is suspicion for progression or recurrence of known cancer based on clinical signs/symptoms, laboratory tests or basic imaging studies
Surveillance	Imaging performed in individuals who: <ul style="list-style-type: none"> Are asymptomatic or have chronic stable symptoms, and Have no clinical suspicion of change in disease status, and Are not receiving active anti-tumor treatment or are receiving maintenance treatment

General phase-related considerations

- Conventional imaging performed prior to diagnosis should not be repeated unless there is a delay of at least 6 weeks since previous imaging and treatment initiation or there are new or significantly worsening clinical signs or symptoms

Phase	Imaging Timeframe
After definitive local therapy of primary tumor (surgery or radiation therapy)	<ul style="list-style-type: none"> Follow surveillance guidelines

Phase	Imaging Timeframe
During adjuvant chemotherapy or endocrine therapy	<ul style="list-style-type: none">Follow surveillance guidelines
After ablative therapy	<ul style="list-style-type: none">See disease-specific guidelines
During chemotherapy or immunotherapy for measurable disease	<ul style="list-style-type: none">Every 2 cycles (generally every 6 to 8 weeks)
During endocrine/hormonal therapy for measurable disease	<ul style="list-style-type: none">Every 3 months (12 weeks)
Metastatic disease on maintenance therapy	<ul style="list-style-type: none">Every 3 months (12 weeks)
Measurable metastatic disease being monitored off therapy	<ul style="list-style-type: none">Every 3 months (12 weeks) for up to 5 years after completion of treatment for metastatic disease

Nuclear Medicine (NM) Imaging in Oncology (ONC-1.3)

ON.GG.0001.3.A

v2.0.2024

- This section does not apply to PET imaging. PET imaging considerations can be found in [PET Imaging in Oncology \(ONC-1.4\)](#)
- Bone Scan:
 - Primarily used for evaluation of bone metastases in individuals with solid malignancies.
 - Indications for bone scan in individuals with history of malignancy include – bone pain, rising tumor markers, elevated alkaline phosphatase or in individuals with primary bone tumor.
 - For evaluation of suspected or known bony metastases, CPT® 78306 (Nuclear bone scan whole-body), may be approved.
 - Radiopharmaceutical Localization scan SPECT (CPT® 78803 or CPT® 78831) or SPECT/CT (CPT® 78830 or CPT® 78832) may be approved as an add-on test for further evaluation of a specific area of interest with prior positive whole-body scan or documented bone metastasis.
 - CPT® codes 78300 (Nuclear bone scan limited), 78305 (Nuclear bone scan multiple areas) or 78315 do not have any indications in oncology nuclear medicine imaging.
- Octreotide scan:
 - Specific for low and intermediate grade neuroendocrine tumors which express specific cell surface somatostatin receptors. See cancer specific guidelines for recommended use.
 - One of the following codes may be approved when Octreotide scan is requested:
 - CPT® 78802 (Radiopharmaceutical localization of tumor whole-body single day study)
 - CPT® 78804 (Radiopharmaceutical localization of tumor whole-body two or more days)
 - In addition to one of the above CPT codes, CPT® 78803 (Radiopharmaceutical localization of tumor SPECT), SPECT CPT® 78831, or hybrid SPECT/CT (CPT® 78830 or 78832) may be approved as an add-on test for further evaluation of a specific area of interest.
- Bone marrow imaging:
 - This study is rarely performed for evaluation of the entire bone marrow in conditions like myeloproliferative disorders, sickle cell bone infarct or ischemia, avascular necrosis or myeloma

- The correct CPT code for this study is CPT® 78104 (Diagnostic Nuclear Medicine Procedures on the Hematopoietic, Reticuloendothelial and Lymphatic System)
- Brain imaging SPECT with Technetium-99m or thallium-201 (CPT® 78803):
 - Immunocompromised individuals with mass lesion detected on CT or MRI for differentiation between lymphoma and infection
 - In distinguishing recurrent brain tumor from radiation necrosis
- Radiopharmaceutical localization of tumor or distribution of radiopharmaceutical agent(s):
 - CPT® 78800, CPT® 78801, CPT® 78802, CPT® 78804, CPT® 78803, CPT® 78831 (SPECT), or CPT® 78830 or CPT® 78832 (SPECT/CT)
 - For evaluation of fever of unknown origin and osteomyelitis
 - For suspected infections such as infected central lines, grafts or shunts
- Gallium Isotope Scan:
 - Radiopharmaceutical Localization of tumor (CPT® 78800, CPT® 78801, CPT® 78802, CPT® 78803, or CPT® 78804), SPECT CPT® 78831, or hybrid SPECT/CT CPT® 78830 or 78832
 - This may be rarely used in place of PET/CT scan when PET/CT scan not available and PET/CT is indicated by guidelines for lymphoma, sarcoma, melanoma or myeloma

PET Imaging in Oncology (ONC-1.4)

ON.GG.0001.4.U

v2.0.2024

- CPT codes:
 - PET imaging in oncology should use PET/CT fusion (CPT® 78815 or CPT® 78816) Unbundling PET/CT imaging into separate PET and diagnostic CT codes is otherwise not supported.
 - The decision whether to use skull base to mid-femur (“eyes to thighs”) procedure code for PET (CPT® 78812 or CPT® 78815) or whole-body PET (CPT® 78813 or CPT® 78816) is addressed in the diagnosis-specific guideline sections.
 - “Limited area” protocol is done infrequently, but may be considered, and is reported with PET (CPT® 78811) or for PET/CT (CPT® 78814).
- Radiotracers:
 - Unless specified otherwise, the term “PET” refers to ¹⁸F-FDG-PET and PET/CT fusion studies
 - Indications for PET/CT imaging using non-FDG radiotracers are listed in diagnosis-specific guidelines. The indications may be as follows:
- Supported radiotracers:
 - ¹⁸F-FDG
 - ⁶⁸Gallium DOTATATE (NETSPOT®) for low-grade neuroendocrine tumors and medullary thyroid cancer
 - ⁶⁴Cu-DOTATATE (DETECTNET®) for low-grade neuroendocrine tumors
 - ⁶⁸Ga-DOTA-TOC for low-grade neuroendocrine tumors
 - ¹¹C Choline for prostate cancer
 - ¹⁸F-Fluciclovine (AXUMIN®) for prostate cancer
 - ⁶⁸Ga PSMA-11 for prostate cancer
 - ¹⁸F Piflufolastat (Pylarify®) for prostate cancer
 - ⁶⁸Ga Gozetotide (Illuccix® and Locametz®) for prostate cancer
 - ¹⁸F Flotufolastat (Posluma®) for prostate cancer
 - ¹⁸F Fluoroestradiol (Cerianna®) for breast cancer
- Unsupported radiotracers:
 - ¹⁸F-Na Fluoride PET bone scan
 - PET/CT imaging using isotopes other than those specified above

CPT/ HCPCS Code	Code Description	Brand or common name	Guideline Section and Cancer Type
A9552	¹⁸ F Fluoro deoxyglucose	FDG	Various guideline sections where PET is indicated
A9580	¹⁸ F Sodium fluoride	N/A	ONC-1

CPT/ HCPCS Code	Code Description	Brand or common name	Guideline Section and Cancer Type
A9587	⁶⁸ Ga-68 Dotatate	NETSPOT [®]	ONC-15: Low-grade neuroendocrine tumors, ONC-6: Medullary thyroid cancer
A9515	¹¹ C Choline	N/A	ONC-19, Prostate Cancer
A9588	¹⁸ F-Fluciclovine	AXUMIN [®]	ONC-19, Prostate Cancer
A9593 A9594	⁶⁸ Ga PSMA-11	N/A	ONC-19, Prostate Cancer
A9595	¹⁸ F Piflufolastat	Pylarify [®]	ONC-19, Prostate Cancer
A9596	⁶⁸ Ga Gozetotide	Illucix [®]	ONC-19, Prostate Cancer
A9800	⁶⁸ Ga Gozetotide	Locametz [®]	ONC-19, Prostate Cancer
A9608	¹⁸ F Flutufolastat	Posluma [®]	ONC-19, Prostate Cancer
A9591	¹⁸ F Fluoroestradiol	Cerianna [®]	ONC-11, Breast Cancer
A9592	⁶⁴ Cu Copper dotatate	Detectnet [®]	ONC-15, Low-grade neuroendocrine tumors
C9067	⁶⁸ Ga Gallium-DOTA- TOC	N/A	ONC-15, Low-grade neuroendocrine tumors

- Unless specified in diagnosis-specific guideline section PET/CT Imaging is NOT indicated for:
 - Infection, inflammation, trauma, post-operative healing, granulomatous disease, rheumatological conditions
 - Concomitantly with separate diagnostic CT studies
 - Conclusive evidence of distant or diffuse metastatic disease on recent conventional imaging studies
 - Metastatic disease in the central nervous system (CNS)
 - Lesions less than 8 mm in size
 - Follow up after localized therapy (i.e. radiofrequency ablation, embolization, stereotactic radiation, etc.)
 - Rare malignancies, due to lack of available evidence regarding the diagnostic accuracy of PET in rare cancers
 - Surveillance
 - Serial monitoring of individuals who are not currently receiving anti-tumor treatment or are receiving maintenance treatment
 - Serial monitoring of FDG avidity until resolution.

- PET/CT avidity in a residual mass at the end of planned therapy is not an indication for PET/CT imaging during surveillance.
- Residual mass that has not changed in size since the last conventional imaging does not justify PET imaging
- Unless otherwise specified for a specific cancer type, once PET has been documented to be negative for a given individual's cancer or all PET-avid disease has been surgically resected, PET should not be used for continued disease monitoring or surveillance.

PET/CT may be indicated if:

- Conventional imaging (CT, MRI or bone scan) reveals findings that are inconclusive or negative, with continued suspicion for recurrence
- The individual is undergoing salvage treatment for a recurrent solid tumor with residual measurable disease on conventional imaging and confirmed repeat negative PET imaging will allow the individual to transition from active treatment to surveillance.
- PET/CT may be considered prior to biopsy in order to determine a more favorable site for biopsy when a prior biopsy was nondiagnostic or a relatively inaccessible site is contemplated which would require invasive surgical intervention for biopsy attempt.

PET/CT for rare malignancies is not covered by eviCore guidelines due to lack of available evidence regarding diagnostic accuracy of PET/CT in the majority of rare cancers. Conventional imaging studies should be used for initial staging and treatment response for these diagnoses. PET/CT can be approved if all of the following apply:

- Conventional imaging (CT, MRI or bone scan) reveals equivocal or suspicious findings
- No other specific metabolic imaging (MIBG, octreotide, technetium, etc.) is appropriate for the disease type
- The submitted clinical information describes a specific decision regarding the individual's care that will be made based on the PET/CT results
- Delay PET/CT for at least 12 weeks after completion of radiation treatment, unless required sooner for imminent surgical resection.
- PET mammography (PEM, generally reported with CPT® 78811) is considered experimental and investigational at this time.

Unlisted Procedure Codes in Oncology (ONC-1.5)

ON.GG.0001.5.U

v2.0.2024

- eviCore does not routinely authorize requests for PET associated with image-directed biopsy or radiation therapy treatment planning.
- There is often no unique procedure code for a service performed solely for treatment planning purposes. AMA instructions in the CPT state that if no specific code exists for a particular service, the service is reported with an unlisted code.
- Advanced imaging being used for radiation therapy treatment planning should not be authorized using any of the diagnostic imaging codes for CT, MRI or PET. In the absence of written payor guidelines, advanced imaging performed in support of radiation therapy treatment planning should be reported with:
 - **CPT® 76498 for Unlisted MRI** – when MRI will be used for treatment planning of radiation therapy to be delivered ONLY to the brain, prostate and cervix. The use of this code for radiation treatment planning of any other cancers/body parts not listed above may be reviewed on a case-by-case basis.
 - **CPT® 76497 for Unlisted CT** – may NOT be used for radiation treatment planning. CT imaging performed in support of radiation therapy treatment planning is bundled in with the concurrent radiation treatment authorization codes and a separate authorization for treatment planning is not required.
 - **CPT® 78999 for Unlisted procedure, nuclear medicine (PET)** – eviCore does not perform prior authorization for this CPT code for any payor. This code may not be reviewed or offered as an alternative recommendation to the provider.
 - Imaging associated with image-directed biopsy should be reported with the corresponding interventional codes. See also: **CT-, MR-, or Ultrasound-Guided Procedures (Preface-4.2)** in the Preface Imaging Guidelines.
 - For advanced imaging used solely for the purpose of Surgical planning, see: **Unlisted Procedures/Therapy treatment planning (Preface-4.3)** in the Preface Imaging Guidelines

Predisposition Syndromes (ONC-1.6)

ON.GG.0001.6.A

v2.0.2024

- For predisposition syndrome screening in adult individuals, see: **Screening Imaging in Cancer Predisposition Syndromes (PEDONC-2)** in the Pediatric Oncology Imaging Guidelines

References (ONC-2)

Primary Central Nervous System Tumors – General Considerations (ONC-2.1)

ON.CN.0002.1.U

v2.0.2024

- This guideline section applies to primary CNS tumors only. For imaging guidelines in metastatic brain cancer, see the appropriate diagnosis-specific section or **Brain Metastases (ONC-31.3)** for imaging guidelines.
- Primary brain tumors presenting only with uncomplicated headache are very uncommon. Most primary brain tumors present with specific CNS symptoms.
- Histologic confirmation is critical. Therapeutic decisions should not be made on radiographic findings alone, except for ANY of the following:
 - Medically fragile individuals for whom attempted biopsy carries excess medical risk, as stated in writing by both the attending physician and surgeon.
 - Brain stem tumors or other sites where the imaging findings are pathognomonic and the risk of permanent neurological damage is excessive with even a limited biopsy attempt.
- For evaluation of known or suspected spinal cord compromise, see: **Spinal/Vertebral Metastases (ONC-31.6)**
- For suspected brain tumors in neurofibromatosis, see: **Screening Imaging in Cancer Predisposition Syndromes (PEDONC-2)** in the Pediatric Oncology Imaging Guidelines
- Rare tumors occurring more commonly in the pediatric population should be imaged according to the imaging guidelines in: **Pediatric Central Nervous System Tumors (PEDONC-4)** in the Pediatric Oncology Imaging Guidelines

Indication	Imaging Study
Characterization and follow up of all brain tumors	<ul style="list-style-type: none"> • MRI Brain without and with contrast (CPT® 70553) • CT Head without and with contrast (CPT® 70470) can be approved when MRI is contraindicated or not available, or there is skull bone involvement • CT Head (contrast as requested) can be approved for preoperative planning when requested by the operating surgeon
Preoperative planning or to clarify inconclusive findings on MRI or CT	<ul style="list-style-type: none"> • MRA Head (CPT® 70544) or CTA Head (CPT® 70496)

Indication	Imaging Study
Within 24 to 72 hours following brain tumor surgery	<ul style="list-style-type: none"> MRI Brain without and with contrast (CPT® 70553)
Clinical deterioration or development of new neurological features	<ul style="list-style-type: none"> MRI Brain without and with contrast (CPT® 70553) MRI Spine without and with contrast (Cervical-CPT® 72156, Thoracic-CPT® 72157, Lumbar-CPT® 72158) for signs/symptoms of spinal involvement or if spinal involvement is suspected

MR Spectroscopy in Brain Tumors (MRS, CPT® 76390)

- MRS is only supported for use in brain tumors of specified histologies where diagnostic accuracy has been established in peer-reviewed literature
 - See diagnosis-specific guidelines for MRS indications
- MRS is considered investigational/experimental for all other histologies and indications not listed in a diagnosis-specific guideline section.

PET Brain Imaging (CPT® 78608 and CPT® 78609)

- PET Brain Metabolic Imaging (CPT® 78608) is only supported for use in brain tumors of specified histologies where diagnostic accuracy has been established in peer-reviewed literature
 - According to **Medicare NCD 220.6.17**, FDG-PET may be approved once for initial treatment strategy and three times for subsequent treatment strategy for brain tumors.
- PET Brain metabolic imaging (CPT® 78608) is considered investigational/experimental for all other histologies and indications not listed in a diagnosis-specific guideline section.
- PET Brain perfusion imaging (CPT® 78609) is not indicated in the evaluation or management of primary CNS tumors, and is nationally non-covered by Medicare per **NCD 220.6.17**.
- Body PET studies (CPT® 78811, CPT® 78812, and CPT® 78813) and fusion PET/CT studies (CPT® 78814, CPT® 78815, or CPT® 78816) are not indicated in the evaluation or management of primary CNS tumors
- See: **Other Imaging Studies (HD-24)** in the Head Imaging Guidelines for details on other advanced neuro-imaging studies

Low Grade Gliomas (ONC-2.2)

ON.CN.0002.2.A

v2.0.2024

- These tumors are defined as having a WHO histologic grade of I or II (out of IV), can occur anywhere in the CNS, and includes the following tumors:
 - Pilocytic Astrocytoma
 - Fibrillary (or Diffuse) Astrocytoma
 - Optic Pathway Gliomas
 - Pilomyxoid Astrocytoma
 - Oligodendroglioma
 - Oligoastrocytoma
 - Oligodendrocytoma
 - Subependymal Giant Cell Astrocytoma (SEGA)
 - Ganglioglioma
 - Gangliocytoma
 - Dysembryoplastic infantile astrocytoma (DIA)
 - Dysembryoplastic infantile ganglioglioma (DIG)
 - Dysembryoplastic neuroepithelial tumor (DNT)
 - Tectal plate gliomas
 - Cervicomedullary gliomas
 - Pleomorphic xanthoastrocytoma (PXA)
 - Any other glial tumor with a WHO grade of I or II

Indication	Imaging Study
Initial Staging	<ul style="list-style-type: none"> • MRI Brain without and with contrast (CPT® 70553) if not already done • MRI Spine without and with contrast (Cervical-CPT® 72156, Thoracic-CPT® 72157, Lumbar-CPT® 72158) <ul style="list-style-type: none"> • MRI Spine with contrast only (Cervical-CPT® 72142, Thoracic-CPT® 72147, Lumbar-CPT® 72149) can be approved if being performed immediately following a contrast-enhanced MRI Brain
After initial resection or other treatment (radiation therapy, etc.)	<ul style="list-style-type: none"> • MRI Brain without and with contrast (CPT® 70553)

Indication	Imaging Study
For individuals undergoing chemotherapy treatment	<ul style="list-style-type: none"> MRI Brain without and with contrast (CPT® 70553) every 2 cycles Individuals with spinal cord involvement at diagnosis can have MRI without and with contrast of the involved spinal region on the same schedule as MRI brain
<u>ONE of the following:</u> <ul style="list-style-type: none"> Determine need for biopsy when transformation to high-grade glioma is suspected based on clinical symptoms or recent MRI findings Evaluate a brain lesion of indeterminate nature when the study will be used to determine whether biopsy/resection can be safely postponed 	<u>ANY of the following:</u> <ul style="list-style-type: none"> PET Brain Metabolic Imaging (CPT® 78608) MRI Perfusion imaging (CPT® 70553)
<u>ONE of the following:</u> <ul style="list-style-type: none"> Distinguish low-grade from high-grade gliomas Evaluate a brain lesion of indeterminate nature when the study will be used to determine whether biopsy/resection can be safely postponed Distinguish radiation-induced tumor necrosis from progressive disease within 18 months of completing radiotherapy 	<u>ANY of the following:</u> <ul style="list-style-type: none"> MR Spectroscopy (CPT® 76390) MRI Perfusion imaging (CPT® 70553)
Suspected intracranial or intraspinal recurrence	<ul style="list-style-type: none"> All imaging supported for initial staging may be repeated
Surveillance	<ul style="list-style-type: none"> MRI Brain without and with contrast (CPT® 70553) every 3 months for 2 years, then every 6 months thereafter Individuals with spinal cord involvement at diagnosis can have MRI Spine without and with contrast (Cervical-CPT® 72156, Thoracic-CPT® 72157, Lumbar-CPT® 72158) on the same schedule as MRI Brain

High Grade Gliomas (ONC-2.3)

ON.CN.0002.3.A

v2.0.2024

- These tumors are defined as having a WHO histologic grade of III or IV (out of IV can occur anywhere in the CNS (though the majority occur in the brain), and include the following tumors:
 - Anaplastic astrocytoma
 - Glioblastoma multiforme
 - Diffuse intrinsic pontine glioma (DIPG, or “brainstem glioma”)
 - Gliomatosis cerebri
 - Gliosarcoma
 - Anaplastic oligodendroglioma
 - Anaplastic ganglioglioma
 - Anaplastic mixed glioma
 - Anaplastic mixed ganglioneuronal tumors
 - Any other glial tumor with a WHO grade of III or IV

Indication	Imaging Study
Initial Staging	<ul style="list-style-type: none"> • MRI Brain without and with contrast (CPT® 70553) if not already done • MRI Spine without and with contrast (Cervical-CPT® 72156, Thoracic-CPT® 72157, Lumbar-CPT® 72158) <ul style="list-style-type: none"> • MRI Spine with contrast only (Cervical-CPT® 72142, Thoracic-CPT® 72147, Lumbar-CPT® 72149) can be approved if being performed immediately following a contrast-enhanced MRI Brain
Immediately following partial or complete resection	<ul style="list-style-type: none"> • MRI Brain without and with contrast (CPT® 70553)
Immediately following radiation therapy (XRT)	<ul style="list-style-type: none"> • MRI Brain without and with contrast (CPT® 70553) once within 2 to 6 weeks following completion of treatment, and then go to surveillance imaging

Indication	Imaging Study
For individuals undergoing chemotherapy treatment	<ul style="list-style-type: none"> MRI Brain without and with contrast (CPT® 70553) every 2 cycles Individuals with spinal cord involvement at diagnosis can have MRI without and with contrast of the involved spinal region on the same schedule as MRI Brain
<p><u>ONE of the following:</u></p> <ul style="list-style-type: none"> Distinguish low-grade from high-grade gliomas Evaluate a brain lesion of indeterminate nature when the study will be used to determine whether biopsy/resection can be safely postponed Distinguish radiation-induced tumor necrosis from progressive disease within 18 months of completing radiotherapy 	<p><u>ANY of the following:</u></p> <ul style="list-style-type: none"> MR Spectroscopy (CPT® 76390) MRI Perfusion imaging (CPT® 70553)
<p><u>ONE of the following:</u></p> <ul style="list-style-type: none"> Distinguish radiation-induced tumor necrosis from progressive disease Evaluate inconclusive MRI findings when the study will be used to determine need for biopsy or change in therapy, including a change from active therapy to surveillance Evaluate a brain lesion of indeterminate nature when the study will be used to determine whether biopsy/resection can be safely postponed 	<p><u>ANY of the following:</u></p> <ul style="list-style-type: none"> MRI Perfusion imaging (CPT® 70553) PET Brain metabolic imaging (CPT® 78608) <ul style="list-style-type: none"> PET Brain is not indicated in gliomas occurring in the brain stem due to poor uptake and lack of impact on individual outcomes
Suspected intracranial or intraspinal recurrence	<ul style="list-style-type: none"> All imaging supported for initial staging may be repeated

Indication	Imaging Study
Surveillance	<ul style="list-style-type: none">• MRI Brain without and with contrast (CPT® 70553) every 3 months for 3 years and every 6 months thereafter• Individuals with spinal cord involvement at diagnosis can have MRI Spine without and with contrast (Cervical-CPT® 72156, Thoracic-CPT® 72157, Lumbar-CPT® 72158) on the same schedule as MRI Brain

Medulloblastoma and Supratentorial Primitive Neuroectodermal Tumors (sPNET) (ONC-2.4)

ON.CN.0002.4.A

v2.0.2024

- Medulloblastoma and sPNET imaging indications in adult individuals are identical to those for pediatric individuals. See: **Medulloblastoma (MDB), Supratentorial Primitive Neuroectodermal Tumors (sPNET), and Pineoblastoma (PEDONC-4.4)** in the Pediatric Oncology Imaging Guidelines.

Ependymoma (ONC-2.5)

ON.CN.0002.5.A

v2.0.2024

- Ependymoma imaging indications in adult individuals are identical to those for pediatric individuals. See: **Ependymoma (PEDONC-4.8)** in the Pediatric Oncology Imaging Guidelines.

Central Nervous System Germ Cell Tumors (ONC-2.6)

ON.CN.0002.6.A

v2.0.2024

- Central nervous system germ cell tumor imaging indications in adult individuals are identical to those for pediatric individuals. See: **CNS Germinomas and Non-Germinomatous Germ Cell Tumors (NGGCT) (PEDONC-4.7)** in the Pediatric Oncology Imaging Guidelines.

CNS Lymphoma (also known as Microglioma) (ONC-2.7)

ON.CN.0002.7.A

v2.0.2024

Indication	Imaging Study
Initial Staging	<p><u>ALL of the following are indicated:</u></p> <ul style="list-style-type: none"> MRI Brain without and with contrast (CPT® 70553) MRI Cervical Spine without and with contrast (CPT® 72156) MRI Thoracic Spine without and with contrast (CPT® 72157) MRI Lumbar Spine without and with contrast (CPT® 72158)
<p>Extra-neural evaluation to confirm CNS primary</p> <p>*Individuals with CNS Lymphoma that is metastatic should be imaged according to:</p> <ul style="list-style-type: none"> <u>Non-Hodgkin Lymphomas (ONC-27)</u> for individuals age ≥18 years <u>Pediatric Aggressive Mature B-Cell Non-Hodgkin Lymphomas (NHL) (PEDONC-5.3)</u> in the Pediatric Oncology Imaging Guidelines for individuals age ≤17 years 	<p><u>ANY or ALL of the following are indicated:</u></p> <ul style="list-style-type: none"> CT Chest with contrast (CPT® 71260) CT Abdomen and Pelvis with contrast (CPT® 74177) PET/CT (CPT® 78815) can be approved for evaluation of inconclusive findings on CT imaging
Treatment Response	<ul style="list-style-type: none"> MRI without and with contrast of all positive disease sites every 2 cycles
Suspected intracranial or intraspinal recurrence	<ul style="list-style-type: none"> All imaging supported for initial staging may be repeated
Surveillance	<ul style="list-style-type: none"> MRI without and with contrast of all positive disease sites every 3 months for 2 years, then every 6 months for 3 years, then annually thereafter

Meningiomas (Intracranial and Intraspinal) (ONC-2.8)

ON.CN.0002.8.A

v2.0.2024

Indication	Imaging Study
Initial Staging of Intracranial Meningioma	<p><u>ANY or ALL of the following are indicated:</u></p> <ul style="list-style-type: none"> MRI Brain without and with contrast (CPT® 70553) CT Head (contrast as requested)
Initial staging of Intraspinal Meningioma	<p><u>ONE of the following:</u></p> <ul style="list-style-type: none"> MRI without and with contrast of appropriate spinal region (Cervical CPT® 72156, Thoracic CPT® 72157, and Lumbar CPT® 72158) <p>OR</p> <ul style="list-style-type: none"> CT without and with contrast of the appropriate spinal region (Cervical CPT® 72127, Thoracic CPT® 72130, and Lumbar CPT® 72133)
Treatment Response	<ul style="list-style-type: none"> MRI without and with contrast of all positive disease sites every 2 cycles
Suspected recurrence of intracranial or intraspinal recurrence	<ul style="list-style-type: none"> All imaging supported for initial staging may be repeated
Suspected recurrence with inconclusive findings on MRI	<p>Any ONE of the following studies:</p> <ul style="list-style-type: none"> Octreotide SPECT Brain (CPT® 78803) Octreotide SPECT/CT Brain (CPT® 78830) Dotatate PET/CT Brain (CPT® 78814)
<p>Surveillance for Grade I (low-grade) and Grade II (atypical) intracranial meningioma</p> <p>(completely resected, partially resected, and unresected)</p>	<ul style="list-style-type: none"> MRI Brain without and with contrast (CPT® 70553) at 3, 6, and 12 months, then annually for 5 years Imaging beyond 5 years is only indicated for evaluation of new signs or symptoms

Indication	Imaging Study
Surveillance for Grade I (low-grade) and Grade II (atypical) intraspinal meningioma (completely resected, partially resected, and unresected)	<p><u>ONE of the following at 3, 6, and 12 months, and then annually for 5 years:</u></p> <ul style="list-style-type: none">• MRI without and with contrast (CPT® 72156 [Cervical spine], CPT® 72157 [Thoracic spine], CPT® 72158 [Lumbar spine]) of the involved spinal level <p>OR</p> <ul style="list-style-type: none">• CT without and with contrast (CPT® 72127 [Cervical spine], CPT® 72130 [Thoracic spine], CPT® 72133 [Lumbar spine]) of the involved spinal level• Imaging beyond 5 years is only indicated for evaluation of new signs or symptoms
Surveillance for Grade III (malignant or anaplastic) Meningioma	<ul style="list-style-type: none">• <u>Intracranial Meningioma</u>: MRI Brain without and with contrast (CPT® 70553) every 3 months for 3 years, and then every 6 months thereafter• <u>Intraspinal Meningioma</u>: MRI or CT without and with contrast of the involved spinal region every 3 months for 3 years and then every 6 months thereafter

Spinal Cord Tumors (Benign and Malignant) (ONC-2.9)

ON.CN.0002.9.A

v2.0.2024

- See: **Low Grade Gliomas (ONC-2.2)** and **High Grade Gliomas (ONC-2.3)** for imaging guidelines of low-grade and high-grade gliomas of the spinal cord
- See: **Malignant Tumors of the Spinal Cord (PEDONC-4.9)** in the Pediatric Oncology Imaging Guidelines for other malignant spinal cord tumors
- See: **Neurofibromatosis 1 and 2 (NF1 and NF2) (PEDONC-2.3)** in the Pediatric Oncology Imaging Guidelines for spinal tumors in individuals with Neurofibromatosis 1 or 2
- See: **Spinal/Vertebral Metastases (ONC-31.6)** for known secondary malignancy involving the spine/spinal canal/spinal cord

Choroid Plexus Tumors (ONC-2.10)

ON.CN.0002.10.A

v2.0.2024

- Choroid Plexus Tumor imaging indications in adult individuals are identical to those for pediatric individuals. See: **Choroid Plexus Tumors (PEDONC-4.13)** in the Pediatric Oncology Imaging Guidelines.

Squamous Cell Carcinomas of the Head and Neck (ONC-3)

Guideline

Squamous Cell Carcinomas of the Head and Neck – General
Considerations (ONC-3.0)

Squamous Cell Carcinomas of the Head and Neck – Suspected/Diagnosis
(ONC-3.1)

Squamous Cell Carcinomas of the Head and Neck – Initial
Work-up/Staging (ONC-3.2)

Squamous Cell Carcinomas of the Head and Neck –
Restaging/Recurrence (ONC-3.3)

Squamous Cell Carcinomas of the Head and Neck – Surveillance/Follow-
up (ONC-3.4)

References (ONC-3)

Squamous Cell Carcinomas of the Head and Neck – General Considerations (ONC-3.0)

ON.HN.0003.0.A
v2.0.2024

- Individuals with esthesioneuroblastoma should be imaged according to this guideline section
- Stage III/IV disease encompasses any primary tumor larger than 4 cm or documented lymph node positive disease

Squamous Cell Carcinomas of the Head and Neck – Suspected/Diagnosis (ONC-3.1)

ON.HN.0003.1.A
v2.0.2024

- See: **Neck Masses - Imaging (NECK-5.1)** in the Neck Imaging Guidelines for evaluation of suspected malignancy in the neck
- PET may be considered prior to biopsy in order to determine a more favorable site for biopsy when:
 - A prior biopsy was nondiagnostic or
 - A relatively inaccessible site is contemplated which would require invasive surgical intervention for biopsy attempt

Squamous Cell Carcinomas of the Head and Neck – Initial Work-up/Staging (ONC-3.2)

ON.HN.0003.2.A
v2.0.2024

Indication	Imaging Study
All Stages of Disease	<ul style="list-style-type: none"> CT Neck with contrast (CPT® 70491) or MRI Orbits/Face/Neck (OFN) without and with contrast (CPT® 70543) CT Chest with contrast (CPT® 71260)
For sentinel lymph node evaluation when nodes are not clinically positive	<ul style="list-style-type: none"> Lymph system imaging (lymphoscintigraphy, CPT® 78195) <ul style="list-style-type: none"> SPECT/CT (CPT® 78830) is indicated as an add on code if requested
Nasal cavity and paranasal sinuses (bony erosion or skull base and intracranial involvement)	<p><u>ONE of the following studies is indicated:</u></p> <ul style="list-style-type: none"> CT Maxillofacial with contrast (CPT® 70487) CT Neck with contrast (CPT® 70491) MRI Orbits/Face/Neck without and with contrast (CPT® 70543)
Nasopharyngeal (NPC) Cancer	<ul style="list-style-type: none"> PET/CT (CPT® 78815) MRI Orbits/Face/Neck without and with contrast (CPT® 70543) is the preferred study <ul style="list-style-type: none"> CT Neck (CPT® 70491) and/or CT Maxillofacial (CPT® 70487) with contrast can be approved if contraindication to MRI CT Chest with contrast (CPT® 71260)

Indication	Imaging Study
<u>For ANY of the following:</u> <ul style="list-style-type: none">• Known stage III or IV disease• Prior to start of primary chemoradiotherapy and have not undergone definitive surgical resection• Inconclusive findings on conventional imaging (CT, MRI)• In order to direct laryngoscopy/exam under anesthesia for biopsy• Pulmonary nodule(s) ≥ 8 mm in size• Cervical lymph node biopsy positive for squamous cell carcinoma and no primary site identified on CT or MRI Neck and Chest• Inconclusive findings suggestive of disease outside the head and neck area	<ul style="list-style-type: none">• PET/CT (CPT® 78815)
Signs or symptoms of abdominal metastatic disease, including elevated liver function tests	<ul style="list-style-type: none">• CT Abdomen with contrast (CPT® 74160)
Any head and neck cancer with neurological findings or suspicion of skull base invasion	<ul style="list-style-type: none">• MRI Brain without and with contrast (CPT® 70553)

Squamous Cell Carcinomas of the Head and Neck – Restaging/Recurrence (ONC-3.3)

ON.HN.0003.3.A

v2.0.2024

Indication	Imaging Study
Following complete resection and/or radical neck dissection	See: <u>Surveillance/Follow-up (ONC-3.4)</u>
Following primary chemoradiotherapy or radiation therapy in individuals who have not undergone surgical resection of primary tumor or neck dissection	<p><u>ONE</u> of the following:</p> <ul style="list-style-type: none"> CT Neck with contrast (CPT® 70491); or MRI Orbits/Face/Neck without and with contrast (CPT® 70543); or PET/CT (CPT® 78815) no sooner than 12 weeks (3 months) post completion of radiation therapy <ul style="list-style-type: none"> If post-treatment PET/CT scan is negative, further surveillance imaging is not routinely indicated.
Induction chemotherapy response	<ul style="list-style-type: none"> CT Neck with contrast (CPT® 70491) or MRI Orbits/Face/Neck without and with contrast (CPT® 70543) PET not indicated to assess response to induction chemotherapy
Measurable or metastatic disease undergoing active treatment	<p><u>Every 2 cycles (6-8 weeks):</u></p> <ul style="list-style-type: none"> CT Neck with contrast (CPT® 70491) <p>OR</p> <ul style="list-style-type: none"> MRI Orbits/ Face/Neck without and with contrast (CPT® 70543) <p>AND</p> <ul style="list-style-type: none"> CT with contrast of involved body sites
Suspected local recurrence	<ul style="list-style-type: none"> CT Neck with contrast (CPT® 70491) or MRI Orbits/Face/Neck without and with contrast (CPT® 70543) CT Chest with contrast (CPT® 71260)

Indication	Imaging Study
Biopsy proven local recurrence	<u>ONE of the following:</u> <ul style="list-style-type: none">PET/CT (CPT® 78815) or <ul style="list-style-type: none">CT Neck with contrast (CPT® 70491) or MRI Orbits/Face/Neck without and with contrast (CPT® 70543) and CT Chest with contrast (CPT® 71260)
Inconclusive conventional imaging (CT or MRI)	<ul style="list-style-type: none">PET/CT (CPT® 78815)
If new pulmonary symptoms or chest previously involved	<ul style="list-style-type: none">CT Chest with contrast (CPT® 71260)

Squamous Cell Carcinomas of the Head and Neck – Surveillance/Follow-up (ONC-3.4)

ON.HN.0003.4.A

v2.0.2024

Indications	Imaging Study
Individuals treated with surgical resection of primary site and/or neck dissection (with or without postoperative radiation therapy)	<u>Once within 6 months of completing all treatment:</u> <ul style="list-style-type: none"> CT Neck with contrast (CPT® 70491) or MRI Orbits/Face/Neck without and with contrast (CPT® 70543) CT with contrast of any other involved body area
Individuals treated with definitive radiation therapy or combined chemoradiation, and post-treatment imaging is negative	Further surveillance imaging is not routinely indicated
If post-treatment imaging shows residual abnormalities	<u>ONE of the following, once within 6 months of prior imaging:</u> <ul style="list-style-type: none"> CT Neck with contrast (CPT® 70491) OR MRI Orbits/Face/Neck without and with contrast (CPT® 70543)
<u>After initial post-treatment study, for ANY of the following:</u> <ul style="list-style-type: none"> Nasopharyngeal primary site Physical exam unable to visualize deep-seated primary site 	<u>Annually for 3 years:</u> <ul style="list-style-type: none"> CT Neck with contrast (CPT® 70491) or MRI Orbits/Face/Neck without and with contrast (CPT® 70543)
<ul style="list-style-type: none"> CT Chest is not indicated for surveillance. Individuals with smoking history may undergo annual low dose CT cancer screening if criteria are met (See: Lung Cancer Screening (CH-33) in the Chest Imaging Guidelines)

Salivary Gland Cancers (ONC-4)

Guideline

- Salivary Gland Cancers – General Considerations (ONC-4.0)
- Salivary Gland Cancers – Suspected/Diagnosis (ONC-4.1)
- Salivary Gland Cancers – Initial Work-up/Staging (ONC-4.2)
- Salivary Gland Cancers – Restaging/Recurrence (ONC-4.3)
- Salivary Gland Cancers – Surveillance/Follow-up (ONC-4.4)
- References (ONC-4)

Salivary Gland Cancers – General Considerations (ONC-4.0)

ON.SG.0004.0.A**v2.0.2024**

- Salivary gland tumors may originate within the parotid, submandibular, sublingual or minor salivary glands in the mouth.
- Histological subtypes include:
 - Mucoepidermoid
 - Acinic
 - Adenocarcinoma
 - Adenoid cystic carcinoma
 - Malignant myoepithelial tumors
 - Squamous cell carcinoma
 - Lymphoma and metastatic squamous carcinoma can occur in the parotid gland
- Over 80% of parotid gland tumors are benign. A bilateral parotid tumor is most likely Warthin's tumor.
- The role of PET in salivary gland tumors is considered experimental, investigational, or unproven.

Salivary Gland Cancers – Suspected/Diagnosis (ONC-4.1)

ON.SG.0004.1.A

v2.0.2024

- See: **Salivary Gland Disorders (NECK-11)** and **Neck Masses – Imaging (NECK-5.1)** in the Neck Imaging Guidelines for evaluation of salivary gland masses, salivary gland stones and neck masses.

Salivary Gland Cancers – Initial Work-up/Staging (ONC-4.2)

ON.SG.0004.2.A

v2.0.2024

Indication	Imaging Study
Biopsy-proven malignancy	<u>ONE</u> of the following can be approved: <ul style="list-style-type: none">• MRI Orbits/Face/Neck without and with contrast (CPT® 70543)• CT Neck with contrast (CPT® 70491)• CT Neck without contrast (CPT® 70490)
Skull base invasion	<ul style="list-style-type: none">• MRI Brain without and with contrast (CPT® 70553)
<ul style="list-style-type: none">• Adenoid cystic carcinoma• Lymphadenopathy in the neck• Pulmonary signs or symptoms• Abnormal chest x-ray	<ul style="list-style-type: none">• CT Chest with contrast (CPT® 71260)

Salivary Gland Cancers – Restaging/Recurrence (ONC-4.3)

ON.SG.0004.3.A

v2.0.2024

Indication	Imaging Study
After complete surgical resection	See: Salivary Gland Cancers - Surveillance (ONC-4.4)
Individuals with unresected disease receiving systemic therapy (chemotherapy)	<u>ONE of the following may be approved every 2 cycles:</u> <ul style="list-style-type: none">• CT Neck with contrast (CPT® 70491) and any other sites of disease• MRI Orbits/Face/Neck without and with contrast (CPT® 70543) and any other sites of disease
Recurrence or progression suspected based on new or worsening signs or symptoms	<u>ONE of the following may be approved:</u> <ul style="list-style-type: none">• CT Neck with contrast (CPT® 70491)• MRI Orbits/Face/Neck without and with contrast (CPT® 70543) <u>In addition, for all individuals:</u> <ul style="list-style-type: none">• CT Chest with contrast (CPT® 71260)
All other individuals	<ul style="list-style-type: none">• No routine advanced imaging indicated

Salivary Gland Cancers – Surveillance/ Follow-up (ONC-4.4)

ON.SG.0004.4.A

v2.0.2024

Indication	Imaging Study
Total surgical resection	<ul style="list-style-type: none">No routine advanced imaging indicated
Unresectable or partially resected disease, including those treated with radiation therapy	<ul style="list-style-type: none">Either CT Neck with contrast (CPT® 70491) or MRI Orbits/Face/Neck without and with contrast (CPT® 70543) once within 6 months of completion of treatment
Adenoid cystic carcinoma	<p><u>ANY of the following, annually for up to 10 years:</u></p> <ul style="list-style-type: none">CT Neck with contrast (CPT® 70491) or MRI Orbits/Face/Neck without and with contrast (CPT® 70543)CT Chest with contrast (CPT® 71260) or CT Chest without contrast (CPT® 71250)

Melanomas and Other Skin Cancers (ONC-5)

Guideline

- Melanoma – General Considerations (ONC-5.0)
- Melanoma – Suspected/Diagnosis (ONC-5.1)
- Melanoma – Initial Work-up/Staging (ONC-5.2)
- Melanoma – Restaging/Recurrence (ONC-5.3)
- Melanoma – Surveillance/Follow-up (ONC-5.4)
- Non-Melanoma Skin Cancers – General Considerations (ONC-5.5)
- Non-Melanoma Skin Cancers – Initial Work-up/Staging (ONC-5.6)
- Non-Melanoma Skin Cancers – Restaging/Recurrence (ONC-5.7)
- Non-Melanoma Skin Cancers – Surveillance/Follow-up (ONC-5.8)
- Ocular Melanoma (ONC-5.9)
- References (ONC-5)

Melanoma – General Considerations (ONC-5.0)

ON.SC.0005.0.A
v2.0.2024

- Melanomas can metastasize in an unpredictable fashion.

Melanoma – Suspected/Diagnosis (ONC-5.1)

ON.SC.0005.1.A

v2.0.2024

Indication	Imaging Study
All	<ul style="list-style-type: none">Imaging is not indicated until histologic diagnosis is confirmed

Melanoma – Initial Work-up/Staging (ONC-5.2)

ON.SC.0005.2.A

v2.0.2024

Indication	Imaging Study
Stage 0 or IA (in situ or disease <1 mm)	<ul style="list-style-type: none"> Routine advanced imaging is not indicated
<ul style="list-style-type: none"> Stage IB (<0.8 mm with ulceration or 0.8-1 mm without or with ulceration) Stage II (lesions >1 mm thick, but node negative) 	<ul style="list-style-type: none"> CT with contrast or MRI without and with contrast of specific areas, only if signs or symptoms indicate need for further evaluation
For sentinel lymph node evaluation in stages IB and II	<ul style="list-style-type: none"> Lymph system imaging (lymphoscintigraphy, CPT® 78195) <ul style="list-style-type: none"> SPECT/CT (CPT® 78830) is indicated as an add on code if requested
<u>Any of the following:</u> <ul style="list-style-type: none"> Stage III (sentinel node positive, palpable regional nodes) Stage IV (metastatic) 	<ul style="list-style-type: none"> PET/CT (CPT® 78815 or CPT® 78816) OR <ul style="list-style-type: none"> CT Chest with contrast (CPT® 71260) and CT Abdomen and Pelvis with contrast (CPT® 74177) MRI Brain without and with contrast (CPT® 70553)
