<ul style="list-style-type: none"> Head or neck primary site Palpable lymphadenopathy in the neck Mucosal melanoma of the head or neck region 	In addition to above initial staging imaging, if PET/CT not performed: <ul style="list-style-type: none"> CT Neck with contrast (CPT® 70491)
<ul style="list-style-type: none"> Primary site of melanoma is unknown and CT Chest, Abdomen, and Pelvis are negative 	<ul style="list-style-type: none"> PET/CT (CPT® 78815 or CPT® 78816)

Melanoma – Restaging/Recurrence (ONC-5.3)

ON.SC.0005.3.A

v2.0.2024

- All recurrences should be confirmed histologically, except when excessive morbidity from a biopsy may occur, such as a biopsy requiring craniotomy.

Indication	Imaging Study
Individuals receiving chemotherapy, with measurable disease, every 2 cycles (commonly every 6 to 8 weeks)	<ul style="list-style-type: none"> CT Chest with contrast (CPT® 71260); and CT Abdomen and Pelvis with contrast (CPT® 74177)
All in situ recurrences	<ul style="list-style-type: none"> Restaging imaging is not needed after adequate aggressive local therapy (See Surveillance below)
<u>Documented or clinically suspected (See top of page regarding biopsy morbidity) recurrence at:</u> <ul style="list-style-type: none"> Primary site In-transit disease Regional lymph nodes Metastatic site 	<ul style="list-style-type: none"> CT Chest with contrast (CPT® 71260); and CT Abdomen and Pelvis with contrast (CPT® 74177) <p><u>In addition, for all individuals:</u></p> <ul style="list-style-type: none"> MRI Brain without and with contrast (CPT® 70553)
<u>ANY of the following:</u> <ul style="list-style-type: none"> Inconclusive findings on conventional imaging Isolated metastatic site found on conventional imaging 	<ul style="list-style-type: none"> PET/CT (CPT® 78815 or CPT® 78816)
<u>Brain imaging is indicated for:</u> <ul style="list-style-type: none"> New discovery of metastatic disease or progression of metastatic disease Signs or symptoms of CNS disease If considering Interleukin (IL-2) therapy 	<ul style="list-style-type: none"> MRI Brain without and with contrast (CPT® 70553)

Melanoma – Surveillance/Follow-up (ONC-5.4)

ON.SC.0005.4.A

v2.0.2024

Indication	Imaging Study
Stage 0, IA, IB and IIA Melanomas	<ul style="list-style-type: none"> No routine advanced imaging indicated
Stage IIB, IIC, IIIA and IIIB Melanomas	<ul style="list-style-type: none"> CT Chest (CPT® 71260) and CT Abdomen and Pelvis (CPT® 74177) with contrast every 6 months for 2 years, then annually for 3 years For melanoma arising from extremities, advanced imaging of the primary site is not routinely indicated for surveillance in asymptomatic individuals.
Stage IIIC and IV Melanomas	<ul style="list-style-type: none"> CT Chest (CPT® 71260) and CT Abdomen and Pelvis (CPT® 74177) with contrast every 3 months for 2 years, then every 6 months for 3 years MRI Brain without and with contrast (CPT® 70553) annually for 3 years For melanoma arising from extremities, advanced imaging of the primary site is not routinely indicated for surveillance in asymptomatic individuals.
Mucosal Melanoma of the head or neck region	<p>In addition to above stage-based surveillance imaging, the following may be obtained ONCE within 6 months of completing all treatment:</p> <ul style="list-style-type: none"> CT Neck with contrast (CPT® 70491) or MRI Orbits/Face/Neck without and with contrast (CPT® 70543) CT with contrast of any other involved body area
Liver metastases treated with focal therapy	<ul style="list-style-type: none"> See: <u>Liver Metastases (ONC-31.2)</u>

Non-Melanoma Skin Cancers – General Considerations (ONC-5.5)

ON.SC.0005.5.A**v2.0.2024**

- Advanced imaging is generally not indicated for basal cell and squamous cell skin cancers
- PET/CT scan is not indicated for evaluation of non-melanoma skin cancers unless specified within the guidelines below (e.g. Merkel cell carcinoma)
- Merkel cell carcinoma is an unusual skin cancer with neuroendocrine-like histologic features, which has a high propensity (25% to 33%) for regional lymph node spread and occasionally, metastatic spread to lungs.
- Merkel cell carcinoma may present as a primary cancer or as a skin metastasis from a non-cutaneous primary neuroendocrine carcinoma (i.e., small cell lung cancer), therefore conventional imaging is indicated initially to confirm the absence of metastasis prior to considering PET scan.

Non-Melanoma Skin Cancers – Initial Work-up/Staging (ONC-5.6)

ON.SC.0005.6.A

v2.0.2024

Indication	Imaging Study
Body area with unexplained signs or symptoms	<ul style="list-style-type: none"> CT with contrast of that body area
Perineural invasion or local regional extension (i.e. bone; deep soft tissue) involvement	<p><u>ONE of the following may be approved of the primary site:</u></p> <ul style="list-style-type: none"> MRI without contrast or without and with contrast CT (contrast as requested)
Skin lesion may be a dermal metastasis from distant primary	<ul style="list-style-type: none"> CT Chest (CPT® 71260) and CT Abdomen and Pelvis (CPT® 74177) with contrast PET/CT (CPT® 78815 or CPT® 78816) is indicated if conventional imaging (CT or MRI) is unable to identify a primary site
Squamous cell carcinoma head or neck skin with regional lymphadenopathy	<ul style="list-style-type: none"> CT Neck (CPT® 70491) and CT Chest (CPT® 71260) with contrast
Merkel Cell carcinoma	<ul style="list-style-type: none"> CT Chest with contrast (CPT® 71260) and CT Abdomen and Pelvis with contrast (CPT® 74177) CT with contrast of other involved body area(s) PET/CT (CPT® 78815 or CPT® 78816) if inconclusive conventional imaging Lymph system imaging (lymphoscintigraphy, CPT® 78195) for sentinel lymph node evaluation <ul style="list-style-type: none"> SPECT/CT (CPT® 78830) is indicated as an add on code if requested
Signs or symptoms of CNS involvement	<ul style="list-style-type: none"> MRI Brain with and without contrast (CPT® 70553)

Non-Melanoma Skin Cancers – Restaging/Recurrence (ONC-5.7)

ON.SC.0005.7.A

v2.0.2024

- All recurrences should be confirmed histologically, except when excessive morbidity from a biopsy may occur, such as a biopsy requiring craniotomy.

Indication	Imaging Study
Recurrence where planned therapy is more extensive than simple wide local excision	<ul style="list-style-type: none">CT with contrast of the primary and recurrent site(s)
Suspected or biopsy-proven recurrence of Merkel cell carcinoma	<ul style="list-style-type: none">CT Chest (CPT® 71260) and CT Abdomen and Pelvis (CPT® 74177) with contrastCT with contrast of other symptomatic body area(s)
Inconclusive findings on conventional imaging	<ul style="list-style-type: none">PET/CT (CPT® 78815 or 78816)
Signs or symptoms of CNS involvement	<ul style="list-style-type: none">MRI Brain without and with contrast (CPT® 70553)

Non-Melanoma Skin Cancers – Surveillance/Follow-up (ONC-5.8)

ON.SC.0005.8.A

v2.0.2024

Indication	Imaging Study
Merkel cell cancer – only if node positive	<ul style="list-style-type: none">CT Chest (CPT® 71260) and CT Abdomen and Pelvis (CPT® 74177) with contrast every 6 months for 5 yearsAdd CT Neck with contrast (CPT® 70491) if known prior neck disease or scalp/facial/neck disease
All others	<ul style="list-style-type: none">Routine advanced imaging for surveillance is not indicatedImaging indicated only for signs and symptoms of recurrent disease

Ocular Melanoma (ONC-5.9)

ON.SC.0005.9.A

v2.0.2024

General Considerations

- Approximately 95% of ocular melanomas arise from the uvea (iris, ciliary body and choroid) and 5% arise from the conjunctiva or orbit.
- Biopsy is usually not necessary for initial diagnosis of uveal melanoma but may be useful in cases when diagnosis is uncertain (e.g. amelanotic tumors, retinal detachment) or for prognostic analysis and risk stratification.
- Treatment is directed to the affected eye with systemic therapy reserved only for known metastatic disease.
- The most common site of metastatic disease is the liver.
- Surveillance of the affected eye is with clinical examination only; advanced imaging is supported for surveillance of systemic metastatic disease based on individual risk factors. See risk categories below for surveillance recommendations.

Ocular Melanoma Risk Categories

Low Risk	Medium Risk	High-Risk
T1	T2 and T3	T4
Class IA	Class IB	Class 2
Spindle cell histology	Mixed Spindle and Epitheloid cells	Epitheloid cell histology
No extraocular extension	No extraocular extension	Extraocular extension present
No ciliary body involvement	No ciliary body involvement	Ciliary body involvement present
Chromosome mutations: <ul style="list-style-type: none">• Disomy 3• EIF1AX mutation• Gain of chromosome 6p	Chromosome mutations: <ul style="list-style-type: none">• SF3B1 mutation	Chromosome mutations: <ul style="list-style-type: none">• BAP1 mutation• PRAME mutation• Monosomy 3• Gain of chromosome 8q

Indication	Imaging Study
Initial staging of suspected or biopsy-proven uveal melanoma	<p><u>ANY or ALL of the following:</u></p> <ul style="list-style-type: none"> CT Chest with contrast (CPT® 71260) CT Abdomen and Pelvis with contrast (CPT® 74177) MRI Orbits/Face/Neck without and with contrast (CPT® 70543)
Neurological signs/symptoms	<ul style="list-style-type: none"> MRI Brain without and with contrast (CPT® 70553)
Restaging/Suspected Recurrence	<p><u>ANY or ALL of the following:</u></p> <ul style="list-style-type: none"> CT Chest with contrast (CPT® 71260) CT Abdomen and Pelvis with contrast (CPT® 74177) MRI Orbits/Face/Neck without and with contrast (CPT® 70543) MRI Brain without and with contrast (CPT® 70553)
Surveillance for Low Risk disease	<p><u>Annually for 10 years:</u></p> <ul style="list-style-type: none"> CT Chest with contrast (CPT® 71260) CT Abdomen with contrast (CPT® 74160) or MRI Abdomen without and with contrast (CPT® 74183)
Surveillance for Medium Risk disease	<p><u>Every 6 months for 2 years and then annually up to year 10:</u></p> <ul style="list-style-type: none"> CT Chest with contrast (CPT® 71260) CT Abdomen with contrast (CPT® 74160) or MRI Abdomen without and with contrast (CPT® 74183)
Surveillance for High Risk disease	<p><u>Every 3 months for 2 years, every 6 months for 3 years, then annually up to year 10:</u></p> <ul style="list-style-type: none"> CT Chest with contrast (CPT® 71260) CT Abdomen with contrast (CPT® 74160) or MRI Abdomen without and with contrast (CPT® 74183)

Thyroid Cancer (ONC-6)

Guideline

Thyroid Cancer – General Considerations (ONC-6.0)

Thyroid Cancer – Suspected/Diagnosis (ONC-6.1)

Thyroid Cancer – Initial Work-up/Staging (ONC-6.2)

Thyroid Cancer – Restaging/Recurrence (ONC-6.3)

Thyroid Cancer – Surveillance/Follow-up (ONC-6.4)

References (ONC-6)

Thyroid Cancer – General Considerations (ONC-6.0)

ON.TC.0006.0.A

v2.0.2024

- Individuals of all ages with thyroid cancer are imaged according to this guideline.
- Whole-Body Thyroid Nuclear scan (also known as whole-body radioiodine scan) is coded with CPT® 78018. If CPT® 78018 is obtained and found to be positive, CPT® 78020 may be approved as an add-on test to evaluate the degree of iodine uptake.
- Single photon emission computed tomography (SPECT) imaging – Radiopharmaceutical Localization of Tumor SPECT (CPT® 78803 or CPT® 78831) or SPECT/CT Hybrid study (CPT® 78830 or CPT® 78832) may complement planar and pinhole imaging and can be approved as an add-on wherever radioiodine (RAI) scans are indicated.
- Whole-Body Thyroid Nuclear scan (also known as whole-body RAI scan) is the imaging modality of choice for differentiated thyroid cancers, as these are usually not well visualized on FDG-PET/CT scans. Individuals who have RAI-diagnostic scan negative and PET-positive disease will generally not respond to RAI treatment, whereas individuals who have PET-negative and RAI-diagnostic scan negative disease may still be candidates for empiric RAI treatment.
- Radioiodine (RAI) refractory disease is defined as: (i) the malignant/metastatic tissue does not ever concentrate RAI (no uptake outside the thyroid bed at the first therapeutic WBS), (ii) the tumor tissue loses the ability to concentrate RAI after previous evidence of RAI-avid disease (in the absence of stable iodine contamination), (iii) RAI is concentrated in some lesions but not in others, and (iv) metastatic disease progresses despite significant concentration of RAI⁶.

Small Cell Lung Cancer (ONC-7)

Guideline

Small Cell Lung Cancer – General Considerations (ONC-7.0)

Small Cell Lung Cancer – Suspected/Diagnosis (ONC-7.1)

Small Cell Lung Cancer – Initial Work-up/Staging (ONC-7.2)

Small Cell Lung Cancer – Restaging/Recurrence (ONC-7.3)

Small Cell Lung Cancer – Surveillance/Follow-up (ONC-7.4)

References (ONC-7)

Small Cell Lung Cancer – General Considerations (ONC-7.0)

ON.SL.0007.0.A

v2.0.2024

- Combined histologies of Small and Non-Small cell are considered Small cell lung cancer. Use this guideline for imaging recommendations for small and large cell high-grade (poorly differentiated) neuroendocrine tumors of the lung.
- Imaging is presently guided by traditional staging of limited or extensive disease.
 - Extensive stage is either metastatic disease or an extent which cannot be encompassed by a single radiotherapy portal.
 - Limited staging is confined to one side of the chest.
- Individuals treated curatively for SCLC are at increased risk for developing a second lung cancer. If new lung nodule is seen on imaging without any evidence of other systemic disease, follow **Lung Metastases (ONC-31.1)** for work-up of nodule.
- For carcinoid (low-grade neuroendocrine tumors) of the lung, see: **Neuroendocrine Cancers and Adrenal Tumors (ONC-15)**

Small Cell Lung Cancer – Suspected/Diagnosis (ONC-7.1)

ON.SL.0007.1.A

v2.0.2024

Indication	Imaging Study
<ul style="list-style-type: none"> Abnormal chest x-ray or clinical suspicion remains high despite a normal chest x-ray in symptomatic individual 	<ul style="list-style-type: none"> CT Chest without contrast (CPT® 71250) or CT Chest with contrast (CPT® 71260)
<ul style="list-style-type: none"> Pulmonary nodule <8 mm in size noted on CT Chest 	<ul style="list-style-type: none"> See: <u>Incidental Pulmonary Nodules Detected on CT Images (CH-16.2)</u> in the Chest Imaging Guidelines
<ul style="list-style-type: none"> Pulmonary nodule 8 mm (0.8 cm) to 30 mm (3 cm) seen on CT Chest or MRI Chest 	<ul style="list-style-type: none"> See: <u>PET (CH-16.4)</u> in the Chest Imaging Guidelines If PET is Positive: Qualifies as initial staging PET/CT Biopsy is indicated prior to PET imaging for pulmonary masses ≥31 mm (3.1 cm) in size
<ul style="list-style-type: none"> Mediastinal/Hilar Mass 	See: <u>Lymphadenopathy (CH-2)</u> in the Chest Imaging Guidelines
<ul style="list-style-type: none"> Paraneoplastic syndrome suspected 	See: <u>Paraneoplastic Syndromes (ONC-30.3)</u>

Small Cell Lung Cancer – Initial Work-up/Staging (ONC-7.2)

ON.SL.0007.2.A

v2.0.2024

Indication	Imaging Study
Initial staging	<u>ANY or ALL</u> of the following: <ul style="list-style-type: none">• CT Chest with contrast (CPT® 71260)• CT Abdomen and Pelvis with contrast (CPT® 74177)• MRI Brain without and with contrast (CPT® 70553)• Bone scan, if PET/CT not being done (See also: <u>Nuclear Medicine (NM) Imaging (ONC-1.3)</u> in Oncology)
To confirm the extent of disease when initial CT and MRI indicate limited stage disease (confined to one side of the chest)	<ul style="list-style-type: none">• PET/CT (CPT® 78815)

Small Cell Lung Cancer – Restaging/Recurrence (ONC-7.3)

ON.SL.0007.3.A

v2.0.2024

Indication	Imaging study
<u>Treatment Response:</u> <ul style="list-style-type: none"> After every 2 cycles of chemotherapy Following completion of chemoradiation 	<u>ANY or ALL of the following:</u> <ul style="list-style-type: none"> CT Chest with contrast (CPT® 71260) CT Abdomen and Pelvis with contrast (CPT® 74177) MRI Brain without and with contrast (CPT® 70553) for measurable brain metastases being treated with systemic therapy Bone scan (See also: <u>Nuclear Medicine (NM) Imaging in Oncology (ONC-1.3)</u>) PET is not indicated for evaluation of treatment response in SCLC, but can be considered on a case-by-case basis.
Restaging (suspected recurrence)	<u>ANY or ALL of the following:</u> <ul style="list-style-type: none"> CT Chest with contrast (CPT® 71260) CT Abdomen and Pelvis with contrast (CPT® 74177) MRI Brain without and with contrast (CPT® 70553) Bone scan (See: <u>Nuclear Medicine (NM) Imaging in Oncology (ONC-1.3)</u>) PET is not indicated for evaluation of recurrent SCLC but can be considered on a case-by-case basis.
Complete or partial response to initial treatment, if prophylactic cranial irradiation (PCI) is planned	<ul style="list-style-type: none"> MRI Brain without and with contrast (CPT® 70553)

Small Cell Lung Cancer – Surveillance/ Follow-up ONC-7.4

ON.PC.0007.4.A

v2.0.2024

Indication	Imaging Study
Limited stage SCLC	<u>Every 3 months for one year, every 6 months for two years, and then annually:</u> <ul style="list-style-type: none">• CT Chest without (CPT® 71250) or CT Chest with (CPT® 71260) contrast• CT Abdomen and Pelvis with contrast (CPT® 74177)• For new nodules, see: <u>Lung Metastases (ONC-31.1)</u>
Extensive stage SCLC	<u>Every 2 months for one year, every 4 months for two years, every 6 months for two years, and then annually:</u> <ul style="list-style-type: none">• CT Chest without (CPT® 71250) or CT Chest with (CPT® 71260) contrast• CT Abdomen and Pelvis with contrast (CPT® 74177)• For new nodules, see: <u>Lung Metastases (ONC-31.1)</u>
Screening for brain metastases, regardless of PCI status	<ul style="list-style-type: none">• MRI Brain without and with contrast (CPT® 70553) every 4 months for 1 year and then every 6 months thereafter

Non-Small Cell Lung Cancer (ONC-8)

Guideline

Non-Small Cell Lung Cancer – General Considerations (ONC-8.0)
Non-Small Cell Lung Cancer – Asymptomatic Screening (ONC-8.1)
Non-Small Cell Lung Cancer – Suspected/Diagnosis (ONC-8.2)
Non-Small Cell Lung Cancer – Initial Work-up/Staging (ONC-8.3)
Non-Small Cell Lung Cancer – Restaging/Recurrence (ONC-8.4)
Non-Small Cell Lung Cancer – Surveillance/Follow-up (ONC-8.5)
References (ONC-8)

Non-Small Cell Lung Cancer – General Considerations (ONC-8.0)

ON.NL.0008.0.A

v2.0.2024

- Non-small cell lung cancer includes adenocarcinoma, squamous cell carcinoma, adenosquamous and large cell tumors.
- See: **Bronchopulmonary or Thymic Carcinoid – Initial Staging (ONC-15.6)** for evaluation of low-grade neuroendocrine tumors (carcinoid) of the lung.
- See: **Small Cell Lung Cancer (ONC-7)** for evaluation of high-grade small cell and large cell neuroendocrine tumors of the lung.
- PET/CT scan is generally not indicated for initial staging or restaging of NSCLC when multiple sites of extra-pulmonary metastases are found on conventional imaging (i.e., liver, bone and adrenal metastases, etc.).
- PET/CT may be considered to confirm solitary focus of extra-pulmonary metastatic disease (i.e., brain or adrenal) if the individual is being considered for an aggressive treatment for oligometastatic disease.

Non-Small Cell Lung Cancer – Asymptomatic Screening (ONC-8.1)

ON.NL.0008.1.A

v2.0.2024

- See: **Lung Cancer Screening (CH-33)** in the Chest Imaging Guidelines for criteria for Low-dose CT Chest for lung cancer screening.

Non-Small Cell Lung Cancer – Suspected/Diagnosis (ONC-8.2)

ON.NL.0008.2.A

v2.0.2024

Indication	Imaging Study
Abnormal Chest X-ray or clinical suspicion remains high despite a normal Chest X-ray in symptomatic individual	<ul style="list-style-type: none"> CT Chest without contrast (CPT® 71250) or <ul style="list-style-type: none"> CT Chest with contrast (CPT® 71260)
Pulmonary nodule <8 mm in size noted on CT Chest	<ul style="list-style-type: none"> See: <u>Incidental Pulmonary Nodules Detected on CT Images (CH-16.2)</u> in the Chest Imaging Guidelines
Pulmonary nodule 8 mm (0.8 cm) to 30 mm (3 cm) seen on CT Chest or MRI Chest	<ul style="list-style-type: none"> PET/CT (CPT® 78815) See: <u>PET (CH-16.4)</u> in the Chest Imaging Guidelines If PET is Positive: Qualifies as initial staging PET/CT
Pulmonary mass 31 mm (3.1 cm) or greater seen on CT or MRI	<ul style="list-style-type: none"> PET/CT (CPT® 78815) can be approved prior to biopsy if ONE or MORE of the following applies: <ul style="list-style-type: none"> Definitive treatment with resection or radiation will be utilized instead of biopsy if PET confirms limited disease Multiple possible biopsy options are present within the chest and PET findings will be used to determine the most favorable biopsy site Biopsy is indicated prior to PET imaging for all other indications in pulmonary masses ≥31 mm (3.1 cm) in size
Mediastinal/Hilar Lymphadenopathy	See: <u>Mediastinal Lymphadenopathy (CH-2.3)</u> in the Chest Imaging Guidelines
Mediastinal/Hilar Mass	See: <u>Mediastinal Mass (CH-20)</u> in the Chest Imaging Guidelines
Paraneoplastic syndrome suspected	See: <u>Paraneoplastic Syndromes (ONC-30.3)</u>

Non-Small Cell Lung Cancer – Initial Work-up/Staging (ONC-8.3)

ON.NL.0008.3.A

v2.0.2024

Indication	Imaging Study
All individuals	<p><u>ANY or ALL of the following:</u></p> <ul style="list-style-type: none"> CT Chest with contrast (CPT® 71260) CT Abdomen with contrast (CPT® 74160) <ul style="list-style-type: none"> CT Abdomen may be omitted if CT Chest report clearly documents upper abdomen through level of adrenals Bone scan, if PET/CT not being done <p>See also: <u>Nuclear Medicine (NM) Imaging in Oncology (ONC-1.3)</u></p>
<p><u>ANY of the following:</u></p> <ul style="list-style-type: none"> Stage I-IIIB Stage IV confined to the chest region (including pleural/pericardial effusion) Stage IV with oligometastatic disease on conventional imaging and individual is a candidate for aggressive surgical resection or other localized treatment of metastases with a curative intent Conventional imaging is inconclusive 	<ul style="list-style-type: none"> PET/CT (CPT® 78815) (if not already completed prior to histological diagnosis)
<p><u>ANY of the following:</u></p> <ul style="list-style-type: none"> All Stage II-IV disease Stage I disease and considering surgical resection as primary therapy 	<ul style="list-style-type: none"> MRI Brain without and with contrast (CPT® 70553)
Superior sulcus (Pancoast) tumor suspected	<p><u>ANY or ALL of the following:</u></p> <ul style="list-style-type: none"> MRI Chest without and with contrast (CPT® 71552) MRI Cervical Spine without and with contrast (CPT® 72156) MRI Thoracic Spine without and with contrast (CPT® 72157)

Non-Small Cell Lung Cancer – Restaging/Recurrence (ONC-8.4)

ON.NL.0008.4.A

v2.0.2024

Indication	Imaging Study
Stage I or II individuals who undergo definitive local treatment with surgery, radiation, or radiosurgery	<ul style="list-style-type: none"> Restaging imaging is not indicated. See: <u>Surveillance/Follow-up (ONC-8.5)</u>
Measurable disease, undergoing active treatment	<p><u>ANY or ALL of the following every 2 cycles:</u></p> <ul style="list-style-type: none"> CT Chest with (CPT® 71260) or CT Chest without contrast (CPT® 71250) CT Abdomen with contrast (CPT® 74160) <ul style="list-style-type: none"> CT Abdomen and Pelvis with contrast (CPT® 74177) may be substituted for known pelvic disease or pelvic symptoms MRI Brain without and with contrast (CPT® 70553) for measurable brain metastases being treated with systemic therapy
<p><u>ANY of the following:</u></p> <ul style="list-style-type: none"> After neoadjuvant treatment for evaluation of surgical resectability Prior to starting adjuvant therapy Inadequately resected disease 	<ul style="list-style-type: none"> CT Chest with (CPT® 71260) or CT Chest without contrast (CPT® 71250)
Suspected recurrence	<p><u>ANY or ALL of the following:</u></p> <ul style="list-style-type: none"> CT Chest with (CPT® 71260) or CT Chest without contrast (CPT® 71250) CT Abdomen with contrast (CPT® 74160) CT Abdomen and Pelvis with contrast (CPT® 74177) may be substituted for known pelvic disease or pelvic symptoms
Newly identified lung nodule(s)	<ul style="list-style-type: none"> See: <u>Lung Metastases (ONC-31.1)</u> for new nodule evaluation

Indication	Imaging Study
<u>ANY of the following:</u> <ul style="list-style-type: none">• Suspected/biopsy proven recurrence localized to the chest cavity• Inconclusive findings conventional imaging• To differentiate tumor from radiation scar/fibrosis• Stage IV with oligometastatic disease on conventional imaging and individual is a candidate for aggressive surgical resection or other localized treatment of metastases with a curative intent	<ul style="list-style-type: none">• PET/CT (CPT® 78815)
<u>ANY of the following:</u> <ul style="list-style-type: none">• Following a demonstrated adequate response to neoadjuvant therapy if intracranial disease will preclude surgery• Documented recurrence/progression• New or worsening neurological signs or symptoms	<ul style="list-style-type: none">• MRI Brain without and with contrast (CPT® 70553)

Non-Small Cell Lung Cancer – Surveillance/Follow-up (ONC-8.5)

ON.NL.0008.5.A

v2.0.2024

Indication	Study
Stage I-II	<ul style="list-style-type: none">CT Chest with contrast (CPT® 71260) or CT Chest without contrast (CPT® 71250) every 6 months for 3 years and then annually <p>***Individuals treated with radiation therapy and residual abnormality on imaging may undergo CT Chest every 3 months for the first year after therapy, every 6 months for 2 years, and then annually thereafter</p>
Stage III-IV (metastatic sites treated with definitive intent)	<ul style="list-style-type: none">CT Chest with contrast (CPT® 71260) or CT Chest without contrast (CPT® 71250) every 3 months for 2 years, every 6 months for 3 years and then annually
New lung nodule	<ul style="list-style-type: none">See: Lung Metastases (ONC-31.1)

(ONC-9.4)

References (ONC-9)

Esophageal and GE Junction Cancer – General Considerations (ONC-9.0)

ON.EJ.0009.0.A

v2.0.2024

- Imaging for esophageal cancer is determined by cell type and in which third of the esophagus it occurs.
- Cancers of the upper and middle third are usually squamous cell and are highly associated with tobacco and alcohol abuse.
- Cancers of the gastroesophageal (GE) junction are treated as lower third cancers. Lower third cancers are usually adenocarcinomas; 62% of these arise in the setting of Barrett's esophagus, a condition associated with high body mass index (BMI).

Esophageal and GE Junction Cancer – Suspected/Diagnosis (ONC-9.1)

ON.EJ.0009.1.A

v2.0.2024

- See: **Dysphagia and Esophageal Disorders (NECK-3.1)** in the Neck Imaging Guidelines for evaluation of suspected esophageal malignancy.

Esophageal and GE Junction Cancer – Initial Work-up/Staging (ONC-9.2)

ON.EJ.0009.2.A

v2.0.2024

Indication	Imaging Study
Biopsy proven	<ul style="list-style-type: none">CT Chest (CPT® 71260) and CT Abdomen (CPT® 74160) with contrastCT Abdomen and Pelvis with contrast (CPT® 74177) may be approved instead of CT Abdomen if there are pelvic signs or symptoms
Upper 1/3 or neck mass	<ul style="list-style-type: none">CT Neck with contrast (CPT® 70491)
If no evidence of metastatic disease on conventional imaging	<ul style="list-style-type: none">PET/CT (CPT® 78815)

Esophageal and GE Junction Cancer – Restaging/Recurrence (ONC-9.3)

Breast Cancer (ONC-11)

Guideline

Breast Cancer – General Considerations (ONC-11.0)

Breast Cancer – Suspected/Diagnosis (ONC-11.1)

Breast Cancer – Initial Work-up/Staging (ONC-11.2)

Breast Cancer – Restaging/Recurrence (ONC-11.3)

Breast Cancer – Surveillance/Follow-up (ONC-11.4)

References (ONC-11)

Breast Cancer – General Considerations (ONC-11.0)

ON.BC.0011.0.A**v2.0.2024**

- This guideline applies to invasive and pre-invasive (lobular and ductal carcinoma in-situ) histologies of breast cancer.
- MRI Breast is not routinely indicated for all individuals with newly diagnosed breast cancer or carcinoma in situ. The use of MRI has not shown to increase the likelihood of negative surgical margins, decrease the rate of mastectomy, reduce local recurrence rates or improve long-term survival.
- Advanced imaging to evaluate for distant metastases is not indicated for asymptomatic individuals with invasive or pre-invasive or in-situ breast cancer (histologies such as DCIS and LCIS).
- Bone scan has a high concordance rate with PET for detecting bone metastases.
- Scintimammography and Breast Specific Gamma Imaging (BSGI) are considered experimental, investigational, or unproven.

Breast Cancer – Suspected/Diagnosis (ONC-11.1)

ON.BC.0011.1.A

v2.0.2024

- See: **Breast MRI Indications (BR-5)** in the Breast Imaging Guidelines for evaluation of suspected breast cancer.

Breast Cancer – Initial Work-up/Staging (ONC-11.2)

ON.BC.0011.2.A

v2.0.2024

Indication	Imaging Study
Newly diagnosed breast cancer or carcinoma in situ	<ul style="list-style-type: none"> Diagnostic bilateral mammogram and/or Ultrasound Breast (CPT® 76641 or CPT® 76642) are imaging modalities of choice MRI Breast is not routinely indicated for all individuals with newly diagnosed breast cancer or carcinoma in situ^{1, 11, 12, 13, 14}
<u>ANY of the following:</u> <ul style="list-style-type: none"> Multifocal or multicentric breast cancer Before neoadjuvant systemic therapy High risk histologies: atypical ductal hyperplasia (ADH), atypical lobular hyperplasia (ALH), lobular carcinoma in situ (LCIS), or invasive lobular carcinoma (ILC) Paget's disease of the breast Inconclusive findings on both mammogram and ultrasound Extremely dense breast tissue (breast density category D) on mammography Adenocarcinoma in axillary lymph node without a breast primary site identified on mammogram/ultrasound 	<ul style="list-style-type: none"> MRI Breast Bilateral without and with contrast (CPT® 77049)
<u>ANY of the following:</u> <ul style="list-style-type: none"> Ductal carcinoma in situ Stage I-III 	<ul style="list-style-type: none"> For planned sentinel lymph node (SLN) biopsy: Lymph system imaging (lymphoscintigraphy, CPT® 78195) <ul style="list-style-type: none"> SPECT/CT (CPT® 78830) is indicated as an add on code if requested

Indication	Imaging Study
Stages I, II, and III	<ul style="list-style-type: none"> Routine systemic imaging is not indicated for initial staging of non-metastatic breast cancer in the absence of signs or symptoms
<u>ANY of the following:</u> <ul style="list-style-type: none"> Clinically suspected or biopsy proven metastatic/Stage IV disease Signs or symptoms of systemic disease Elevated liver function tests or tumor markers Inflammatory breast cancer (stage T4d) 4 or more axillary lymph nodes positive for cancer involvement 	<u>ANY or ALL of the following:</u> <ul style="list-style-type: none"> CT Chest (CPT® 71260) and CT Abdomen and Pelvis (CPT® 74177) with contrast Bone scan <p>See: <u>Nuclear Medicine (NM) Imaging in Oncology (ONC-1.3)</u></p>

Bone and Soft Tissue Sarcomas – General Considerations (ONC-12.1)

ON.SS.0012.1.A

v2.0.2024

- Sarcomas are tumors of mesenchymal origin, classified as high-, intermediate-, and low-grade (G) tumors (sometimes described as “spindle cell” cancers). They can arise in any bony, cartilaginous, smooth muscle, skeletal muscle, or cardiac muscle tissue.
- Malignant nerve sheath tumor cell types should be imaged as high-grade sarcoma.
- Sarcomas occur in both adult and pediatric individuals, but some are more common in one age group than the other. Unless specified below, individuals age ≥ 18 years old should be imaged according to this guideline section.
- Exceptions include:
 - Rhabdomyosarcoma in individuals of all ages should be imaged according to guidelines in **Rhabdomyosarcoma (RMS) (PEDONC-8.2)** in the Pediatric Oncology Imaging Guidelines
 - Osteogenic sarcoma (Osteosarcoma) in individuals of all ages should be imaged according to guidelines in **Osteogenic Sarcoma (OS) (PEDONC-9.3)** in the Pediatric Oncology Imaging Guidelines
 - Ewing sarcoma and Primitive Neuroectodermal Tumor in individuals of all ages should be imaged according to guidelines in **Ewing Sarcoma and Primitive Neuroectodermal Tumors (ESFT) (PEDONC-9.4)** in the Pediatric Oncology Imaging Guidelines
 - Kaposi’s sarcoma in individuals of all ages should be imaged according to guidelines in **Kaposi’s Sarcoma (ONC-31.10)**
 - See: **Uterine Cancer (ONC-22)** for imaging recommendations for uterine sarcoma
 - Desmoplastic small round cell tumor in individuals of all ages should be imaged according to guidelines in **Non-Rhabdomyosarcoma Soft Tissue Sarcomas (NRSTS) (PEDONC-8.3)**

Soft Tissue Sarcomas – Initial Work-up/Staging (ONC-12.2)

ON.SS.0012.2.A

v2.0.2024

Indication	Imaging Study
Retroperitoneal or intra-abdominal primary site	<p><u>ANY or ALL of the following:</u></p> <ul style="list-style-type: none"> CT Chest with (CPT® 71260) or without (CPT® 71250) contrast Either CT Abdomen and Pelvis with contrast (CPT® 74177) or MRI Abdomen (CPT® 74183) and MRI Pelvis (CPT® 72197) without and with contrast
<p><u>ANY of the following:</u></p> <ul style="list-style-type: none"> Extremity or trunk primary site Head or neck primary site 	<p><u>ANY or ALL of the following:</u></p> <ul style="list-style-type: none"> MRI without and with contrast of involved area CT Chest with (CPT® 71260) or without (CPT® 71250) contrast
<p><u>ANY of the following:</u></p> <ul style="list-style-type: none"> Angiosarcoma Alveolar soft part sarcoma Clear cell sarcoma Epithelioid sarcoma Hemangiopericytoma Leiomyosarcoma Other histologies documented to have propensity for lymphatic spread and deep-seated tumors 	<p><u>ANY or ALL of the following:</u></p> <ul style="list-style-type: none"> MRI without and with contrast of involved area CT Chest with (CPT® 71260) or without (CPT® 71250) contrast Either CT Abdomen and Pelvis with contrast (CPT® 74177) or MRI Abdomen (CPT® 74183) and MRI Pelvis (CPT® 72197) without and with contrast
Myxoid round cell liposarcoma	<p><u>ANY or ALL of the following:</u></p> <ul style="list-style-type: none"> MRI without and with contrast of involved area CT Chest with (CPT® 71260) or without contrast (CPT® 71250) Either CT Abdomen and Pelvis with contrast (CPT® 74177) or MRI Abdomen (CPT® 74183) and Pelvis (CPT® 72197) without and with contrast MRI Cervical/Thoracic/Lumbar Spine without and with contrast (CPT® 72156, CPT® 72157, and CPT® 72158)

Indication	Imaging Study
<u>ANY of the following:</u> <ul style="list-style-type: none">• Angiosarcoma• Alveolar soft part sarcoma• All individuals with signs/symptoms of brain metastases	<ul style="list-style-type: none">• MRI Brain without and with contrast (CPT® 70553)

Gastrointestinal Stromal Tumor (GIST) (ONC-12.5)

ON.SS.0012.5.A

v2.0.2024

General Considerations

- GISTs are mesenchymal neoplasms of the gastrointestinal (GI) tract, mostly found in the stomach and upper small bowel, commonly metastasizing to the liver and abdominal cavity and primarily treated with surgery.
- Recurrence risk of GIST is estimated by prognostic model based on location, size of primary tumor, and mitotic rate per high power field (HPF). High-risk category includes any tumor >5 cm with >5 mitoses/50 HPF and any tumors >10 cm in size regardless of mitotic rate.

Indication	Imaging Study
Suspected/Diagnosis	<ul style="list-style-type: none"> CT Abdomen and Pelvis with contrast (CPT® 74177)
Initial Work-up/Staging	<ul style="list-style-type: none"> CT Chest (CPT® 71260) and CT Abdomen and Pelvis (CPT® 74177) with contrast MRI Abdomen without and with contrast (CPT® 74183) is indicated for evaluation of liver lesions that are equivocal on CT imaging or for preoperative assessment of liver PET (CPT® 78815) is indicated for evaluation of inconclusive findings on conventional imaging
<u>Monitoring response to treatment (every 8 to 12 weeks) in either of the following:</u> <ul style="list-style-type: none"> Unresectable primary disease Metastatic disease 	<u>EITHER of the following:</u> <ul style="list-style-type: none"> CT Abdomen and Pelvis with contrast (CPT® 74177) MRI Abdomen without and with contrast (CPT® 74183) and MRI Pelvis without and with contrast (CPT® 72197)
Known or suspected recurrence	<ul style="list-style-type: none"> <u>CT Abdomen and Pelvis with contrast (CPT® 74177)</u>
<u>Any of the following:</u> <ul style="list-style-type: none"> Prior evidence of chest disease Signs or symptoms of chest disease 	<ul style="list-style-type: none"> CT Chest with contrast (CPT® 71260)
Evaluation of inconclusive findings on conventional imaging	<ul style="list-style-type: none"> PET/CT (CPT® 78815)

Indication	Imaging Study
<u>Surveillance for any of the following:</u> <ul style="list-style-type: none">Incompletely resectedMetastatic diseaseHigh-risk disease	<ul style="list-style-type: none">CT Abdomen and Pelvis with contrast (CPT® 74177) every 3 months for 3 years, then every 6 months for 2 years, and then annually
Surveillance for all others	<ul style="list-style-type: none">CT Abdomen and Pelvis with contrast (CPT® 74177) every 6 months for 5 years, then annually

Bone Sarcomas – Initial Work-up/Staging (ONC-12.6)

ON.SS.0012.6.A

v2.0.2024

Indication	Imaging Study
Chondrosarcoma <ul style="list-style-type: none"> Low-grade intra-compartmental High-grade (grade II or grade III) Clear cell Extra-compartmental 	<u>ANY or ALL of the following:</u> <ul style="list-style-type: none"> MRI without contrast or without and with contrast of involved area CT (contrast as requested) of involved area CT Chest with (CPT® 71260) or without (CPT® 71250) contrast
Dedifferentiated chondrosarcoma	See: <u>Osteogenic Sarcoma (OS) (PEDONC-9.3)</u> for imaging recommendations
Mesenchymal chondrosarcoma	See: <u>Ewing's Sarcoma Family of Tumors (PEDONC-9.4)</u> for imaging recommendations
Chordoma	<u>ANY or ALL of the following:</u> <ul style="list-style-type: none"> MRI without contrast or without and with contrast of involved area CT (contrast as requested) of involved area CT Chest with (CPT® 71260) or without (CPT® 71250) contrast CT Abdomen and Pelvis with contrast (CPT® 74177) MRI Cervical (CPT® 72156), Thoracic (CPT® 72157), and Lumbar (CPT® 72158) Spine without and with contrast Bone scan (see also: <u>Nuclear Medicine (NM) Imaging in Oncology (ONC-1.3)</u>) PET may be approved for inconclusive conventional imaging

Bone Sarcomas – Restaging/Recurrence (ONC-12.7)

Mesenchymal chondrosarcoma	See: <u>Ewing's Sarcoma Family of Tumors (PEDONC-9.4)</u> for imaging recommendations
Chordoma	<ul style="list-style-type: none"> Plain x-ray of primary site every 6 months for 5 years and then annually until year 10 MRI without and with contrast is indicated for new findings on plain x-ray or new/worsening clinical symptoms. Chest x-ray every 6 months for 5 years and then annually until year 10 <ul style="list-style-type: none"> CT Chest with (CPT® 71260) or without (CPT® 71250) contrast may be obtained annually or for evaluation of any new findings on chest x-ray or new/worsening signs/symptoms

Benign Bone Tumors – General Considerations (ONC-12.9)

ON.SS.0012.9.A

v2.0.2024

- Variety of diagnoses, including osteoid osteochondroma, chondroblastoma, desmoplastic fibroma, Paget's disease, osteoid osteoma and others.
- Plain x-ray appearance is diagnostic for many benign bone tumors and advanced imaging is generally unnecessary except for preoperative planning.
- MRI without and with contrast is the primary modality for advanced imaging of bone tumors, and can be approved to help narrow differential diagnoses and determine whether biopsy is indicated.
- Some benign bone tumor types carry a risk of malignant degeneration over time, but routine advanced imaging surveillance has not been shown to improve outcomes for these individuals.
- MRI without and with contrast can be approved to evaluate new findings on Plain x-ray new/worsening clinical symptoms not explained by a recent Plain x-ray.
- There are no data to support the use of PET/CT in the evaluation of benign bone tumors, and PET requests should not be approved without biopsy confirmation of a malignancy.
- Other benign bone tumors should be imaged according to guidelines in **Lesion of Bone (MS-10.1)** in the General Musculoskeletal Imaging Guidelines or **Mass Involving Bone (including Lytic and Blastic Metastatic Disease) (PEDMS-3.4)** in the Pediatric Musculoskeletal Imaging Guidelines.

Benign Bone Tumors – Initial Work-up/ Staging (ONC-12.10)

ON.SS.0012.10.A

v2.0.2024

Indication	Imaging Study
Giant Cell Tumor of Bone (GCTB)	<u>ANY or ALL of the following:</u> <ul style="list-style-type: none">• MRI without contrast or without and with contrast of involved area• CT (contrast as requested) of involved area• CT Chest with (CPT® 71260) or without (CPT® 71250) contrast• Bone scan (see also: <u>Nuclear Medicine (NM) in Oncology [ONC-1.3]</u>)
Enchondroma	<ul style="list-style-type: none">• MRI without contrast or without and with contrast of primary site

Benign Bone Tumors – Restaging/Recurrence (ONC-12.11)

ON.ss.0012.11.A

v2.0.2024

Indication	Imaging Study
Giant Cell Tumor of Bone (GCTB)	<u>ANY or ALL of the following, after completion of radiotherapy or every 2 cycles of chemotherapy:</u> <ul style="list-style-type: none">• MRI without contrast or without and with contrast of involved area• CT (contrast as requested) of involved area• Bone scan (see also: Nuclear Medicine (NM) Imaging in Oncology [ONC-1.3])
Enchondroma	Plain films of primary site

Benign Bone Tumors – Surveillance/Follow-up (ONC-12.12)

ON.SS.0012.12.A

v2.0.2024

Indication	Imaging Study
Giant Cell Tumor of Bone (GCTB)	<u>ANY or ALL of the following every 6 months for 4 years, then annually thereafter:</u> <ul style="list-style-type: none">• Plain x-ray of primary site<ul style="list-style-type: none">• MRI without and with contrast is indicated for new findings on plain x-ray or new/worsening clinical symptoms.• Chest x-ray<ul style="list-style-type: none">• CT Chest with (CPT® 71260) or without (CPT® 71250) contrast for new findings on chest x-ray, or new/worsening signs/symptoms.
Enchondroma	Plain films of primary site

Pancreatic Cancer (ONC-13)

Guideline

Pancreatic Cancer – General Considerations (ONC-13.0)

Pancreatic Cancer – Screening Studies for Pancreatic Cancer
(ONC-13.1)

Pancreatic Cancer – Suspected/Diagnosis (ONC-13.2)

Pancreatic Cancer – Initial Work-up/Staging (ONC-13.3)

Pancreatic Cancer – Restaging/Recurrence (ONC-13.4)

Pancreatic Cancer – Surveillance/Follow-up (ONC-13.5)

References (ONC-13)

Pancreatic Cancer – General Considerations (ONC-13.0)

ON.PC.0013.0.A

v2.0.2024

- This guideline refers only to adenocarcinoma of the exocrine pancreas, which accounts for over 90% of pancreatic malignancies. This guideline may also be used for cancer of the Ampulla of Vater.
- Neuroendocrine and carcinoid tumors of the pancreas are not included in this guideline, see: **Neuroendocrine Cancers and Adrenal Tumors (ONC-15)**.

Pancreatic Cancer – Screening Studies for Pancreatic Cancer (ONC-13.1)

ON.PC.0013.1.A

v2.0.2024

- Detailed history of any known inherited syndrome in the individual and detailed family history in first- and second-degree relatives, including the age and lineage, is essential to guide screening recommendations. See table below for age- and risk-specific screening recommendations
- New onset of diabetes in individuals older than 50 has been recognized as a potential indicator of the development of pancreatic cancer. Approximately 1% of individuals in this category are diagnosed with cancer within 3 years. A prediction model has been established which identifies those individuals at greatest risk for pancreatic malignancy. The scoring system, known as ENDPAC (Enriching New-Onset Diabetes for Pancreatic Cancer) is based on 3 discriminatory factors, including change in blood glucose, change in weight, and age of onset at the time of the new diagnosis of diabetes. A score of >3 imparts an elevated risk of pancreatic cancer (3.6%), and these individuals should be screened. Screening is not indicated at this time for scores of 0-2.

Indications	Imaging Study
<p>Individuals who meet BOTH of the following criteria:</p> <ul style="list-style-type: none"> One or more first- or second-degree relative affected with pancreatic cancer AND Known mutation carrier of ONE of the following genes: <ul style="list-style-type: none"> Lynch Syndrome (MLH1, MSH2, or MSH6 gene mutations) BRCA1, BRCA2 (Familial Breast and Ovarian syndrome) PALB2 mutation ATM (Ataxia-Telangiectasia) 	<ul style="list-style-type: none"> MRI Abdomen without and with contrast (CPT® 74183) starting at age 50 or 10 years earlier than the youngest affected family member, repeat annually
<p>Individuals with family history of pancreatic cancer but no known genetic mutation:</p> <ul style="list-style-type: none"> Individuals with 2 relatives with pancreatic cancer where one is a first-degree relative Individuals with 3 or more relatives with pancreatic cancer 	<ul style="list-style-type: none"> MRI Abdomen without and with contrast (CPT® 74183) starting at age 45 or 10 years earlier than the youngest affected family member, repeat annually

Indications	Imaging Study
Pancreatic Cancer Kindred (individuals who have at least one first-degree relative with pancreatic cancer who in turn also has a first-degree relative with pancreatic cancer) and NO known genetic germline mutations	<ul style="list-style-type: none"> MRI Abdomen without and with contrast (CPT® 74183) starting at age 50 or 10 years earlier than the youngest affected family member, repeat annually
Hereditary Pancreatitis (PRSS1, CPA1, and CTRC gene mutations)	<ul style="list-style-type: none"> MRI Abdomen without and with contrast (CPT® 74183) beginning at age 40 or 20 years after the first pancreatitis attack, repeat annually.
Peutz-Jeghers Syndrome (LKB1/STK11 gene mutation)	<ul style="list-style-type: none"> MRI Abdomen without and with contrast (CPT® 74183) starting at age 30, repeat annually
CDKN2A mutation (also known as p16, p16INK4a, and MTS1, FMM-Familial Atypical Multiple Melanoma and Mole Syndrome)	<ul style="list-style-type: none"> MRI Abdomen without and with contrast or MRCP (CPT® 74183) beginning at age 40, repeat annually.
Screening MRI reveals cystic lesion of the pancreas	<ul style="list-style-type: none"> Repeat MRI Abdomen without and with contrast (CPT® 74183) in 6 months
Screening MRI reveals indeterminate solid lesion	<ul style="list-style-type: none"> CT Abdomen with contrast – pancreatic protocol (CPT® 74160) May repeat MRI Abdomen without and with contrast (CPT® 74183) in 3 months after the CT scan
Screening MRI reveals pancreatic stricture and/or dilation ≥ 6 mm without a mass	<ul style="list-style-type: none"> CT Abdomen with contrast – pancreatic protocol (CPT® 74160) May repeat MRI Abdomen without and with contrast (CPT® 74183) in 3 months after the CT scan

References (ONC-14)

Hepatocellular Carcinoma (HCC) – General Considerations (ONC-14.1)

ON.GI.0014.1.A

v2.0.2024

- A biopsy is not always required for the diagnosis of Hepatocellular carcinoma (HCC). A dedicated triple-phase CT or MRI may be obtained. MRI with contrast is the test of choice for the evaluation of liver masses. It offers soft tissue contrast resolution superior to CT as well as the possibility of using two different contrast agents, one of which is more blood flow based and the other which also is blood flow based and demonstrates hepatobiliary function (Eovist). Classical imaging findings include:
 - Arterial phase hyperenhancement
 - Venous phase washout appearance
 - Capsule appearance
 - Threshold growth
- For individuals who are high-risk for developing HCC (cirrhosis, chronic Hepatitis B or current or prior HCC), if the liver lesion is >1 cm with 2 classic enhancements on triple-phase CT or MRI, the diagnosis is confirmatory and biopsy is not needed.
- For lesions less than 1 cm or with less than 2 classical enhancements or for any liver lesions in individuals who are not high-risk, a biopsy is needed for histological confirmation. PET/CT scan is considered experimental, investigational, or unproven for the diagnosis or staging of HCC

Hepatocellular Carcinoma (HCC) – Suspected/Diagnosis (ONC-14.2)

ON.GI.0014.2.A

Neuroendocrine Cancers and Adrenal Tumors (ONC-15)

Guideline

General Considerations (ONC-15.1)

Gastrointestinal/Pancreatic Neuroendocrine Cancers –
Suspected/Diagnosis (ONC-15.2)

Gastrointestinal/Pancreatic Neuroendocrine Cancers – Initial
Work-up/Staging (ONC-15.3)

Gastrointestinal/Pancreatic Neuroendocrine Cancers –
Restaging/Recurrence (ONC-15.4)

Gastrointestinal/Pancreatic Neuroendocrine Cancers – Surveillance
(ONC-15.5)

Bronchopulmonary or Thymic Carcinoid – Initial Staging (ONC-15.6)

Bronchopulmonary or Thymic Carcinoid – Restaging/Recurrence
(ONC-15.7)

Bronchopulmonary or Thymic Carcinoid – Surveillance (ONC-15.8)

Adrenal Tumors – Suspected/Diagnosis (ONC-15.9)

Adrenal Tumors – Initial Work-up/Staging (ONC-15.10)

Adrenal Tumors – Restaging/Recurrence (ONC-15.11)

Adrenal Tumors – Surveillance (ONC-15.12)

Adrenocortical Carcinoma (ONC-15.13)

References (ONC-15)

General Considerations (ONC-15.1)

ON.NA.0015.1.A

v2.0.2024

This guideline includes low-grade or well-differentiated carcinoid and endocrine tumors of the lung, thymus, pancreas, gastrointestinal tract or unknown primary site; including insulinoma, glucagonoma, VIPoma, gastrinoma, somatostatinoma and others as well as catecholamine-secreting tumors of the adrenal gland such as pheochromocytoma, paraganglioma, adrenocortical carcinoma, and others.

- For poorly-differentiated or high-grade small cell or large cell neuroendocrine tumors arising outside the lung or from an unknown primary site, see: **Extrathoracic Small Cell and Large Cell Neuroendocrine Tumors (ONC-31.8)**.
- For poorly-differentiated or high grade neuroendocrine tumors of the lung, see: **Small Cell Lung Cancer (ONC-7)**.
- Neuroblastoma, ganglioneuroblastoma, and ganglioneuroma occurring in adults should be imaged according to **Neuroblastoma (PEDONC-6)** in the Pediatric Oncology Imaging Guidelines.
- Many are associated with Multiple Endocrine Neoplasia (MEN) familial syndromes. – See: **Multiple Endocrine Neoplasias (MEN) (PEDONC-2.8)** in the Pediatric Oncology Imaging Guidelines for screening recommendations.
- Somatostatin receptor (SSR) based imaging is more sensitive and specific for evaluation of well-differentiated neuroendocrine tumors and may be performed using ^{111}In DTPA Octreotide scintigraphy or PET/CT scan with SSR radiotracers (such as ^{68}Ga -DOTATATE, ^{68}Ga -DOTATOC, or ^{64}Cu -DOTATATE). This study is not part of evaluation of poorly-differentiated or high-grade neuroendocrine tumors, which are imaged according to: **Extrathoracic Small Cell and Large Cell Neuroendocrine Tumors (ONC-31.8)**.

v2.0.2024

Indication	Imaging Study
GI or pancreatic neuroendocrine (carcinoid) tumors	<p><u>If not already done:</u></p> <ul style="list-style-type: none"> CT Abdomen and Pelvis with contrast (CPT® 74177) or without and with contrast (CPT® 74178) OR MRI Abdomen (CPT® 74183) and Pelvis (CPT® 72197) without and with contrast is indicated CT Chest with contrast (CPT® 71260) or CT Chest without contrast (CPT® 71250)
Inconclusive CT or MRI scans	<p><u>ONE of the following:</u></p> <ul style="list-style-type: none"> Octreotide scan (ANY ONE of the following): <ul style="list-style-type: none"> Any one of the following planar imaging codes - CPT® 78801, 78802, or 78804 AND Any one of the following SPECT/SPECT-CT codes - CPT® 78803, 78830, 78831, 78832 PET/CT scan (CPT® 78815) with any ONE of the following SSR radiotracers: <ul style="list-style-type: none"> ⁶⁸Ga-DOTATATE ⁶⁸Ga-DOTATOC ⁶⁴Cu-DOTATATE
<p><u>ANY of the following:</u></p> <ul style="list-style-type: none"> Markers fail to normalize after complete resection AND CT/MRI and somatostatin-receptor based study are negative Biopsy-proven neuroendocrine tumor of unknown primary site AND CT/MRI and somatostatin-receptor based study are negative 	<ul style="list-style-type: none"> FDG-PET/CT scan (CPT® 78815)

Gastrointestinal/Pancreatic Neuroendocrine Cancers – Restaging/ Recurrence (ONC-15.4)

ON.NA.0015.4.A

v2.0.2024

Indication	Imaging Study
All after surgical resection	<ul style="list-style-type: none"> See: <u>Gastrointestinal/Pancreatic Neuroendocrine Cancers – Surveillance (ONC-15.5)</u>
Unresectable/metastatic disease on treatment with somatostatin analogues	<ul style="list-style-type: none"> CT of involved body area no more frequently than every 3 months
Unresectable/metastatic disease on treatment with chemotherapy	<ul style="list-style-type: none"> CT of involved body area every 2 cycles (6 to 8 weeks)
Progression of symptoms or elevation of tumor markers	<ul style="list-style-type: none"> CT Chest without contrast (CPT® 71250) or CT Chest with contrast (CPT® 71260) <p><u>And ONE of the following:</u></p> <ul style="list-style-type: none"> CT Abdomen and Pelvis with contrast (CPT® 74177) CT Abdomen and Pelvis without and with contrast (CPT® 74178) MRI Abdomen (CPT® 74183) and MRI Pelvis (CPT® 72197) without and with contrast
Continued suspicion for recurrence with negative or inconclusive CT or MRI	<p><u>ONE of the following:</u></p> <ul style="list-style-type: none"> Octreotide scan: <ul style="list-style-type: none"> Any one of the following planar imaging codes - CPT® 78801, 78802, or 78804 AND Any one of the following SPECT/SPECT-CT codes - CPT® 78803, 78830, 78831, 78832 PET/CT scan (CPT® 78815) with any ONE of the following SSR radiotracers: <ul style="list-style-type: none"> ⁶⁸Ga-DOTATATE ⁶⁸Ga-DOTATOC ⁶⁴Cu-DOTATATE

Indication	Imaging Study
To assess candidacy for peptide receptor radionuclide therapy (PRRT) with Lutetium ¹⁷⁷ Lu-dotatate	<ul style="list-style-type: none">• PET/CT scan (CPT® 78815) with any ONE of the following SSR radiotracers:<ul style="list-style-type: none">• ⁶⁸Ga-DOTATATE• ⁶⁸Ga-DOTATOC• ⁶⁴Cu-DOTATATE

Gastrointestinal/Pancreatic Neuroendocrine Cancers – Surveillance (ONC-15.5)

ON.NA.0015.5.A

v2.0.2024

Indication	Imaging Study
<p><u>ANY of the following:</u></p> <ul style="list-style-type: none"> Appendix carcinoid ≤2 cm, completely resected Rectal carcinoid <1 cm, completely resected Gastric carcinoid treated with complete endoscopic resection 	<ul style="list-style-type: none"> Advanced imaging is not routinely indicated for surveillance
Rectal carcinoid 1-2 cm, completely resected	<ul style="list-style-type: none"> MRI Pelvis without and with contrast (CPT® 72197) at 6 and 12 months post resection. If clear, no further surveillance imaging indicated
All other GI neuroendocrine tumors (stomach, large and small intestine)	<ul style="list-style-type: none"> CT Abdomen and Pelvis with contrast (CPT® 74177) once at 3 to 12 months postoperatively and annually for 3 years and then every 2 years up to year 10
Unresected GI neuroendocrine tumors being monitored with observation alone	<ul style="list-style-type: none"> CT Abdomen with contrast (CPT® 74160) once at 3 to 12 months from initial diagnosis then annually up to year 10
Pancreatic neuroendocrine tumors	<ul style="list-style-type: none"> CT Abdomen with contrast (CPT® 74160) once at 3 to 12 months postoperatively then annually up to year 10
Unresected pancreatic neuroendocrine tumors being monitored with observation alone	<ul style="list-style-type: none"> CT Abdomen with contrast (CPT® 74160) once at 3 to 12 months from initial diagnosis then annually up to year 10
Measurable metastatic disease on maintenance treatment or off therapy	<ul style="list-style-type: none"> CT of involved body area no more frequently than every 3 months

Bronchopulmonary or Thymic Carcinoid – Initial Staging (ONC-15.6)

ON.NA.0015.6.A

v2.0.2024

Indication	Imaging Study
Initial diagnosis	<p><u>If not already done:</u></p> <ul style="list-style-type: none"> CT Chest with contrast (CPT® 71260) CT Abdomen with contrast (CPT® 74160) or without and with contrast (CPT® 74170) <ul style="list-style-type: none"> If CT inconclusive, MRI Abdomen (CPT® 74183) without and with contrast is indicated
Inconclusive CT or MRI scans	<p><u>ONE of the following:</u></p> <ul style="list-style-type: none"> Octreotide scan (ANY ONE of the following): <ul style="list-style-type: none"> Any one of the following planar imaging codes - CPT® 78801, 78802, or 78804 AND Any one of the following SPECT/SPECT-CT codes - CPT® 78803, 78830, 78831, 78832 PET/CT scan (CPT® 78815) with any ONE of the following SSR radiotracers: <ul style="list-style-type: none"> ⁶⁸Ga-DOTATATE ⁶⁸Ga-DOTATOC ⁶⁴Cu-DOTATATE
<p><u>ANY of the following:</u></p> <ul style="list-style-type: none"> Markers fail to normalize after complete resection AND CT/MRI and somatostatin-receptor based study are negative Biopsy-proven neuroendocrine tumor of unknown primary site AND CT/MRI and somatostatin-receptor based study are negative 	<ul style="list-style-type: none"> FDG-PET/CT scan (CPT® 78815)

Bronchopulmonary or Thymic Carcinoid – Restaging/Recurrence (ONC-15.7)

ON.NA.0015.7.A

v2.0.2024

Indication	Imaging Study
All after surgical resection	<ul style="list-style-type: none"> See: <u>Bronchopulmonary or Thymic Carcinoid - Surveillance (ONC-15.8)</u>
Unresectable/metastatic disease on treatment with somatostatin analogues	<ul style="list-style-type: none"> CT of involved body area no more frequently than every 3 months
Unresectable/metastatic disease on treatment with chemotherapy	<ul style="list-style-type: none"> CT of involved body area every 2 cycles (6 to 8 weeks)
Progression of symptoms or elevation of tumor markers	<ul style="list-style-type: none"> CT Chest without (CPT® 71250) or CT Chest with contrast (CPT® 71260) <u>And ONE of the following:</u> CT Abdomen and Pelvis with contrast (CPT® 74177) CT Abdomen and Pelvis without and with contrast (CPT® 74178) MRI Abdomen (CPT® 74183) and Pelvis (CPT® 72197) without and with contrast
Continued suspicion for recurrence with negative or inconclusive CT or MRI	<p><u>ONE of the following:</u></p> <ul style="list-style-type: none"> Octreotide scan <ul style="list-style-type: none"> Any one of the following planar imaging codes - CPT® 78801, 78802, or 78804 AND Any one of the following SPECT/SPECT-CT codes - CPT® 78803, 78830, 78831, 78832 PET/CT scan (CPT® 78815) with any ONE of the following SSR radiotracers: <ul style="list-style-type: none"> ⁶⁸Ga-DOTATATE ⁶⁸Ga-DOTATOC ⁶⁴Cu-DOTATATE

Bronchopulmonary or Thymic Carcinoid – Surveillance (ONC-15.8)

ON.NA.0015.8.A

v2.0.2024

Indication	Imaging Study
Carcinoid tumors of lung or thymus	<ul style="list-style-type: none">CT Chest with contrast (CPT® 71260) or CT Chest without contrast (CPT® 71250) once at 3 to 12 months post resection and then annually for 3 years and then every 2 years up to year 10
Unresected primary tumors being monitored with observation alone	<ul style="list-style-type: none">CT Chest with contrast (CPT® 71260) or CT Chest without contrast (CPT® 71250) once at 3 to 12 months from initial diagnosis then annually for 3 years and then every 2 years up to year 10
Measurable metastatic disease on maintenance treatment or off therapy	<ul style="list-style-type: none">CT of involved body area no more frequently than every 3 months

Adrenal Tumors – Suspected/Diagnosis (ONC-15.9)

ON.NA.0015.9.A

v2.0.2024

- See: **Adrenal Cortical Lesions (AB-16.1)** in the Abdomen Imaging Guidelines for evaluation of indeterminate adrenal masses.
- Adrenal tumors that involve the adrenal medulla or neural crest tissue outside the adrenal gland include pheochromocytoma, paraganglioma, and paraganglioneuroma
 - These tumors are imaged according to sections **ONC-15.10 through ONC-15.12**
 - Malignant adrenal tumors that involve the adrenal cortex are addressed in **Adrenocortical Carcinoma (ONC-15.13)**
- Adrenocortical carcinoma is imaged according to **Adrenocortical Carcinoma (ONC-15.13)**
- If concern for genetic predisposition syndrome such as MEN, neurofibromatosis, or Von Hippel-Lindau disease, see screening recommendations in **Screening Imaging and Cancer Predisposition Syndromes (PEDONC-2)** in the Pediatric Oncology Imaging Guidelines.

Adrenal Tumors – Initial Work-up/Staging (ONC-15.10)

ON.NA.0015.10.A

v2.0.2024

Indication	Imaging Study
<p><u>For ANY of the following:</u></p> <ul style="list-style-type: none"> • Pheochromocytoma • Paraganglioma • Paraganglioneuroma 	<p><u>If not already done:</u></p> <ul style="list-style-type: none"> • CT Chest without (CPT® 71250) or CT Chest with contrast (CPT® 71260) <p><u>And ONE of the following (if not already done):</u></p> <ul style="list-style-type: none"> • CT Abdomen and Pelvis with contrast (CPT® 74177) • CT Abdomen and Pelvis without and with contrast (CPT® 74178) • MRI Abdomen (CPT® 74183) and MRI Pelvis (CPT® 72197) without and with contrast • CT with contrast or MRI without and with contrast of any other symptomatic body areas
<p>Continued suspicion with negative/inconclusive CT or MRI</p>	<p><u>ONE of the following:</u></p> <ul style="list-style-type: none"> • Octreotide or MIBG scan: <ul style="list-style-type: none"> • Any one of the following planar imaging codes - CPT® 78801, 78802, 78804 AND • Any one of the following SPECT/SPECT-CT codes - CPT® 78803, 78830, 78831, 78832 • PET/CT scan (CPT® 78815) with any ONE of the following SSR radiotracers: <ul style="list-style-type: none"> • ⁶⁸Ga-DOTATATE • ⁶⁸Ga-DOTATOC • ⁶⁴Cu-DOTATATE
<p>All above studies done and negative/inconclusive</p>	<ul style="list-style-type: none"> • FDG-PET/CT scan (CPT® 78815)

Adrenal Tumors – Restaging/Recurrence (ONC-15.11)

ON.NA.0015.11.A

v2.0.2024

Indication	Imaging Study
If surgery is primary therapy	<ul style="list-style-type: none"> CT Abdomen with contrast (CPT® 74160) one time within first year post resection then go to surveillance recommendations
Recurrence, progression of symptoms, or elevation of tumor markers	<ul style="list-style-type: none"> CT Chest without contrast (CPT® 71250) or CT Chest with contrast (CPT® 71260) CT with contrast of involved areas <p><u>And ONE of the following:</u></p> <ul style="list-style-type: none"> CT Abdomen and Pelvis with contrast (CPT® 74177) CT Abdomen and Pelvis without and with contrast (CPT® 74178) MRI Abdomen (CPT® 74183) and MRI Pelvis (CPT® 72197) without and with contrast
Continued suspicion for recurrence with negative or inconclusive CT or MRI	<p><u>ONE of the following:</u></p> <ul style="list-style-type: none"> Octreotide scan (ANY ONE of the following): <ul style="list-style-type: none"> Any one of the following planar imaging codes - CPT® 78801, 78802, or 78804 AND Any one of the following SPECT/SPECT-CT codes - CPT® 78803, 78830, 78831, 78832 PET/CT scan (CPT® 78815) with any ONE of the following SSR radiotracers: <ul style="list-style-type: none"> ⁶⁸Ga-DOTATATE ⁶⁸Ga-DOTATOC ⁶⁴Cu-DOTATATE
All above studies done and negative/inconclusive	<ul style="list-style-type: none"> FDG-PET/CT scan (CPT® 78815)

Adrenal Tumors – Surveillance (ONC-15.12)

ON.NA.0015.12.A

v2.0.2024

Indication	Imaging Study
All individuals	Once within 3-12 months post resection and then annually for 10 years: <ul style="list-style-type: none">• CT Chest with contrast (CPT® 71260) or without contrast (CPT® 71250)• CT Abdomen and Pelvis with contrast (CPT® 74177) or MRI Abdomen and Pelvis without and with contrast (CPT® 74183 and 72197)• CT with contrast of other involved body areas
Measurable metastatic disease being observed off therapy or on maintenance treatment	<ul style="list-style-type: none">• CT of involved body area no more frequently than every 3 months for up to 5 years after completion of definitive therapy and annually thereafter

Adrenocortical Carcinoma (ONC-15.13)

ON.NA.0015.13.A

v2.0.2024

Indication	Imaging Study
Initial Staging	<ul style="list-style-type: none"> CT Chest without (CPT® 71250) or CT Chest with contrast (CPT® 71260) <p><u>And ONE of the following (if not already done):</u></p> <ul style="list-style-type: none"> CT Abdomen and Pelvis with contrast (CPT® 74177) CT Abdomen and Pelvis without and with contrast (CPT® 74178) MRI Abdomen (CPT® 74183) and MRI Pelvis (CPT® 72197) without and with contrast
Suspected recurrence	<ul style="list-style-type: none"> CT Chest without (CPT® 71250) or CT Chest with contrast (CPT® 71260) <p><u>And ONE of the following:</u></p> <ul style="list-style-type: none"> CT Abdomen and Pelvis with contrast (CPT® 74177) CT Abdomen and Pelvis without and with contrast (CPT® 74178) MRI Abdomen (CPT® 74183) and MRI Pelvis (CPT® 72197) without and with contrast
<ul style="list-style-type: none"> Solitary adrenal mass >4 cm on conventional imaging and plans for aggressive surgical resection Inconclusive findings on conventional imaging 	<ul style="list-style-type: none"> FDG PET/CT scan (CPT® 78815)
Surveillance after complete response to definitive treatment	<p><u>Annually for 5 years:</u></p> <ul style="list-style-type: none"> CT Chest with contrast (CPT® 71260), CT Abdomen with contrast (CPT® 74160), and CT of other involved body areas with contrast
Measurable metastatic disease on maintenance therapy or being monitored off therapy	<p><u>Every 3 months for up to 5 years after completion of definitive therapy:</u></p> <ul style="list-style-type: none"> CT Chest with contrast (CPT® 71260), CT Abdomen and Pelvis with contrast (CPT® 74177), and CT with contrast of other involved body areas

Renal Cell Cancer (RCC) (ONC-17)

Guideline

Renal Cell Cancer (RCC) – General Considerations (ONC-17.0)
Renal Cell Cancer (RCC) – Suspected/Diagnosis (ONC-17.1)
Renal Cell Cancer (RCC) – Initial Work-up/Staging (ONC-17.2)
Renal Cell Cancer (RCC) – Restaging/Recurrence (ONC-17.3)
Renal Cell Cancer (RCC) – Surveillance (ONC-17.4)
References (ONC-17)

Renal Cell Cancer (RCC) – General Considerations (ONC-17.0)

ON.RC.0017.0.A**v2.0.2024**

- PET considered experimental, investigational, or unproven for initial diagnosis, staging or restaging of renal cell cancer.
- A minority of adult individuals with renal cell cancer (RCC) will have translocations in TFE3 or TFEB, which have a different natural history than “adult type” RCC. Individuals of any age with TFE3 or TFEB translocated RCC should be imaged according to guidelines in **Pediatric Renal Cell Carcinoma (RCC) (PEDONC-7.4)** in the Pediatric Oncology Imaging Guidelines.
- Individuals of any age with Wilms tumor should be imaged according to guidelines in section **Unilateral Wilms Tumor (UWT) (PEDONC-7.2)** or **Bilateral Wilms Tumor (BWT) (PEDONC-7.3)** in the Pediatric Oncology Imaging Guidelines.
- Oncocytoma in individuals of all ages should be imaged according to these guidelines.

Renal Cell Cancer (RCC) – Suspected/ Diagnosis (ONC-17.1)

ON.RC.0017.1.A

v2.0.2024

Indication	Imaging Study
<ul style="list-style-type: none">Solitary renal mass suspicious for renal cell cancer	<ul style="list-style-type: none">See: Indeterminate Renal Lesion (AB-35.1) in the Abdomen Imaging Guidelines for evaluation of suspected renal malignanciesChest x-ray or CT Chest with contrast with (CPT® 71260) or without contrast (CPT® 71250)

Renal Cell Cancer (RCC) – Initial Work-up/Staging (ONC-17.2)

ON.RC.0017.2.A

v2.0.2024

Indication	Imaging study
All individuals	<u>If not done previously:</u> <ul style="list-style-type: none">CT Chest with (CPT® 71260) or without (CPT® 71250) contrastCT Abdomen and Pelvis, contrast as requested
<u>ANY of the following:</u> <ul style="list-style-type: none">Extension of tumor into the vena cava by other imagingInconclusive findings on CT	<ul style="list-style-type: none">MRI Abdomen without and with contrast (CPT® 74183)
Bone pain	<ul style="list-style-type: none">Bone scan (See: <u>Nuclear Medicine (NM) Imaging in Oncology (ONC-1.3)</u>)
<u>EITHER of the following:</u> <ul style="list-style-type: none">Signs/symptoms suspicious for brain metastasesNewly diagnosed stage IV/metastatic RCC	<ul style="list-style-type: none">MRI Brain without and with contrast (CPT® 70553)

Renal Cell Cancer (RCC) – Restaging/Recurrence (ONC-17.3)

ON.RC.0017.3.A

v2.0.2024

Indication	Imaging Study
Unresectable disease or metastatic disease on systemic therapy	<u>Every 2 cycles of treatment (commonly every 6 to 8 weeks):</u> <ul style="list-style-type: none">• CT Chest with contrast (CPT® 71260)• CT Abdomen and Pelvis with contrast (CPT® 74177)• CT with contrast of other involved or symptomatic areas
Recurrence suspected	<ul style="list-style-type: none">• CT Chest with contrast (CPT® 71260)• CT Abdomen and Pelvis with contrast (CPT® 74177)
<u>EITHER of the following:</u> <ul style="list-style-type: none">• Biopsy-proven recurrent/metastatic disease• Signs or symptoms concerning for brain metastases	<ul style="list-style-type: none">• MRI Brain without and with contrast (CPT® 70553)

Renal Cell Cancer (RCC) – Surveillance (ONC-17.4)

ON.RC.0017.4.A

v2.0.2024

Indication	Imaging Study
RCC on active surveillance of renal mass <1 cm	<p><u>ONE of the following, once within 6 months of surveillance initiation and annually thereafter:</u></p> <ul style="list-style-type: none"> CT Abdomen without and with contrast (CPT® 74170) MRI Abdomen without and with contrast (CPT® 74183) See: Indeterminate Renal Lesion (AB-35.1) in the Abdomen Imaging Guidelines Chest x-ray (in addition to abdominal imaging) <ul style="list-style-type: none"> CT Chest with contrast (CPT® 71260) or without contrast (CPT® 71250) may be obtained for one of the following: <ul style="list-style-type: none"> New chest x-ray abnormalities Pulmonary signs/symptoms
RCC on active surveillance of renal mass ≥1 cm	<p><u>One of the following, every 3 months for year 1, every 6 months for years 2 and 3 and annually thereafter:</u></p> <ul style="list-style-type: none"> CT Abdomen without and with contrast (CPT® 74170) MRI Abdomen without and with contrast (CPT® 74183) Chest x-ray (in addition to abdominal imaging) <ul style="list-style-type: none"> CT Chest with contrast (CPT® 71260) or without contrast (CPT® 71250) may be obtained for one of the following: <ul style="list-style-type: none"> New chest x-ray abnormalities Pulmonary signs/symptoms
Follow up after post-ablation therapy of RCC	<p><u>EITHER of the following, at 1 to 3 months, 6 months, and 12 months post-ablation and then annually thereafter:</u></p> <ul style="list-style-type: none"> CT Abdomen without and with contrast (CPT® 74170) or MRI Abdomen without and with contrast (CPT® 74183) <p>AND</p> <p>Annually for 5 years:</p> <ul style="list-style-type: none"> Chest x-ray or CT Chest with contrast (CPT® 71260) or without contrast (CPT® 71250)

Transitional Cell Cancer (ONC-18)

Guideline

Transitional Cell Cancer – General Considerations (ONC-18.0)
Transitional Cell Cancer – Suspected/Diagnosis (ONC-18.1)
Transitional Cell Cancer – Initial Work-up/Staging (ONC-18.2)
Transitional Cell Cancer – Restaging/Recurrence (ONC-18.3)
Transitional Cell Cancer – Surveillance/Follow-up (ONC-18.4)
References (ONC-18)

Transitional Cell Cancer – General Considerations (ONC-18.0)

ON.TS.0018.0.A

v2.0.2024

- Transitional cell cancers can include: tumors of the bladder, ureters, prostate, urethra, or renal pelvis. For primary cancer of the kidney, see: **Renal Cell Cancer (RCC) (ONC-17)**.
- Most common histology of bladder cancer is transitional cell (TCC) or urothelial carcinoma (UCC). Rare histologies include adenocarcinoma, squamous cell (imaged according to **Transitional Cell Cancer (ONC-18)**), or small cell (imaged according to **Extrathoracic Small Cell and Large Cell Neuroendocrine Tumors (ONC-31.8)**).
- Urachal cancer is rare type of bladder cancer; the most common histology is adenocarcinoma. These are imaged according to muscle invasive bladder cancer.
- PET not routinely indicated in transitional cell cancer with exception noted below in **Transitional Cell Cancer – Initial Work-up/Staging (ONC-18.2)**

Transitional Cell Cancer – Suspected/Diagnosis (ONC-18.1)

ON.TS.0018.1.A

v2.0.2024

- See: **Hematuria and Hydronephrosis (AB-39)** in the Abdomen Imaging Guidelines for evaluation of suspected transitional cell malignancies.

Transitional Cell Cancer – Initial Work-up/Staging (ONC-18.2)

Prostate Cancer – General Considerations (ONC-19.0)

ON.PR.0019.0.A

v2.0.2024

- Prostate cancer screening begins at age 45 for individuals at average risk of prostate cancer. However, individuals at high-risk may begin screening at age 40. High-risk features include:
 - African ancestry
 - Germline mutations (BRCA1 or 2, HOXB13, ATM, CHEK2, or mismatch repair genes - MLH1, MSH2, MSH6, PMS2) that increase the risk of prostate cancer
 - Family history of first or second-degree relative with prostate, male breast, colorectal, pancreatic, endometrial or female breast cancer at age <45 years.
- Treatment of benign prostatic hyperplasia with 5- α reductase inhibitors (such as finasteride and dutasteride) can falsely reduce the measured PSA levels by 50%. Thus, the reported PSA level should be doubled when prostate cancer is suspected in individuals on these medications.
- Individuals with high-risk adverse clinical and pathological factors may benefit from a more aggressive diagnostic and therapeutic approach at the time of relapse after initial treatment. These factors include pre-treatment Gleason score of ≥ 8 , pre-treatment clinical stage of cT3b or higher, positive surgical margins, post-treatment PSA doubling time of <3 months, and an interval to biochemical failure of <3 years after initial treatment.
- PET/CT scan using ^{18}F -FDG radiotracer are considered investigational and experimental for evaluation of prostate cancer.
- ^{11}C Choline, ^{18}F -Fluciclovine (AXUMIN®), and PSMA-specific radiopharmaceuticals have recently gained FDA approval for evaluation of prostate cancer. Optimal detection rates for these radiotracers vary greatly with PSA levels. False positive rate is high and histological confirmation of positive sites is recommended. Coverage may vary with individual health care plan.
- PSMA-specific PET radiopharmaceuticals that are currently FDA-approved and indicated in prostate cancer are: ^{68}Ga PSMA-11 (UCSF & UCLA), ^{18}F Piflufolastat (Pylarify®), ^{18}F Flotufolastat (Posluma®), and ^{68}Ga Gozetotide (Illuccix® and Locametz®).
- While early detection of low-volume recurrence after treatment of prostate cancer using PET/CT scans may influence therapeutic decisions, there is lack of evidence that this approach has any meaningful impact on overall survival.
- As high intensity focused ultrasound prostate ablation is considered investigational and experimental at this time, and advanced imaging for treatment planning and/or surveillance of high intensity focused ultrasound prostate ablation is not indicated.
- MR Spectroscopy (CPT® 76390) is considered investigational and experimental in the evaluation of prostate cancer at this time.

- As laser prostate ablation is considered investigational and experimental at this time, advanced imaging for treatment planning and/or surveillance of laser prostate ablation is not indicated.
- Monitoring an elevated prostate-specific antigen level (PSA) with serial MRI is not indicated for suspected prostate cancer.
- Requests for imaging based on PSA must provide a recent (within the last 60 days) PSA.

ISUP Prostate Cancer Grade Groups³⁰

Grade Group	Gleason Score	Gleason Pattern
1	≤6	≤3+3
2	7	3+4
3	7	4+3
4	8	4+4, 3+5, 5+3
5	9 or 10	4+5, 5+4, or 5+5

NCCN Initial Risk Stratification

- Very Low Risk
 - ALL of the following features are present:
 - Tumor not clinically palpable, but present on one or both lobes on biopsy (cT1a, cT1b, or cT1c)
 - PSA (ng/mL) <10
 - Gleason Grade Group = 1
 - <3 prostate biopsy cores positive, ≤50% cancer in each core
 - PSA Density <0.15 ng/mL/g
- Low Risk
 - ALL of the following features are present but does not qualify for very low risk:
 - Clinical T Stage = cT1-cT2a (palpable tumor limited to ≤1/2 of one side)
 - PSA (ng/mL) <10
 - Gleason Grade Group = 1
- Favorable Intermediate Risk
 - ALL of the following features are present:
 - Gleason Grade Group = 1 or 2
 - <50% biopsy cores positive (e.g., <6 of 12 cores)
 - And only ONE of the following features is present:
 - Clinical T Stage = cT2b (tumor involves more than half of one lobe, but not both lobes) and cT2c (tumor involves both lobes)
 - PSA (ng/mL) = 10-20

- Unfavorable Intermediate Risk
 - Any one of the following are present:
 - Gleason grade group = 3
 - ≥50% biopsy cores positive (e.g., ≥6 of 12 cores)
 - Presence of at least two of the following three features:
 - PSA (ng/mL) = 10-20
 - Gleason Grade Group = 2 or 3
 - Clinical T Stage = cT2b (tumor involves more than half of one lobe, but not both lobes) and cT2c (tumor involves both lobes)
- High-Risk
 - Only ONE of the following high-risk features is present:
 - Clinical T Stage = cT3a (unilateral or bilateral extra-prostatic extension that is not fixed and does not invade the seminal vesicles)
 - PSA (ng/mL) >20
 - Gleason Grade Group = 4 or 5
- Very High-Risk
 - At least ONE of the following features is present:
 - Clinical T stage = cT3b-cT4 (extension into the seminal vesicles or invasion into adjacent structures)
 - Primary Gleason Pattern = 5
 - Gleason Grade Group = 4 or 5 in >4 cores
 - Presence of 2 or 3 high-risk features (noted above)

3D Rendering of MRI for MRI / Ultrasound Fusion Biopsy:

- When specific target lesion(s) is (are) detected on mpMRI (multi-parametric MRI) prostate and classified as PIRADS 4 or 5, 3D Rendering (CPT® 76377) to generate prostate segmentation data image set for target identification on MRI/Transrectal ultrasound (TRUS) fusion biopsy is approvable as:
 - Subsequent separate standalone request; or
 - As retrospective request for medical necessity.
- For MRI/TRUS fusion biopsy of a PIRADS 1-3 lesion, approval of 3D rendering at independent workstation (CPT® 76376 or CPT® 76377) can be considered on a case-by-case basis.
- If there is no target lesion identified on MRI then 3D rendering and MRI/TRUS fusion biopsy is generally not indicated.
- The 3D rendering for the TRUS component of the fusion is a part of the UroNav Fusion Equipment Software and an additional 3D code CPT® 76376 or CPT® 76377 should not be approved.

Suspected Prostate Cancer (ONC-19.1)

ON.PR.0019.1.A

v2.0.2024

Indication	Imaging Study
<p><u>ANY of the following:</u></p> <ul style="list-style-type: none"> Age 40-75 years with PSA >3 ng/ml or very suspicious DRE and ONE of the following high-risk features: <ul style="list-style-type: none"> African ancestry Germline mutations that increase the risk of prostate cancer Family history of first or second-degree relative with prostate, male breast, colorectal, pancreatic, endometrial or female breast cancer at age <45 years Age 45-75 years and ONE of the following: <ul style="list-style-type: none"> PSA >3 ng/ml Very suspicious DRE Age >75 years and ONE of the following: <ul style="list-style-type: none"> PSA ≥4 ng/ml Very suspicious DRE At least one negative/non-diagnostic TRUS biopsy and ANY of the following: <ul style="list-style-type: none"> Rising PSA Abnormal DRE Need for confirmatory MR/US fusion biopsy 	<p><u>ANY of the following:</u></p> <ul style="list-style-type: none"> Transrectal ultrasound (CPT® 76872) TRUS-guided biopsy (CPT® 76942) MRI Pelvis without and with contrast (CPT® 72197) or MRI Pelvis without contrast (CPT® 72195) if an MR/US guided fusion biopsy is planned MRI/US fusion biopsy (CPT® 76942)

Prostate Cancer – Restaging/Recurrence (ONC-19.3)

ON.PR.0019.3.A

v2.0.2024

Indication	Imaging Study
<p><u>For ANY of the following:</u></p> <ul style="list-style-type: none"> Obvious progression by DRE with plans for prostatectomy or radiation therapy Repeat TRUS biopsy for rising PSA shows progression to a higher Gleason's score with plans for prostatectomy or radiation therapy Inconclusive findings on CT scan 	<ul style="list-style-type: none"> MRI Pelvis without and with contrast (CPT® 72197)
<p><u>Non-metastatic prostate cancer previously treated with prostatectomy, radiation therapy, ablation, hormonal therapy or chemotherapy and any one of the following:</u></p> <ul style="list-style-type: none"> Clinical suspicion of relapse/recurrence PSA fails to become undetectable post prostatectomy Palpable anastomotic recurrence PSA rises above post-treatment baseline to >0.2 ng/mL but <0.5 ng/mL on two consecutive measurements 	<p>Any ONE of the following combinations:</p> <ul style="list-style-type: none"> CT Chest with contrast (CPT® 71260), CT Abdomen and Pelvis with contrast (CPT® 74177), and Bone scan (see: <u>Nuclear Medicine (NM) Imaging in Oncology (ONC-1.3)</u> for bone scan coding) CT Chest with contrast (CPT® 71260), CT Abdomen with contrast (CPT® 74160), MRI Pelvis without and with contrast (CPT® 72197), and Bone scan (see: <u>Nuclear Medicine (NM) Imaging in Oncology (ONC-1.3)</u> for bone scan coding)

Indication	Imaging Study
<p><u>Non-metastatic prostate cancer previously treated with prostatectomy or radiation therapy, and all of the following are met:</u></p> <ul style="list-style-type: none"> PSA rises on two consecutive measurements above post-treatment baseline and PSA ≥ 0.5 ng/mL and Individual is a candidate for salvage local therapy 	<p>Any ONE of the following:</p> <ul style="list-style-type: none"> PSMA PET/CT scan (CPT® 78815 or CPT® 78816) with any of the following radiotracers: <ul style="list-style-type: none"> ^{68}Ga-PSMA-11 ^{18}F Piflufolastat (Pylarify®) ^{18}F Flotufolastat (Posluma®) ^{68}Ga Gozetotide (Illuccix® and Locametz®) CT Chest with contrast (CPT® 71260), CT Abdomen and Pelvis with contrast (CPT® 74177), and Bone scan CT Chest with contrast (CPT® 71260), CT Abdomen with contrast (CPT® 74160), MRI Pelvis without and with contrast (CPT® 72197), and Bone scan (see: Nuclear Medicine (NM) Imaging in Oncology (ONC-1.3) for bone scan coding)
<p><u>Non-metastatic prostate cancer previously treated with prostatectomy or radiation therapy, and all of the following are met:</u></p> <ul style="list-style-type: none"> PSA rises on two consecutive measurements above post-treatment baseline and PSA ≥ 1 ng/mL and Recent CT scan and bone scan are negative for metastatic disease and Individual is a candidate for salvage local therapy 	<ul style="list-style-type: none"> PET/CT scan (CPT® 78815 or CPT® 78816) using any ONE of the following radiotracers: <ul style="list-style-type: none"> ^{18}F-Fluciclovine ^{11}C Choline
<p><u>Suspected progression of known metastatic disease based on:</u></p> <ul style="list-style-type: none"> New or worsening signs/symptoms Rising PSA levels 	<ul style="list-style-type: none"> CT Chest with contrast (CPT® 71260), CT Abdomen and Pelvis with contrast (CPT® 74177), and Bone scan (see: Nuclear Medicine (NM) Imaging in Oncology (ONC-1.3) for bone scan coding) CT with contrast of any involved or symptomatic body part

Indication	Imaging Study
Metastatic prostate cancer receiving treatment with chemotherapy	<ul style="list-style-type: none"> CT Abdomen and Pelvis with contrast (CPT® 74177) and CT scan with contrast of any involved body part every 2 cycles (6 to 8 weeks) while on chemotherapy Bone scan may be obtained every 3-6 months (see: <u>Nuclear Medicine (NM) Imaging in Oncology (ONC-1.3)</u> for bone scan coding)
Metastatic prostate cancer receiving anti-androgen therapy	<ul style="list-style-type: none"> CT Abdomen and Pelvis with contrast (CPT® 74177) and CT scan of any involved body part every 3 months while on anti-androgen therapy Bone scan may be obtained every 3-6 months (see: <u>Nuclear Medicine (NM) Imaging in Oncology (ONC-1.3)</u> for bone scan coding)
Previously treated metastatic prostate cancer progressed on conventional imaging and being considered for ¹⁷⁷ Lu-PSMA-617 (Pluvicto®) treatment ^{31, 32}	<ul style="list-style-type: none"> PSMA PET/CT scan (CPT® 78815 or CPT® 78816) with one of the following agents: <ul style="list-style-type: none"> ⁶⁸Ga PSMA-11 ¹⁸F Piflufolastat (Pylarify®) ⁶⁸Ga Gozetotide (Illuccix® and Locametz®) ¹⁸F Flotufolastat (Posluma®)
Prior to start of Xofigo (Radium-223) therapy	<ul style="list-style-type: none"> ONE time CT Chest, Abdomen, and Pelvis with contrast (CPT® 71260 and CPT® 74177)
Inconclusive bone scan	<ul style="list-style-type: none"> CT with contrast or MRI without and with contrast of involved body site

Indication	Imaging Study
<p><u>For ANY of the following:</u></p> <ul style="list-style-type: none">Inconclusive bone findings on both CT/MRI and bone scanConventional imaging studies (CT and bone scan) suggests oligo- or low volume metastatic disease that needs further confirmation	<ul style="list-style-type: none"><u>PET/CT scan (CPT® 78815 or CPT® 78816) using any one of the following radiotracers:</u><ul style="list-style-type: none">¹⁸F Fluciclovine¹¹C Choline⁶⁸Ga-PSMA-11¹⁸F Piflufolastat (Pylarify®)⁶⁸Ga Gozetotide (Illuccix® and Locametz®)¹⁸F Flotufolastat (Posluma®)

Prostate Cancer – Follow-up On Active Surveillance (ONC-19.4)

ON.PR.0019.4.A

v2.0.2024

Active surveillance is being increasingly utilized in prostate cancer, and this therapeutic option involves regimented monitoring of an individual with known diagnosis of low risk prostate cancer for disease progression, without specific anticancer treatment. While being treated with active surveillance, an individual is generally considered a potential candidate for curative intent treatment approaches in the event that disease progression occurs.

It is important to distinguish active surveillance from watchful waiting (or observation), which is generally employed in individuals with limited life expectancy. Watchful waiting involves cessation of routine monitoring and treatment is initiated only if symptoms develop.

Current active surveillance guidelines suggest the following protocol:

- PSA every 6 months
- Digital Rectal Exam (DRE) every 12 months
- Repeat prostate biopsy every 12 months
- Repeat mpMRI (CPT® 72195 or CPT® 72197) no more often than every 12 months

Indication	Imaging Study
Routine monitoring on active surveillance protocol	<ul style="list-style-type: none"> • MRI Pelvis without (CPT® 72195) or without and with contrast (CPT® 72197) at initiation of active surveillance, and every 12 months thereafter
<u>For ANY of the following:</u> <ul style="list-style-type: none"> • Progression is suspected based on DRE changes or rising PSA and a recent TRUS biopsy was negative • Repeat TRUS biopsy shows progression to a higher Gleason score 	<ul style="list-style-type: none"> • MRI Pelvis without (CPT® 72195) or MRI Pelvis without and with contrast (CPT® 72197)
Individuals on active surveillance who are noted to have progression and have plans to initiate treatment	<ul style="list-style-type: none"> • Imaging studies for initial staging as per <u>ONC-19.2</u>

Surveillance/Follow-up For Treated Prostate Cancer (ONC-19.5)

ON.PR.0019.5.A

v2.0.2024

Indication	Imaging Study
<u>ANY of the following:</u> <ul style="list-style-type: none">Asymptomatic or stable chronic symptomsStable DRE findingsStable PSA levels	<ul style="list-style-type: none">Advanced imaging is not routinely indicated for surveillance

Testicular, Ovarian and Extragonadal Germ Cell Tumors (ONC-20)

Guideline

Testicular, Ovarian and Extragonadal Germ Cell Tumors – General Considerations (ONC-20.0)

Testicular, Ovarian and Extragonadal Germ Cell Tumors – Initial Work-Up/Staging (ONC-20.1)

Testicular, Ovarian and Extragonadal Germ Cell Tumors – Restaging/Recurrence (ONC-20.2)

Testicular, Ovarian and Extragonadal Germ Cell Tumors – Surveillance (ONC-20.3)

References (ONC-20)

Testicular, Ovarian and Extragonadal Germ Cell Tumors – General Considerations (ONC-20.0)

ON.TO.0020.0.A
v2.0.2024

- This section applies to primary germ cell tumors occurring outside the central nervous system if individual's age >15 years at the time of initial diagnosis. Individuals age ≤15 years at diagnosis should be imaged according to pediatric guidelines in: **Pediatric Germ Cell Tumors (PEDONC-10)** in the Pediatric Oncology Imaging Guidelines.
- These guidelines are for germ cell tumors of the testicle, ovary and extragonadal sites as well as malignant sex cord stromal tumors (granulosa cell and Sertoli-Leydig cell tumors).
- Requests for imaging must state the histologic type of the cancer being evaluated.
- Classified as pure seminomas (dysgerminomas, 40%) or Non-seminomatous germ cell tumors (NSGCT, 60%):
 - Pure seminomas are defined as pure seminoma histology with a normal serum concentration of alpha fetoprotein (AFP). Seminomas with elevated AFP are by definition Mixed.
 - Required for TNM staging are the tumor marker levels indicated by “S” (TNMS)
 - Mixed tumors are treated as NSGCTs, as they tend to be more aggressive.
 - The NSGCT histologies include:
 - Yolk-Sac tumors
 - Immature (malignant) teratomas
 - Choriocarcinomas (<1%)
 - Embryonal cell carcinomas (15% to 20%)
 - Endodermal Sinus Tumors (ovarian)
 - Combinations of all of the above (Mixed)
- MRI in place of CT scans to reduce risk of secondary malignancy is not supported by the peer-reviewed literature. CT scans are indicated for surveillance and are the preferred modality of imaging to assess for recurrence.
- PET/CT Scan is considered experimental, investigational, or unproven for evaluation of non-seminomatous germ cell tumors
- Active surveillance in testicular cancer refers to treatment with surgery (orchiectomy) alone without any additional post-operative treatment such as chemotherapy or radiotherapy

Testicular, Ovarian and Extragonadal Germ Cell Tumors – Initial Work-Up/Staging (ONC-20.1)

ON.TO.0020.1.A
v2.0.2024

Indication	Imaging Study
Orchiectomy/oophorectomy is both diagnostic and therapeutic	<u>All individuals, following orchiectomy or oophorectomy:</u> <ul style="list-style-type: none">CT Abdomen and Pelvis with contrast (CPT® 74177)
<u>For ANY of the following:</u> <ul style="list-style-type: none">Non-seminoma histologyOvarian germ cell tumorAbdominal lymphadenopathy noted on CT scanAbnormal Chest X-ray or signs/symptoms suggestive of chest involvement	<ul style="list-style-type: none">CT Chest with contrast (CPT® 71260)
Extragonadal Germ Cell Tumor	<ul style="list-style-type: none">CT Chest with contrast (CPT® 71260) and CT Abdomen and Pelvis with contrast (CPT® 74177)

Testicular, Ovarian and Extragonadal Germ Cell Tumors – Restaging/Recurrence (ONC-20.2)

ON.TO.0020.2.A
v2.0.2024

Indication	Imaging Study
Treatment response for stage II-IV individuals with measurable disease on CT	<ul style="list-style-type: none"> CT with contrast of previously involved body areas every 2 cycles
Seminoma with residual mass >3 cm after completion of chemotherapy	<ul style="list-style-type: none"> PET/CT (CPT® 78815)
End of therapy evaluation for NSGCT post chemotherapy or post retroperitoneal lymph node dissection (RPLND)	<ul style="list-style-type: none"> CT Abdomen and Pelvis with contrast (CPT® 74177)
Recurrence suspected, including increased tumor markers	<ul style="list-style-type: none"> CT Chest (CPT® 71260) and CT Abdomen and Pelvis (CPT® 74177) with contrast Ultrasound (CPT® 76856 or CPT® 76857) of the remaining gonad if applicable
Unexplained pulmonary symptoms despite a negative chest x-ray, or new findings on chest x-ray	<ul style="list-style-type: none"> CT Chest with contrast (CPT® 71260)
All others	<ul style="list-style-type: none"> See: Surveillance (ONC-20.3)

Testicular, Ovarian and Extragonadal Germ Cell Tumors – Surveillance (ONC-20.3)

ON.TO.0020.3.A

v2.0.2024

Indication	Imaging Study
Stage I Seminoma treated with orchiectomy alone (no radiotherapy or chemotherapy, also called active surveillance)	<ul style="list-style-type: none"> CT Abdomen and Pelvis with contrast (CPT® 74177) or CT Abdomen with contrast (CPT® 74160) once at 4-6 months and 12 months post-orchiectomy, then every 6 months for years 2 and 3, and then annually until year 5
Stage I Seminoma treated with radiotherapy and/or chemotherapy	<ul style="list-style-type: none"> CT Abdomen and Pelvis with contrast (CPT® 74177) or CT Abdomen with contrast (CPT® 74160) annually for 3 years
Stage IIA and non-bulky Stage IIB Seminomas treated with radiotherapy or chemotherapy	<ul style="list-style-type: none"> CT Abdomen and Pelvis with contrast (CPT® 74177) or CT Abdomen with contrast (CPT® 74160) once at 3 months then once at 9-12 months after completion of therapy, then annually for 2 additional years
Bulky Stage IIB, IIC, and III Seminomas treated with chemotherapy	<p><u>For individuals with ≤3 cm residual mass:</u></p> <ul style="list-style-type: none"> CT Abdomen and Pelvis with contrast (CPT® 74177) or CT Abdomen with contrast (CPT® 74160) every 4 months for 1 year, every 6 months for 1 year and then annually for 2 additional years <p><u>For individuals with >3 cm residual mass and negative PET scan:</u></p> <ul style="list-style-type: none"> CT Abdomen and Pelvis with contrast (CPT® 74177) or CT Abdomen with contrast (CPT® 74160) at 6 and 12 months after completion of therapy, then annually until year 5 <p><u>For individuals with thoracic disease:</u></p> <ul style="list-style-type: none"> CT Chest with contrast (CPT® 71260) every 2 months for 1 year, then every 3 months for 1 year, then annually until year 5 after completion of therapy

Indication	Imaging Study
Stage IA Non-Seminomatous germ cell tumors treated with orchiectomy alone (without risk factors)	<ul style="list-style-type: none"> CT Abdomen and Pelvis with contrast (CPT[®] 74177) or CT Abdomen with contrast (CPT[®] 74160) every 6 months for 2 years and then annually for 1 additional year
Stage IB Non-Seminomatous germ cell tumors treated with orchiectomy alone (with risk factors – lymphovascular invasion or invasion into spermatic cord/scrotum)	<ul style="list-style-type: none"> CT Abdomen and Pelvis with contrast (CPT[®] 74177) or CT Abdomen with contrast (CPT[®] 74160) every 4 months for 1 year, then every 6 months for 2 years, then annually until year 4
Stage IA/IB Non-Seminomatous germ cell tumors treated with chemotherapy and/or primary RPLND	<ul style="list-style-type: none"> CT Abdomen and Pelvis with contrast (CPT[®] 74177) or CT Abdomen with contrast (CPT[®] 74160) annually for 2 years
Stage II-III Non-Seminomatous germ cell tumors with complete response to chemotherapy +/- post-chemotherapy RPLND	<ul style="list-style-type: none"> CT Abdomen and Pelvis with contrast (CPT[®] 74177) or CT Abdomen with contrast (CPT[®] 74160) once at 6, 12, 24 and 36 months after completion of therapy <p><u>For individuals with thoracic disease:</u></p> <ul style="list-style-type: none"> CT Chest with contrast (CPT[®] 71260) every 6 months for 2 years, then annually until year 4 after completion of therapy
Stage IIA or IIB Non-Seminomatous germ cell tumors treated with post-primary RPLND <u>and</u> adjuvant chemotherapy	<ul style="list-style-type: none"> CT Abdomen and Pelvis with contrast (CPT[®] 74177) or CT Abdomen with contrast (CPT[®] 74160) once at 4 months after completion of RPLND
Stage IIA or IIB Non-Seminomatous germ cell tumors treated with post-primary RPLND <u>without</u> adjuvant chemotherapy	<ul style="list-style-type: none"> CT Abdomen and Pelvis with contrast (CPT[®] 74177) or CT Abdomen with contrast (CPT[®] 74160) once at 3 to 4 months after completion of therapy and repeat annually for 1 additional year
All stages of ovarian dysgerminoma germ cell tumors	<ul style="list-style-type: none"> CT Abdomen and Pelvis with contrast (CPT[®] 74177) every 4 months for 1 year, every 6 months for 1 year and then annually for 3 years after completion of therapy

Indication	Imaging Study
<u>All ovarian non-dysgerminoma germ cell tumors</u> <ul style="list-style-type: none">Embryonal tumorEndodermal sinus tumorImmature teratomaNon-gestational choriocarcinoma	<ul style="list-style-type: none">CT Abdomen and Pelvis with contrast (CPT® 74177) every 4 months for 1 year, every 6 months for 1 year and then annually for 3 years after completion of therapyCT Chest with contrast (CPT® 71260) every 4 months for 1 year and every 6 months for 1 year after completion of therapy
<ul style="list-style-type: none">Sex cord stromal tumors (male and female)Mature teratoma	<ul style="list-style-type: none">No routine advanced imaging indicated unless elevated tumor markers or clinical signs/symptoms of recurrence
Extragenital germ cell tumors	<ul style="list-style-type: none">CT of the involved region every 3 months for one year and every 6 months for one year.

Ovarian Cancer – General Considerations (ONC-21.0)

ON.OC.0021.0.A

v2.0.2024

- Ovarian cancers include: epithelial ovarian cancers, ovarian cancers of low malignant potential and mixed Müllerian tumors, primary peritoneal and fallopian tube cancers.
 - There are five main types of epithelial ovarian cancers:
 - High-grade serous carcinoma (HGSC) (70%)
 - Endometrioid carcinoma (EC) (10%)
 - Clear cell carcinoma (CCC) (10%)
 - Mucinous carcinoma (MC) (3%)
 - Low-grade serous carcinoma (LGSC) (<5%)
- Borderline tumors (formerly referred to as tumors of low malignant potential) usually have some feature of carcinoma when they recur.
- Fallopian tube and primary peritoneal are usually serous carcinoma.
- Germ cell tumors and sex cord stromal tumors (granulosa cell tumors), are imaged according to **Testicular, Ovarian and Extragonadal Germ Cell Cancer (ONC-20)**.

Screening for Ovarian Cancer (ONC-21.1)

ON.OC.0021.1.A

v2.0.2024

Indication	Imaging/Lab Study
<u>High-Risk Factors:</u> <ul style="list-style-type: none">Family history of BRCA 1 or BRCA 2 mutationsFamily history of ovarian cancerHereditary ovarian cancer syndrome that includes ovarian, breast, and/or endometrial and gastrointestinal cancers [Lynch II syndrome] in multiple members of two to four generationsLow parityDecreased fertilityDelayed childbearing	<ul style="list-style-type: none">Ovarian cancer screening is considered experimental & investigational and is not recommended.Genetic counseling is recommended for women with an increased-risk family history (USPSTF, 2015)
Known BRCA-1 or BRCA-2 mutation	<ul style="list-style-type: none">Transvaginal ultrasound (CPT® 76830), combined with CA-125 for ovarian cancer screening may be considered annually starting at age 30, until risk-reducing salpingo-oophorectomy is performed

Ovarian Cancer – Suspected/Diagnosis (ONC-21.2)

ON.OC.0021.2.A

v2.0.2024

- See: **Complex Adnexal Masses (PV-5.3)** for imaging guidelines for evaluation of suspected ovarian malignancies
- Staging of ovarian cancer is primarily surgical and routine imaging is not indicated pre-operatively, unless it is obtained to evaluate specific signs/symptoms.
- To differentiate the origin of pelvic masses that are not clearly of ovarian origin, see: **Suspected Adnexal Mass (PV-5.1)**

Indication	Imaging/Lab Study
<ul style="list-style-type: none"> • Pelvic symptoms (pelvic pain, abdominal bloating) • Palpable pelvic mass 	<ul style="list-style-type: none"> • Transvaginal (TV) ultrasound imaging (CPT® 76830) and/or Pelvic ultrasound (CPT® 76856 or CPT® 76857)
Ultrasound shows a complex and/or solid adnexal mass	<ul style="list-style-type: none"> • See: Complex Adnexal Masses (PV-5.3)
Ultrasound shows complex and/or solid adnexal mass suspicious for ovarian malignancy AND any of the following signs/symptoms concerning for metastatic disease: <ul style="list-style-type: none"> • Ascites • Abdominal symptoms (distension, tenderness) • Elevated CA-125 • Elevated LFTs • Obstructive uropathy** 	<ul style="list-style-type: none"> • CT Abdomen and Pelvis with contrast (CPT® 74177) • **CT Abdomen and Pelvis without and with contrast (CT Urogram – CPT® 74178) may be approved only for symptoms of obstructive uropathy

Ovarian Cancer – Initial Work-Up/Staging (ONC-21.3)

ON.OC.0021.3.A

v2.0.2024

Indication	Imaging Study
Clinical stage II disease or higher	<ul style="list-style-type: none">CT Abdomen and Pelvis with contrast (CPT® 74177)CT Chest with contrast (CPT® 71260) for:<ul style="list-style-type: none">Abnormal signs/symptoms of pulmonary diseaseAbnormal chest x-ray
<u>ANY of the following:</u> <ul style="list-style-type: none">Primary peritoneal disease with biopsy-proven malignancy consistent with ovarian carcinomaElevated tumor markers with negative or inconclusive CT imaging	<ul style="list-style-type: none">PET/CT (CPT® 78815)

Ovarian Cancer – Restaging/Recurrence (ONC-21.4)

ON.OC.0021.4.A

v2.0.2024

Indication	Imaging Study
Completely resected or definitively treated with chemotherapy and normal(ized) tumor markers	<ul style="list-style-type: none"> No advanced imaging needed
<u>ANY of the following:</u> <ul style="list-style-type: none"> Unresected disease Unknown preoperative markers Difficult or abnormal examination Elevated LFTs Elevated tumor markers (CA-125, inhibin) Signs or symptoms of recurrence 	<ul style="list-style-type: none"> CT Abdomen and Pelvis with contrast (CPT® 74177) CT Chest with contrast (CPT® 71260) for ANY of the following: <ul style="list-style-type: none"> Known prior thoracic disease New or worsening pulmonary symptoms New or worsening chest x-ray findings Rising tumor markers (CA-125, inhibin)
Monitoring response to treatment (every 2 cycles, or ~every 6 to 8 weeks)	<ul style="list-style-type: none"> CT Abdomen and Pelvis with contrast (CPT® 74177) CT Chest with contrast (CPT® 71260) for ANY of the following: <ul style="list-style-type: none"> Known prior thoracic disease New or worsening pulmonary symptoms New or worsening chest x-ray findings
<ul style="list-style-type: none"> CT negative or inconclusive and CA-125 continues to rise or elevated LFTs Conventional imaging failed to demonstrate tumor or if persistent radiographic mass with rising tumor markers 	<ul style="list-style-type: none"> PET/CT (CPT® 78815)

Ovarian Cancer – Surveillance (ONC-21.5)

ON.OC.0021.5.A

v2.0.2024

Indication	Imaging Study
Stages I-III	<ul style="list-style-type: none">Advanced imaging is not routinely indicated for surveillance
Measurable metastatic disease on maintenance therapy or being monitored off therapy	<u>Every 3 months for up to 5 years after completion of active treatment:</u> <ul style="list-style-type: none">CT Abdomen and Pelvis with contrast (CPT[®] 74177)CT with contrast of previously involved body areas

Uterine Cancer – Surveillance (ONC-22.4)

Gestational Trophoblastic Neoplasia (GTN) (ONC-22.5)

References (ONC-22)

Uterine Cancer – General Considerations (ONC-22.0)

ON.UC.0022.0.A

v2.0.2024

- Gestational trophoblastic neoplasia (GTN) – see: **Molar Pregnancy and Gestational Trophoblastic Neoplasia (GTN) (PV-16.1)** in the Pelvic Imaging Guidelines.
- Most common cell type is adenocarcinoma. Uterine sarcomas are also imaged according to this guideline.
- Staging of uterine cancer is primarily surgical. Advanced imaging is not routinely indicated pre-operatively for laparoscopic/minimally invasive surgery unless initial staging criteria are met. Pelvic and para-aortic lymphadenectomy can still be performed.

Uterine Cancer – Suspected/Diagnosis (ONC-22.1)

ON.UC.0022.1.A

v2.0.2024

- See: **Abnormal Uterine Bleeding (PV-2.1)** in the Pelvic Imaging Guidelines for evaluation of suspected uterine malignancies.

Uterine Cancer – Initial Work-Up/Staging (ONC-22.2)

ON.UC.0022.2.A

v2.0.2024

Indication	Imaging Study
<p><u>ANY of the following:</u></p> <ul style="list-style-type: none"> • Extrauterine disease suspected • To assess local extent of tumor prior to fertility-sparing surgery for well-differentiated Stage IA (grade 1) uterine cancer • Poor surgical candidate (due to medical comorbidities) considering medical therapy 	<ul style="list-style-type: none"> • MRI Pelvis without and with contrast (CPT® 72197) • Transvaginal ultrasound (CPT® 76830) if MRI is contraindicated • Chest x-ray <ul style="list-style-type: none"> • CT Chest with contrast (CPT® 71260) if chest x-ray is abnormal
<p><u>ANY of the following:</u></p> <ul style="list-style-type: none"> • Abdominal symptoms or abnormal examination findings • Elevated LFTs • Other imaging studies suggest liver involvement 	<p><u>ONE of the following:</u></p> <ul style="list-style-type: none"> • CT Abdomen and Pelvis with contrast (CPT® 74177) • CT Abdomen with contrast (CPT® 74160)
<p><u>ANY of the following high-risk histologies:</u></p> <ul style="list-style-type: none"> • Papillary serous • Clear cell • High-grade/poorly differentiated endometrioid carcinoma • Uterine sarcomas: <ul style="list-style-type: none"> • Carcinosarcoma • Soft tissue sarcoma of the uterus • Leiomyosarcoma • Rhabdomyosarcoma • Undifferentiated sarcoma • Endometrial stromal sarcoma 	<ul style="list-style-type: none"> • CT Chest (CPT® 71260) and CT Abdomen and Pelvis (CPT® 74177) with contrast

Indication	Imaging Study
<u>Tumors detected incidentally or incompletely staged surgically <i>and</i> ANY of the following high-risk features:</u> <ul style="list-style-type: none">• Myoinvasion >50%• Cervical stromal involvement• Lymphovascular invasion• Tumor >2 cm	<ul style="list-style-type: none">• CT Chest (CPT® 71260) and CT Abdomen and Pelvis (CPT® 74177) with contrast
Inconclusive findings on conventional imaging	<ul style="list-style-type: none">• PET/CT scan (CPT® 78815)

Uterine Cancer – Surveillance (ONC-22.4)

ON.UC.0022.4.A

v2.0.2024

Indication	Imaging Study
Stage I-III of uterine carcinoma	Advanced imaging is not routinely indicated for surveillance
Measurable metastatic disease on maintenance therapy or being monitored off therapy	<u>Every 3 months for up to 5 years after completion of definitive treatment:</u> <ul style="list-style-type: none">• CT Abdomen and Pelvis with contrast (CPT® 74177)• CT with contrast of previously involved body areas
<u>All stages of uterine sarcoma:</u> <ul style="list-style-type: none">• Soft tissue sarcoma of the uterus• Leiomyosarcoma• Adenosarcoma• Carcinosarcoma• Rhabdomyosarcoma• Undifferentiated sarcoma• Endometrial stromal sarcoma	CT Chest (CPT® 71260) and CT Abdomen and Pelvis with contrast (CPT® 74177) every 3 months for 2 years, every 6 months for 3 years, and then every 1-2 years until year 10

Gestational Trophoblastic Neoplasia (GTN) (ONC-22.5)

ON.UC.0022.5.A

v2.0.2024

- The most common form of gestational trophoblastic disease (GTD) is hydatidiform mole (HM), a benign form, also known as molar pregnancy.
 - See: **Molar Pregnancy and GTN (PV-16.1)**
- Gestational trophoblastic neoplastic disorders including a malignant form of GTD, and can present as invasive mole, choriocarcinoma, placental site trophoblastic tumor (PSTT), or epithelioid trophoblastic tumor (ETT). GTN cells are malignant and can metastasize to other organs such as lungs, brain, bone and vagina. These tumors have a high likelihood of cure and treatment with methotrexate usually allows for fertility preservation.
- Surveillance is generally with serial monitoring of HCG levels, and advanced imaging is reserved for high-risk histologies where HCG levels may not be a reliable marker.

Indication	Imaging Study
Initial staging	<ul style="list-style-type: none"> CT Chest with contrast (CPT® 71260) CT Abdomen and Pelvis with contrast (CPT® 74177)
<u>EITHER of the following:</u> <ul style="list-style-type: none"> Pulmonary metastases noted on CT scan Signs/symptoms of CNS involvement 	<ul style="list-style-type: none"> MRI Brain without and with contrast (CPT® 70553)
<u>EITHER of the following:</u> <ul style="list-style-type: none"> Monitoring response to systemic therapy (every 2 cycles, i.e., 6-8 weeks) Suspected progression 	<ul style="list-style-type: none"> CT Chest with contrast (CPT® 71260) CT Abdomen and Pelvis with contrast (CPT® 74177)
<u>Surveillance for any of the following high risk histologies:</u> <ul style="list-style-type: none"> Placental site trophoblastic tumor (PSTT) Epithelioid trophoblastic tumor (ETT) 	<u>Annually for 2 years:</u> <ul style="list-style-type: none"> CT Chest with contrast (CPT® 71260) CT Abdomen and Pelvis with contrast (CPT® 74177)

Multiple Myeloma and Plasmacytomas – General Considerations (ONC-25.0)

ON.MM.0025.0.A

v2.0.2024

- Multiple myeloma (MM) is a neoplastic disorder characterized by the proliferation of a single clone of plasma cells derived from B cells which grows in the bone marrow and adjacent bone, producing skeletal destruction.
- Multiple myeloma group of disorders can be classified as below, which influence imaging modality of choice.

Condition	Monoclonal protein	Bone marrow plasma cells	CRAB criteria**
Solitary Plasmacytoma (biopsy proven tumor containing plasma cells)	<3 gm/dL	Absent	Absent
Monoclonal Gammopathy of Unknown Significance (MGUS)	<3 gm/dL	<10%	Absent
Smoldering Myeloma (SMM) (stage I MM or asymptomatic MM)	≥3 gm/dL	10% - 60%	Absent
Multiple Myeloma (MM)	≥3 gm/dL	≥10%	Present

**CRAB criteria = hypercalcemia, renal insufficiency, anemia, lytic bony lesions

- Diagnosis and monitoring of response to therapy is primarily with laboratory studies that include urine and serum monoclonal protein levels, serum free light chain levels, LDH and beta-2 microglobulin. Routine advanced imaging to monitor response to treatment is not indicated.
- Rarely, (<5%), an individual may have Nonsecretory Myeloma, which does not produce measurable M-protein. These individuals require imaging as primary method to monitor disease.
- Other conditions that may present with Monoclonal Gammopathy include:
 - POEMS syndrome: Polyneuropathy, Organomegaly, Endocrinopathy, Monoclonal protein and Skin Changes – may also have sclerotic bone lesions and Castleman's disease. See: **Multiple Myeloma and Plasmacytomas – Initial Work-up/Staging (ONC-25.2)** for imaging recommendations.
 - Waldenström's Macroglobulinemia: IgM monoclonal protein along with bone marrow infiltration of small lymphocytes. See: **Waldenström Macroglobulinemia or Lymphoplasmacytic Lymphoma (ONC-27.10)** for imaging recommendations.
 - Systemic Light chain Amyloidosis: light chain monoclonal protein in serum or urine with clonal plasma cells in bone marrow, systemic involvement of the kidneys, liver, heart, gastrointestinal tract or peripheral nerves due to amyloid

deposition. See: **Multiple Myeloma and Plasmacytomas – Initial Work-up/Staging (ONC-25.2)** and **Cardiac Amyloidosis (CD-3.8)** for imaging recommendations for systemic light chain amyloidosis.

Leukemias, Myelodysplasia and Myeloproliferative Neoplasms (ONC-26)

Guideline

Leukemias, Myelodysplasia and Myeloproliferative Neoplasms – General Considerations (ONC-26.1)

Acute Leukemias (ONC-26.2)

Chronic Myeloid Leukemias, Myelodysplastic Syndrome and Myeloproliferative Disorders (ONC-26.3)

Chronic Lymphocytic Leukemia (CLL)/Small Lymphocytic Lymphoma (SLL) (ONC-26.4)

References (ONC-26)

Leukemias, Myelodysplasia and Myeloproliferative Neoplasms – General Considerations (ONC-26.1)

ON.LM.0026.1.A

v2.0.2024

- PET imaging is considered investigational, experimental, or unproven for all indications in acute lymphoblastic leukemia, acute myeloid leukemia, and chronic myeloid leukemia.
- Routine advanced imaging is not indicated for the evaluation and management of Hairy cell leukemia in the absence of specific localizing clinical symptoms.

Acute Leukemias (ONC-26.2)

ON.LM.0026.2.A

v2.0.2024

- Imaging indications for acute lymphoblastic leukemia in adult individuals are identical to those for pediatric individuals. See: **Acute Lymphoblastic Leukemia (ALL) (PEDONC-3.2)** in the Pediatric Oncology Imaging Guidelines.
- Imaging indications for acute myeloid leukemia in adult individuals are identical to those for pediatric individuals. See: **Acute Myeloid Leukemia (AML) (PEDONC-3.3)** in the Pediatric Oncology Imaging Guidelines.

Chronic Myeloid Leukemias, Myelodysplastic Syndrome and Myeloproliferative Disorders (ONC- 26.3)

ON.LM.0026.3.A

v2.0.2024

- Routine advanced imaging is not indicated in the evaluation and management of chronic myeloid leukemias, myelodysplastic syndromes or myeloproliferative disorders in the absence of specific localizing clinical symptoms or clearance for hematopoietic stem cell transplantation.
- See: **Hematopoietic Stem Cell Transplantation (ONC-29)** for imaging guidelines related to transplant.
- For work-up of elevated blood counts, see: **Paraneoplastic Syndromes – General Considerations (ONC-30.3)**.

Chronic Lymphocytic Leukemia (CLL)/ Small Lymphocytic Lymphoma (SLL) (ONC-26.4)

ON.LM.0026.4.A
v2.0.2024

- PET imaging is not indicated in the evaluation of CLL/SLL with the exception of suspected Richter's transformation (See Suspected transformation, below).
- CLL/SLL is monitored with serial laboratory studies. Routine advanced imaging is not indicated for monitoring treatment response or surveillance, except when initial studies reveal bulky disease involvement.
- Bulky disease is defined as lymph node mass >10 cm or spleen >6 cm below costal margin

Indication	Imaging Study
Initial Staging/Diagnosis	<ul style="list-style-type: none"> • Advanced imaging is not routinely indicated for initial evaluation of asymptomatic individuals
<u>For ANY of the following:</u> <ul style="list-style-type: none"> • Bulky lymph node mass (>10 cm) • Splenomegaly >6 cm below costal margin • Presence of B symptoms • Progressive anemia and thrombocytopenia • Prior to planned systemic therapy 	<u>ANY or ALL of the following may be approved:</u> <ul style="list-style-type: none"> • CT Chest with contrast (CPT® 71260) • CT Abdomen and Pelvis with contrast (CPT® 74177)
Treatment Response	<ul style="list-style-type: none"> • For individuals with bulky nodal disease at diagnosis, CT with contrast of previously involved area(s) every 2 cycles of therapy • Routine imaging is not indicated for individuals without bulky nodal disease at diagnosis
End of Therapy Evaluation	<ul style="list-style-type: none"> • For individuals with bulky nodal disease at diagnosis, CT with contrast of previously involved area(s)
Suspected Progression	<u>ANY or ALL of the following may be approved:</u> <ul style="list-style-type: none"> • CT Chest with contrast (CPT® 71260) • CT Abdomen and Pelvis with contrast (CPT® 74177) • CT with contrast of previously involved area(s)

Indication	Imaging Study
<u>Suspected transformation (Richter's) from a low-grade lymphoma to a more aggressive type based on one or more of the following:</u> <ul style="list-style-type: none">• New B symptoms• Rapidly growing lymph nodes• Extranodal disease develops• Significant recent rise in LDH above normal range	<ul style="list-style-type: none">• PET/CT (CPT® 78815 or CPT® 78816)
Surveillance	<u>For individuals with bulky nodal disease at diagnosis, every 6 months for two years, then annually:</u> <ul style="list-style-type: none">• CT Chest with contrast (CPT® 71260)• CT Abdomen and Pelvis with contrast (CPT® 74177)• CT with contrast of previously involved area(s) <p>Routine imaging is not indicated for individuals without bulky nodal disease at diagnosis</p>

Post-Transplant Lymphoproliferative Disorders (ONC-27.9)
Waldenström Macroglobulinemia or Lymphoplasmacytic Lymphoma (ONC-27.10)
References (ONC-27)

Non-Hodgkin Lymphomas – General Considerations (ONC-27.1)

ON.NH.0027.1.A

v2.0.2024

- Lymphoma is often suspected when individuals have any of the following:
 - Bulky lymphadenopathy (lymph node mass >10 cm in size), hepatomegaly or splenomegaly
 - The presence of systemic symptoms (fever, drenching night sweats or unintended weight loss of >10%, called “B symptoms”)
- Individuals with AIDS-related lymphoma should be imaged according to the primary lymphoma histology
- See: **Castleman’s Disease (unicentric and multicentric) (ONC-31.11)** for guidelines covering Castleman’s disease.
- See: **Chronic Lymphocytic Leukemia (CLL)/Small Lymphocytic Lymphoma (SLL) (ONC-26.4)** for guidelines covering Chronic Lymphocytic Leukemia (CLL)/Small Lymphocytic Lymphoma (SLL).

Indication	Imaging Study
<u>Biopsy proven lymphoma or suspected lymphoma with one of the following:</u> <ul style="list-style-type: none"> • Bulky lymphadenopathy (LN mass >10 cm) • Hepatomegaly • Splenomegaly • B symptom: Unexplained fever, drenching night sweats, unintended weight loss >10% total body weight 	<ul style="list-style-type: none"> • CT Chest (CPT® 71260) and CT Abdomen and Pelvis (CPT® 74177) with contrast • MRI without and with contrast for individuals who cannot tolerate CT contrast due to allergy or impaired renal function
Signs or symptoms of disease involving the neck	<ul style="list-style-type: none"> • CT Neck with contrast (CPT® 70491)
Signs or symptoms suggesting CNS involvement with lymphoma.	<ul style="list-style-type: none"> • MRI Brain without and with contrast (CPT® 70553) • See: CNS Lymphoma (also known as Microglioma) (ONC-2.7)
Known or suspected bone involvement with lymphoma	<ul style="list-style-type: none"> • MRI without and with contrast of symptomatic or previously involved bony areas • Bone scan is inferior to MRI for evaluation of known or suspected bone involvement with lymphoma

Indication	Imaging Study
Determine a more favorable site for biopsy when a relatively inaccessible site is contemplated	<ul style="list-style-type: none">PET/CT (CPT® 78815 or CPT® 78816)<ul style="list-style-type: none">PET/CT is not indicated for all other indications prior to histological confirmation of lymphoma
CAR-T cell therapy	<u>Once before treatment and once 30-60 days after completion of treatment:</u> <ul style="list-style-type: none">PET/CT (CPT® 78815 and CPT® 78816)

Diffuse Large B Cell Lymphoma (DLBCL) (ONC-27.2)

ON.TO.0027.2.A

v2.0.2024

- Grey zone lymphomas, primary mediastinal B cell lymphomas, Grade 3 (high) follicular lymphoma, double-hit or triple-hit lymphomas, and primary cutaneous diffuse large B cell lymphoma should also be imaged according to these guidelines.

Indication	Imaging Study
Initial Staging/Diagnosis	<p><u>ONE of the following may be approved:</u></p> <ul style="list-style-type: none"> PET/CT (CPT® 78815 or CPT® 78816) <p>OR</p> <ul style="list-style-type: none"> CT Chest with contrast (CPT® 71260) and CT Abdomen and Pelvis with contrast (CPT® 74177)
Treatment response for all stages	<p><u>ANY one of the following may be approved, not both:</u></p> <ul style="list-style-type: none"> CT with contrast of previously involved area(s) may be approved every 2 cycles (6-8 weeks) of therapy <p>Or</p> <ul style="list-style-type: none"> PET/CT (CPT® 78815 or CPT® 78816) after 3-4 cycles of chemotherapy
End of Chemotherapy and/or Radiation Therapy Evaluation	<p><u>ANY or ALL of the following may be approved:</u></p> <ul style="list-style-type: none"> PET/CT (CPT® 78815 or CPT® 78816) may be approved at the end of chemotherapy and again at the end of radiation CT with contrast of previously involved area(s)
Suspected Recurrence	<p><u>ANY or ALL of the following may be approved:</u></p> <ul style="list-style-type: none"> CT Chest with contrast (CPT® 71260) CT Abdomen and Pelvis with contrast (CPT® 74177) CT with contrast of previously involved area(s) PET/CT can be considered in rare circumstances (e.g. bone involvement).
Biopsy-proven recurrence	<ul style="list-style-type: none"> PET/CT (CPT® 78815 or CPT® 78816)
CAR-T cell therapy	<p><u>Once before treatment and once 30-60 days after completion of treatment:</u></p> <ul style="list-style-type: none"> PET/CT (CPT® 78815 or CPT® 78816)

Indication	Imaging Study
<u>Surveillance for ANY of the following:</u> <ul style="list-style-type: none">• All stages of DLBCL• Relapsed lymphoma• Primary mediastinal large B cell lymphoma• Primary cutaneous diffuse large B cell lymphoma	<ul style="list-style-type: none">• <u>Every 6 months for 2 years after completion of treatment:</u><ul style="list-style-type: none">• CT Chest with contrast (CPT® 71260)• CT Abdomen and Pelvis with contrast (CPT® 74177)• CT with contrast of previously involved area(s)

Follicular Lymphoma (ONC-27.3)

ON.NH.0027.3.A

v2.0.2024

- This section applies to follicular lymphomas with WHO grade of 1 (low) or 2 (intermediate) and primary cutaneous follicle center lymphoma. Grade 3 (high) follicular lymphomas should be imaged according to guidelines found in: **Diffuse Large B Cell Lymphoma (DLBCL) (ONC-27.2)**.

Indication	Imaging Study
Initial Staging/Diagnosis	<p><u>ANY or ALL of the following may be approved:</u></p> <ul style="list-style-type: none"> CT Chest with contrast (CPT® 71260) CT Abdomen and Pelvis with contrast (CPT® 74177)
<p><u>For ANY of the following:</u></p> <ul style="list-style-type: none"> If radiation therapy is being considered for stage I or II disease If systemic therapy is planned Pediatric-type follicular lymphoma in adults 	<ul style="list-style-type: none"> PET/CT (CPT® 78815 or CPT® 78816)
Treatment Response	<ul style="list-style-type: none"> CT with contrast of previously involved area(s) every 2 cycles of therapy
End of Therapy Evaluation	<p><u>ONE of the following may be approved:</u></p> <ul style="list-style-type: none"> PET/CT (CPT® 78815 or CPT® 78816) <p>OR</p> <ul style="list-style-type: none"> CT Chest with contrast (CPT® 71260) and CT Abdomen and Pelvis with contrast (CPT® 74177) CT with contrast of previously involved area(s)
Suspected Recurrence	<p><u>ANY or ALL of the following may be approved:</u></p> <ul style="list-style-type: none"> CT Chest with contrast (CPT® 71260) CT Abdomen and Pelvis with contrast (CPT® 74177) CT with contrast of previously involved area(s)

Indication	Imaging Study
<u>Suspected transformation (Richter's) from a low grade lymphoma to a more aggressive type based on one or more of the following:</u> <ul style="list-style-type: none">• New B symptoms• Rapidly growing lymph nodes• Extranodal disease develops• Significant recent rise in LDH above normal range	<ul style="list-style-type: none">• PET/CT (CPT® 78815 or CPT® 78816)
<u>Surveillance for ANY of the following:</u> <ul style="list-style-type: none">• After completion of active treatment• On maintenance treatment• Observation without any treatment	<u>For all stages, every 6 months for two years, then annually:</u> <ul style="list-style-type: none">• CT Chest with contrast (CPT® 71260)• CT Abdomen and Pelvis with contrast (CPT® 74177)• CT with contrast of previously involved area(s)
Surveillance of pediatric-type follicular lymphoma in adults	Advanced imaging is not indicated routinely after complete response

Marginal Zone Lymphomas (ONC-27.4)

ON.NH.0027.4.A

v2.0.2024

- MALT lymphomas in any location and primary cutaneous marginal zone lymphoma should also be imaged according to these guidelines
- Splenic Marginal Zone Lymphoma is diagnosed with splenomegaly, peripheral blood flow cytometry and bone marrow biopsy. Splenectomy is diagnostic and therapeutic. PET scan is not routinely indicated prior to splenectomy.

Indication	Imaging Study
Initial Staging/Diagnosis	<u>ANY or ALL of the following may be approved:</u> <ul style="list-style-type: none"> • CT Chest with contrast (CPT® 71260) • CT Abdomen and Pelvis with contrast (CPT® 74177)
<u>EITHER of the following:</u> <ul style="list-style-type: none"> • If radiation therapy is being considered for stage I or II disease • If systemic therapy is planned 	<ul style="list-style-type: none"> • PET/CT (CPT® 78815 or CPT® 78816)
Treatment Response	<ul style="list-style-type: none"> • CT with contrast of previously involved area(s) every 2 cycles of therapy
End of Therapy Evaluation	<u>ONE of the following may be approved:</u> <ul style="list-style-type: none"> • CT with contrast of previously involved area(s) • PET/CT (CPT® 78815 or CPT® 78816)
Suspected Recurrence	<u>ANY or ALL of the following may be approved:</u> <ul style="list-style-type: none"> • CT Chest with contrast (CPT® 71260) • CT Abdomen and Pelvis with contrast (CPT® 74177) • CT with contrast of previously involved area(s) • PET/CT can be considered in rare circumstances (e.g. bone involvement).

Indication	Imaging Study
<u>Surveillance of all stages of nodal marginal zone lymphoma for any of the following:</u> <ul style="list-style-type: none">• After completion of active treatment• On maintenance treatment• Observation without any treatment	<u>Every 6 months for two years, then annually:</u> <ul style="list-style-type: none">• CT Chest with contrast (CPT® 71260)• CT Abdomen and Pelvis with contrast (CPT® 74177)• CT with contrast of previously involved area(s)
Surveillance of all stages of extranodal marginal zone lymphoma	Advanced imaging is not routinely indicated for surveillance of asymptomatic individuals

Mantle Cell Lymphoma (ONC-27.5)

ON.NH.0027.5.A

v2.0.2024

Indication	Imaging Study
Initial Staging/Diagnosis	<p><u>ONE of the following may be approved:</u></p> <ul style="list-style-type: none"> CT Chest with contrast (CPT® 71260) and CT Abdomen and Pelvis with contrast (CPT® 74177) <p>OR</p> <ul style="list-style-type: none"> PET/CT (CPT® 78815 or CPT® 78816)
Treatment Response	<ul style="list-style-type: none"> CT with contrast of previously involved area(s) every 2 cycles of therapy PET/CT is not indicated for monitoring treatment response but can be considered in rare circumstances when CT did not show disease (e.g. bone).

Indication	Imaging Study
Surveillance, all stages	<u>Every 6 months for 2 years, then annually for 5 years:</u> <ul style="list-style-type: none">CT Chest with contrast (CPT® 71260), CT Abdomen and Pelvis with contrast (CPT® 74177), and CT of previously involved areas

Post-Transplant Lymphoproliferative Disorders (ONC-27.9)

ON.NH.0027.9.A

v2.0.2024

- Post-transplant lymphoproliferative disorder (PTLD) or viral-associated lymphoproliferative disorder can rarely occur following solid organ or hematopoietic stem cell transplantation, or in primary immunodeficiency. When reduction of immunosuppression is unsuccessful, these are often treated with chemoimmunotherapy similar to high-grade NHL.
- This section applies to Monomorphic (B-cell type) PTLD and Polymorphic PTLD.
- For Hodgkin-lymphoma subtype of PTLD, see: **Hodgkin Lymphomas (ONC-28)** for imaging recommendations.

Indication	Imaging Study
Initial Staging/Diagnosis	<u>ANY or ALL of the following may be approved:</u> <ul style="list-style-type: none"> • PET/CT (CPT® 78815 or CPT® 78816) • CT Chest with contrast (CPT® 71260) • CT Abdomen and Pelvis with contrast (CPT® 74177)
Treatment Response	<u>ANY or ALL of the following may be approved after 4 weeks of reducing immunosuppression or every 2 cycles (6-8 weeks) of chemo/immunotherapy:</u> <ul style="list-style-type: none"> • CT Chest with contrast (CPT® 71260), and • CT Abdomen and Pelvis with contrast (CPT® 74177), and • CT with contrast of previously involved area(s)
End of Therapy Evaluation	<u>ANY one of the following may be approved at the end of treatment:</u> <ul style="list-style-type: none"> • PET/CT (CPT® 78815 or CPT® 78816) or <ul style="list-style-type: none"> • CT Chest with contrast (CPT® 71260), and • CT Abdomen and Pelvis with contrast (CPT® 74177), and • CT with contrast of previously involved area(s)
Suspected recurrence	<ul style="list-style-type: none"> • CT Chest with contrast (CPT® 71260) • CT Abdomen and Pelvis with contrast (CPT® 74177)
Surveillance	Advanced imaging is not routinely indicated for surveillance

Waldenström Macroglobulinemia or Lymphoplasmacytic Lymphoma (ONC-27.10)

ON.NH.0027.10.A
v2.0.2024

Indication	Imaging Study
Initial Staging/Diagnosis	<u>ANY or ALL of the following may be approved:</u> <ul style="list-style-type: none">CT Chest with contrast (CPT® 71260)CT Abdomen and Pelvis with contrast (CPT® 74177)
Treatment Response	<ul style="list-style-type: none">CT with contrast of previously involved area(s) every 2 cycles of therapy
End of Therapy Evaluation	<ul style="list-style-type: none">CT with contrast of previously involved area(s)
Suspected Recurrence	<u>ANY or ALL of the following may be approved:</u> <ul style="list-style-type: none">CT Chest with contrast (CPT® 71260)CT Abdomen and Pelvis with contrast (CPT® 74177)CT with contrast of previously involved area(s)
Surveillance	Advanced imaging is not routinely indicated for surveillance

Hodgkin Lymphoma (ONC-28)

Guideline

Hodgkin Lymphoma – General Considerations (ONC-28.1)

Classical Hodgkin Lymphoma (ONC-28.2)

Nodular Lymphocyte – Predominant Hodgkin Lymphoma (ONC-28.3)

References (ONC-28)

Hodgkin Lymphoma – General Considerations (ONC-28.1)

ON.HL.0028.1.A

v2.0.2024

- Lymphoma is often suspected when individuals have any of the following:
 - Bulky lymphadenopathy (lymph node mass >10 cm in size), hepatomegaly or splenomegaly
 - The presence of systemic symptoms (fever, drenching night sweats or unintended weight loss of >10%, called “B symptoms”)
- Individuals with AIDS-related lymphoma should be imaged according to the primary lymphoma histology
- The **Deauville Criteria** are internationally accepted criteria, which utilize a five-point scoring system for the FDG avidity of a Hodgkin's lymphoma or Non-Hodgkin's lymphoma tumor mass as seen on FDG PET.
 - Score 1: No uptake above the background
 - Score 2: Uptake ≤mediastinum
 - Score 3: Uptake >mediastinum but ≤liver
 - Score 4: Uptake moderately increased compared to the liver at any site
 - Score 5: Uptake markedly increased compared to the liver at any site
 - Score X: New areas of uptake unlikely to be related to lymphoma

Indication	Imaging Study
<u>Biopsy proven lymphoma or suspected lymphoma with one of the following:</u> <ul style="list-style-type: none"> • Bulky lymphadenopathy (LN mass >10 cm) • Hepatomegaly • Splenomegaly • B symptom: Unexplained fever, drenching night sweats, unintended weight loss >10% total body weight 	<ul style="list-style-type: none"> • CT Chest (CPT® 71260) and CT Abdomen and Pelvis (CPT® 74177) with contrast • MRI without and with contrast for individuals who cannot tolerate CT contrast due to allergy or impaired renal function
Signs or symptoms of disease involving the neck	<ul style="list-style-type: none"> • CT Neck with contrast (CPT® 70491)
Signs or symptoms suggesting CNS involvement with lymphoma	<ul style="list-style-type: none"> • MRI Brain without and with contrast (CPT® 70553) • See: <u>CNS Lymphoma (also known as Microglioma) (ONC-2.7)</u>

Indication	Imaging Study
Known or suspected bone involvement with lymphoma	<ul style="list-style-type: none">MRI without and with contrast of symptomatic or previously involved bony areasBone scan is inferior to MRI for evaluation of known or suspected bone involvement with lymphoma
Determine a more favorable site for biopsy when a relatively inaccessible site is contemplated	<ul style="list-style-type: none">PET/CT (CPT® 78815 or CPT® 78816)PET/CT is medically unnecessary for all other indications prior to histological confirmation of lymphoma
CAR-T cell therapy	<u>Once before treatment and once 30-60 days after completion of treatment:</u> <ul style="list-style-type: none">PET/CT (CPT® 78815 or CPT® 78816)

Classical Hodgkin Lymphoma (ONC-28.2)

ON.HL.0028.2.A

v2.0.2024

- This section applies to nodular sclerosis, mixed cellularity, lymphocyte-depleted and lymphocyte-rich subtypes of Hodgkin lymphoma.

Indication	Imaging Study
Initial Staging/Diagnosis	<p><u>ANY or ALL of the following may be approved:</u></p> <ul style="list-style-type: none"> PET/CT (CPT® 78815 or CPT® 78816) CT Neck with contrast (CPT® 70491) CT Chest with contrast (CPT® 71260) CT Abdomen and Pelvis with contrast (CPT® 74177)
Treatment Response	<ul style="list-style-type: none"> PET/CT (CPT® 78815 or CPT® 78816) as frequently as every 2 cycles
End of Chemotherapy and/or Radiation Therapy Evaluation	<ul style="list-style-type: none"> PET/CT (CPT® 78815 or CPT® 78816) may be approved at the end of chemotherapy and again at the end of radiation (at least 12 weeks after completion of radiation therapy)
Suspected Recurrence	<p><u>ANY or ALL of the following may be approved:</u></p> <ul style="list-style-type: none"> CT Neck with contrast (CPT® 70491) CT Chest with contrast (CPT® 71260) CT Abdomen and Pelvis with contrast (CPT® 74177) CT with contrast of previously involved area(s)
Biopsy proven recurrence	<ul style="list-style-type: none"> PET/CT (CPT® 78815 or CPT® 78816)
Surveillance	<p><u>ANY or ALL of the following may be approved every 6 months for 2 years after completion of therapy:</u></p> <ul style="list-style-type: none"> CT Neck with contrast (CPT® 70491) CT Chest with contrast (CPT® 71260) CT Abdomen and Pelvis with contrast (CPT® 74177) CT with contrast of previously involved area(s) <p><u>In addition to the above studies:</u></p> <ul style="list-style-type: none"> A single follow-up PET/CT may be approved at three months if end of therapy PET/CT shows Deauville 4 or 5 FDG avidity

Hematopoietic Stem Cell Transplantation (ONC-29)

Guideline

General Considerations for Stem Cell Transplant (ONC-29.1)

Reference (ONC-29)

General Considerations for Stem Cell Transplant (ONC-29.1)

ON.HT.0029.1.A

v2.0.2024

Transplant types:

Allogeneic (“allo”): The donor and recipient are different people, and there are multiple types depending on the source of the stem cells and degree of match between donor and recipient. This is most commonly used in diseases originating in the hematopoietic system, such as leukemias and lymphomas, and bone marrow failure syndromes or metabolic disorders. Common types are:

- Matched sibling donor (MSD or MRD): Donor and recipient are full siblings and HLA-matched
- Matched unrelated donor (MUD): Donor and recipient are HLA matched but not related to each other
- Cord blood: Donor stem cells come from frozen umbilical cord blood not related to the recipient, sometimes from multiple different donors at once
- Haploidentical transplant (haplo): Donor is a half-HLA match to the recipient, usually a parent

Autologous (“auto”): The donor and recipient are the same person. The process involves delivery of high dose chemotherapy that is ablative to the bone marrow, followed by an infusion of one’s own harvested stem cells.

Allogeneic HSCT results in a much greater degree of immunosuppression than autologous HSCT because of the need to allow the new immune system to chimerize with the recipient’s body. Immune reconstitution commonly takes more than a year for individuals who receive allogeneic HSCT, and individuals remain at high- risk for invasive infections until that has occurred.

Pre-Transplant Imaging in HSCT:

- Pre-transplant imaging in HSCT generally takes place within 30 days prior to transplant and involves a reassessment of the individual’s disease status as well as infectious disease clearance.

Indication	Imaging
Immediate pre-transplant period	<ul style="list-style-type: none"> • Chest x-ray • CT Chest with contrast (CPT® 71260) or CT Chest without contrast (CPT® 71250) for new findings on chest x-ray, or new/worsening signs/symptoms • CT Sinus (CPT® 70486) for any clinical signs or symptoms

Indication	Imaging
Assess cardiac function	<ul style="list-style-type: none"> Echocardiogram (CPT® 93306, CPT® 93307 or CPT® 93308) MUGA scan (CPT® 78472) may be indicated in specific circumstances, see: <u>Oncologic Indications for Cancer Therapeutics-Related Cardiac Dysfunction (CTRCD) (CD-12.1)</u> in the Cardiac Imaging Guidelines
Assess pulmonary function	<ul style="list-style-type: none"> Pulmonary function tests
Assess primary disease status	<ul style="list-style-type: none"> See disease-specific guidelines for end of therapy response assessment

Post-Transplant Imaging in HSCT:

- There are many common complications from HSCT, including infection, acute and chronic graft versus host disease (GVHD), hepatic sinusoidal obstruction syndrome, restrictive lung disease, among others.
- Disease response generally takes place at ~Day +30 (autos and some allos) or ~Day +100 (allos) post-transplant.

Indication	Imaging
Assess known or suspected HSCT complications	<ul style="list-style-type: none"> Site-specific imaging should generally be approved
Suspected hepatic GVHD (elevated liver enzymes)	<ul style="list-style-type: none"> Abdominal US (CPT® 76700 or CPT® 76705)
Suspected Bronchiolitis Obliterans Syndrome (BOS)	<ul style="list-style-type: none"> CT Chest without contrast (CPT® 71250)
Assess primary disease status post-transplant	<ul style="list-style-type: none"> See disease-specific guidelines for end of therapy evaluation and surveillance
Individuals receiving tandem auto transplants (2-4 autos back-to-back, spaced 6 to 8 weeks apart)	<ul style="list-style-type: none"> Guideline recommended imaging can be repeated after each transplant

Medical Conditions with Cancer in the Differential Diagnosis (ONC-30)

Guideline

Fever of Unknown Origin (FUO) (ONC-30.1)

Unexplained Weight Loss (ONC-30.2)

Paraneoplastic Syndromes (ONC-30.3)

References (ONC-30)

Fever of Unknown Origin (FUO) (ONC-30.1)

ON.MC.0030.1.A

v2.0.2024

- FUO is defined as a persistent fever $\geq 101^{\circ}\text{F}$ and ≥ 3 weeks with unidentified cause.
- While fever is a classic “B” symptom of advanced lymphoma, a cancer-related fever presenting in isolation without any other signs or symptoms of neoplastic disease is rare.

Indication	Imaging Study
If physical examination, Chest X-ray, and laboratory studies are non-diagnostic	<ul style="list-style-type: none"> Echocardiogram (CPT® 93306) Abdominal ultrasound (CPT® 76700) MRI Brain without and with contrast (CPT® 70553)
Above studies (including PE/ENT exam, pelvic exam, and DRE with laboratory studies) have failed to demonstrate site of infection	<ul style="list-style-type: none"> CT Chest (CPT® 71260) and CT Abdomen and Pelvis (CPT® 74177) with contrast Radiopharmaceutical localization of tumor or distribution of radiopharmaceutical agent(s): CPT® 78800, CPT® 78801, or CPT® 78802, CPT® 78804, CPT® 78803 or CPT® 78831 (SPECT), or CPT® 78830, or CPT® 78832 (SPECT/CT)
“B” symptoms	<ul style="list-style-type: none"> See: <u>Non-Hodgkin Lymphomas (ONC-27)</u>
Any CNS sign/symptom accompanied by fever	<ul style="list-style-type: none"> MRI Brain without and with contrast (CPT® 70553)
All individuals	<ul style="list-style-type: none"> PET is not indicated in the work-up of individuals with FUO

Unexplained Weight Loss (ONC-30.2)

ON.MC.0030.2.A

v2.0.2024

- Unintentional weight loss is defined as loss of ≥ 10 lbs. or $\geq 5\%$ of body weight over 6 months or less, without an identifiable reason.
- Initial workup for all individuals may include appropriate detailed history, physical exam, baseline laboratory studies (e.g., CBC, CMP, HgbA1c, ESR/CRP, infectious workup, stool hemoccult, endocrine evaluation to rule out thyroid, pituitary, or gonadal dysfunction, etc.), chest x-ray, age-appropriate cancer screening, and neurological evaluation to rule out depression/dementia.
- Additional workup is directed to evaluate specific signs, symptoms, red flags, or abnormalities detected on initial workup. See condition-specific imaging guidelines for additional details.
- PET is not appropriate in the work-up of individuals with unexplained weight loss.

Indication	Imaging Study
CNS symptoms or abnormal pituitary hormones	<ul style="list-style-type: none"> MRI Brain or Sella Turcica without and with contrast (CPT® 70553)
Abnormal thyroid function	<ul style="list-style-type: none"> Thyroid ultrasound (CPT® 76536)
Abnormal liver function	<ul style="list-style-type: none"> Abdominal ultrasound (CPT® 76700)
Abnormal kidney function	<ul style="list-style-type: none"> Ultrasound kidney and bladder (CPT® 76770 or CPT® 76775)
Suspected cardiac dysfunction	<ul style="list-style-type: none"> Echocardiogram (CPT® 93306)
Non-smokers	<ul style="list-style-type: none"> Chest x-ray CT Chest with contrast (CPT® 71260) to evaluate abnormalities on chest x-ray
Current or former smokers	<ul style="list-style-type: none"> CT Chest with contrast (CPT® 71260)
Dysphagia or early satiety	<ul style="list-style-type: none"> See: <u>Dysphagia and Esophageal Disorders (NECK-3)</u>
GI bleeding	<ul style="list-style-type: none"> See: <u>GI Bleeding (AB-22)</u>
Abdominal pain without red flag signs	See: <u>Abdominal Pain (AB-2)</u>

Indication	Imaging Study
<p><u>Suspected pancreatic cancer in individuals aged ≥60 years with weight loss and at least one of the following</u> ¹³:</p> <ul style="list-style-type: none"> • Diarrhea • Back pain • Abdominal pain • Nausea/vomiting • Constipation • New onset diabetes • Abnormal labs (CA 19-9, LFTs) • Non-diagnostic or negative abdominal ultrasound 	<p><u>Any ONE of the following may be obtained:</u></p> <ul style="list-style-type: none"> • CT Abdomen with contrast (CPT® 74160) • CT Abdomen and Pelvis with contrast (CPT® 74177) • MRI Abdomen without and with contrast (CPT® 74183) <p>See also: <u>Epigastric Pain and Dyspepsia (AB-2.5)</u></p>
<p>If all of the above do not identify cause of weight loss</p>	<p><u>Any of the following, if not previously performed:</u></p> <ul style="list-style-type: none"> • CT Chest (CPT® 71260) • CT Abdomen and Pelvis (CPT® 74177) with contrast

Paraneoplastic Syndromes (ONC-30.3)

ON.MC.0030.3.A

v2.0.2024

- Paraneoplastic syndromes are metabolic and neuromuscular disturbances. These syndromes are not directly related to a tumor or to metastatic disease. There may be a lead time between initial finding of a possible paraneoplastic syndrome and appearance of the cancer with imaging. Limited studies suggest annual imaging for 2 years after diagnosis of possible paraneoplastic syndrome may detect cancer, however benefit after 2 years is not well documented.
- The following are the most common symptoms of paraneoplastic syndromes known to arise from various malignancies:
 - Hypertrophic Pulmonary Osteoarthropathy: Often presents as a constellation of rheumatoid-like polyarthritis, periostitis of long bones, and clubbing of fingers and toes
 - Amyloidosis
 - Hypercalcemia
 - Hypophosphatemia
 - Cushing's Syndrome
 - Somatostatinoma syndrome (vomiting, abdominal pain, diarrhea, cholelithiasis)
 - Syndrome of inappropriate antidiuretic hormone secretion (SIADH)
 - Polymyositis/dermatomyositis
 - Opsoclonus
 - Paraneoplastic sensory neuropathy
 - Subacute cerebellar degeneration
 - Eaton-Lambert syndrome (a myasthenia-like syndrome)
 - Second event of unprovoked thrombosis
 - Disseminated Intravascular Coagulation
 - Migratory thrombophlebitis
 - Polycythemia
 - Chronic leukocytosis and/or thrombocytosis
 - Elevated tumor markers
 - Cryptogenic stroke (see also: **HD-21.3**)
- See: **Muscle Disorders (PN-6)** in the Peripheral Nerve Disorders Imaging Guidelines.
- See: **Multiple Myeloma and Plasmacytomas (ONC-25)** for evaluation of possible multiple myeloma.

Indication	Imaging Study
Initial evaluation	<ul style="list-style-type: none"> CT Chest (CPT® 71260) and CT Abdomen and Pelvis (CPT® 74177) with contrast
<u>ANY of the following:</u> <ul style="list-style-type: none"> Abnormality on conventional imaging difficult to biopsy Inconclusive conventional imaging Documented paraneoplastic antibody and conventional imaging fails to demonstrate primary site 	<ul style="list-style-type: none"> PET/CT (CPT® 78815 or CPT® 78816)
Subsequent evaluation for known paraneoplastic syndrome	<ul style="list-style-type: none"> CT Chest (CPT® 71260) and CT Abdomen and Pelvis (CPT® 74177) with contrast may be repeated every 6 months for 2 years after initial imaging for Lambert-Eaton Myasthenia syndrome CT Chest (CPT® 71260) and CT Abdomen and Pelvis (CPT® 74177) with contrast may be repeated every 6 months for 4 years for all other paraneoplastic syndromes
Systemic mastocytosis	<u>ANY ONE of the following:</u> <ul style="list-style-type: none"> CT Abdomen and Pelvis (CPT® 74177) with contrast MRI Abdomen (CPT® 74183) and MRI Pelvis (CPT® 72197) without and with contrast is indicated PET/CT scan is not indicated for evaluation of mastocytosis
First episode of unprovoked DVT/VTE	<ul style="list-style-type: none"> Imaging to evaluate for malignancy is not indicated
Second unprovoked DVT/PE	<ul style="list-style-type: none"> Imaging may be considered in the setting of a negative work-up for inherited thrombophilia and antiphospholipid syndrome
Thyroid US is recommended for elevated CEA, and upper/lower endoscopy is recommended for elevated CEA or CA 19-9.

General Guidelines (ONC-31.0)

ON.UP.0031.0.A

v2.0.2024

- Guideline sections **Lung Metastases (ONC-31.1)** through Bone (Non-Vertebral) Metastases (ONC-31.5) should only be used for individuals with metastatic cancer in the following circumstances:
 - The primary diagnosis section does not address a particular metastatic site that is addressed in these sections
 - The cancer type is rare and does not have its own diagnosis-specific imaging guidelines

Lung Metastases (ONC-31.1)

ON.UP.0031.1.A

v2.0.2024

Indication	Imaging Study
New or worsening signs or symptoms suggestive of metastatic lung involvement or new or worsening chest x-ray abnormality	<ul style="list-style-type: none">CT Chest with contrast (CPT® 71260)CT Chest without contrast (CPT® 71250) can be approved if there is a contraindication to CT contrast or only parenchymal lesions are being evaluated
Chest wall or brachial plexus involvement	<ul style="list-style-type: none">MRI Chest without and with contrast (CPT® 71552)
<u>ONE of the following and no diagnosis-specific guideline regarding PET imaging:</u> <ul style="list-style-type: none">Lung nodule(s) ≥8 mmConfirm solitary metastasis amenable to resection on conventional imaging	<ul style="list-style-type: none">PET/CT (CPT® 78815)When primary cancer known, PET request should be reviewed by primary cancer guideline
Previous or current malignancy and pulmonary nodule(s) that would reasonably metastasize to the lungs	<ul style="list-style-type: none">CT Chest with contrast (CPT® 71260) at 3, 6, 12, and 24 months from the first study

Liver Metastases (ONC-31.2)

ON.UP.0031.2.A

v2.0.2024

- Ablation of liver metastases or primary HCC may be performed utilizing chemical, chemotherapeutic, radiofrequency, or radioactive isotope. Regardless of the modality of ablation, PET is not indicated for assessing response to this mode of therapy.

Indication	Imaging Study
New or worsening signs or symptoms suggestive of metastatic liver involvement or new elevation in LFTs	<ul style="list-style-type: none"> CT Abdomen with (CPT® 74160) or without and with (CPT® 74170) contrast
<u>ANY of the following:</u> <ul style="list-style-type: none"> Considering limited resection Inconclusive CT findings 	<ul style="list-style-type: none"> MRI Abdomen without and with contrast (CPT® 74183)
<u>ONE of the following and no diagnosis-specific guideline regarding PET imaging:</u> <ul style="list-style-type: none"> Confirm solitary metastasis amenable to resection on conventional imaging LFT's and/or tumor markers continue to rise and CT and MRI are negative 	<ul style="list-style-type: none"> PET/CT (CPT® 78815) <ul style="list-style-type: none"> When primary cancer known, PET request should be reviewed by primary cancer guideline
Monitoring of liver metastases that have been surgically resected	<ul style="list-style-type: none"> Review according to primary cancer guideline
Evaluation of hepatic artery chemotherapy infusion or TACE (transarterial chemoembolization)	<u>ONE of the following studies, if not previously done:</u> <ul style="list-style-type: none"> CT Abdomen without and with contrast (CPT® 74170) MRI Abdomen without and with contrast (CPT® 74183)

Indication	Imaging Study
Evaluation for hepatic artery radioembolization with Y-90 radioactive spheres (TheraSphere or SIR Spheres) for liver metastases or primary liver tumors	<p><u>To assess hepatic vascular anatomy before the procedure, any ONE of the following:</u></p> <ul style="list-style-type: none"> 3D Rendering (CPT® 76377) if conventional hepatic angiogram is being performed CTA Abdomen (CPT® 74175) <p><u>ONE of the following studies may be approved PRE-treatment based upon provider preference:</u></p> <ul style="list-style-type: none"> Liver Imaging Planar (CPT® 78201) Radiopharmaceutical Localization Limited Area (CPT® 78800 or CPT® 78801) SPECT or SPECT/CT (CPT® 78803, 78831, 78830, or 78832) <p><u>ONE of the following studies may be approved POST-treatment based upon provider preference:</u></p> <ul style="list-style-type: none"> Liver Planar Imaging (CPT® 78201) Radiopharmaceutical Localization Limited Area (CPT® 78800 or CPT® 78801) SPECT or SPECT/CT (CPT® 78803, 78831, 78830, or 78832) <p>Please note: liver-lung shunt calculation is included in the pre-treatment Liver Scan and does not require additional Lung Perfusion Scan</p>
Monitoring of ablated liver metastases or primary tumors	<p><u>ONE of the following, immediately prior to ablation, 1 month post-ablation, then every 3 months for 2 years, and then every 6 months until year 5:</u></p> <ul style="list-style-type: none"> CT Abdomen without and with contrast (CPT® 74170) MRI Abdomen without and with contrast (CPT® 74183)

Brain Metastases (ONC-31.3)

ON.UP.0031.3.A

v2.0.2024

Indication	Imaging Study
Individual with cancer and signs or symptoms of CNS disease or known brain metastasis with new signs or symptoms.	<ul style="list-style-type: none"> MRI Brain without and with contrast (CPT® 70553)
To determine candidacy for SRS, and a diagnostic thin-slice MRI Brain has not been performed in the preceding 30 days	<ul style="list-style-type: none"> MRI Brain without and with contrast (CPT® 70553)
Stereotactic radiosurgery planning	<ul style="list-style-type: none"> Unlisted MRI for treatment planning purposes (CPT® 76498)
Monitoring of brain metastases treated with surgery or radiation therapy	<p><u>Post-treatment, then every 3 months for 1 year and every 6 months thereafter:</u></p> <ul style="list-style-type: none"> MRI Brain without and with contrast (CPT® 70553) <p>***Individuals treated with stereotactic radiosurgery alone may have MRI Brain without and with contrast (CPT® 70553) immediately after stereotactic radiosurgery, then every 2 months for the first year, and then every 6 months thereafter</p>
Brain metastases treated with radiation therapy, with recent MRI Brain indeterminate in distinguishing radiation necrosis vs. tumor progression	<ul style="list-style-type: none"> MRI Perfusion imaging (CPT® 70553)
Brain metastases treated with radiation therapy, with recent MRI Brain and MR Perfusion studies both unable to distinguish radiation necrosis vs. tumor progression	<ul style="list-style-type: none"> PET Metabolic Brain (CPT® 78608)

Indication	Imaging Study
<p><u>Any of the following:</u></p> <ul style="list-style-type: none">• Solitary brain metastasis suspected in individual with prior diagnosis of cancer and no diagnosis-specific guideline regarding PET imaging• Brain metastases and no known primary tumor	<ul style="list-style-type: none">• CT Chest (CPT® 71260) and CT Abdomen and Pelvis (CPT® 74177) with contrast• Mammography for female individuals• PET/CT (CPT® 78815 or CPT® 78816) is indicated for ANY of the following:<ul style="list-style-type: none">• Inconclusive conventional imaging• Confirm either stable systemic disease or absence of other metastatic disease• When primary cancer known, PET request should be reviewed by primary cancer guideline
Primary brain tumors	See: <u>Primary Central Nervous System Tumors (ONC-2)</u>
MR Spectroscopy (CPT® 76390) is considered investigational and experimental for evaluation of metastatic brain cancer	

Adrenal Gland Metastases (ONC-31.4)

ON.UP.0031.4.A

v2.0.2024

Indication	Imaging Study
Differentiate benign adrenal adenoma from metastatic disease	<ul style="list-style-type: none"> See: Adrenal Cortical Lesions (AB-16.1) in the Abdomen Imaging Guidelines
<u>Known cancer and no known systemic metastases:</u> <ul style="list-style-type: none"> New adrenal mass Enlarging adrenal mass Inconclusive findings on recent CT 	<u>If not done previously, ANY of the following may be obtained:</u> <ul style="list-style-type: none"> CT Abdomen without contrast (CPT® 74150) CT Abdomen without and with contrast (CPT® 74170, adrenal protocol) MRI Abdomen without contrast (CPT® 74181) MRI Abdomen without and with contrast (CPT® 74183) CT-directed needle biopsy (CPT® 77012)
<u>One of the following and no diagnosis-specific guideline regarding PET imaging:</u> <ul style="list-style-type: none"> Biopsy is not feasible or is non-diagnostic Isolated metastasis on conventional imaging and individual is a candidate for aggressive surgical management 	<ul style="list-style-type: none"> PET/CT (CPT® 78815) <p>When primary cancer known, PET request should be reviewed by primary cancer guideline</p>
Known extra-adrenal malignancy and undiagnosed adrenal mass being monitored off treatment	See: Phases of Oncology Imaging and General Phase-Related Considerations (ONC-1.2)

Bone (Non-Vertebral) Metastases (ONC-31.5)

ON.UP.0031.5.A

v2.0.2024

Indication	Imaging Study
<u>ANY of the following in an individual with a current or prior malignancy:</u> <ul style="list-style-type: none"> Bone pain Rising tumor markers Elevated alkaline phosphatase 	<ul style="list-style-type: none"> Bone scan supplemented by plain x-rays is the initial diagnostic imaging study of choice (see: Nuclear Medicine (NM) Imaging in Oncology [ONC-1.3])
<u>ANY of the following:</u> <ul style="list-style-type: none"> Bone scan is not feasible or readily available Bone scan is equivocal or indeterminate Continued suspicion despite negative/inconclusive bone scan or other imaging modalities Soft tissue component suspected on other imaging modalities Differentiate neoplastic disease from Paget's disease of the bone 	<u>ANY one of the following:</u> <ul style="list-style-type: none"> MRI without and with contrast of the involved body site CT without or with contrast of the involved body site
Bone metastases suspected and both bone scan and either CT or MRI are inconclusive	<ul style="list-style-type: none"> ¹⁸F-FDG-PET/CT (CPT® 78815 or CPT® 78816)
Suspected metastatic bone disease and negative work-up for myeloma	<ul style="list-style-type: none"> CT Chest (CPT® 71260) and CT Abdomen and Pelvis (CPT® 74177) with contrast
No prior cancer history with suspected pathologic fracture on plain x-ray	<ul style="list-style-type: none"> See: Carcinoma of Unknown Primary Site (ONC-31.7)

Spinal/Vertebral Metastases (ONC-31.6)

ON.UP.0031.6.A

v2.0.2024

- Individuals with stage IV cancer with new onset back pain can forgo a bone scan (and plain films) in lieu of an MRI with and without contrast of the spine.

Indication	Imaging Study
<p><u>Known cancer history and spinal cord compression suspected based on signs/symptoms of neurological compromise, including, but not limited to:</u></p> <ul style="list-style-type: none"> Unexpected, sudden loss of bowel or bladder control Sudden loss of ability to ambulate Complete loss of pinprick sensation corresponding to a specific vertebral level Loss of pain at a site that had previously been refractory to pain management 	<ul style="list-style-type: none"> MRI Cervical (CPT® 72156), MRI Thoracic (CPT® 72157), and MRI Lumbar Spine (CPT® 72158) without and with contrast OR without contrast CT Cervical (CPT® 72126), CT Thoracic (CPT® 72129), and CT Lumbar (CPT® 72132) Spine if MRI is contraindicated
<p><u>Individual with a known history of cancer and ANY of the following:</u></p> <ul style="list-style-type: none"> Metastatic or stage IV cancer with new or worsening back pain Back pain and suspicion of spinal malignancy based on any one of the following: <ul style="list-style-type: none"> Night pain Age >70 years Uncontrolled or unintentional weight loss Pain unrelieved by change in position Severe and worsening spinal pain despite a reasonable (generally after 1 week) trial of provider-directed treatment with re-evaluation 	<p><u>ONE of the following:</u></p> <ul style="list-style-type: none"> MRI of the relevant spinal level without contrast MRI of the relevant spinal level without and with contrast CT of the relevant spinal level without contrast CT Myelogram of the relevant spinal level

Indication	Imaging Study
Monitoring untreated vertebral metastases	<p><u>One of the following, every 3 months for 1 year:</u></p> <ul style="list-style-type: none">• MRI without and with contrast of the involved spinal level• CT without or with contrast of the involved spinal level <p>**Imaging beyond 1 year is based on any new clinical signs/symptoms</p>
Monitoring metastases within the spine treated with surgery and/or radiation therapy	<p><u>One of the following, once within 3 months post-treatment, and then every 3 months for 1 year:</u></p> <ul style="list-style-type: none">• MRI without and with contrast of the involved spinal level• CT without or with contrast of the involved spinal level <p>**Imaging beyond 1 year is based on any new clinical signs/symptoms</p>

Indication	Imaging Study
Leptomeningeal involvement with cancer	<p><u>Suspected:</u></p> <ul style="list-style-type: none">• MRI Brain without and with contrast (CPT® 70553) and MRI Cervical (CPT® 72156), Thoracic (CPT® 72157), and Lumbar spine (CPT® 72158) without and with contrast• CT Cervical (CPT® 72127), Thoracic (CPT® 72130), and Lumbar Spine (CPT® 72133) without and with contrast can be approved if MRI is contraindicated or not readily available <p><u>On active treatment:</u></p> <ul style="list-style-type: none">• MRI Brain without and with contrast (CPT® 70553) and MRI Cervical (CPT® 72156), Thoracic (CPT® 72157), and Lumbar spine (CPT® 72158) without and with contrast every 2 cycles• CT with or without contrast of the involved spinal level if MRI is contraindicated <p><u>Once treatment completed:</u></p> <ul style="list-style-type: none">• Routine advanced imaging not indicated for surveillance in asymptomatic individuals

Carcinoma of Unknown Primary Site (ONC-31.7)

ON.UP.0031.7.A

v2.0.2024

General Considerations

- Defined as carcinoma found in a lymph node or in an organ known not to be the primary for that cell type (e.g., adenocarcinoma arising in the brain or in a neck lymph node).
- This guideline also applies to a pathologic fracture that is clearly due to metastatic neoplastic disease in an individual without a previous cancer history.
- Detailed history and physical examination including pelvic and rectal exams and laboratory tests to be performed before advanced imaging.
- Individuals presenting with a thoracic squamous cell carcinoma described as metastatic appearing on chest imaging, or in lymph nodes above the clavicle, should undergo a detailed head and neck examination by a clinician skilled in laryngeal and pharyngeal examinations, especially in smokers.
- Individuals with suspected unknown primary based on only suspicious lytic bone lesions should be considered for serum protein electrophoresis (SPEP); urine protein electrophoresis (UPEP) and serum free light chains prior to consideration of extensive imaging.

Indication	Imaging Study
Carcinoma found in a lymph node or in an organ known not to be primary	<ul style="list-style-type: none"> CT Chest (CPT® 71260) and CT Abdomen and Pelvis with contrast (CPT® 74177) CT Neck with contrast (CPT® 70491) if cervical or supraclavicular involvement CT with contrast or MRI without and with contrast of any other symptomatic site For female individuals: <ul style="list-style-type: none"> Diagnostic (not screening) mammogram and full pelvic exam MRI Breasts Bilateral (CPT® 77049) if pathology consistent with breast primary and mammogram is inconclusive
Sebaceous carcinoma of the skin (can be associated with underlying primary malignancy)	<ul style="list-style-type: none"> CT Chest (CPT® 71260) and CT Abdomen and Pelvis with contrast (CPT® 74177) CT Neck with contrast (CPT® 70491) if cervical or supraclavicular involvement CT with contrast or MRI without and with contrast of any other symptomatic site

Indication	Imaging Study
Axillary adenocarcinoma	<ul style="list-style-type: none"> Diagnostic (not screening) mammogram and full pelvic exam MRI Breasts Bilateral (CPT® 77049) if pathology consistent with breast primary and mammogram is inconclusive If the above are non-diagnostic for primary site: <ul style="list-style-type: none"> CT Neck (CPT® 70491), CT Chest (CPT® 71260), and CT Abdomen (CPT® 74160) with contrast CT with contrast or MRI without and with contrast of any other symptomatic site
Carcinoma found within a bone lesion	<ul style="list-style-type: none"> CT Chest (CPT® 71260) and CT Abdomen and Pelvis with contrast (CPT® 74177) Bone Scan (see: ONC-1.3) CT with contrast or MRI without and with contrast of any symptomatic site
<u>ANY of the following:</u> <ul style="list-style-type: none"> Above studies have failed to demonstrate site of primary CT scans reveal isolated metastatic disease for which definitive curative therapy is planned 	<ul style="list-style-type: none"> PET/CT (CPT® 78815 or CPT® 78816)
Post-treatment surveillance	<ul style="list-style-type: none"> Advanced imaging is not indicated for routine surveillance of asymptomatic individuals after treatment completion

Extrathoracic Small Cell and Large Cell Neuroendocrine Tumors (ONC-31.8)

ON.UP.0031.8.A
v2.0.2024

All poorly-differentiated or high-grade, small cell and large cell neuroendocrine tumors arising outside the lungs or of unknown primary origin are imaged according to these guidelines.

Indication	Imaging Study
Initial staging	<ul style="list-style-type: none"> CT Chest (CPT® 71260) and CT Abdomen and Pelvis (CPT® 74177) with contrast
Inconclusive findings on conventional imaging studies	<ul style="list-style-type: none"> PET/CT (CPT® 78815)
<p><u>ANY of the following:</u></p> <ul style="list-style-type: none"> Poorly differentiated neuroendocrine cancers of the head or neck Signs or symptoms of CNS involvement 	<ul style="list-style-type: none"> MRI Brain without and with contrast (CPT® 70553)
Restaging during treatment	<ul style="list-style-type: none"> CT Chest (CPT® 71260) and CT Abdomen and Pelvis (CPT® 74177) and any known sites of disease with contrast every 2 cycles
Suspected Recurrence	<p><u>ANY or ALL of the following are indicated:</u></p> <ul style="list-style-type: none"> CT Chest (CPT® 71260) and CT Abdomen and Pelvis (CPT® 74177) with contrast MRI Brain without and with contrast (CPT® 70553) Bone scan (See: Nuclear Medicine (NM) Imaging in Oncology (ONC-1.3)) PET imaging is generally not indicated but can be considered for rare circumstances.
Surveillance	<ul style="list-style-type: none"> CT Chest (CPT® 71260) and CT Abdomen and Pelvis (CPT® 74177) with contrast every 3 months for 1 year, then every 6 months for 4 additional years and then annually

Primary Peritoneal Mesothelioma (ONC-31.9)

ON.UP.0031.9.A

v2.0.2024

Indication	Imaging Study
Initial staging	<ul style="list-style-type: none">CT Chest (CPT® 71260) and CT Abdomen and Pelvis (CPT® 74177) with contrastPET/CT (CPT® 78815) if there is no evidence of metastatic disease or conventional imaging is inconclusive
Recurrence/ Restaging	<ul style="list-style-type: none">If there is known prior disease, CT Chest (CPT® 71260) and CT Abdomen and Pelvis (CPT® 74177) with contrastPET for inconclusive finding on conventional imaging
Surveillance	<ul style="list-style-type: none">CT Abdomen and Pelvis with contrast (CPT® 74177) every 3 months for 2 years, then every year of life

Kaposi's Sarcoma (ONC-31.10)

ON.UP.0031.10.A

v2.0.2024

Indication	Imaging Study
Kaposi's Sarcoma	<ul style="list-style-type: none">Advanced imaging is not generally indicated since disease is generally localized to skin.CT Chest (CPT® 71260) and CT Abdomen and Pelvis (CPT® 74177) with contrast can be approved at initial diagnosis. If initial scans are negative then future imaging would be based on signs or symptoms.

Castleman's Disease (Unicentric and Multicentric) (ONC-31.11)

ON.UP.0031.11.A

v2.0.2024

Indication	Imaging Study
Initial staging	<ul style="list-style-type: none"> Either CT Chest (CPT® 71260) and CT Abdomen and Pelvis (CPT® 74177) with contrast or PET/CT (CPT® 78815) CT Neck with contrast (CPT® 70491) if cervical or supraclavicular involvement If CT scans were utilized initially and suggested unicentric disease, and surgical resection is being considered, PET/CT (CPT® 78815) can be approved to confirm unicentric disease If unicentric disease is surgically removed, proceed to Surveillance section
<u>Restaging:</u> <ul style="list-style-type: none"> Multicentric disease or surgically unresected unicentric disease on chemotherapy 	<u>ONE of the following every 2 cycles:</u> <ul style="list-style-type: none"> CT Chest (CPT® 71260) and CT Abdomen and Pelvis (CPT® 74177) with contrast PET/CT (CPT® 78815)
<u>ANY of the following:</u> <ul style="list-style-type: none"> Suspected recurrence Recurrent B symptoms Rising LDH/IL-6/VEGF levels 	<u>ONE of the following:</u> <ul style="list-style-type: none"> CT Chest (CPT® 71260) and CT Abdomen and Pelvis (CPT® 74177) with contrast PET/CT (CPT® 78815)
Surveillance	<ul style="list-style-type: none"> CT with contrast of involved areas no more than every 6 months up to 5 years

Abbreviations for Pelvis Imaging Guidelines

PV.GG.Abbreviations.A
v2.0.2024

Abbreviations for Pelvis Imaging Guidelines	
CA-125	cancer antigen 125 test
CT	computed tomography
FSH	follicle-stimulating hormone
GTN	gestational trophoblastic neoplasia
HCG	human chorionic gonadotropin
IC/BPS	interstitial cystitis/bladder pain syndrome
IUD	intrauterine device
KUB	kidneys, ureters, bladder (frontal supine abdomen radiograph)
LH	luteinizing hormone
MRA	magnetic resonance angiography
MRI	magnetic resonance imaging
MSv	millisievert
PA	posteroanterior projection
PID	pelvic inflammatory disease
TA	transabdominal
TSH	thyroid-stimulating hormone
TV	transvaginal
UCPPS	Urologic Chronic Pelvic Pain Syndrome
WBC	white blood cell count

General Guidelines (PV-1.0)

PV.GG.0001.0.U

v2.0.2024

- A current clinical evaluation since the onset or change in symptoms is required before advanced imaging can be considered. The clinical evaluation should include a relevant history and physical examination including a pelvic and/or urological exam, appropriate laboratory studies, and non-advanced imaging modalities such as plain x-ray or Pelvic ultrasound (CPT® 76856 or CPT® 76857) and/or Transvaginal ultrasound (CPT® 76830) and/or Transperineal ultrasound (CPT® 76872).
 - Other meaningful contact (telehealth visit, telephone call, electronic mail or messaging) since the onset or change in symptoms for follow up visit by an established individual can substitute for a face-to-face clinical evaluation.
- The use of gynecology CPT codes for pregnant females is not supported. Therefore, transvaginal ultrasound (CPT® 76830) and pelvic ultrasound (CPT® 76856 or CPT® 76857) are not supported for those with a positive pregnancy test or known pregnancy. If a pregnancy test is positive, then obstetrical CPT codes are indicated.
- The uterus, tubes and ovaries arise out of the pelvis and are considered pelvic organs. If the uterus rises out of the pelvic cavity, the imaging field can be determined on scout films. Imaging of the abdomen is not routinely supported for problems suspected to arise from the pelvis unless specifically described in other areas of the guidelines.
- The scout images (CT) and localizer images (MRI) are used to define the imaging field that is relevant to anatomical structures of clinical interest. The imaging field is defined by this clinical question, not by the imaging procedure code. The imaging code indicates the general anatomical region but does not define the specific imaging protocol or sequences.
- MRI (MRI Pelvis without contrast CPT® 72195 for Defecography is considered investigational/experimental by UHC.

General Guidelines – Overview (PV-1.1)

PV.GG.0001.1.A

v2.0.2024

- When indicated, pregnant females should be evaluated with ultrasound or MRI without contrast to avoid radiation exposure. In carefully selected clinical circumstances, evaluation with CT may be considered with careful attention to technique and radiation protection as deemed clinically appropriate.

Ultrasound

- Transvaginal ultrasound is the recommended modality for imaging; no alternative modality has demonstrated sufficient superiority to justify routine use, and Transvaginal (TV) ultrasound (CPT® 76830) is the optimal study to evaluate adult female pelvic pathology.
- Pelvic ultrasound (complete CPT® 76856, or limited CPT® 76857) is supported if it is a complementary study to the TV ultrasound. It may substitute for TV in pediatric individuals or non-sexually active females.
- Transperineal ultrasound (CPT® 76872) is supported for cases of suspected urethral abnormalities, urinary incontinence, pelvic prolapse, or vaginal cysts.
- CPT® 76942 is used to report ultrasound imaging guidance for needle placement during biopsy, aspiration, and other percutaneous procedures.

Soft Tissue Ultrasound

- Pelvic wall, buttocks, and penis - CPT® 76857

Scrotal Ultrasound

- See
 - **Impotence/Erectile Dysfunction (PV-17.1)**
 - **Penis-Soft Tissue Mass (PV-18.1)**
- Ultrasound scrotum and contents - CPT® 76870

3D Rendering with Ultrasound

- 3D Rendering (CPT® 76376 or CPT® 76377)
 - CPT® 76377 (3D rendering requiring image post-processing on an independent work station) or CPT® 76376 (3D rendering not requiring image post-processing on an independent workstation) can be considered in the following clinical scenarios:
 - Uterine intra-cavitary lesion when initial ultrasound is equivocal (See **Abnormal Uterine Bleeding (AUB) (PV-2.1)** and **Leiomyoma/Uterine Fibroids (PV-12.1)**)

- Hydrosalpinges or peritoneal cysts when initial ultrasound is equivocal (See **Complex Adnexal Masses (PV-5.3)**)
- Lost IUD (inability to feel or see IUD string) with initial ultrasound (See **Intrauterine Device (PV-10.1)**)
- Uterine anomaly is suspected on ultrasound (See **Uterine Anomalies (PV-14.1)**)
- Infertility if ultrasound is indeterminate or there is clinical suspicion for intra-cavitary lesion (such as polyp or fibroid), hydrosalpinx, uterine synechia, adenomyosis or uterine anomalies (See **Initial Infertility Evaluation, Female (PV-9.1)**)
- There is currently insufficient data to generate appropriateness criteria for the use of 3D and 4D rendering in conjunction with Obstetrical ultrasound imaging. Per ACOG, proof of a clinical advantage of 3-dimensional ultrasonography in prenatal diagnosis, in general, is still lacking.
- However, 3D-4D (CPT® 76376 or CPT® 76377) rendering can be considered in certain situations of abnormal pregnancy implantation like suspected C-section scar pregnancies or suspected cornual (interstitial) ectopic pregnancy, or to locate an IUD.
- 3D-4D (CPT® 76376 or CPT® 76377) rendering can be used for surgical planning with diagnosis of complex CHD in the fetus or for surgical planning of other complex fetal malformations.

Other Ultrasound

- CPT® 93975 Duplex scan (complete) of arterial inflow and venous outflow of abdominal, pelvic, scrotal contents and/or retroperitoneal organs; complete study.
- CPT® 93976 Duplex scan (limited) of arterial inflow and venous outflow of abdominal, pelvic, scrotal contents and/or retroperitoneal organs; limited study.
- CPT® 93975 and CPT® 93976 should not be reported together during the same session.

CT

- CT is not generally warranted for evaluating pelvic anatomy because it is limited due to soft tissue contrast resolution.

MRI

- Can be used as a more targeted study or for individuals allergic to iodinated contrast.
 - MRI Pelvis without contrast (CPT® 72195)
 - MRI Pelvis without and with contrast (CPT® 72197)
 - MRI Pelvis with contrast only (CPT® 72196) is rarely performed

Abnormal Uterine Bleeding (PV-2)

Guideline

Abnormal Uterine Bleeding (AUB) (PV-2.1)

Retained Products of Conception (PV-2.2)

References (PV-2)

Abnormal Uterine Bleeding (AUB) (PV-2.1)

PV.UB.0002.1.A

v2.0.2024

- Pregnancy test should be done initially if premenopausal
- If pregnancy test is negative or post menopausal initial evaluation includes ANY or ALL of the following:
 - Pelvic ultrasound (CPT® 76856 or CPT® 76857) and/or Transvaginal ultrasound (CPT® 76830), D&C and/or endometrial biopsy
- Advanced imaging is not indicated for endometrial intraepithelial neoplasia.
- If biopsy confirms a malignancy, then see the appropriate oncology guideline.
- If ultrasound is equivocal for intracavitary lesion
 - Duplex (Doppler) scan (CPT® 93975 complete; CPT® 93976 limited) as an add-on to TV ultrasound (CPT® 76830).
 - 3-D Rendering (CPT® 76377 or CPT® 76376) as an add-on.
- If ultrasound is equivocal for an intracavitary lesion, saline infusion sonohysterography (CPT® 76831) may be indicated.
- CT is not generally warranted for evaluating AUB since uterine anatomy is limited due to soft tissue contrast resolution.
 - An abnormal endometrium found incidentally on CT should be referred for TV ultrasound for further evaluation.
- MRI is not indicated for evaluation of abnormal uterine bleeding, please see specific Pelvis Imaging sections for MRI indications for ultrasound findings such as adnexal mass or uterine fibroids. See **Adnexal Mass/Ovarian Cysts (PV-5)** and **Leiomyomata (PV-12.1)**.

Retained Products of Conception (PV-2.2)

PV.UB.0002.2.A

v2.0.2024

- For abnormal uterine bleeding and/or pelvic pain with concern for retained products of conception (RPOC):
 - Pelvic ultrasound (CPT® 76856 or CPT® 76857) and/or Transvaginal ultrasound (CPT® 76830) is supported one time, repeat US is indicated for continued symptoms
 - Color Doppler ultrasonography (CPT® 93975 or CPT® 93976) may be added to ultrasound to aid in diagnosis of RPOC
 - CT Pelvis with and without contrast (CPT® 72194) OR MRI Pelvis with and without contrast (CPT® 72197) is supported if US with Color Doppler is equivocal AND further imaging is needed for surgical planning

Guideline

Secondary Amenorrhea (PV-3.1)

Primary Amenorrhea (PV-3.2)

References (PV-3)

Secondary Amenorrhea (PV-3.1)

PV.AM.0003.1.A

v2.0.2024

- Pregnancy test should be done initially
- If a pregnancy test is positive:
 - Refer to the member's individual coverage policy regarding obstetrical imaging indications and appropriate obstetrical imaging procedural codes. Billing of gynecology codes during pregnancy is not supported.
- If a pregnancy test is negative, further evaluation includes any of the following:
 - FSH, TSH, estradiol, and/or prolactin levels are indicated depending on clinical suspicion.
 - Serum free and total testosterone and/or DHEAS levels are indicated if there is evidence of hyperandrogenism
 - Pelvic ultrasound (CPT® 76856 or CPT® 76857) and/or TV ultrasound (CPT® 76830) for suspected uterine or ovarian pathology
- The results of test(s) above determine the next steps, which include:
 - For suspected adrenal tumor, See **Adrenal Cortical Lesions (AB-16)** in the Abdomen Imaging Guidelines.
 - For suspected pituitary tumor, See **Pituitary (HD-19)** in the Head Imaging Guidelines
 - For suspected Asherman's Syndrome:
 - Hysterosalpingogram (CPT® 74740), sonohysterosalpingography (CPT® 76831), and/or hysteroscopy if ultrasound is indeterminate for Asherman's syndrome.
 - MRI Pelvis without contrast (CPT® 72195) or without and with contrast (CPT® 72197) if hysterosalpingogram (CPT® 74740), sonohysterosalpingography (CPT® 76831), or hysteroscopy is indeterminate for Asherman's Syndrome.

Background and Supporting Information

- Asherman's syndrome: an acquired condition which refers to having scar tissue in the uterus

Primary Amenorrhea (PV-3.2)

PV.AM.0003.2.A

v2.0.2024

- Prior to imaging a history, physical examination and Tanner stage should be evaluated.
- Initial evaluation may include pelvic ultrasound (CPT® 76856 or CPT® 76857) and/or TV ultrasound (CPT® 76830) if ANY of the following:
 - Normal pubertal development and negative pregnancy test
 - Pelvic exam is indeterminate or unable to be performed
 - Delayed puberty with follicle-stimulating hormone (FSH) or luteinizing hormone (LH) that is elevated for the individual's age and Tanner stage
- If ultrasound defines a uterine or vaginal anomaly see **Uterine Anomalies (PV-14.1)**
- For suspected pituitary tumor, See **Pituitary (HD-19)** in the Head Imaging Guidelines

Background and Supporting Information

- Evaluation of an individual without a uterus (determined by imaging or examination) may include karyotype and/or testosterone levels.
- TV ultrasound (CPT® 76830) is appropriate in pediatric individuals who are sexually active or use a tampon and consent to the study.

Adenomyosis (PV-4)

Guideline

Adenomyosis (PV-4.1)

References (PV-4)

Adenomyosis (PV-4.1)

PV.AD.0004.1.A

v2.0.2024

- TV ultrasound (CPT® 76830) and/or Pelvic ultrasound (CPT® 76856 or CPT® 76857) is the diagnostic procedure of choice for the initial evaluation of suspected adenomyosis. Duplex Doppler (CPT® 93975 or CPT® 93976) can be added if requested.
- MRI Pelvis without contrast (CPT® 72195) or MRI Pelvis without and with contrast (CPT® 72197) is considered a second-line imaging option after transvaginal ultrasound if:
 - Diagnosis is inconclusive for adenomyosis and the individual has failed a 3-month trial of medical treatment and further delineation would affect management
 - MRI needed to guide the treatment of adenomyosis in an individual with an enlarged uterus, and coexisting leiomyoma/fibroid following indeterminate ultrasound

Background and Supporting Information

Adenomyosis is when endometrial tissue, which normally lines the uterus, moves into the outer muscular walls of the uterus. Adenomyosis is a histologic diagnosis and is suspected by history and physical examination. Ultrasound findings of adenomyosis include heterogeneous myometrium, myometrial cysts, asymmetric myometrial thickness, and subendometrial echogenic linear striations.

Adnexal Mass/Ovarian Cysts (PV-5)

Guideline

Suspected Adnexal Mass – Initial Evaluation (PV-5.1)

Simple Cysts (PV-5.2)

Complex Adnexal Masses (PV-5.3)

Screening for Ovarian Cancer/Suspected Ovary Cancer (PV-5.4)

References (PV-5)

Suspected Adnexal Mass – Initial Evaluation (PV-5.1)

PV.MC.0005.1.A

v2.0.2024

- A potential mass is found on exam and/or found incidentally on other imaging
- Transvaginal (TV) ultrasound imaging (CPT® 76830) is the initial study of choice.
 - Pelvic ultrasound (CPT® 76856 or CPT® 76857) can be performed if requested as a complimentary study to the TV ultrasound.
 - Once confirmed, Color Doppler ultrasonography (CPT® 93975 or CPT® 93976) may be useful to evaluate the vascular characteristics of adnexal masses.
- MRI Pelvis without contrast (CPT® 72195), OR without and with contrast (CPT® 72197; CPT® 72195 if pregnant) if ultrasound does not identify the origin of the pelvic mass (adnexal, uterine, or other in etiology).
 - If the mass is unrelated to female pelvic anatomy, see **Abdominal Mass (AB-13)** in the Abdomen Imaging Guidelines.
 - The uterus, tubes, and ovaries arise out of the pelvis and are considered pelvic organs. If the uterus rises out of the pelvic cavity, the imaging field can be determined on scout films. Imaging of the abdomen is not supported for problems suspected to arise from the pelvis.

Background and Supporting Information

- Consultation with or referral to a gynecologic oncologist is recommended for females with an adnexal mass who meet one or more of the following criteria:⁷
 - Postmenopausal with elevated CA-125 level, ultrasound findings suggestive of malignancy, ascites, a nodular or fixed pelvic mass, or evidence of abdominal or distant metastasis.⁷
 - Premenopausal with very elevated CA-125 level, ultrasound findings suggestive of malignancy, ascites, a nodular or fixed pelvic mass, or evidence of abdominal or distant metastasis.⁷
 - Premenopausal or postmenopausal with an elevated score on a formal risk assessment test such as the multivariate index assay, risk of malignancy index, or the Risk of Ovarian Malignancy Algorithm or one of the ultrasound-based scoring systems from the International Ovarian Tumor Analysis group.⁷
- Simple and Complex Adnexal Cysts
 - Simple cysts are smooth walled and clear without debris.
 - Complex cysts can have solid areas or excrescences, and/or debris in them, greater than 3mm irregular septations, mural nodules with Doppler-detected blood flow, and/or free abdominal/pelvic fluid.
- Suspected Adnexal Mass – Tumor Markers

- The adnexa include the ovaries, Fallopian tubes, and ligaments that hold the uterus in place.
- CA-125 is a tumor marker that is useful for the evaluation of adnexal mass:
 - Elevation occurs with both malignant (epithelial cancer) and benign entities (leiomyoma, endometriosis, PID, inflammatory disease such as lupus, and inflammatory bowel disease).
 - Increase in the markers over time occurs with malignancy only
 - Consider tumor markers in individuals with an abnormal ultrasound that is not a simple cyst
- Other markers include Beta hCG, LDH, and AFP (germ cell tumors) and Inhibin A and B (granulosa cell tumor).

Simple Cysts (PV-5.2)

PV.MC.0005.2.A

v2.0.2024

- Simple cysts are smooth, thin walled, anechoic and clear without debris. Simple cysts up to 10 cm in diameter as measured by ultrasound are almost universally benign.
 - Repeat TV ultrasound (CPT® 76830) and/or Pelvic ultrasound (CPT® 76857 or CPT® 76856)
 - Follow up according to the below schedule if ≤ 10 cm
 - Routine use of 3D rendering (CPT® 76376/CPT® 76377) for evaluation of simple ovarian cysts is not supported.

Simple Cyst Follow-Up

Size	Pre-Menopausal	Post-Menopausal
≤ 3 cm	<ul style="list-style-type: none">• None	<ul style="list-style-type: none">• None
> 3 cm to 5 cm	<ul style="list-style-type: none">• None	<ul style="list-style-type: none">• Follow-up in 12 months with TV ultrasound (CPT® 76830) and/or Pelvic ultrasound (CPT® 76857 or CPT® 76856)<ul style="list-style-type: none">• If smaller (≥ 10-15% decrease) no further surveillance.• If stable follow-up TV ultrasound (CPT® 76830) and/or Pelvic ultrasound (CPT® 76857 or CPT® 76856) at 24 months from initial exam• If enlarging (≥ 10%-15% increase) follow-up TV ultrasound (CPT® 76830) and/or Pelvic ultrasound (CPT® 76857 or CPT® 76856) at 12 and 24 months from initial exam• If there is a change in morphology on follow imaging see Complex Adnexal Masses (PV 5.3)

Size	Pre-Menopausal	Post-Menopausal
>5 cm to ≤10 cm	<ul style="list-style-type: none">Follow up in 8-12 weeks (proliferative phase if possible) TV ultrasound (CPT® 76830) and/or Pelvic ultrasound (CPT® 76857 or CPT® 76856); further follow-up intervals may be adjusted on basis of degree of cyst change	<ul style="list-style-type: none">Follow-up in 3-6 months with TV ultrasound (CPT® 76830) and/or Pelvic ultrasound (CPT® 76857 or CPT® 76856); further follow-up intervals may be adjusted on basis of degree of cyst change.Subsequent follow up with TV ultrasound (CPT® 76830) and/or Pelvic ultrasound (CPT® 76857 or CPT® 76856), annually and if stable for 2 years or decreasing in size, no further imaging follow-up is needed.

Size	Pre-Menopausal	Post-Menopausal
>10 cm	<ul style="list-style-type: none"> • If not excised consider US follow up within 6 months. TV Ultrasound (CPT® 76830) and/or Pelvic ultrasound (CPT® 76857 or CPT® 76856) • If stable follow up Ultrasound can be done at 12 and 24 months from initial exam • If solid component, MRI Pelvis without and with contrast (CPT® 72197) may be approved • If ultrasound equivocal for Simple cyst, MRI Pelvis without and with contrast (CPT® 72197) • If follow up ultrasound imaging shows changing morphology and/or a vascular component then consider MRI Pelvis without and with contrast (CPT® 72197) 	<ul style="list-style-type: none"> • If not excised consider US follow up within 6 months. TV ultrasound (CPT® 76830) and/or Pelvic ultrasound (CPT® 76857 or CPT® 76856) • If stable follow up Ultrasound can be done at 12 and 24 months from initial exam • If solid component, MRI Pelvis without and with contrast (CPT® 72197) may be approved • If ultrasound equivocal for Simple cyst, MRI Pelvis without and with contrast (CPT® 72197) • If follow up ultrasound imaging shows changing morphology and/or a vascular component then consider MRI Pelvis without and with contrast (CPT® 72197)

Complex Adnexal Masses (PV-5.3)

PV.MC.0005.3.A

v2.0.2024

- Ultrasound imaging should provide characteristics of the cyst/mass prior to consideration of advanced imaging.
- Complex cysts found on ultrasound have characteristics that include: solid areas or excrescences, and/or debris, may have greater than 3mm irregular septations, and/or mural nodules with Doppler-detected blood flow, and/or free abdominal/pelvic fluid. Complex cysts have an O-RADS™ score of 2 or higher.
- Routine use of 3D rendering (CPT® 76376/CPT® 76377) for evaluation of complex ovarian cysts is not supported unless otherwise mentioned in the table below.

Follow up Complex Adnexal Masses

Condition	Pre-Menopausal	Post-Menopausal
Typical hemorrhagic cyst < 10 cm (O-RADS™ 2)	<ul style="list-style-type: none">• If initial ultrasound imaging confirms hemorrhagic cyst ≤5 cm no further imaging is necessary• If initial ultrasound imaging confirms hemorrhagic cyst >5 cm but <10 cm, follow up with Pelvic ultrasound (CPT® 76856 or CPT® 76857) and/or TV ultrasound (CPT® 76830) in 8-12 weeks is indicated. Duplex (Doppler) scan (CPT® 93975 complete; CPT® 93976 limited) may be approved as an add-on to TV ultrasound (CPT® 76830).• If follow-up imaging confirms a hemorrhagic cyst that has not completely resolved or has enlarged, an MRI Pelvis without and with contrast (CPT® 72197) can be considered.• If stable follow up TV ultrasound (CPT® 76830) and/or Pelvic ultrasound (CPT® 76857 or CPT® 76856) can be done at 24 months from initial exam	<ul style="list-style-type: none">• Early postmenopausal (<5 years) either:<ul style="list-style-type: none">• follow-up TV ultrasound (CPT® 76830) and/or Pelvic ultrasound (CPT® 76857 or CPT® 76856) in 2-3 months OR• MRI Pelvis without and with contrast (CPT® 72197)• Late postmenopausal (≥ 5 years) hemorrhagic cyst should not occur<ul style="list-style-type: none">• MRI Pelvis without and with contrast (CPT® 72197)

Condition	Pre-Menopausal	Post-Menopausal
Hemorrhagic cyst $\geq 10\text{cm}$ (O-RADS™ 3)	<ul style="list-style-type: none"> If initial ultrasound imaging confirms a Typical Hemorrhagic cyst $\geq 10\text{cm}$ <ul style="list-style-type: none"> If not excised consider TV ultrasound (CPT® 76830) and/or Pelvic ultrasound (CPT® 76857 or CPT® 76856) follow up within 6 months If stable, follow up Ultrasound can be done at 12 and 24 months from initial exam If solid component, MRI Pelvis without and with contrast (CPT® 72197) may be approved If ultrasound equivocal for Hemorrhagic cyst, MRI Pelvis without and with contrast (CPT® 72197) If follow up ultrasound imaging shows changing morphology and/or a vascular component then consider MRI Pelvis without and with contrast (CPT® 72197) 	<ul style="list-style-type: none"> MRI Pelvis without and with contrast (CPT® 72197) can be considered
Typical Endometriomas < 10cm (O-RADS™ 2)	<ul style="list-style-type: none"> If initial imaging confirms a Typical Endometrioma, follow-up Pelvic ultrasound (CPT® 76856 or CPT® 76857) and/or TV ultrasound (CPT® 76830); duplex (Doppler) scan (CPT® 93975 complete; CPT® 93976 limited) may be approved as an add-on to TV ultrasound (CPT® 76830) <ul style="list-style-type: none"> If <10cm and not surgically excised follow-up TV ultrasound (CPT® 76830) and/or Pelvic ultrasound (CPT® 76857 or CPT® 76856) in 12 months If stable follow up Ultrasound can be done at 24 months from initial exam If ultrasound equivocal for Endometriomas, MRI Pelvis without and with contrast (CPT® 72197) If follow up ultrasound imaging shows changing morphology and/or a vascular component then consider MRI Pelvis without and with contrast (CPT® 72197) 	<ul style="list-style-type: none"> If initial ultrasound imaging confirms a typical endometrioma < 10cm then either: <ul style="list-style-type: none"> Follow-up TV ultrasound (CPT® 76830) and/or Pelvic ultrasound (CPT® 76857 or CPT® 76856) in 2-3 months OR MRI Pelvis without and with contrast (CPT® 72197)

Condition	Pre-Menopausal	Post-Menopausal
Typical Endometriomas ≥10cm (O-RADS™ 3)	<ul style="list-style-type: none">• If initial ultrasound imaging confirms a Typical Endometrioma ≥10cm<ul style="list-style-type: none">• If not excised consider TV ultrasound (CPT® 76830) and/or Pelvic ultrasound (CPT® 76857 or CPT® 76856) follow up within 6 months• If stable follow up Ultrasound can be done at 12 and 24 months from initial exam• If solid component, MRI Pelvis without and with contrast (CPT® 72197) may be approved• If ultrasound equivocal for Endometrioma, MRI Pelvis without and with contrast (CPT® 72197)• If follow up ultrasound imaging shows changing morphology and/or a vascular component then consider MRI Pelvis without and with contrast (CPT® 72197)	<ul style="list-style-type: none">• MRI Pelvis without and with contrast (CPT® 72197)

Condition	Pre-Menopausal	Post-Menopausal
Typical Dermoid < 10cm (O-RADS™ 2)	<ul style="list-style-type: none"> If initial features are only suggestive for or if assessment is uncertain follow up Pelvic ultrasound (CPT® 76856 or CPT® 76857) and/or TV ultrasound (CPT® 76830) within 3 months is appropriate If initial ultrasound imaging confirms a Dermoid, follow-up Pelvic ultrasound (CPT® 76856 or CPT® 76857); and/or TV ultrasound (CPT® 76830); duplex (Doppler) scan (CPT® 93975 complete; CPT® 93976 limited) may be approved as an add-on to TV ultrasound (CPT® 76830). <ul style="list-style-type: none"> If ≤3 cm, may consider follow-up TV ultrasound (CPT® 76830) and/or Pelvic ultrasound (CPT® 76857 or CPT® 76856) in 12 months <ul style="list-style-type: none"> If stable follow up Ultrasound can be done at 24 months from initial exam If >3cm but <10cm, follow-up Ultrasound in 12 months if not surgically excised If stable follow up Ultrasound can be done at 24 months from initial exam If ultrasound equivocal for Dermoid, MRI Pelvis without and with contrast (CPT® 72197) If follow up ultrasound imaging shows changing morphology and/or a vascular component then consider MRI Pelvis without and with contrast (CPT® 72197) 	<ul style="list-style-type: none"> Same as Pre-Menopausal

Condition	Pre-Menopausal	Post-Menopausal
Typical Dermoid ≥ 10cm (O-RADS™ 3)	<ul style="list-style-type: none"> If initial ultrasound imaging confirms a Typical Dermoid ≥10cm <ul style="list-style-type: none"> If not excised consider TV ultrasound (CPT® 76830) and/or Pelvic ultrasound (CPT® 76857 or CPT® 76856) follow up within 6 months If stable follow up Ultrasound can be done at 12 and 24 months from initial exam If solid component, MRI Pelvis without and with contrast (CPT® 72197) may be approved If ultrasound equivocal for Dermoid, MRI Pelvis without and with contrast (CPT® 72197) If follow up ultrasound imaging shows changing morphology and/or a vascular component then consider MRI Pelvis without and with contrast (CPT® 72197) 	<ul style="list-style-type: none"> Same as Pre-Menopausal
Typical benign extraovarian lesions Hydrosalpinges (Hydrosalpinx) or Peritoneal cysts (ORADS™ 2)	<ul style="list-style-type: none"> If initial imaging confirms hydrosalpinx or peritoneal cysts, follow up imaging is not indicated 	<ul style="list-style-type: none"> If initial imaging confirms hydrosalpinx or peritoneal cysts, follow up imaging is not indicated

Complex and/or solid adnexal mass incompletely evaluated by ultrasound

- Generally a repeat ultrasound is recommended (see table above for appropriate time intervals): TV ultrasound (CPT® 76830) and/or Pelvic ultrasound (CPT® 76857 or CPT® 76856)
- MRI Pelvis without and with contrast (CPT® 72197, CPT® 72195 if pregnant) one time:
 - To follow masses when they cannot be optimally visualized by ultrasound (e.g. suboptimal sonography due to large mass or obese individual)
 - Unexplained change of appearance during ultrasound follow-up
 - Other Individual-driven indications (e.g. the application of established risk prediction models (e.g., family history of ovarian cancer), correlation with abnormal serum biomarkers, and/or pelvic symptoms)
 - Differentiate the origin of pelvic masses that are not clearly of ovarian origin

- O-RADS™ score of 3 with a solid component
- O-RADS™ score of 4 or 5
- Concern for metastatic ovarian malignancy, see **Ovarian Cancer (ONC-21)** in the Oncology Imaging Guidelines

Background and Supporting Information

O-RADS™ Classification

O-RADS	
O-RADS™ 0	Incomplete Evaluation
O-RADS™ 1	Normal Ovary <ul style="list-style-type: none"> • No ovarian lesion • Physiologic cyst: follicle ≤3cm or corpus luteum typically ≤3cm
O-RADS™ 2	Almost Certainly Benign <ul style="list-style-type: none"> • Simple cyst less than 10 cm • Bilocular, smooth cyst • Unilocular, smooth, non-simple cysts (internal echos and/or incomplete septations) • Typical benign ovarian lesions <10cm (hemorrhagic cyst, dermoid cyst, endometrioma) • Typical benign extraovarian lesions (paraovarian cyst, peritoneal inclusion cysts, hydrosalpinx)
O-RADS™ 3	Low Risk <ul style="list-style-type: none"> • Typical benign ovarian lesions ≥10cm • Uni- or bilocular cyst, smooth, ≥10cm • Unilocular cyst, irregular, any size • Multilocular cyst, smooth, <10cm, Color Score (CS) <4 • Solid lesion, ± shadowing, smooth, any size, CS =1 • Solid lesion, shadowing, smooth, any size, CS 2-3

O-RADS	
ORADS™ 4	<p>Intermediate Risk</p> <ul style="list-style-type: none"> • Bilocular cysts without solid component(s), Irregular, any size, any color score • Multilocular cysts without solid component(s) <ul style="list-style-type: none"> • Smooth, 10 cm, CS <4 • Smooth, any size, CS 4 • Irregular, any size, any CS • Unilocular cyst with solid component(s) <ul style="list-style-type: none"> • <4 papillary projections or any solid component(s) not considered a papillary projection, any size • Bi- or multilocular cyst with solid component(s), any size, CS 1-2 • Solid lesion, non-shadowing, smooth, any size, CS 2-3
ORADS™ 5	<p>High Risk</p> <ul style="list-style-type: none"> • Unilocular cyst, ≥4 papillary projections, any size, and CS • Bi- or multilocular cyst with solid component(s), any size, CS 3-4 • Solid lesion, ± shadowing, smooth, any size, CS 4 • Solid lesion, irregular, any size, any CS • Ascites and/or peritoneal nodules

Pre-Menopausal – see table above

- For females of reproductive age (Pre-Menopausal), evaluation may include a pregnancy test (a quantitative hCG may be necessary if an ectopic pregnancy is suspected), CBC, serial hematocrit measurements, and appropriate cultures.
- Symptomatic individuals often require immediate interventions (antibiotics, surgery, and/or expectant management).
- Ultrasound characteristics usually suggest the diagnosis (ectopic pregnancy, functional cysts, tubo-ovarian abscess (See **Pelvic Inflammatory Disease (PV-7.1)**), hydrosalpinx, dermoid, endometrioma, hemorrhagic cyst and pedunculated fibroids (See **Leiomyomata/Uterine Fibroids (PV-12.1)**) and direct the treatment.

- An ovarian mass suspicious for metastatic disease (e.g. from breast, uterine, colorectal or gastric cancer) should be evaluated based on the appropriate Oncology Imaging Guidelines.

Post-Menopausal – see table above

- For post-menopausal females, most pelvic complex cysts or solid masses should be evaluated for surgical intervention and have tumor markers (i.e. CA-125) measured.
- Some females for whom the usual management of a pelvic mass would include surgery may be at increased risk for perioperative morbidity and mortality. In such cases, repeat imaging may be a safer alternative than immediate surgery, although the frequency of follow-up imaging has not been determined.
- An ovarian mass suspicious for metastatic disease (e.g. from breast, uterine, colorectal or gastric cancer) should be evaluated based on the appropriate Oncology Imaging Guidelines.

Endometriosis (PV-6)

Guideline

Endometriosis (PV-6.1)

References (PV-6)

Endometriosis (PV-6.1)

PV.EM.0006.1.A

v2.0.2024

- TV ultrasound (CPT® 76830) and/or Pelvic ultrasound (CPT® 76856 or CPT® 76857) is the first line diagnostic exam for suspected endometriosis.
- MRI Pelvis without contrast (CPT® 72195) or without and with contrast (CPT® 72197):
 - Prior to planned surgery for suspected deep pelvic endometriosis such as rectovaginal endometriosis, deeply infiltrative bladder endometriosis, and cul-de-sac obliteration.
 - To characterize complex adnexal masses as endometrioma if ultrasound equivocal See **Complex Adnexal Masses (PV-5.3)**
 - If known or suspected thoracic endometriosis, see **Pneumothorax/Hemothorax (CH-19.1)** in the Chest Imaging Guidelines.

Pelvic Inflammatory Disease (PID) (PV-7)

Guideline

Pelvic Inflammatory Disease (PV-7.1)

References (PV-7)

Pelvic Inflammatory Disease (PV-7.1)

PV.PI.0007.1.A

v2.0.2024

- Clinical examination alone is usually sufficient for confirming the diagnosis of pelvic inflammatory disease. See **Pelvic Pain/Dyspareunia, Female (PV-11.1)** if other causes of pelvic pain are suspected.
- Pelvic ultrasound (CPT® 76856 or CPT® 76857) and/or TV ultrasound (CPT® 76830) is the initial study for imaging of suspected pelvic inflammatory disease (PID) if diagnosis is uncertain following bimanual pelvic examination and laboratory testing (such as WBC, CRP and ESR, Microscopy of the vaginal secretions, and testing for *Neisseria gonorrhoeae* and *Chlamydia trachomatis*) OR for suspected Tubo-Ovarian Abscess (TOA). Color Doppler ultrasonography (CPT® 93975 or CPT® 93976) may be added.
- CT Pelvis with contrast (CPT® 72193) or MRI Pelvis with and without contrast (CPT® 72197):
 - If diagnosis is uncertain following examination, laboratory testing and ultrasound
 - Ultrasound shows extensive abscess formation and further imaging is needed for treatment planning
 - Suspected TOA with inconclusive ultrasound
- If suspected abdominal abscess see **Abdominal Sepsis (Suspected Abdominal Abscess) (AB-3.1)** in the Abdomen Imaging Guidelines.

Background and Supporting Information

PID may be clinically suspected based on findings of abdominal and/or pelvic pain, cervical or vaginal mucopurulent discharge, dyspareunia, inter-menstrual and/or post coital bleeding, fever, low back pain, nausea/vomiting, urinary frequency, cervical motion tenderness, uterine and/or adnexal tenderness on exam.

Laboratory findings may include elevated erythrocyte sedimentation rate, elevated C-reactive protein, lab documentation of cervical infection with *N. gonorrhoeae* or *C. trachomatis*, WBC on saline microscopy of vaginal fluid, and/or endometrial biopsy with endometritis.

Polycystic Ovary Syndrome (PV-8)

Guideline

Polycystic Ovary Syndrome (PCOS) (PV-8.1)

References (PV-8)

Polycystic Ovary Syndrome (PCOS) (PV-8.1)

PV.PC.0008.1.A

v2.0.2024

- Pelvic ultrasound (CPT® 76856 or CPT® 76857) and/or TV ultrasound (CPT® 76830) is indicated when history, exam, and/or laboratory findings are suspicious for PCOS.
- Laboratory testing to be done prior to advanced imaging: Virilizing hormone levels (Testosterone and DHEAS). Disorders that mimic the clinical features of Polycystic ovary syndrome (PCOS) should be excluded by measuring: TSH, Prolactin, and 17-OHP (hydroxyprogesterone) levels. Others to consider based on the clinical presentation: Cortisol levels, ACTH, dexamethasone suppression testing, IGF-1, FSH, LH, estradiol.
- If elevated serum levels of androgens are found and an adrenal etiology is suspected - see **Adrenal Cortical Lesions (AB-16.1)** in the Abdomen Imaging Guidelines.

Background and Supporting Information

- Polycystic ovary syndrome is the most common hormonal disorder among females of reproductive age, and is one of the leading causes of infertility.
- Diagnostic criteria of polycystic ovary syndrome (Two of the following three criteria are required):
 - Oligo/anovulation
 - Hyperandrogenism
 - Clinical (hirsutism or less commonly male pattern alopecia) or
 - Biochemical (raised FAI (free androgen index) or free testosterone)
 - Polycystic ovaries on ultrasound
 - Defined as an ovary containing 12 or more follicles (or 25 or more follicles using new ultrasound technology) measuring 2 to 9 mm in diameter or an ovary that has a volume of greater than 10 mL on ultrasonography. A single ovary meeting either or both of these definitions is sufficient for diagnosis of polycystic ovaries.
- Clinical Features of PCOS
 - Hirsutism and male pattern balding consistent with hyperandrogenism
 - Irregular or absent menstrual cycles
 - Subfertility or infertility
 - Psychological symptoms – anxiety, depression, psychosexual dysfunction, eating disorders
 - Metabolic features – obesity, dyslipidaemia, diabetes

Initial Infertility Evaluation, Female (PV-9)

Guideline

Initial Infertility Evaluation, Female (PV-9.1)

References (PV-9)

Initial Infertility Evaluation, Female (PV-9.1)

PV.IE.0009.1.U

v2.0.2024

This guideline is not intended for fertility treatment follow-up and management. See individual fertility coverage policy for imaging during active fertility treatment.

- A one time Pelvic ultrasound (CPT® 76856 or CPT® 76857) and/or TV ultrasound (CPT® 76830) for initial infertility workup.¹
 - Repeat ultrasounds or serial ultrasounds are not indicated for initial infertility workup
- To evaluate for tubal patency:
 - Hysterosalpingography (HSG) (CPT® 74740) **or** Sonohysterosalpingography (CPT® 76831)
- If ultrasound is indeterminate or there is clinical suspicion for intra-cavitary lesion (such as polyp or fibroid), hydrosalpinx, uterine synechia, adenomyosis or uterine anomalies:
 - 3D US imaging (add-on CPT® 76376 or CPT® 76377)
 - US Color Doppler (CPT® 93975 or CPT® 93976)

Intrauterine Device (IUD) and Tubal Occlusion (PV-10)

Guideline

Intrauterine Device (PV-10.1)

Hysteroscopically Placed Tubal Occlusion Device (PV-10.2)

References (PV-10)

Intrauterine Device (PV-10.1)

PV.ID.0010.1.A

v2.0.2024

- Imaging to evaluate position prior to, immediately after and, for example, 6 weeks after IUD insertion is not indicated
- Pelvic ultrasound (CPT® 76856 or CPT® 76857) and/or TV ultrasound (CPT® 76830) if:
 - Abnormal pelvic exam prior to IUD insertion, such as pelvic mass, irregularly shaped uterus, or enlarged uterus
 - Suspected IUD complication:
 - Abnormal IUD position
 - Uterine perforation
 - Severe pain
 - Excessive bleeding
 - Suspected infection
- “Lost” IUD inability to palpate IUD string on pelvic exam, and/or see IUD on speculum exam:
 - Desires continuation of IUD for contraception,
 - unable to visualize with cytobrush sweep of the cervix:
 - TV ultrasound (CPT® 76830) with or without 3-D Rendering (CPT® 76377 or CPT® 76376)
 - If TV ultrasound is negative or non-diagnostic, Pelvic ultrasound (CPT® 76856 or CPT® 76857):
 - If Pelvic ultrasound is negative or non-diagnostic, plain x-ray should be performed if pregnancy test is negative.
 - CT Pelvis without contrast (CPT® 72192) or CT Abdomen and Pelvis without contrast (CPT® 74176) or MRI Pelvis without contrast (CPT® 72195) when both ultrasound and plain x-ray are negative or non-diagnostic.
 - Desires removal of IUD
 - If unable to palpate, see, or retrieve IUD string on pelvic exam and/or speculum exam
 - If failed attempt to retrieve IUD with instrumentation of external cervical os
 - TV ultrasound (CPT® 76830); 3-D Rendering (CPT® 76377 or CPT® 76376) may be an add-on
 - If Pelvic ultrasound is negative or non-diagnostic, plain x-ray should be performed if pregnancy test is negative
 - CT Pelvis without contrast (CPT® 72192) or CT Abdomen and Pelvis without contrast (CPT® 74176) or MRI Pelvis without contrast (CPT®

72195) when both ultrasound and plain x-ray are equivocal or non-diagnostic

- If pregnancy test is positive:
 - The use of gynecology CPT codes for pregnant females is not supported. Therefore, transvaginal ultrasound (CPT® 76830) and pelvic ultrasound (CPT® 76856 or CPT® 76857) are not supported for those with a positive pregnancy test or known pregnancy. If a pregnancy test is positive, then obstetrical CPT codes are indicated (General Guidelines (PV-1.0))

Hysteroscopically Placed Tubal Occlusion Device (PV-10.2)

PV.ID.0010.2.A

v2.0.2024

- TV ultrasound (CPT® 76830) and/or Pelvic ultrasound (CPT® 76856 or CPT® 76857) if:
 - Suspected complication of hysteroscopically placed tubal occlusion device:
 - Abnormal tubal occlusion device position
 - Uterine perforation
 - Severe pain
 - Excessive bleeding

Background and Supporting Information

- As of 2019, neither the Essure nor the Adiana tubal occlusion device is in production

Pelvic Pain/Dyspareunia, Female (PV-11)

Guideline

Pelvic Pain/Dyspareunia, Female (PV-11.1)

References (PV-11)

Pelvic Pain/Dyspareunia, Female (PV-11.1)

PV.PD.0011.1.U

v2.0.2024

- Often, the history, physical examination, and laboratory data can guide subsequent workup in individuals presenting with pelvic pain. When possible, use the more specific guideline, depending on clinical presentation and the differential diagnosis. (i.e.-endometriosis **Endometriosis (PV-6.1)**, adnexal mass **Adnexal Mass/Ovarian Cysts (PV-5)**, etc.).
- If there is clinical concern that a non gynecological condition is the cause of pelvic pain, such as a vascular, urological or gastrointestinal etiology, see the applicable guideline section(s).
- Premenopausal pelvic pain - Pregnancy test should be done prior to imaging.
 - If pregnancy test is positive, see the applicable obstetrical imaging policy.
- If pregnancy test is negative or postmenopausal:
 - Ultrasound – transvaginal (CPT® 76830) and/or pelvic (CPT® 76856 or CPT® 76857)
 - Duplex Doppler (CPT® 93975 or CPT® 93976) can be added if there is an ovarian mass and/or suspicion of ovarian torsion on the initial ultrasound.
 - Duplex Doppler (CPT® 93975 or CPT® 93976) for chronic pelvic pain (pelvic pain for 6 months or greater)
- Further imaging as per appropriate section of guidelines (i.e.-ovarian mass/torsion **Adnexal Mass/Ovarian Cysts (PV-5)**, PID **Pelvic Inflammatory Disease (PV-7.1)**, etc.)
- If initial ultrasound is normal, further evaluation depending on the clinical suspicion may include urological work-up, gastroenterology work-up, laparoscopic evaluation(s)
- If the initial ultrasound is equivocal for unexplained chronic pelvic pain (pelvic pain for 6 months or greater) and/or above evaluations are non-diagnostic:
 - CT Pelvis with contrast (CPT® 72193) OR
 - MRI Pelvis without contrast or with and without contrast (CPT® 72195 or CPT® 72197)
- Pelvic Pain/Hip Pain - Rule Out Piriformis Syndrome
 - See **Focal Neuropathy (PN-2.1)** in the Peripheral Nerve Disorders Imaging Guidelines
 - See **Hip(MS-24)** in the Musculoskeletal Imaging Guidelines
- Work-up of interstitial cystitis/bladder pain syndrome (IC/BPS) may include history, physical exam, laboratory exam (urinalysis and urine culture), cystoscopy, and measurement of post void residual urine by bladder catheterization.

- Pelvic ultrasound (CPT® 76856 or CPT® 76857) and/or TV ultrasound (CPT® 76830).
 - CT Pelvis with contrast (CPT® 72193) if ultrasound is equivocal for complicated interstitial cystitis/bladder pain syndrome (when ordered by specialist or any provider in consultation with a specialist).
- Proctalgia Syndromes
 - Prior to advanced imaging, the evaluation of rectal/perineal pain should include:
 - Digital rectal examination (assess for mass, fissures, hemorrhoids, etc.)
 - Pelvic examination in females to exclude PID
 - Recent flexible sigmoidoscopy or colonoscopy subsequent to the start of reported symptoms to exclude inflammatory conditions or malignancy.
 - Endoanal ultrasound (CPT® 76872), MRI Pelvis with and without contrast (CPT® 72197), or CT Pelvis with contrast (CPT® 72193) are appropriate after the above studies have been performed or if laboratory or clinical information suggest infection, abscess, or inflammation
- MRI (MRI Pelvis without contrast CPT® 72195) for Defecography is considered investigational/experimental by UHC.

Background and Supporting Information

- Interstitial Cystitis/Bladder Pain Syndrome (IC/BPS) has an unpleasant sensation (pain, pressure, discomfort), perceived to be related to the urinary bladder. It is associated with lower urinary tract symptoms of more than six weeks duration, in the absence of infection or other identifiable causes.
- Proctalgia syndromes are characterized by recurrent episodes of rectal/perineal pain, and may be due to sustained contractions of the pelvic floor musculature.

Leiomyoma/Uterine Fibroids (PV-12)

Guideline

Leiomyoma/Uterine Fibroids (PV-12.1)

References (PV-12)

Leiomyoma/Uterine Fibroids (PV-12.1)

PV.UF.0012.1.A

v2.0.2024

Leiomyomata are also known as “fibroids.”

The uterus, tubes and ovaries arise out of the pelvis and are considered pelvic organs. If the uterus rises out of the pelvic cavity, the imaging field can be determined on scout films. Imaging of the abdomen is not supported for problems suspected to arise from the pelvis.

- Pelvic ultrasound (CPT® 76856 or CPT® 76857) and/or TV ultrasound (CPT® 76830) for any of the following:
 - Suspected leiomyoma with symptoms of pelvic pain, suspected ureteral obstruction secondary to inability to void urine, pelvic pressure and/or abnormal uterine bleeding and/or an enlarged uterus found on physical exam with a negative pregnancy test (if pre-menopausal).
 - Pre-operative prior to myomectomy
 - Recurrent symptoms such as abnormal bleeding, pain, or pelvic pressure
 - 3-D Rendering (CPT® 76377 or CPT® 76376) and/or Duplex (Doppler) scan (CPT® 93975 complete; CPT® 93976 limited) if ultrasound is equivocal and intracavitary lesion is suspected, or for surgical planning for myomectomy
 - There is no current evidence to support 3-D Rendering (CPT® 76377 or CPT® 76376) for planning for uterine artery embolization.
- MRI Pelvis and/or Abdomen to determine surgical approach for hysterectomy is not supported.
- MRI Pelvis without and with contrast (CPT® 72197), or without contrast (CPT® 72195) in the evaluation of leiomyomas for the following:
 - Guide the treatment of leiomyoma/fibroid in an enlarged uterus with multiple leiomyoma/fibroid following indeterminate ultrasound when myomectomy is planned.
 - Equivocal sonohysterography or panoramic hysteroscopy with suspected submucous leiomyoma and imaging is needed to plan for myomectomy
 - Leiomyoma necrosis is suspected
 - Guide the treatment of leiomyoma/fibroid in an enlarged uterus with multiple leiomyoma/fibroid following indeterminate ultrasound when Radiofrequency Ablation of Leiomyomas is planned
 - Uterine artery embolization is being considered
 - If MRI is equivocal, MRA Pelvis (CPT® 72198) or CTA Pelvis (CPT® 72191) if requested by or in consultation with the interventional radiologist planning the uterine artery embolization
 - There is no evidence to support interval MRI after embolization unless persistent or recurrent symptoms
- If malignancy is suspected, See **Oncology Imaging Guidelines** .

- MRI Pelvis with and without (CPT® 72197) may be considered for suspected leiomyosarcoma if one or more of the following ultrasound features AND symptoms are present;
 - Ultrasound features suggestive of leiomyosarcoma are:
 - Large sized (greater than 8 cm)
 - Irregular borders
 - Areas of cystic change or necrosis
 - Increase in central and peripheral vascularity
 - Rapid change in size
 - Symptoms suggestive of leiomyosarcoma would include postmenopausal woman with an new or rapidly enlarging myometrial mass or rapid growth of a uterine mass in a premenopausal patient (increase of 6 weeks gestation size within 1 year)
- CT is generally not warranted for evaluating pelvic anatomy because it is limited due to soft tissue contrast resolution

Periurethral Cysts, Urethral Diverticula, and Vaginal Masses (PV-13)

Guideline

Periurethral cysts, Skene duct cyst and Gartner's duct cyst (PV-13.1)

Urethral Diverticula (PV-13.2)

Vaginal Masses (PV-13.3)

References (PV-13)

Periurethral cysts, Skene duct cyst and Gartner's duct cyst (PV-13.1)

PV.UD.0013.1.A

v2.0.2024

- Initial evaluation includes any of the following:
 - Pelvic ultrasound (CPT® 76856 or CPT® 76857) and/or Transvaginal ultrasound (CPT® 76830) and/or Transperineal ultrasound (CPT® 76872)
 - MRI Pelvis without and with contrast (CPT® 72197) for surgical planning when ultrasound equivocal

Urethral Diverticula (PV-13.2)

PV.UD.0013.2.A

v2.0.2024

- Initial evaluation may include Pelvic ultrasound (CPT® 76856 or CPT® 76857) and/or Transvaginal ultrasound (CPT® 76830) and/or Transperineal ultrasound (CPT® 76872)
- Urethrography, or CT Urethrography (CT Pelvis without and with contrast CPT® 72194 or CT Pelvis with contrast CPT® 72193) to evaluate any urethral abnormalities
- MRI Pelvis without and with contrast (CPT® 72197) for surgical planning

Vaginal Masses (PV-13.3)

PV.UD.0013.3.A

v2.0.2024

- Initial evaluation includes Pelvic ultrasound (CPT® 76856 or CPT® 76857) and/or Transvaginal ultrasound (CPT® 76830) and/or Transperineal ultrasound (CPT® 76872)
- MRI Pelvis without and with contrast (CPT® 72197) for surgical planning

Background and Supporting Information

Symptomatic infection of congenital periurethral glands can result in urethral diverticula. Symptoms include pain, urinary urgency, frequency of urination, recurrent urinary tract infection, dribbling after urination, or incontinence.

Congenital (Mullerian) Uterine and Vaginal Anomalies (PV-14)

Guideline

Uterine Anomalies (PV-14.1)

Vaginal Anomalies (PV-14.2)

References (PV-14)

Uterine Anomalies (PV-14.1)

PV.UA.0014.1.A

v2.0.2024

- Pelvic ultrasound (CPT® 76856 or CPT® 76857) and/or TV ultrasound (CPT® 76830) indicated for initial evaluation. 3-D Rendering (CPT® 76377 or CPT® 76376) may be an add-on if uterine anomaly is suspected on ultrasound.
- If ultrasound is indeterminate:
 - Sonohysterosalpingography (CPT® 76831)
- Retroperitoneal ultrasound (CPT® 76770 or CPT® 76775) is indicated to evaluate for possible coexisting renal anomalies.
 - MRI Abdomen without contrast or without and with contrast (CPT® 74181 or CPT® 74183) or CT urography (CT Abdomen and Pelvis without and with contrast CPT® 74178) for indeterminate renal anomaly⁸ on ultrasound.
- An arcuate uterus is considered a normal variant. Therefore, advanced imaging of a known arcuate uterus is not supported.
- MRI Pelvis without and with contrast (CPT® 72197):
 - Ultrasound is indeterminate for a complex uterine anomaly, or
 - Requested for surgical planning of previously diagnosed uterine anomaly

Vaginal Anomalies (PV-14.2)

PV.UA.0014.2.A

v2.0.2024

- Pelvic ultrasound (CPT® 76856 or CPT® 76857) and/or TV ultrasound (CPT® 76830) and/or Transperineal ultrasound (CPT® 76872) and/or Translabial ultrasound (CPT® 76857) are indicated for initial evaluation. 3-D Rendering (CPT® 76377 or CPT® 76376) may be an add-on if vaginal anomaly is suspected on ultrasound.
- MRI Pelvis without and with contrast (CPT® 72197):
 - Ultrasound is indeterminate for a complex vaginal anomaly, or
 - Requested for surgical planning of previously diagnosed vaginal anomaly

Background and Supporting Information

- Mullerian anomalies are complex structural anomalies deriving from errors in the embryonic development of the mullerian duct. These may include uterine remnant or agenesis, cervical agenesis, unicornate uterus, bicornuate uterus, uterine didelphys, septate uterus, vaginal septum and/or other complex anomalies.

Fetal MRI and Other Pregnancy Imaging (PV-15)

Guideline

Fetal MRI (PV-15.1)

Placenta Accreta/Placenta Accreta Spectrum/Placenta Percreta (PV-15.2)

C-section or Cornual (interstitial) Ectopic Pregnancy (PV-15.3)

Pelvimetry (PV-15.4)

References (PV-15)

Fetal MRI (PV-15.1)

PV.MR.0015.1.A

v2.0.2024

CPT® Code Guidance

- Fetal MRI (CPT® 74712) [plus CPT® 74713 for each additional fetus]
- Do not report CPT® 74712 and CPT® 74713 in conjunction with CPT® 72195, CPT® 72196, CPT® 72197
- If only placenta or maternal pelvis is imaged without fetal imaging, use MRI Pelvis (CPT® 72195)

Indications for Fetal MRI

- Fetal MRI (CPT® 74712) [plus CPT® 74713 for each additional fetus] optimally performed after 18 to 22 weeks gestation, for assessment of known or suspected fetal abnormalities for counseling, surgical, or delivery planning.
 - There are cases when surgical planning may necessitate imaging earlier than 18 weeks. For those cases where surgery is to be performed prior to 18 weeks and they otherwise meet indications for imaging per this criteria, Fetal MRI may be approved.
- 3D-4D (CPT® 76376 or CPT® 76377) rendering can be added for surgical planning with diagnosis of complex CHD in the fetus or for surgical planning of other complex fetal malformations
- Repeat fetal MRI (CPT® 74712) [plus CPT® 74713 for each additional fetus] later in pregnancy for:
 - Delivery or perinatal surgical planning
- Fetal MRI indications include but may not be limited to the following:
 - Brain
 - Congenital anomalies
 - Ventriculomegaly
 - Agenesis of the corpus callosum
 - Abnormalities of the cavum septum pellucidum
 - Holoprosencephaly
 - Posterior fossa anomalies
 - Malformations of cerebral cortical development
 - Microcephaly
 - Solid or cystic masses
 - Cephalocele
 - Screening fetuses with a family risk for brain anomalies
 - Tuberous sclerosis

- Corpus callosal dysgenesis
 - Malformations of cerebral cortical development
- Vascular abnormalities
 - Vascular malformations
 - Hydranencephaly
 - Intra-uterine cerebrovascular accident (CVA)
- Spine
 - Congenital anomalies
 - Neural tube defects
 - Sacrococcygeal teratomas
 - Caudal regression/sacral agenesis
 - Syringomyelia
 - Vertebral anomalies
- Skull, face, and neck
 - Masses of the face and neck
 - Vascular or lymphatic malformations
 - Hemangiomas
 - Goiter
 - Teratomas
 - Facial clefts
 - Airway obstruction
 - Conditions that may impact parental counseling, prenatal management, delivery planning, and postnatal therapy
- Thorax
 - Masses
 - Congenital pulmonary airway malformations (congenital cystic adenomatoid malformation; sequestration, and congenital lobar emphysema);
 - Congenital diaphragmatic hernia
 - Effusion
 - Mediastinal masses
 - Assessment for esophageal atresia
 - Volumetric assessment of lung
 - Cases at risk for pulmonary hypoplasia secondary to oligohydramnios, chest mass, or skeletal dysplasias
- Abdomen, retroperitoneal and pelvis
 - Bowel anomalies such as anorectal malformations, or complex bowel obstructions such as with megacystis microcolon hypoperistalsis syndrome
 - Abdominal wall defect
 - Mass

- Abdominal–pelvic cyst
- Tumors (e.g. hemangiomas, neuroblastomas, sacrococcygeal teratomas, and suprarenal or renal masses)
 - Complex genitourinary anomalies (e.g. cloaca, prune belly syndrome)
- Congenital Heart Disease (CHD)
- Skeletal dysplasia
- Multiple malformations
- Complications of monochorionic twins/TTTS (e.g. Laser treatment of twins, demise of one twin, conjoined twins)
- Any suspected fetal anomaly associated with severe oligohydramnios or anhydramnios.

Placenta Accreta/Placenta Accreta Spectrum/Placenta Percreta (PV-15.2)

PV.MR.0015.2.A

v2.0.2024

- Obstetrical Ultrasound is the initial imaging modality, Color Doppler CPT® 93975 Duplex scan (complete) or CPT® 93976 Duplex scan (limited) may be added to evaluate vascularity for suspected or confirmed placenta accreta spectrum
- MRI Pelvis without contrast (CPT® 72195) if the ultrasound is indeterminate or advanced imaging is needed for surgical planning.
- MRI Pelvis without contrast (CPT® 72195) is the appropriate code if only placenta or maternal pelvis is imaged without fetal imaging
 - Abdominal imaging is not indicated to evaluate a pelvic organ such as uterus, tubes or ovaries.

C-section or Cornual (interstitial) Ectopic Pregnancy (PV-15.3)

PV.MR.0015.3.A

v2.0.2024

- If a cornual (interstitial) ectopic or C-section scar ectopic pregnancy is suspected on ultrasound:^{9,10}
 - 3D rendering (CPT® 76376 or CPT® 76377), and/or Color Doppler (CPT® 93976) can be performed with ultrasound
 - MRI Pelvis without contrast (CPT® 72195) if ultrasound is inconclusive.

Pelvimetry (PV-15.4)

PV.MR.0015.4.A

v2.0.2024

- Pelvimetry (CT or MRI Pelvimetry) lacks sufficient evidence to be clinically useful. Current recommendations are that further randomized control studies be performed before it is adapted into routine clinical practice.^{11,12}

Molar Pregnancy and Gestational Trophoblastic Neoplasia (GTN) (PV-16)

Guideline

Molar Pregnancy and GTN (PV-16.1)

References (PV-16)

Molar Pregnancy and GTN (PV-16.1)

PV.MP.0016.1.A
v2.0.2024

- Molar pregnancy – once diagnosed on an Obstetrical Ultrasound treatment is usually evacuation. Individuals should undergo chest x-ray pre- and post-evacuation.
 - If chest x-ray is positive for metastases, management as per GTN guidelines, see **Gestational Trophoblastic Neoplasia (GTN)/Choriocarcinoma (ONC-22.5)** in the Oncology Imaging Guidelines.
- Serum hCG levels are obtained every 1-2 weeks after treatment of molar pregnancy until they normalize
- Individuals with a molar pregnancy and rising or plateauing hCG levels post evacuation and/or Gestational trophoblastic neoplasia please see **Gestational Trophoblastic Neoplasia (GTN)/Choriocarcinoma (ONC-22.5)** in the Oncology Imaging Guidelines.

Impotence/Erectile Dysfunction (PV-17)

Guideline

Impotence/Erectile Dysfunction (PV-17.1)

References (PV-17)

Impotence/Erectile Dysfunction (PV-17.1)

PV.ED.0017.1.A

v2.0.2024

- Imaging depends on the suspected disease:
 - Penile Doppler ultrasound (CPT® 93980) if erectile dysfunction suspected²
 - CTA Pelvis with contrast (CPT® 72191) if large vessel vascular insufficiency is suspected following ultrasound.
 - Duplex ultrasound (CPT® 93980) to assess penile vasculature in Peyronie's disease¹
 - If male hypogonadism is suspected, See **Pituitary (HD-19)** in the Head Imaging Guidelines
- Functional MRI or PET studies are considered investigational for this indication.
- Priapism
 - Penile Doppler Ultrasound (CPT® 93980) if non-ischemic priapism is suspected
 - MRI likely does not have a role in the initial diagnosis of priapism given the time sensitive nature of diagnosis and management
 - In patients with persistent non-ischemic priapism where an embolization may be necessary CTA (CPT® 72191) or MRA pelvis (CPT® 72198) may be considered
 - Penial Doppler Ultrasound (CPT® 93980) may be considered post procedure for ischemic priapism

Penis–Soft Tissue Mass (PV-18)

Guideline

Penis-Soft Tissue Mass (PV-18.1)

References (PV-18)

Penis-Soft Tissue Mass (PV-18.1)

PV.PM.0018.1.A

v2.0.2024

- Penile ultrasound (CPT® 76857) for initial evaluation soft-tissue lesions of the penis, Duplex (Doppler) scan CPT® 93975 complete; CPT® 93976 limited) may be approved as an add-on.
- If primary penile cancer is suspected, biopsy is indicated
 - For further workup of biopsy confirmed penile cancer see **Cancers of External Genitalia – Initial Work-up/Staging (ONC-24.6)** in the Oncology Imaging Guidelines.
- Peyronie's Disease
 - Ultrasound (CPT® 76857) recommended
 - MRI Pelvis without and with contrast (CPT® 72197) if ultrasound is equivocal and surgery or injection therapy is being contemplated

Male Pelvic Disorders (PV-19)

Guideline

Male Pelvic Disorders (PV-19.1)

References (PV-19)

Male Pelvic Disorders (PV-19.1)

PV.PE.0019.1.U

v2.0.2024

- Prostate
 - Prostate Disorders
 - Suspected Benign Prostatic Hypertrophy with obstructive voiding symptoms can undergo:
 - Transrectal ultrasound (CPT® 76872) or Pelvis transabdominal ultrasound (bladder and prostate [CPT® 76856 or CPT® 76857]).
 - Prostatitis with urinary retention or suspected abscess can undergo any of the following imaging studies:
 - Transrectal ultrasound (CPT® 76872) or Pelvis transabdominal ultrasound (bladder and prostate [CPT® 76856 or CPT® 76857])
 - CT Pelvis with contrast (CPT® 72193) or MRI Pelvis without contrast (CPT® 72195) or with and without contrast (CPT® 72197) if ultrasound is equivocal for abscess or mass
 - Prostate Artery Embolization (PAE)
 - MRA Pelvis (CPT® 72198) or CTA Pelvis (CPT® 72191) is indicated for evaluation of the pelvic vasculature if:
 - Prostate artery embolization is planned
- Testicular
 - Hematospermia, transrectal ultrasound (TRUS) (CPT® 76872) can be the initial imaging study in all cases.
 - MRI Pelvis without contrast (CPT® 72195) to evaluate:
 - Suspected hemorrhage within the seminal vesicles
 - Radiation injury, neoplasia
 - Failure of conservative treatment for 2 weeks
 - Abnormal findings on Transrectal ultrasound
- Rectal
 - Proctalgia Syndromes
 - Prior to advanced imaging, the evaluation of rectal/perineal pain should include:
 - Digital rectal examination (assess for mass, prostate, fissures, hemorrhoids, etc.)
 - Recent flexible sigmoidoscopy or colonoscopy subsequent to the start of reported symptoms to exclude inflammatory conditions or malignancy
 - Endoanal ultrasound (CPT® 76872), MRI Pelvis without and with contrast (CPT® 72197), or CT Pelvis with contrast (CPT® 72193) are appropriate after the above studies have been performed or if laboratory or clinical information suggest infection, abscess, or inflammation

- MRI (MRI Pelvis without contrast CPT® 72195) for Defecography is considered investigational/experimental by UHC
- Bladder
 - Work-up of interstitial cystitis/bladder pain syndrome (IC/BPS) may include history, physical exam, laboratory exam (urinalysis and urine culture), cystoscopy, and measurement of post void residual urine by bladder catheterization
 - Pelvic ultrasound (CPT® 76856 or CPT® 76857)
 - CT Pelvis with contrast (CPT® 72193) if ultrasound is equivocal for complicated interstitial cystitis/bladder pain syndrome (when ordered by specialist or any provider in consultation with the specialist)

Background and Supporting Information

- The proctalgia syndromes are characterized by recurrent episodes of rectal/perineal pain, and may be due to sustained contractions of the pelvic floor musculature.

Scrotal Pathology (PV-20)

Guideline

Scrotal Pathology (PV-20.1)

Paratesticular and spermatic cord masses (PV-20.2)

Testicular Microlithiasis (PV-20.3)

References (PV-20)

Scrotal Pathology (PV-20.1)

PV.SP.0020.1.A

v2.0.2024

- Scrotal ultrasound (CPT® 76870) and/or Duplex (Doppler) ultrasound (CPT® 93975 or CPT® 93976) of the scrotum for initial evaluation of scrotal pain or mass
 - MRI Pelvis without and with contrast (CPT® 72197) or Tc-99m scrotal scintigraphy (CPT® 78761) if ultrasound is inconclusive.^{1,2}
- Scrotal ultrasound (CPT® 76870), MRI Pelvis without and with contrast (CPT® 72197), or CT Pelvis with contrast (CPT® 72193) for cryptorchidism/undescended testis in the adult.
- Scrotal ultrasound and/or Duplex (Doppler) ultrasound (CPT® 76870 and/or CPT® 93975 or CPT® 93976) of the scrotum with color flow mapping in supine and upright positions to assess venous reflux into plexus pampiniformis if varicocele suspected (for example, in inguinal hernia evaluation)
 - CT Abdomen and Pelvis with contrast (CPT® 74177) for right-sided varicocele, when there is suspicion for intra-abdominal pathology

Background and Supporting Information

- The causes of scrotal pain may include torsion, epididymitis, strangulated hernia, segmental testicular infarction, trauma, testicular tumor, and idiopathic scrotal edema.¹

Paratesticular and spermatic cord masses (PV-20.2)

PV.SP.0020.2.A

v2.0.2024

- Scrotal ultrasound (CPT® 76870) is the appropriate initial imaging procedure.
 - MRI Pelvis without and with contrast (CPT® 72197), exploration and biopsy are additional considerations if ultrasound is inconclusive.

Testicular Microlithiasis (PV-20.3)

PV.SP.0020.3.A

v2.0.2024

- Scrotal ultrasound (CPT® 76870) for initial evaluation
- Annual Scrotal ultrasound (CPT® 76870) follow-up, only if a risk factor is present which include:
 - Family history of germ cell tumor
 - Malescent
 - Orchidopexy
 - Testicular atrophy
- For Personal history of germ cell tumor See **Testicular, Ovarian and Extragonadal Germ Cell Tumors (ONC-20)** in the Oncology Imaging Guidelines

Fistulae, Abscess, and Pilonidal Cyst (PV-21)

Guideline

Fistula in Ano (PV-21.1)

Abscess (PV-21.2)

Pelvic Fistula (PV-21.3)

Pilonidal Cyst (PV-21.4)

References (PV-21)

Fistula in Ano (PV-21.1)

PV.PA.0021.1.A

v2.0.2024

- MRI Pelvis without and with contrast (CPT® 72197) is the preferred study.
 - If MRI cannot be performed, endoscopic ultrasound is superior, and thus preferential, to CT imaging.
 - CT Pelvis with contrast (CPT® 72193) is an inferior study to either of the above (accuracy of endoscopic ultrasound vs. CT for perianal fistula is 82% vs. 24%) and its use should be limited only to those circumstances in which MRI and endoscopic ultrasound cannot be performed.

Abscess (PV-21.2)

PV.PA.0021.2.A

v2.0.2024

- MRI Pelvis without and with contrast (CPT® 72197) is the preferred study
 - CT Pelvis with contrast (CPT® 72193) is supported as an alternative study if desired.
- For the evaluation of Perianal and Perirectal Disease related to Crohn's Disease, See **Perirectal/Perianal Disease (AB-23.3)** in the Abdomen Imaging Guidelines.

Pelvic Fistula (PV-21.3)

PV.PA.0021.3.A

v2.0.2024

- History and physical exam (to include pelvic and/or anorectal examination):
 - Rectovesicular Fistula:
 - MRI Pelvis with and without contrast (CPT® 72197) OR
 - CT Pelvis with contrast (CPT® 72193)
 - Vaginal Fistula:
 - Enterovaginal, Colovaginal, Rectovaginal or Anovaginal:
 - Anoscopy and/or proctoscopy
 - Endoanal ultrasound (rarely used)
 - MRI Pelvis with and without contrast (CPT® 72197) is the preferred initial modality for suspected enterovaginal fistula
 - CT Pelvis with contrast (CPT® 72193) can be considered if:
 - MRI contraindicated OR urgent evaluation of acute diverticulitis OR early postoperative period
 - Urinary Vaginal Fistula (Ureterovaginal, Vesicovaginal, or Urethrovaginal):
 - Cystoscopy
 - CT urography (CT Abdomen and Pelvis without and with contrast CPT® 74178) and/or CT cystography (CT Pelvis without contrast CPT® 72192) or
 - MRI Pelvis with and without contrast (CPT® 72197)

Background and Supporting Information

- A vaginal fistula is an abnormal communication between the vagina and either a portion of the digestive system or the urinary tract
 - Causes of vaginal fistula may include IBD, endometriosis, infection, tumor, radiation, obstetrical trauma and surgical injuries.
 - Symptoms of vaginal fistula-Persistent vaginitis, dyspareunia, perineal dermatitis, foul-smelling vaginal discharge, and/or urinary or fecal incontinence.
- A rectovesicular fistula is an abnormal communication between the rectum and the bladder.
 - Causes of rectovesicular fistula may include chronic infection, cancer, diverticulitis, IBD, radiation and surgical injuries.
 - Symptoms of rectovesicular fistula-Bubbles in the urine, brown or cloudy urine, blood in the urine, painful urination, recurrent urinary tract infection, and/or abdominal pain

Pilonidal Cyst (PV-21.4)

PV.PA.0021.4.A

v2.0.2024

- Advanced imaging is not indicated for pilonidal cyst disease⁹.
- For suspected osteomyelitis, see: **Infection/Osteomyelitis (MS-9)** in the Musculoskeletal Imaging Guidelines
- For abdominal fistulae, see: **Fistulae (AB-48)** in the Abdomen Imaging Guidelines
- For suspected spinal dysraphism, see: **Cutaneous Indications to Suspect Occult Spinal Dysraphism (PEDSP-4.2)** in the Pediatric Spine Imaging Guidelines

Urinary Incontinence/Pelvic Prolapse/Fecal Incontinence (PV-22)

Guideline

Urinary Incontinence – Initial Imaging (PV-22.1)
Urinary Incontinence – Further Imaging (PV-22.2)
Pelvic Prolapse (PV-22.3)
Fecal Incontinence (PV-22.4)
References (PV-22)

Urinary Incontinence – Initial Imaging (PV-22.1)

PV.IN.0022.1.A

v2.0.2024

- Initial Imaging, associated with other evaluations, are:
 - Non-Neurogenic Incontinence
 - Measurements of post void residual urine by Bladder ultrasound (CPT® 51798) OR Bladder catheterization
 - In addition to post void residual volume determination, screening for UTI should be considered
 - Neurogenic Incontinence
 - Ultrasound urinary tract (CPT® 76770 or CPT® 76775)

Background and Supporting Information

Urinary incontinence can be “stress,” “urgency,” or mixed; neurogenic or non-neurogenic; and complicated or uncomplicated. Neurogenic incontinence can occur from cerebral, spinal or peripheral neurological diseases.

Urinary Incontinence – Further Imaging (PV-22.2)

PV.IN.0022.2.A

v2.0.2024

- CT Abdomen and Pelvis, contrast as requested, or CT Pelvis, contrast as requested, for any of the following:
 - Abnormality on ultrasound that requires further evaluation
 - Complicated incontinence
 - Failed conservative treatment
 - Pain or dysuria
 - Hematuria
 - Recurrent infection
 - Previous radical pelvic surgery
 - Suspected fistula
 - Suspected mass
 - Previous pelvic or prostate irradiation
 - Suspected fistulae
 - Detecting ectopic ureters if ultrasound is non-diagnostic
 - Pre-operative planning for complicated incontinence when ordered by or in consultation with the operating physician

Background and Supporting Information

- For neurogenic urinary incontinence See **Red Flag Indications (SP-1.2)** and **Myelopathy (SP-7.1)** in the Spine Imaging Guidelines and **Dementia (HD-8.1)** and **Normal Pressure Hydrocephalus (NPH) (HD-8.4)** in the Head Imaging Guidelines

Pelvic Prolapse (PV-22.3)

PV.IN.0022.3.U

v2.0.2024

- Transvaginal (TV) ultrasound (CPT® 76830) and/or Transperineal ultrasound (CPT® 76872) is the initial study of choice
 - Pelvic ultrasound (CPT® 76856 or CPT® 76857) can be performed if requested as a complimentary study.
- Urodynamic testing may be helpful if there is incontinence with a stage II or greater prolapse or voiding dysfunction
- MRI Pelvis (CPT® 72195 or CPT® 72197) for the following:
 - Pelvic floor anatomy and pelvic organ prolapse evaluations if exam and TV ultrasound (CPT® 76830) and/or Pelvic ultrasound (CPT® 76856 or CPT® 76857) are equivocal; or
 - Pre-operative planning for complex organ prolapse when ordered by or in consultation with the operating physician; or
 - Persistent incontinence following surgery
- Mesh and Graft complications
 - Diagnostic evaluation for mesh and graft complications may include colonoscopy, cystoscopy, and/or urodynamics
 - Transvaginal (TV) ultrasound (CPT® 76830) and/or Pelvic ultrasound (CPT® 76856 or CPT® 76857), CT Abdomen and/or Pelvis, contrast as requested, MRI Pelvis without contrast or without and with contrast (CPT® 72195 or CPT® 72197) depending on the mesh and graft complication
- Sacral osteomyelitis may be a complication of sacrocolpopexy. MRI Pelvis with and without contrast (CPT® 72197) is indicated for lower back pain and/or suspected sacral osteomyelitis after this procedure.
- MRI (MRI Pelvis without contrast CPT® 72195) for Defecography is considered investigational/experimental by UHC.

Fecal Incontinence (PV-22.4)

PV.IN.0022.4.U

v2.0.2024

The evaluation of fecal incontinence generally proceeds as follows:

- Determine the severity of the incontinence (Bristol Stool Scale, Fecal Incontinence Severity Index, etc.)
- History and Physical to include digital rectal examination and perianal pinprick (to assess for neurogenic causes)
- Trial of conservative management
- Diagnostic Testing if symptoms persist to include:
 - Ano-rectal Manometry
 - Balloon Expulsion Test
 - Endoanal ultrasound (CPT® 76872) to confirm sphincter defects in individuals with suspected sphincter injury (e.g. history of vaginal delivery or anorectal surgery)
 - MRI Pelvis (CPT® 72197) can be considered if:
 - Ano-rectal manometry suggests weak sphincter pressures AND/OR there is an abnormal balloon expulsion test
- **AND**
 - There has been a failure of a recent trial of conservative management
- **AND**
 - Surgery is being considered
- MRI (MRI Pelvis without contrast (CPT® 72195) for Defecography is considered investigational/experimental by UHC.

Background and Supporting Information

With regards to fecal incontinence ACG Guidelines note that “the internal sphincter is visualized more clearly by endoanal ultrasound, whereas MRI is superior for discriminating between an external anal sphincter tear and a scar and for identifying external sphincter atrophy.

However, guidelines adopted by the American Society of Colon and Rectal Surgeons note that “Endoanal ultrasound is a useful and sensitive tool in the evaluation of patients with FI (fecal incontinence), especially when there is a history of vaginal delivery or anorectal surgery. Ultrasound can reliably identify internal and external sphincter defects that may be associated with sphincter dysfunction.” In addition, the guidelines note “Other modalities (eg, MRI) have shown substantial interobserver variability and, at this point, are likely inferior to ultrasound imaging, but they may provide additional information where endoanal ultrasound is unavailable.”

Bladder Mass (PV-24)

Guideline

Bladder Mass (PV-24.1)

References (PV-24)

Bladder Mass (PV-24.1)

PV.BL.0024.1.A

v2.0.2024

- Bladder masses incidentally found on other imaging (ultrasound, cystoscopy or KUB):
 - CT Pelvis without contrast (CPT® 72192) for suspected bladder stone if initial imaging is equivocal or if surgery is planned
 - CT Pelvis with and without contrast (CPT® 72194) for suspected bladder diverticuli
- See **Oncology Imaging Guidelines** for biopsy confirmed or suspected malignancy

Background and Supporting Information

Symptoms of bladder mass may include hematuria, urgency, frequency, chronic urinary infection, obstruction or urinary retention.

References (PV-24)

Ureteral and/or Bladder Trauma or Injury (PV-25)

Guideline

Ureteral and/or Bladder Trauma or Injury (PV-25.1)

References (PV-25)

Ureteral and/or Bladder Trauma or Injury (PV-25.1)

PV.BT.0025.1.A

v2.0.2024

- Abdominal and/or Pelvic ultrasound (CPT® 76700 and/or CPT® 76856) is supported if requested
- CT cystography (CT Pelvis without contrast CPT® 72192) is supported for suspected bladder injury
- CT Abdomen and Pelvis with OR with and without contrast (CPT® 74177 or CPT® 74178) if:
 - Suspected iatrogenic/operative injury OR
 - Blunt trauma and suspected bladder or ureteral injury with one or more of the following (See **Blunt Abdominal Trauma (AB-10.1)** in the Abdomen Imaging Guidelines):
 - Abdominal pain or tenderness
 - Pelvic or femur fracture
 - Hematocrit <30%
 - Hematuria
 - Non-examinable individual (intoxicated, less than fully conscious, Glasgow Coma Scale Score >13, etc.)
 - Evidence of abdominal wall trauma or seat-belt sign
 - Rapid deceleration injury

Background and Supporting Information

Bladder trauma: CT cystography- CT Pelvis without contrast allowing the radiologist or Urologist to instill contrast to r/o bladder injury and/or perforation.

Ureteral injury: *“Iatrogenic ureteral injuries can occur during gynecologic, obstetric, urologic, colorectal, general, or vascular surgery; gynecologic surgery accounts for more than half of all iatrogenic injuries.”*²

Gender Affirmation Surgery; Pelvic (PV-26)

Guideline

Gender Affirmation Surgery; Pelvic (PV-26.1)
References (PV-26)

Gender Affirmation Surgery; Pelvic (PV-26.1)

PV.GA.0026.1A

v2.0.2024

- Preoperative imaging is supported as outlined below if the individual has a health plan benefit covering pelvic gender affirmation surgery. Preoperative imaging is not supported if pelvic gender affirmation surgery is not a health plan covered benefit.
- Preoperative imaging:
 - Metoidioplasty
 - Preoperative imaging is not supported
 - Phalloplasty
 - Muscular flaps used for neophallus creation are generally obtained from anterior lateral thigh (pedicled flap) or forearm (radial free flap)
 - For planned radial free flap, upper extremity CT angiography (CPT® 73206) of anticipated donor site (unilateral) for evaluation of perforator anatomy.
 - For planned anterior lateral thigh flap, bilateral lower extremity CT angiogram (CPT® 73706)
 - If iodinated contrast allergy, MRA (contrast as requested)
 - Vaginoplasty
 - Preoperative imaging is not supported
- Postoperative complications:
 - Doppler ultrasound (CPT)
 - Monitoring of flap perfusion after phalloplasty for suspected vascular insufficiency
 - CT Abdomen and Pelvis OR CT Pelvis (contrast as requested - CPT® 74176, CPT® 74177, CPT® 74178, CPT® 72192, CPT® 72193, or CPT® 72194) for suspected postoperative complications
 - Complications after surgery may include hematoma, seroma, abscesses, fistula, urinary tract injury, etc. (See **Ureteral and/or Bladder Trauma or Injury (PV-25.1)** for ureteral and/or bladder injury)
 - MRI Pelvis with and without contrast (CPT® 72197)
 - Suspected fistula
 - Non diagnostic CT scan AND further imaging is needed for treatment planning

Background and Supporting Information

- Metoidioplasty-Metoidioplasty is a procedure using clitoral hypertrophy and clitoral release to form masculine-appearing external genitalia

- Phalloplasty-Phalloplasty includes the creation of a neophallus using muscular flaps
- Vaginoplasty-Vaginoplasty refers to the surgical creation of a vulva and vaginal canal

TOS	Thoracic Outlet Syndrome

General Guidelines (PN-1.0)

PN.GG.0001.0.A

v1.0.2024

- A pertinent clinical evaluation is required before advanced imaging can be considered. The clinical evaluation should include a pertinent history and physical examination, including a neurological examination, (since the onset or change in symptoms), appropriate laboratory studies, non-advanced imaging modalities, and electromyography/nerve conduction (EMG/NCV) studies. Other meaningful technological contact (telehealth visit, telephone call or video call, electronic mail or messaging) since the onset or change in symptoms, by an established individual can serve as a pertinent clinical evaluation.
- Nerve conduction studies are often normal early in the disease course with changes occurring from one to four weeks after symptom onset in the majority of individuals. This will be taken into consideration on a case-by-case basis in regards to the EMG/NCV requirement in each section requirement of **Peripheral Nerve Disorders (PND) Imaging Guidelines**.
- During the current COVID-19 pandemic, with limited face-to-face visits, the electrodiagnostic (EMG/NCV) study requirements may be waived with necessity to be determined by the treating neurologist or team coordinating the individual's care.
- If imaging of peripheral nerves is indicated, ultrasound is the preferred modality for superficial peripheral nerves. MRI may be used for imaging deep nerves such as the lumbosacral plexus or nerves obscured by overlying bone such as the brachial plexus or for surgical planning. CT is limited to cases in which MRI is contraindicated.

Focal Neuropathy (PN-2)

Guideline

Focal Neuropathy (PN-2.1)

References (PN-2)

Focal Neuropathy (PN-2.1)

PN.FN.0002.1.A
v1.0.2024

Focal Disorder	EMG/NCV Initially?	Advanced Imaging
Carpal Tunnel Syndrome	YES	<ul style="list-style-type: none">When EMG/NCV and clinical findings are equivocal AND only when requested for pre-operative planning, MRI Wrist without contrast (CPT® 73221) is indicated.See Neck (Cervical Spine) Pain Without/With Neurological Features (Including Stenosis) and Trauma (SP-3) in the Spine Imaging Guidelines.
Ulnar Neuropathy	YES	<p>After EMG/NCV, only ONE of the following is indicated if requested for surgical consideration:</p> <ul style="list-style-type: none">MRI Upper Extremity Joint (Elbow or Wrist) without contrast (CPT® 73221), ORMRI Upper Extremity Non Joint (Forearm or Hand) without contrast (CPT® 73218)
Radial Neuropathy	YES	<ul style="list-style-type: none">MRI Upper Arm or Forearm without contrast (CPT® 73218) in severe cases when surgery is being considered.MRI Upper Arm or Forearm without and with contrast (CPT® 73220) if there is a suspicion of a nerve tumor such as a neuroma.
<p>Radial Neuropathy Notes: Leads to wrist drop with common sites of entrapment the inferior aspect of the humerus (Saturday night palsy) or the forearm (Posterior Interosseous Syndrome). Entrapment of the nerve at the wrist (Wartenberg syndrome or handcuff palsy) typically spares motor involvement and results only in sensory changes.</p> <p>Trauma or fractures of the humerus, radius, or ulna can damage the radial nerve.</p>		

Focal Disorder	EMG/NCV Initially?	Advanced Imaging
Pudendal Neuropathy ⁽⁷⁻¹²⁾	NO	<ul style="list-style-type: none"> • Documented concern specifically for pudendal neuropathy, pudendal neuralgia, or pudendal entrapment: MRI Pelvis without contrast (CPT® 72195) OR MRI Pelvis without and with contrast (CPT® 72197) • If there is a contraindication to MRI and the above documented concern is present, then ONE of the following is indicated: <ul style="list-style-type: none"> • CT Pelvis without contrast (CPT® 72192) • CT Pelvis with contrast (CPT® 72193) • CT Pelvis without and with contrast (CPT® 72194) • For all other pelvic concerns, see the following Pelvic Imaging Guidelines (as indicated): <ul style="list-style-type: none"> • <u>Pelvic Pain/Dyspareunia Female (PV-11.1)</u> • <u>Impotence/Erectile Dysfunction (PV-17.1)</u> • <u>Male Pelvic Disorders (PV-19.1)</u> • <u>Scrotal Pathology (PV-20.1)</u>
Pudendal Neuropathy Notes: Causes pain, sexual dysfunction, or sensory change in the genitals, perineum, and perianal region. May be caused from trauma, recurrent injury from exercise such as cycling, pelvic mass, or after viral infection (e.g., post-herpetic neuralgia).		
Sciatic Neuropathy	YES	<ul style="list-style-type: none"> • MRI Pelvis without contrast (CPT® 72195) • CT Pelvis without contrast (CPT® 72192) is NOT routinely indicated due to lack of soft tissue contrast. • It should only be performed in the rare circumstance of contrast allergy and/or contraindication to MRI such as pacemaking device.

Focal Disorder	EMG/NCV Initially?	Advanced Imaging
<p>Sciatic Neuropathy Notes: May be caused by trauma to the gluteal area with hematoma, injection palsy, hip or pelvic fractures, or hip replacement (arthroplasty).</p> <p>Piriformis Syndrome involves entrapment of the sciatic nerve at the sciatic notch in the pelvis by a tight piriformis muscle band.</p>		
Femoral Neuropathy	NO	<ul style="list-style-type: none"> MRI Pelvis without contrast (CPT® 72195)
<p>Femoral Neuropathy Notes: May occur as a complication of pelvic surgery in females or those on anticoagulants with retroperitoneal bleeding, or as a mononeuropathy in diabetics</p>		
Meralgia Paresthetica	NO	<ul style="list-style-type: none"> MRI Pelvis without contrast (CPT® 72195) is indicated for ANY of the following scenarios: <ul style="list-style-type: none"> Cases of diagnostic uncertainty Pre-operative CT Pelvis without contrast (CPT® 72192) is NOT routinely indicated due to lack of soft tissue contrast. It should only be performed in the rare circumstance of contrast allergy and/or contraindication to MRI such as pacemaking device.
<p>Meralgia Paresthetica Notes: Sensory loss in the lateral femoral cutaneous nerve as it exits the pelvis under the inguinal ligament (lateral thigh without extension into lower leg), and is usually easily diagnosed based on a careful history and physical exam. EMG/NCV testing is often technically difficult and not required.</p>		
Peroneal Neuropathy	YES	<ul style="list-style-type: none"> MRI Knee without contrast (CPT® 73721) OR MRI Lower Extremity other than joint without contrast (CPT® 73718) in severe cases when surgery is considered.
Tarsal Tunnel Syndrome	N/A	<ul style="list-style-type: none"> See Foot (Tarsal Tunnel Syndrome) (MS-27) in the Musculoskeletal Imaging Guidelines.

Polyneuropathy (PN-3.1)

PN.PN.0003.1.A
v1.0.2024

Poly-Disorder	EMG/NCV Initially?	Advanced Imaging	Comments
Polyneuropathies with Central Nervous System (CNS) Involvement	YES	<p>If clinical findings point to abnormalities in those areas, then ANY of the following are indicated:</p> <ul style="list-style-type: none">• MRI Brain without and with contrast (CPT® 70553), AND/OR• MRI Cervical Spine without and with contrast (CPT® 72156), AND/OR• MRI Thoracic Spine without and with contrast (CPT® 72157)	Examples: Guillain-Barré syndrome and Lyme disease

Poly-Disorder	EMG/NCV Initially?	Advanced Imaging	Comments
AIDS-Related Cytomegaloviral Neuropathy/Radiculopathy¹	YES	<ul style="list-style-type: none"> MRI Lumbar Spine without and with contrast (CPT® 72158) If concern for myelopathy, ANY of the following imaging are ALSO indicated: <ul style="list-style-type: none"> MRI Cervical Spine without and with contrast (CPT® 72156), AND/OR MRI Thoracic Spine without and with contrast (CPT® 72157) 	<ul style="list-style-type: none"> Urinary retention and a clinically confusing picture in the legs. For myelopathic signs and symptoms, see <u>Myelopathy (SP-7.1)</u>.
Chronic Inflammatory Demyelinating Polyneuropathy (CIDP)	YES	<p>MRI Lumbar Spine without and with contrast (CPT® 72158) if uncertain following EMG/NCV.</p> <ul style="list-style-type: none"> See <u>Brachial Plexus (PN-4.1)</u>, <u>Lumbar and Lumbosacral Plexus (PN-5.1)</u>, and <u>Muscle Diseases (PN-6.2)</u> 	

Poly-Disorder	EMG/NCV Initially?	Advanced Imaging	Comments
Multifocal Motor Neuropathy	YES	<p>If diagnosis is uncertain following EMG/NCV, MRI of the Brachial Plexus is supported with ONE of the following:</p> <ul style="list-style-type: none"> • MRI Upper Extremity other than joint without and with contrast (CPT® 73220) • MRI Chest without and with contrast (CPT® 71552) • MRI Neck without and with contrast (CPT® 70543) 	
POEMS (Polyneuropathy, Organomegaly, Endocrinopathy, M-protein, Skin changes)	YES	Advanced imaging is for the non-neurological etiologies of this rare osteosclerotic plasmacytoma syndrome.	See Multiple Myeloma and Plasmacytomas (ONC-25) in the Oncology Imaging Guidelines.
Subacute Sensory Neuronopathy & Other Paraneoplastic Demyelinating Neuropathies	YES	<ul style="list-style-type: none"> • Advanced imaging should be guided by specific clinical concern (see relevant guideline). • For evaluation of suspected paraneoplastic syndromes, see Paraneoplastic Syndromes (ONC-30.3) in the Oncology Imaging Guidelines. 	

Background and Supporting Information

- Central Nervous System (CNS) Imaging (Brain and Spine) is not required for Polyneuropathy without CNS signs/symptoms.⁶
- Distal symmetric polyneuropathy is the most common pattern of generalized peripheral neuropathy. It is typically sensory predominant and may demonstrate neurological abnormalities including reduced or absent deep tendon reflexes (DTRs), reduced sensation to multiple testing modalities (vibration, proprioception, etc). In more advanced staging, mild motor weakness may be present. It is most often associated with diabetes and metabolic abnormalities. In the absence of atypical findings (such as asymmetrical presentation, significant weakness, or upper motor neuron exam findings such as hyperreflexia or spasticity), distal symmetric polyneuropathy does not require central nervous system (CNS) imaging.⁶

Brachial Plexus (PN-4)

Guideline

Brachial Plexus (PN-4.1)

References (PN-4)

Brachial Plexus (PN-4.1)

PN.BP.0004.1.A

v1.0.2024

- EMG/NCV examination is required prior to advanced imaging except in cases of malignant infiltration or radiation plexitis as detailed below.⁸⁻¹²

Brachial Plexus Imaging		
Indication	Imaging	Notes
Malignant infiltration (EMG Not required)	Any ONE of the following: <ul style="list-style-type: none"> MRI Upper Extremity other than joint without contrast (CPT® 73218) MRI Upper Extremity other than joint without and with contrast (CPT® 73220) MRI Chest without contrast (CPT® 71550) MRI Chest without and with contrast (CPT® 71552) MRI Neck without contrast (CPT® 70540) MRI Neck without and with contrast (CPT® 70543) 	
Radiation plexitis to rule out malignant infiltration (EMG not required)		
Neurogenic Thoracic Outlet Syndrome (TOS)¹⁰		
Preoperative work up requiring evaluation of the brachial plexus		
Brachial plexitis (Parsonage-Turner Syndrome or painful brachial amyotrophy)	• Any ONE of the above <u>studies</u> AND • If concern for radiculopathy, MRI Cervical Spine without contrast (CPT® 72141)	• For concern for cervical radiculopathy, see <u>Neck (Cervical Spine) Pain Without/With Neurological Features (Including Stenosis) and Trauma (SP-3)</u> • For details of brachial plexitis (Parsonage-Turner Syndrome), see <u>Background and Supporting Information.</u>
Traumatic injury¹³		

MRI Chest and Neck are inherently bilateral, whereas MRI Upper Extremity is unilateral.

- If MRI is not available or is contraindicated, CT offers the next highest level of anatomic visualization and can characterize local osseous or vascular anatomy and injury. In this circumstance, when the above criteria are met, only **ONE** of the following studies is indicated:
 - CT Neck Soft Tissue:** CT Neck without contrast (CPT® 70490); **or**, CT Neck with contrast (CPT® 70491); **or**, CT Neck without and with contrast (CPT® 70492)

- **CT Upper Extremity:** CT Upper Extremity without contrast (CPT® 73200); **or**, CT Upper Extremity with contrast (CPT® 73201); **or**, CT Upper Extremity without and with contrast (CPT® 73202)
- **CT Chest:** CT Chest without contrast (CPT® 71250); **or**, CT Chest with contrast (CPT® 71260); **or**, CT Chest without and with contrast (CPT® 71270)
- MRI should be performed prior to consideration of PET imaging.
 - For PET imaging, see **PET Imaging in Oncology (ONC-1.4)** in the Oncology Imaging Guidelines.

Background and Supporting Information

- Brachial plexitis (Parsonage-Turner syndrome or painful brachial amyotrophy) is a self-limited syndrome characterized by initial shoulder region pain followed by weakness of specific muscles in a pattern which does not conform to involvement of a single root or distal peripheral nerve.

Lumbar and Lumbosacral Plexus (PN-5)

Guideline

Lumbar and Lumbosacral Plexus (PN-5.1)

References (PN-5)

Lumbar and Lumbosacral Plexus (PN-5.1)

PN.LP.0005.1.A

v1.0.2024

- EMG/NCV examination is required prior to advanced imaging.
 - EMG/NCV is **NOT** required if there is concern for malignant infiltration.
- For suspected lumbar and/or lumbosacral plexopathy, **ONE** of the following is indicated
 - MRI Pelvis without contrast (CPT® 72195) with fat suppression imaging, **OR**
 - MRI Pelvis without and with contrast (CPT® 72197) with fat suppression imaging, **OR**
 - MRI Abdomen without contrast (CPT® 74181) and MRI Pelvis without contrast (CPT® 72195) with fat suppression imaging, **OR**
 - MRI Abdomen without and with contrast (CPT® 74183) and MRI Pelvis without and with contrast (CPT® 72197) with fat suppression imaging
- If MRI is not available or is contraindicated, CT offers the next highest level of anatomic visualization and can characterize local osseous or vascular anatomy and injury. In this circumstance, when requested for suspected lumbar and/or lumbosacral plexopathy, **EITHER** of the following is indicated:
 - CT Pelvis with contrast (CPT® 72193), **OR**
 - CT Abdomen and Pelvis with contrast (CPT® 74177)
- If suspected lumbar and/or lumbosacral plexopathy is due to a traumatic injury, then MRI Lumbar Spine without contrast (CPT® 72148) is **ALSO** indicated.
 - See **Low Back (Lumbar Spine) Trauma (SP 6.2)**
- For PET imaging, see **PET Imaging in Oncology (ONC-1.4)** in the Oncology Imaging Guidelines.
 - However, EMG is not needed if concern for malignant infiltration
 - If MRI is contraindicated, CT offers the next highest level of anatomic visualization and can characterize local osseous or vascular anatomy and injury.

Background and Supporting Information

- Lumbar and lumbosacral plexopathy may be caused by any of the following:
 - Malignant infiltration
 - Radiation
 - Traumatic injury
 - Inflammation including sarcoidosis and infection
 - Toxic including iatrogenic during delivery (obstetric) or related to nerve blocks (ex. Botox®)
 - Metabolic including etiologies including diabetes

Muscle Disorders (PN-6)

Guideline

Neuromuscular Junction Disorders (PN-6.1)

Muscle Diseases (PN-6.2)

Gaucher Disease (Storage Disorders) (PN-6.3)

References (PN-6)

Neuromuscular Junction Disorders (PN-6.1)

PN.MD.0006.1.A

v1.0.2024

Myasthenia Gravis (MG)

Myasthenia Gravis (MG) is associated with thymic disease.

- After an established diagnosis of MG or when MG is suspected by a neurologist, rheumatologist, or ophthalmologist, ONE of the following is indicated^{1,4}:
 - CT Chest with contrast (CPT® 71260), **OR**
 - CT Chest without contrast (CPT® 71250), **OR**
 - MRI Chest without and with contrast (CPT® 71552), **OR**
 - MRI Chest without contrast (CPT® 71550)
- Repeat of **ANY ONE** of the above imaging studies is indicated if the initial imaging study was negative for **ANY** of the following scenarios:
 - Symptoms of chest mass
 - Rising anti-striated muscle antibody titers
 - Need for pre-operative evaluation (clinical presentation, electro-diagnostic studies, and antibody titers)

Lambert–Eaton Myasthenic Syndrome (LEMS)

Lambert–Eaton Myasthenic Syndrome (LEMS) is associated with malignancies, especially small cell lung cancer.

- For a suspected diagnosis, **ANY** of the following are indicated: CT Chest with contrast (CPT® 71260) **AND/OR** CT Abdomen and Pelvis with contrast (CPT® 74177)^{5,6}
 - See **Paraneoplastic Syndromes (ONC-30.3)**
- If initial CT was negative and there is persistent suspicion, **ANY** of the above imaging studies are indicated every 6 months for 2 years from date of initial negative imaging.²⁷

Stiff-Person Syndrome

Stiff-person syndrome is associated with cancers such as, but not limited to, small cell lung cancer, pancreatic neuroendocrine cancer, and breast cancer.^{7,8}

- If Stiff-person syndrome is suspected based on clinical findings, **ANY** of the following are indicated:
 - **Abdomen/Pelvis:** CT Abdomen and Pelvis with contrast (CPT® 74177) **or** CT Abdomen and Pelvis without and with contrast (CPT® 74178); **OR**, MRI Abdomen without and with contrast (CPT® 74183) **and** MRI Pelvis without and with contrast (CPT® 72197)
 - **Chest:** CT Chest with contrast (CPT® 71260) **or** CT Chest without contrast (CPT® 71250)
 - **Symptomatic Body Areas:** CT with contrast **or** MRI without and with contrast of any other symptomatic body areas

Background and Supporting Information

- Myasthenia gravis is an autoimmune disease of the neuromuscular junctions, manifested by fatigable weakness of the cranial nerves (examples - ocular: ptosis, diplopia; bulbar: dysphagia, dysarthria, dysphonia), as well as generalized limb weakness, depending on the severity of the disease. Associated antibodies: acetylcholine receptor (AChR), muscle specific kinase (MuSK).
- Lambert Eaton Myasthenic Syndrome (LEMS) is also an autoimmune disease affecting the neuromuscular junction presenting with ocular and bulbar symptoms and proximal limb weakness. Associated antibodies: P/Q voltage-gated calcium channel (VGCC).
- LEMS can occur as a paraneoplastic syndrome associated with malignancy (cancer-associated LEMS) or as an autoimmune phenomenon in the absence of malignancy (non-tumor LEMS). Between 50% and 60% of all LEMS cases are associated with malignancy, particularly small cell lung carcinoma (SCLC), although LEMS has been described in individuals with non-small cell and mixed-cell lung carcinomas, neuroendocrine tumors such as prostate cancer, thymoma, and lymphoproliferative disorders.⁵
- Stiff-person syndrome is an autoimmune disease associated with muscle spasm and muscle rigidity affecting the trunk and limb muscles. Associated antibodies: Glutamic acid decarboxylase (GAD).

Muscle Diseases (PN-6.2)

PN.MD.0006.2.A

v1.0.2024

- MRI may be helpful in demonstrating abnormalities in muscles that are difficult to examine or not clinically weak and can help distinguish between different types of muscle disease. MRI is also useful in determining sites for muscle biopsy.

Imaging for Muscle Disease		
Disease	Indication	Indication Imaging
Any Known or Suspected Muscle Disease	To plan muscle biopsy	Typically an affected muscle is imaged.
Myopathy or Myositis	Additional evaluation <u>after</u> clinical exam, EMG/NCV, OR labs	<ul style="list-style-type: none"> • Upper Extremity: MRI Upper Extremity other than joint without contrast (CPT® 73218); OR, MRI Upper Extremity other than joint without and with contrast (CPT® 73220)*
Inflammatory Muscle Diseases <ul style="list-style-type: none"> • Dermatomyositis • Polymyositis • Inclusion body myositis 	<ul style="list-style-type: none"> • Evaluation of differential diagnosis • Selection of biopsy site • Clinical concern for progression • Treatment monitoring • Detection of occult malignancy 	<p>AND/OR</p> <ul style="list-style-type: none"> • Lower Extremity: MRI Lower Extremity other than joint without contrast (CPT® 73718); OR, MRI Lower Extremity other than joint without and with contrast (CPT® 73720)* <p>* When indication column criteria are met, bilateral studies are supported if requested</p>

For interstitial lung disease associated with inflammatory myopathies, see

Interstitial Lung Disease (ILD)/Diffuse Lung Disease (DLD) (CH-11.1)

in the Chest Imaging Guidelines.

- For dermatomyositis and polymyositis with concern for occult neoplasm, see **Paraneoplastic Syndromes (ONC-30.3)** in the Oncology Imaging Guidelines.

Gaucher Disease (Storage Disorders) (PN-6.3)

PN.MD.0006.3.A

v1.0.2024

Imaging for Gaucher Disease

Initial Imaging

- MRI Lumbar Spine without contrast (CPT® 72148)
- Bilateral femurs with MRI Lower Extremity, other than joint, without contrast (CPT® 73718)
- MRI Abdomen without contrast (CPT® 74181)
- DXA scan
- CT Chest without contrast (CPT® 71250) for individuals with new or worsening pulmonary symptoms

Every 12 months

- To assess treatment response for individuals on enzyme replacement therapy or assess disease progression for individuals in surveillance
 - MRI Lumbar Spine without contrast (CPT® 72148)
 - Bilateral femurs with MRI Lower Extremity, other than joint, without contrast (CPT® 73718)
 - MRI Abdomen without contrast (CPT® 74181)
 - CT Chest without contrast (CPT® 71250) for individuals with documented pulmonary involvement

New or worsening pulmonary symptoms

- CT Chest without contrast (CPT® 71250)

DXA scans

- Every 12-24 months until it is normal
- Enzyme replacement therapy dose change
- Every 3 years

Acute bone pain

- X-ray
 - MRI of affected areas with and without contrast if x-ray is non-diagnostic or indicates the need for further imaging, such as equivocal for osteonecrosis, infection, or malignancy

- PET/CT imaging is considered **investigational** in the evaluation of Gaucher disease. ^{18}F -FDG does not reliably detect Gaucher disease in the marrow, and other isotopes are not yet FDA-approved for clinical use.

Background and Supporting Information

- Gaucher disease is group of autosomal recessive inborn errors of metabolism characterized by lack of the enzyme acid β -glucuronidase with destructive ceramide storage in various tissues. Gaucher disease is a treatable disorder (enzyme replacement) in which the liver, spleen, and bone marrow/bones are the most affected organs. Diagnosis is established by decreased enzyme activity or genetic testing.
- Three major types of Gaucher disease are recognized:
 - **Type I** (non-neuropathic form or adult form): progressive hepatomegaly, splenomegaly, anemia and thrombocytopenia, and marked skeletal involvement; lungs and kidneys may also be involved, but central nervous system is spared
 - **Type II** (acute neuropathic form or infantile form): severe progressive neurological involvement and death by 2 to 4 years of age; hepatomegaly, splenomegaly, is also present (usually evident by 6 months of age)
 - **Type III**: type I with neurological involvement and slowly progressive disease. Onset may be present before two years of age with survival to the third or fourth decade of life.
- Additionally, there is a perinatal-lethal and a cardiovascular form. The cardiovascular form involves the heart, spleen and eyes. Note that cardiopulmonary complications may be present, with varying frequency and severity, in all subtypes.
- Individuals with Gaucher disease are at risk for osteonecrosis, osteomyelitis, and bony tumors

Magnetic Resonance Neurography (MRN) (PN-7)

Guideline

Magnetic Resonance Neurography (MRN) (PN-7.1)

References (PN-7)

Magnetic Resonance Neurography (MRN) (PN-7.1)

PN.MR.0007.1.A

v1.0.2024

- MRN is supported when **ALL** of the following criteria are met:
 - The study is to evaluate a traumatic or compressive focal neuropathy **or** a brachial plexus injury.
 - The study is requested by a neurosurgeon, orthopedic surgeon, neurologist, or podiatrist after an in-person clinical evaluation **AND** when surgery is being considered.
 - EMG/NCV has been performed and results provided.
 - The diagnosis remains unclear following prior imaging of the region with x-ray, ultrasound, or conventional imaging (CT or MRI).
 - For conventional imaging criteria, see **Focal Neuropathy (PN-2.1)** and **Brachial Plexus (PN-4.1)**.
- MRN is reported as **ONE** of the following:
 - Unlisted MRI procedure code (CPT® 76498), **OR**
 - MRI extremity with **ONE** of the following codes:
 - MRI Upper Extremity, other than joint, without contrast (CPT® 73218)
 - MRI Upper Extremity, other than joint, without and with contrast (CPT® 73220)
 - MRI Lower Extremity, other than joint, without contrast (CPT® 73718)
 - MRI Lower Extremity, other than joint, without and with contrast (CPT® 73720)
- MRN for **ANY** other indication is considered **NOT medically necessary** at this time, including for assessment of lumbosacral plexopathy, neuromuscular disease, and polyneuropathy.

Background and Supporting Information

Magnetic resonance neurography utilizes standard MRI equipment with sequences and technology that allow for optimized viewing of the peripheral nerve. MRN creates greater contrast between the nerve and other surrounding soft tissue to allow a detailed view of the nerve tissue and layers. This allows for more accurate diagnosis of the location and degree of nerve injury.

Neuromuscular Disorders (PN-8)

Guideline

Motor Neuron Disease/Amyotrophic Lateral Sclerosis (ALS) (PN-8.1)

Spinal Muscular Atrophy (PN-8.2)

Fasciculations (PN-8.3)

References (PN-8)

Motor Neuron Disease/Amyotrophic Lateral Sclerosis (ALS) (PN-8.1)

PN.ND.0008.1.A

v1.0.2024

- A neurological examination is **NOT** required for an individual with established diagnosis of motor neuron disease/ALS **or** when diagnosis is suspected by a neurologist, geneticist, or a physical medicine and rehabilitation (PM&R) specialist.
- For initial evaluation of suspected motor neuron disease/ALS, **ANY** of the following are indicated
 - **Brain:** MRI Brain without contrast (CPT® 70551) **or** MRI Brain without and with contrast (CPT® 70553), **AND/OR**
 - **Cervical Spine:** MRI Cervical Spine without contrast (CPT® 72141) **or** MRI Cervical Spine without and with contrast (CPT® 72156), **AND/OR**
 - **Thoracic Spine:** MRI Thoracic Spine without contrast (CPT® 72146) **or** MRI Thoracic Spine without and with contrast (CPT® 72157), **AND/OR**
 - **Lumbar Spine:** MRI Lumbar Spine without contrast (CPT® 72148) **or** MRI Lumbar Spine without and with contrast (CPT® 72158)
- Repeat imaging can be evaluated based on the appropriate **Spine Imaging Guidelines**.

Background and Supporting Information

- Evidence of lower motor neuron dysfunction in a muscle may include clinical examination of muscle weakness/wasting or EMG abnormalities to meet the criteria for the diagnosis of ALS.
- Motor Neuron Diseases (also known as Anterior Horn Cell Diseases) are heterogeneous and encompass either upper motor neurons, or lower motor neurons, or both. Upper motor neurons begin in the cerebral cortex and descend into the brainstem (corticobulbar), or spinal cord, where there is a connection to the lower motor neuron that exits the central nervous system and reaches out to the muscle.
 - The various types can be divided into the areas so affected:
 - Amyotrophic Lateral Sclerosis (Lou Gehrig's disease) – both Upper and Lower Motor Neurons
 - Primary Lateral Sclerosis – Upper Motor Neurons
 - Progressive Muscular Atrophy – Lower Motor Neurons
 - Progressive Bulbar Palsy – Rare and limited to bulbar muscles (muscles innervated by the Cranial Nerves – dysarthria and dysphagia)
 - Other rare conditions:
 - Monomelic Amyotrophy (Hirayama disease)
 - Spinal Bulbar Muscular Atrophy (Kennedy Disease)

- Signs of lower motor neuron pathology include weakness, fasciculations, atrophy, decreased muscle tone, decreased reflexes, and a plantar extensor response (Babinski sign).
- Signs of upper motor neuron pathology include weakness, increased muscle tone, increased reflexes, and a plantar flexor response.¹¹

Spinal Muscular Atrophy (PN-8.2)

PN.ND.0008.2.A

v1.0.2024

- Molecular genetic testing is the standard tool for diagnosis for the early consideration in any infant with weakness or hypotonia.
 - MRI is **NOT** supported for diagnosis in children, unless other diseases are being considered. See **Spinal Muscular Atrophy (PEDPN-5.1)**.
- In individuals with adult-onset disease, the differential includes later-onset motor neuron disorders, such as ALS
 - For these conditions, advanced imaging is indicated when upper and lower motor neuron findings are present. For imaging, see **Motor Neuron Disease/Amyotrophic Lateral Sclerosis (ALS) (PN-8.1)**.

Fasciculations (PN-8.3)

PN.ND.0008.3.A

v1.0.2024

Fasciculations are spontaneous, erratic movements of muscle that may be secondary to benign and non-benign etiologies.

- **ALL** of the following evaluations are required prior to advanced imaging:
 - **Clinical history** should include the time course of symptoms, any associated weakness, areas of involvement, as well as the presence or absence of pain, sensory loss, or sphincter dysfunction.
 - **EMG/NCV evaluation**
 - In the setting of clinical concern for radiculopathy, neuromuscular disorders, or muscle disorders, see the following imaging guidelines:
 - **Neuromuscular Junction Disorders (PN-6.1)**
 - **Muscle Diseases (PN-6.2)**
 - **Neck (Cervical Spine) Pain without and with Neurological Features (Including Stenosis) (SP-3.1)**
 - **Lower Extremity Pain with Neurological Features (Radiculopathy, Radiculitis, or Plexopathy and Neuropathy) with or without Low Back (Lumbar Spine) Pain (SP-6.1)**
 - **Laboratory evaluation** (e.g., complete blood count; comprehensive metabolic panel; serum calcium; thyroid function testing; vitamin B12 level; sed rate; ANA; rheumatoid factor; serum protein electrophoresis with immunofixation; Lyme testing; HIV testing; testing for heavy metals; etc.)
- For the presence of upper motor neuron signs (e.g. increased tone; hyperreflexia; presence of Babinski or Hoffman signs) to exclude mimics of non-benign etiologies of muscle fasciculations (i.e. motor neuron disease), **ANY** of the following CNS studies are indicated:
 - **Brain:** MRI Brain without contrast (CPT® 70551) **or** MRI Brain without and with contrast (CPT® 70553), **AND/OR**
 - **Cervical Spine:** MRI Cervical Spine without contrast (CPT® 72141) **or** MRI Cervical Spine without and with contrast (CPT® 72156), **AND/OR**
 - **Thoracic Spine:** MRI Thoracic Spine without contrast (CPT® 72146) **or** MRI Thoracic Spine without and with contrast (CPT® 72157)
- **Lumbar Spine:** Typically, lumbar spine imaging is **NOT** indicated unless there is sphincter involvement or there is a need to rule out lower motor etiologies in the lower extremities (e.g., lumbar radiculopathy). See the following Spine Imaging Guidelines:
 - **Red Flag Indications (SP-1.2)**
 - **Lower Extremity Pain with Neurological Features (Radiculopathy, Radiculitis, or Plexopathy and Neuropathy) with or without Low Back (Lumbar Spine) Pain (SP-6.1)**

Peripheral Nerve Sheath Tumors (PNST) (PN-9)

Guideline

Peripheral Nerve Sheath Tumors (PNST) (PN-9.1)

References (PN-9)

Peripheral Nerve Sheath Tumors (PNST) (PN-9.1)

PN.NS.0009.1.A

v1.0.2024

PNST such as (Schwannomas or Neurofibromas) arise from Schwann cells or other connective tissue of the nerve. They can be located anywhere in the body.

- When PNST is suspected, the following advanced imaging is indicated:
 - Vestibular Schwannoma: MRI Brain without and with contrast (CPT® 70553)
 - See **Acoustic Neuroma and Other Cerebellopontine Angle Tumors (HD-33.1)** in the Head Imaging Guidelines.
 - Suspected Paraspinal Neurofibroma: **ANY** of the following imaging:
 - MRI Cervical Spine without and with contrast (CPT® 72156), **AND/OR**
 - MRI Thoracic Spine without and with contrast (CPT® 72157), **AND/OR**
 - MRI Lumbar Spine without and with contrast (CPT® 72158)
- Routine follow-up imaging is **NOT** indicated except in the following scenarios:
 - New symptoms or neurological findings develop
 - Post-operatively for **ANY** of the following scenarios:
 - At the discretion of or in consultation with the surgeon;
 - If the tumor was not completely removed and the imaging is requested to re-establish baseline
 - Malignant transformation is known **or** suspected. **ANY** of the following imaging is indicated for metastatic work-up:
 - CT Chest with contrast (CPT® 71260), **AND/OR**
 - CT Abdomen with contrast (CPT® 74160)
- For guidelines related to known malignancies in individuals with NF1, see the appropriate imaging guideline for the specific cancer type.

Background and Supporting Information

- The role of PET imaging in Peripheral Nerve Sheath Tumors is not well established yet.⁸
- Malignant transformation may be present in approximately 5% of Peripheral Nerve Sheath Tumors.

v1.0.2024

(See also: [Cardiac Imaging Guidelines Glossary](#))

Abbreviation	Definition
AAA	Abdominal aortic aneurysm
ABI	Ankle brachial index: a noninvasive, non-imaging test for arterial insufficiency – (see toe-brachial index below). This testing can also be done after exercise if resting results are normal.
Claudication	or Intermittent claudication : usually a painful cramping sensation of the legs with walking or severe leg fatigue
CLI	Critical Limb Ischemia
CTA	Computed tomography angiography
CTV	Computed tomography venography
DLCO	Diffusion capacity: defined as the volume of carbon monoxide transferred into the blood per minute per mmHg of carbon monoxide partial pressure
DVT	Deep venous thrombosis
ECG	Electrocardiogram
ENT	Ears, Nose, Throat
EVAR	Endovascular Aneurysm Repair
HbA1C	Hemoglobin A1C: test used to determine blood sugar control for individuals with diabetes
MRA	Magnetic resonance angiography
MRV	Magnetic resonance venography
PAD	Peripheral artery disease
PAH	Pulmonary artery hypertension
PFT	Pulmonary function tests
PVD	Peripheral vascular disease
PSV ratio	Peak systolic velocities
SVC	Superior vena cava
TEVAR	Thoracic Endovascular Aortic Repair
TIA	Transient ischemic attack

Abbreviation	Definition
TTE	Transthoracic echocardiogram
Toe-Brachial Index	Useful in individuals with ABI above the normal range due to non-compressible posterior tibial or dorsalis pedis arteries
V/Q Scan	Ventilation and perfusion scan

PVD.GG.0001.0.A

v1.0.2024

- A pertinent clinical evaluation, or meaningful technological contact (telehealth visit, telephone call, electronic mail or messaging), is required prior to considering advanced imaging, including relevant medical treatments and a vascular history and physical that includes (when applicable):
 - Palpation of pulses
 - Evaluation of lower extremities for presence of non-healing wounds or gangrene
 - Associated skin changes such as thickened nails, absence of hair in the feet or calves, cool extremities
 - Evaluation for the presence of arterial bruits
 - Appropriate laboratory studies
 - Non-advanced imaging modalities, such as recent ABIs (within 60 days) after symptoms started or worsened
- ABI should be measured first:
 - If normal, then further vascular studies are generally not indicated.
 - If clinical suspicion for PAD remains high with normal ABI's, exercise ABI's (CPT® 93924) can be performed on a treadmill to elicit ischemia
 - The TBI (toe-brachial index) is used to establish the diagnosis of PAD in the setting of non-compressible arteries (ABI ≥ 1.40) and may also be used to assess perfusion in individuals with suspected CLI (rest pain and/or non-healing wound)
- If a prior imaging study (Ultrasound, MRA, CTA, Catheter angiogram, etc.) has been completed for a condition, a follow-up, additional, or repeat study for the same condition is generally not indicated unless there has been a change in the individual's condition, previous imaging showed an indeterminate finding, or eviCore healthcare guidelines support routine follow-up imaging.
- Runoff studies (CPT® 75635 for CTA or CPT® 74185, CPT® 73725, and CPT® 73725 for MRA) image from the umbilicus to the feet
 - CTA Abdomen and lower extremities should be reported as CPT® 75635, rather than using the individual CPT® codes for the abdomen, pelvis, and legs
 - MRA Abdomen, MRA Pelvis and MRA Lower extremities should be reported as CPT® 74185, CPT® 73725, and CPT® 73725. The CPT® code for MRA Pelvis (CPT® 72198) should not be included in this circumstance.

General Information (PVD-1.1)

PVD.GG.0001.1.A

v1.0.2024

- Risk factors for vascular disease include:
 - Diabetes
 - Cigarette smoking
 - Hypertension
 - Hyperlipidemia
 - Age >50, with at least one risk factor, are considered “at risk” for vascular disease
 - See also: **Impotence/Erectile Dysfunction (PV-17)** in the Pelvis Imaging Guidelines.
- Signs and symptoms of peripheral arterial disease
 - Claudication (Cramping pain in the legs, most notably back of the calves but can involve hips or thighs, after walking which is relieved with rest but recurs at a predictable distance)
 - Symptoms that are not consistent with claudication include
 - Generalized leg pain
 - Nocturnal cramps
 - Pain that is not easily relieved after a few minutes of rest
 - Burning pain in feet
 - Critical limb ischemia
 - Rest pain: Pain in the foot (not leg) at rest, particularly at night when the leg is elevated. Pain is relieved by dangling the leg off the bed or moving to an upright position
 - Non-healing wounds: Wounds present for >2 weeks with little to no evidence of healing
 - Erectile dysfunction can be associated with vascular disease
- Claudication and critical limb ischemia have different natural histories. Claudication generally follows a benign indolent course. 70% of individuals with claudication will have the same symptoms after five years with no progression. Critical limb ischemia, on the other hand, is associated with a high rate of limb loss (25%) and death (35%) one year after presentation
- Simultaneous venous and arterial systems evaluation are unusual but are occasionally needed
- Post-angioplasty/reconstruction: follow-up imaging is principally guided by symptoms. See also:
 - **Post Aortic Endovascular/Open Surgery Surveillance Studies (PVD-6.8)**
 - **Post-Procedure Surveillance Studies (PVD-7.3)**

Procedure Coding (PVD-1.2)

PVD.GG.0001.2.A

v1.0.2024

Non-Invasive Physiologic Studies of Extremity Arteries	CPT®
<ul style="list-style-type: none"> Limited bilateral noninvasive physiologic studies of upper or lower extremity arteries. Non-invasive physiologic studies of upper or lower extremity arteries, single level, bilateral (e.g., ankle/brachial indices, Doppler waveform analysis, volume plethysmography, transcutaneous oxygen tension measurement). 	93922
<ul style="list-style-type: none"> Complete bilateral noninvasive physiologic studies of upper or lower extremity arteries, 3 or more levels. Non-invasive physiologic studies of upper or lower extremity arteries, multiple levels or with provocative functional maneuvers, complete bilateral study (e.g., segmental blood pressure measurements, segmental Doppler waveform analysis, segmental volume plethysmography, segmental transcutaneous oxygen tension measurements, measurements with postural provocative tests, measurements with reactive hyperemia). 	93923

- CPT® 93922 and CPT® 93923 can be requested and reported only once for the upper extremities and once for the lower extremities.
- CPT® 93922 and CPT® 93923 should not be ordered on the same request nor billed together for the same date of service.
- CPT® 93924 and CPT® 93922 and/or CPT® 93923 should not be ordered on the same request and should not be billed together for the same date of service.
- ABI studies performed with handheld dopplers, where there is no hard copy output for evaluation of bidirectional blood flow, are not reportable by these codes.

Non-Invasive Physiologic Studies of Extremity Arteries	CPT®
Non-invasive physiologic studies of lower extremity arteries, at rest and following treadmill stress testing, complete bilateral study.	93924

Arterial Duplex – Upper and Lower Extremities	CPT®
Duplex scan of lower extremity arteries or arterial bypass grafts; complete bilateral.	93925
<ul style="list-style-type: none"> A complete duplex scan of the lower extremity arteries includes examination of the full length of the common femoral, superficial femoral and popliteal arteries. The iliac, deep femoral, and tibioperoneal arteries may also be examined. 	
Duplex scan of lower extremity arteries or arterial bypass grafts; unilateral or limited study.	93926

Arterial Duplex – Upper and Lower Extremities		CPT®
<ul style="list-style-type: none"> The limited study is reported when only one extremity is examined or when less than a full examination is performed (e.g. only one or two vessels or follow-up). 		
Duplex scan of upper extremity arteries or arterial bypass grafts; complete bilateral.		93930
<ul style="list-style-type: none"> A complete duplex of the upper extremity arteries includes examination of the subclavian, axillary, and brachial arteries. The radial and ulnar arteries may also be included. 		
Duplex scan of upper extremity arteries or arterial bypass grafts; unilateral or limited study.		93931
<ul style="list-style-type: none"> The limited study is reported when only one extremity is examined or when less than a full examination is performed (e.g. only one or two vessels or follow-up). 		

Cerebrovascular Artery Studies		CPT®
Duplex scan of extracranial arteries; complete bilateral study.		93880
Duplex scan of extracranial arteries; unilateral or limited study.		93882
<ul style="list-style-type: none"> This study is often referred to as a “carotid ultrasound” or “carotid duplex”. Typically, it includes evaluation of the common, internal, and external carotid arteries. 		

Transcranial Doppler Studies		CPT®
Transcranial Doppler study of the intracranial arteries; complete study		93886
Transcranial Doppler study of the intracranial arteries; limited study		93888
Transcranial Doppler vasoreactivity study		93890
Transcranial Doppler study of the intracranial arteries; emboli detection without intravenous microbubble injection		93892
Transcranial Doppler study of the intracranial arteries; emboli detection with intravenous microbubble injection		93893

Venous Studies - Extremities		CPT®
Duplex scan of extremity veins, including responses to compression and other maneuvers; complete bilateral study.		93970
Duplex scan of extremity veins, including responses to compression and other maneuvers; unilateral or limited study.		93971

Venous Studies - Extremities	CPT®
<ul style="list-style-type: none"> • These codes are used to report studies of lower or upper extremity veins. • A complete bilateral study of the lower extremity veins includes examination of the common femoral, proximal deep femoral, great saphenous and popliteal veins. Calf veins may also be included. • A complete bilateral study of upper extremity veins includes examination of the subclavian, jugular, axillary, brachial, basilica, and cephalic veins. Forearm veins may also be included. 	

Visceral Vascular Studies	CPT®
Duplex scan of arterial inflow and venous outflow of abdominal, pelvic, scrotal contents and/or retroperitoneal organs; complete study.	93975
Duplex scan of arterial inflow and venous outflow of abdominal, pelvic, scrotal contents and/or retroperitoneal organs; limited study	93976
Duplex scan of aorta, inferior vena cava, iliac vasculature, or bypass grafts; complete study	93978
Duplex scan of aorta, inferior vena cava, iliac vasculature, or bypass grafts; unilateral or limited study	93979

Duplex for Hemodialysis Access	CPT®
Duplex scan of hemodialysis access (including arterial inflow, body of access and venous outflow).	93990
Duplex scan of arterial inflow and venous outflow for preoperative vessel assessment prior to creation of hemodialysis access; complete bilateral study	93985
Duplex scan of arterial inflow and venous outflow for preoperative vessel assessment prior to creation of hemodialysis access; complete unilateral study	93986

General Guidelines – Imaging (PVD-1.3)

PVD.GG.0001.3.A

v1.0.2024

- Imaging Studies:
 - Carotid studies MRA Neck (CPT® 70543) or CTA Neck (CPT® 70491) capture the area from the top of the aortic arch (includes the origin of the innominate artery, common carotid artery, and subclavian artery, which gives off the vertebral artery) to the base of the skull.
 - CTA or MRA Abdomen (CPT® 74175 or CPT® 74185) images from the diaphragm to the umbilicus or iliac crest
 - CTA or MRA Chest (CPT® 71275 or CPT® 71555) images from the base of the neck to the dome of the liver
 - Runoff studies (CPT® 75635 for CTA or CPT® 74185, CPT® 73725, and CPT® 73725 for MRA) image from the umbilicus to the feet
 - CTA Abdomen and lower extremities should be reported as CPT® 75635, rather than using the individual CPT® codes for the abdomen, pelvis, and legs
 - MRA Abdomen, MRA Pelvis and MRA Lower extremities should be reported as CPT® 74185, CPT® 73725, and CPT® 73725. The CPT® code for MRA Pelvis (CPT® 72198) should not be included in this circumstance
 - Studies used to quantify plaque morphology in noncoronary vessels (CPT® 0710T, CPT® 0711T, CPT® 0712T, CPT® 0713T) are considered experimental, investigational, or unproven.

Nuclear Medicine Imaging indications (PVD-10.1)

PVD.GG.0010.1.A

v1.0.2024

- Nuclear medicine studies are rarely used in the evaluation of peripheral vascular disorders but are indicated in the following circumstances:
 - Lymphoscintigraphy (CPT® 78195) is indicated for evaluation of lower extremity lymphedema when recent Doppler ultrasound of the lower extremity and abdomen are negative for valvular insufficiency.
 - Vascular flow imaging (CPT® 78445) is an obsolete study that has been replaced by MRA, CTA, or Duplex ultrasonography, and is not supported for any indication at this time.
 - Venous thrombosis imaging (CPT® 78456, CPT® 78457, and CPT® 75458) are obsolete studies that have been replaced by MRA, CTA, or Duplex ultrasonography, and are not supported for any indication at this time.
 - Indium 111 (¹¹¹In)–labeled white blood cell (WBC) or Gallium-67 citrate studies (CPT® 78800, CPT® 78801, CPT® 78802, or CPT® 78803) can be approved for evaluation of the following:
 - Mycotic aneurysms.
 - Vascular graft infection.
 - Infection of central venous catheter or other indwelling device.

Genetic Predisposition to Arterial Disease

Guideline

Screening for Suspected Peripheral Artery Disease/Aneurysmal Disease (PVD-2)

Screening for Suspected Peripheral Artery Disease/Aneurysmal Disease (PVD-2)

Guideline

PVD.GP.0002.A

v1.0.2024

Asymptomatic Screening (PVD-2.1)

Screening for Vascular related genetic connective tissue Disorders (PVD-2.2)

Screening for TAA with bicuspid aortic valves (PVD-2.3)

Screening for Vascular Related Disorders in Multisystemic Smooth Muscle Syndrome (MSMS)/Smooth Muscle Dysfunction Syndrome (SMDS)/

ACTA2 Mutations (PVD 2.4)

References

Asymptomatic Screening (PVD-2.1)

- Routine screening of asymptomatic individuals for PAD is not advised. Those with CVD risk factors should be placed on best medical management and should be questioned on symptoms of PAD at annual physicals.
- Currently, there is no evidence to demonstrate that screening all individuals with PAD for asymptomatic atherosclerosis in other arterial beds improves clinical outcome. ^{1 2 3}
- Resting ABI's may be indicated in individuals with abnormal pulse exams. ^{2,3}

Screening for Vascular related genetic connective tissue Disorders (PVD-2.2)

- Vascular related genetic connective tissue Disorders include:
 - Familial Aneurysm Syndromes
 - Fibromuscular Dysplasia
 - Spontaneous Coronary Artery Dissection (SCAD)
 - Ehlers-Danlos
 - Marfan
 - Loeys-Dietz
- Screening for Familial Syndromes in individuals with a positive family history (1st degree relative with dissection/TAA) but no known genetic syndrome/mutation, otherwise known as Suspected **Familial** Aneurysm Syndrome.
 - ECHO (CPT® 93306, CPT® 93307, or CPT® 93308) and chest x-ray for all First-degree relatives (parents, siblings, children) of individuals with TAA and/or dissection.

¹ Andras A, Ferket B. Screening for peripheral arterial disease. Cochrane Database Syst Rev. 2014;(4):CD010835. Published 2014 Apr 7. doi:10.1002/14651858.CD010835.pub2

² Firnhaber JM, Powell CS. Lower Extremity Peripheral Artery Disease: Diagnosis and Treatment [published correction appears in Am Fam Physician. 2019 Jul 15;100(2):74]. Am Fam Physician. 2019;99(6):362-369

³ US Preventive Services Task Force, Curry SJ, Krist AH, et al. Screening for Peripheral Artery Disease and Cardiovascular Disease Risk Assessment with the Ankle-Brachial Index:US Preventive Services Task Force Recommendation Statement. JAMA. 2018;320(2):177. doi:10.1001/jama.2018.8357

- Any imaging listed in the Table of Thoracic Aorta Imaging Options can be performed if these studies identify a TAA or are equivocal or do not visualize the ascending or descending aorta adequately.

Table of Thoracic Aorta Imaging Options

Description	CPT®
CT Chest without contrast	71250
CT Chest with contrast	71260
CTA Chest	71275
MRA Chest	71555
Transesophageal echocardiogram (TEE)	93312 or 93313 or 93314

- Studies can be repeated at 2 year intervals if prior results are negative
- Initial imaging for individuals with documented SCAD/fibromuscular dysplasia/Marfan/Loeys-Dietz/Ehlers-Danlos type IV:
 - On initial diagnosis of Ehlers-Danlos, Loeys Deitz or Marfans or SCAD or suspicion of fibromuscular dysplasia, full vascular imaging should be performed from head to pelvis with:
 - CTA or MRA Head (CPT® 70496 or CPT® 70546 or CPT® 70545)
 - CTA or MRA Neck (CPT® 70498 or CPT® 70548 or CPT® 70549)
 - CTA or MRA Chest or CT Chest with contrast
 - CTA Abdomen/Pelvis or MRA Abdomen/Pelvis (CPT® 74174) or (CPT® 74185 and CPT® 72198)
 - If there are no identified aneurysms or dissections, repeat imaging can be obtained at two-year intervals
- Surveillance imaging
 - If an aneurysm is identified in individuals with fibromuscular dysplasia, then the aneurysm can be surveilled per the typical timeframe as described in **Thoracic Aortic Aneurysm (TAA) (PVD-6.2)**, **Abdominal Aortic Aneurysm (PVD-6.3)**, **Iliac Artery Aneurysm (PVD- 6.4)**, and **Visceral Artery Aneurysm (PVD-6.5)**.
 - Follow-Up of aneurysms in individuals with documented SCAD/Marfan's/Loeys-Dietz/Ehlers-Danlos type IV
 - Imaging can be performed every 6 months once an aneurysm has been identified until a decision has been made to repair.
 - Intracranial aneurysm – CTA or MRA Head (CPT® 70496 or 70544)
 - Aneurysm of a cervical artery – Carotid duplex or CTA or MRA neck if unable to fully visualize with carotid duplex
 - Thoracic aorta – CTA Chest (CPT® 71275) or CT Chest with (CPT® 71260) or without (CPT® 71250), MRA chest (CPT® 71555)
 - Abdominal aneurysm – Abdominal duplex (CPT® 93975/93976/93978/93979/76770/76775)

- Visceral aneurysm – These can be difficult to visualize on duplex. If not visible on duplex, can obtain a CTA or MRA Abdomen and Pelvis.

Background and supporting information

Fibromuscular dysplasia and spontaneous coronary artery dissection is diagnosed radiographically. Loeys-Dietz, Marfans, Ehlers-Danlos type IV are diagnosed with genetic testing.

Screening for TAA with bicuspid aortic valves (PVD-2.3)

- Screening in individuals with bicuspid aortic valve:
 - Screening, any requested imaging from the “Table of Thoracic Aorta Imaging Options” and/or ECHO (CPT® 93306, CPT® 93307, or CPT® 93308).

Table of Thoracic Aorta Imaging Options

Description	CPT®
CT Chest without contrast	71250
CT Chest with contrast	71260
CTA Chest	71275
MRA Chest	71555
Transesophageal echocardiogram (TEE)	93312 or 93313 or 93314

- Additional imaging such as Cardiac MRI, Cardiac CT, or CCTA is NOT generally indicated.
- There is no evidence-based data to support screening relatives of individuals with bicuspid aortic valve for TAA except with echocardiogram.
- Follow-up per TAA Follow-Up guidelines in **Thoracic Aortic Aneurysm (TAA) (PVD-6.2)**
- If no dilatation of the aortic root or ascending thoracic aorta is found, there is no evidence-based data to support continued surveillance imaging.

Screening for Vascular Related Disorders in Multisystemic Smooth Muscle Syndrome (MSMS)/Smooth Muscle Dysfunction Syndrome (SMDS)/ACTA2 Mutations (PVD 2.4)

Initial imaging

Upon initial genetic confirmation, all of the following studies can be approved:

- Transthoracic echocardiogram (TTE) (CPT® 93306)
- MRA Chest (CPT® 71555) or CTA Chest and CT Chest with contrast (CPT® 71275 and 71260)
- MRA Abdomen and Pelvis (CPT® 74185 and 72198) or CTA Abdomen and Pelvis (CPT® 74174)
- MRI Perfusion study Brain CPT® 70553
- MRA Head and Neck (CPT® 70544 or 70545 AND 70548)
- Ultrasound Upper extremity(ies) (CPT® 93930 or 93931) or CTA Upper extremity (CPT® 73206) or MRA Upper extremity (CPT® 73225)

Repeat testing

Repeat testing with any of the studies listed under initial imaging is indicated when there is documentation of new signs or symptoms.

Surveillance imaging

Surveillance imaging with any of the studies listed in initial imaging is indicated according to the following:

- Transthoracic echocardiogram repeat every 6 months
- Chest imaging can be repeated every 12 months starting at age 10
- Abdomen and pelvis imaging can be repeated every 12 months starting age 10
- Upper extremity imaging can be repeated every 12 months starting age 10
- MRI perfusion study Brain see **Dysfunction Syndrome (SMDS)/ACTA2 Mutations (PEDHD-12.8)**
- MRA Head and Neck see **Dysfunction Syndrome (SMDS)/ACTA2 Mutations (PEDHD-12.8)**

Background and supporting information

Smooth Muscle Dysfunction Syndrome presents as congenital mydriasis, a patent ductus arteriosus (PDA), pulmonary arterial hypertension (PAH) during infancy. Patients go on to developed aortic, peripheral arterial, and cerebrovascular disorders in childhood.

- Caused by heterozygous mutation of ACTA2. P.Arg179His

- Cases mostly due to de novo mutations, so imaging screening based on family history without genetic confirmation is not supported.
- Because radiation is a known risk factor for moyamoya disease. MRI/MRA Head is recommended instead of Computed Tomography (CT)/CTA

Cerebrovascular Imaging

Guideline

Cerebrovascular and Carotid Disease - Initial Imaging (PVD-3.1)

Surveillance Imaging with NO History of Carotid Surgery or Intervention (PVD-3.2)

Surveillance Imaging WITH History of Carotid Surgery or Intervention (PVD-3.3)

References

Cerebrovascular and Carotid Disease - Initial Imaging (PVD-3.1)

PVD.CV.0003.1.A

v1.0.2024

- Duplex ultrasound (CPT® 93880 bilateral or CPT® 93882 unilateral) should generally be used to evaluate possible carotid artery disease, prior to considering advanced imaging, when ANY of the following apply:
 - Known or suspected retinal arterial emboli or Hollenhorst plaque
 - Pulsatile neck masses
 - Carotid or cervical bruit
 - Abnormal findings on physical exam of the carotid arteries (e.g., absent carotid pulses)
 - Preoperative evaluation of individuals with evidence of severe diffuse atherosclerosis, scheduled for major cardiovascular surgical procedures
 - Preoperative evaluation of individuals prior to elective cardiovascular surgery in individuals older than 65 years of age and in those with peripheral artery disease, history of cigarette smoking, history of stroke or TIA, or carotid bruit
 - Suspected Subclavian Steal Syndrome
 - See **Subclavian Steal Syndrome (CH-27)** in the Chest Imaging Guidelines
 - Blunt neck trauma in the absence of focal neurologic symptoms
 - Neurologic complaints after chiropractic neck manipulation
 - Vasculitis potentially involving carotid arteries, such as Takayasu's arteritis and fibromuscular dysplasia (FMD). In patients with neurologic symptoms and concern for cerebral vasculitis, see **Cerebral vasculitis (HD 22.1)**
 - Remote history of stroke or TIA (Greater than one month).
- Typical Symptoms of TIA/Stroke, see **Stroke/TIA (HD-21)** in the Head Imaging Guidelines
- CTA or MRA Neck is indicated for suspected internal carotid artery dissection, in individuals with **ANY** of the following mechanisms of injury or risk factors for arterial dissection:
 - Chiropractic manipulation of neck
 - Whiplash injury
 - Fibromuscular dysplasia/Marfan's
 - Stroke in the young (age ≤50)
- CTA or MRA Neck can be approved for suspected vertebrobasilar pathology:
 - Symptoms include:
 - Vertigo associated with nausea and vomiting
 - Diplopia
 - Loss of vision in one or both eyes

- Dysarthria
- Bifacial numbness
- Bilateral extremity weakness and/or numbness
- Acute changes in mental status
- Loss of consciousness
- Ataxia
- MRA or CTA of **both** Neck and Head are required to visualize the entire vertebral-basilar system for evaluation of posterior circulation disease. See **General Guidelines – CT and MR Angiography (HD-1.5)** in the Head Imaging Guidelines
- Surveillance imaging, post-stenting or known vertebrobasilar disease, interval determined by Vascular Specialist, Neurologist, or Neurosurgeon or any provider in consultation with a vascular specialist, neurologist, or neurosurgeon for ANY of the following:
 - Asymptomatic
 - Unchanged symptoms
 - New or worsening symptoms
- **After Intracranial Hemorrhage:**
 - Initial Imaging see **Head Trauma (HD-13.1)** in the Head Imaging Guidelines
 - Surveillance Imaging
 - Interval determined by neurosurgeon or neurologist or any provider in consultation with a neurologist or neurosurgeon.
- For Suspected Subclavian Steal Syndrome:
 - Initial imaging should be a carotid duplex
 - If initial duplex demonstrates high-grade stenosis or occlusion of the subclavian artery, advanced imaging is NOT indicated unless the individual is symptomatic with arm claudication or signs of hypo-perfusion of the vertebral artery with recurrent dizziness
 - Surveillance of subclavian arterial disease is NOT indicated if there has not been any intervention such as a carotid-subclavian bypass or subclavian stent
 - Advanced imaging, see **Subclavian Steal Syndrome – General (CH-27)** in the Chest Imaging Guidelines
- Carotid ultrasound screening in asymptomatic individuals due only to risk factors is **not** indicated.
- Repeat imaging of the cervical vessels (regardless of when the previous carotid imaging was performed) is indicated for new signs and symptoms consistent with carotid artery disease (e.g., TIA, amaurosis fugax, change in nature of a carotid bruit) using one of the following:
 - Duplex ultrasound (CPT® 93880 bilateral study or CPT® 93882 unilateral study)
 - MRA Neck with contrast (CPT® 70548) or without and with contrast (CPT® 70549)
 - CTA Neck (CPT® 70498)

Surveillance Imaging with NO History of Carotid Surgery or Intervention (PVD-3.2)

PVD.CV.0003.2.A

v1.0.2024

- Surveillance imaging is indicated once a year for individuals with fibromuscular dysplasia of the extracranial internal carotid arteries.
- Reporting standards for carotid stenosis varies widely. The most commonly used criteria, however, is noted in the chart below published by the Society of Radiology in 2003

Primary parameters			Additional Parameters	
% Stenosis	ICA PSV (cm/sec)	Plaque estimate (%)	ICA/CCA PSV ratio	ICA/EDV (cm/sec)
Normal	< 125	None	< 2.0	< 40
< 50	< 125	< 50	< 2.0	< 40
50-69	125-230	≥ 50	2.0-4.0	40-100
≥ 70 but less than near occlusion	> 230	> 50	> 4.0	> 100
Near occlusion	High, low, or undetectable	Visible	Variable	Variable
Total occlusion	undetectable	Visible- no detectable lesion	Not applicable	Not applicable

- If normal study, no routine follow-up imaging is indicated
- If <50% internal carotid stenosis
 - Duplex ultrasound (CPT® 93880 bilateral or CPT® 93882 unilateral) can be performed every **two** years
- Between 50% and 70% internal carotid stenosis

- Duplex ultrasound (CPT® 93880 bilateral or CPT® 93882 unilateral) can be performed annually.
- A repeat duplex (CPT® 93880 bilateral or CPT® 93882 unilateral) may be performed in three to six months until stability is reached when **one** of the following occurs:
 - Change in the character of the bruit
 - Duplex demonstrates rapid progression, including:
 - Doubling of peak systolic velocities in the internal carotid arteries
 - Increase of the ICA/CCA ratio
 - Heavy calcification in the internal carotid arteries
 - Thrombus in the internal carotid arteries
 - Ulcerated plaque in the internal carotid arteries
 - Echolucent plaque in the internal carotid arteries
- A one-time CTA Neck (CPT® 70498) or MRA Neck (CPT® 70548) is indicated to confirm degree of stenosis in individuals with ulcerated plaque or heavy calcification of the internal carotid artery seen on duplex.
- Internal carotid stenosis $\geq 70\%$ or ICA/CCA ratio >4
 - Duplex ultrasound (CPT® 93880 bilateral or CPT® 93882 unilateral) or MRA Neck with contrast (CPT® 70548) or CTA Neck (CPT® 70498) can be performed at the following intervals:
 - Every 6 months until one of the following occurs:
 - Intervention is performed
 - Decision is made to not intervene
- MRA Neck with contrast (CPT® 70548) or CTA Neck (CPT® 70498) is indicated if duplex Ultrasound shows $\geq 70\%$ occlusion/stenosis of the internal carotid artery or the ICA/CCA ratio is >4.0 , even with a lower percentage of stenosis.
 - If carotid stent is planned
 - MRA Head (CPT® 70544, or CPT® 70545, or CPT® 70546) or CTA Head (CPT® 70496) can be added

Surveillance Imaging WITH History of Carotid Surgery or Intervention (PVD-3.3)

PVD.CV.0003.3.A

v1.0.2024

- Duplex ultrasound (CPT® 93880 bilateral or CPT® 93882 unilateral) is indicated post-carotid surgery or intervention at the following intervals:
 - 1 month after procedure
 - Every 6 months for 2 years after procedure
 - Then annually
- If $\geq 70\%$ residual internal carotid stenosis is seen on duplex at 1 month after procedure
 - Duplex ultrasound (CPT® 93880 bilateral or CPT® 93882 unilateral) or CTA Neck (CPT® 70498) or MRA Neck (CPT® 70548) is indicated at the following intervals:
 - Every 3-6 months for one year
 - Then annually or until decision is made to re-intervene.
- If $\geq 70\%$ residual internal carotid stenosis is seen on duplex at any time post-procedure, then
 - CTA Neck (CPT® 70498) or MRA Neck (CPT® 70548) is indicated for further evaluation and at six-month intervals until decision is made to re-intervene.

Background and Supporting Information

- Carotid intima-media thickness using duplex ultrasound imaging (Category III code 0126T) is not recommended in clinical practice for risk assessment for a first ASCVD event. Although outcomes data are lacking, Texas has adopted this method in Texas Heart Attack Preventive Screening Bill (HR 1290)
- Texas Heart Attack Preventive Screening Law (HR 1290) mandates that insurers in Texas cover either a calcium scoring study (CPT® 75571 or HCPCS S8092) or a carotid intima-media thickness study (ultrasound—Category III code 0126T) every five years for certain populations. To qualify, the following must apply:
 - Must be a member of a fully-insured Texas health plan.
 - Must be male sex assigned at birth age 45 to 75 or female sex assigned at birth age 55 to 75.
 - Must have either diabetes or a Framingham cardiac risk score of intermediate or higher.
 - Must not have had a calcium scoring study or a carotid intima-media thickness study within the past 5 years

- MRA Neck (CPT® 70548) or CTA Neck (CPT® 70498) may be indicated if ultrasound is technically difficult or confirmation of the degree of stenosis on ultrasound is needed because an interventional procedure is being considered

Aortic Imaging

Guideline

Aortic Disorders General Information (PVD-6.1)
Thoracic Aortic Aneurysm (TAA) (PVD-6.2)
Abdominal Aortic Aneurysm (AAA) (PVD-6.3)
Iliac Artery Aneurysm (IAA) (PVD-6.4)
Aortic and Arterial Dissection and Other Aortic Conditions (PVD-6.7)
Post Aortic Endovascular/Open Surgery Surveillance Studies (PVD-6.8)
Large Vessel Vasculitis (PVD-6.9)
Medium Vessel Vasculitis (PVD-6.10)
Small Vessel Vasculitis (PVD-6.11)

Aortic Disorders General Information (PVD-6.1)

PVD.AD.0006.1.A

v1.0.2024

Duplex ultrasound for visceral vascular studies	CPT®
Duplex scan of arterial inflow and venous outflow of abdominal, pelvic, scrotal contents and/or retroperitoneal organs; complete study.	93975
Duplex scan of arterial inflow and venous outflow of abdominal, pelvic, scrotal contents and/or retroperitoneal organs; limited study.	93976
Duplex scan of aorta, inferior vena cava, iliac vasculature, or bypass grafts; complete study.	93978
Duplex scan of aorta, inferior vena cava, iliac vasculature, or bypass grafts; unilateral or limited study.	93979
Ultrasound, abdominal aorta, real time, with image documentation, screening study for abdominal aortic aneurysm (AAA) for AAA screening	76706

- In clinical practice, CT, CTA, MRA are usually preferred to evaluate for stenosis of these vessels rather than ultrasound (Exception: Duplex ultrasound is indicated to rule out testicular or ovarian torsion or to evaluate an abdominal bruit or a pulsatile abdominal mass).
- Mesenteric Ischemia
 - See **Mesenteric/Colonic Ischemia (AB-6)** in the Abdomen Imaging Guidelines.

Thoracic Aortic Aneurysm (TAA) (PVD-6.2)

PVD.AI.0006.2.A

v1.0.2024

- Advanced imaging with a CT or MR is preferred imaging for this diagnosis. Transesophageal echocardiogram (TEE) can also be indicated for initial imaging of ascending and descending thoracic aortic aneurysms. For repeat imaging or established thoracic aneurysms, TEE is indicated **only** when imaging with CT or MR is contraindicated.
- Given the diversity of studies, pathology, and provider preference, **ONE** of the imaging studies in the Table of Thoracic Aorta Imaging Options can be approved for Thoracic Aortic Aneurysm (TAA) as indicated in this section

Table of Thoracic Aorta Imaging Options	CPT®
CT Chest with contrast	71260
CT Chest without contrast	71250
CTA Chest	71275
MRA Chest	71555
TEE	93312-93314

- For TAA associated with a dissection, please see section **Aortic Dissection and Other Aortic Conditions (PVD-6.7)**
- For suspected TAA, any requested imaging from the Table of Thoracic Aorta Imaging Options above:
 - Abnormalities identified on chest x-ray (abnormality including widened mediastinum, suspicious calcifications) or other imaging studies (fluoroscopy, MRI Spine, etc.) abnormality.
- For known TAA accompanied with chest pain or back pain and suspicion of rupture, any requested imaging from the Table of Thoracic Aorta Imaging Options above.
- For planning for pre-thoracic endovascular repair (TEVAR) of thoracic aorta disease.
 - CTA Chest, and/or Abdomen, and/or Pelvis (CPT® 71275, CPT® 74175, CPT® 72191, CPT® 74174); or
 - MRA Chest, and/or Abdomen, and/or Pelvis (CPT® 71555, CPT® 74185, CPT® 72198).
- For follow-up of ascending aortic aneurysms CTA Chest (CPT® 71275) or CT Chest (CPT® 71250 or CPT® 71260) or MRA chest (CPT® 71555)
 - Operative treatment is reasonable for asymptomatic individuals when the diameter of the arch exceeds 5.5 cm.
 - For individuals with ascending aortic aneurysms <4.0 cm in diameter

- Repeat imaging annually
- For individuals with ascending aortic aneurysms ≥ 4.0 cm
 - Repeat imaging 6 months.
- TEE is indicated **only** when imaging with CT or MR is contraindicated
- For follow-up of descending aortic aneurysms, any requested imaging from the “Table of Thoracic Aorta Imaging Options” above for the following:
 - “Medically” treated/observation.
 - 3.5cm to 4.4 cm TAA can be followed annually.
 - ≥ 4.5 cm TAA can be followed every 6 months.
 - ≥ 3.0 cm TAA when there is concern for growth can have a one-time 3-month interval advanced imaging.
 - TEE is indicated **only** when imaging with CT or MR is contraindicated
- Screening in the presence of other aortic aneurysms.
 - In an individual with a known TAA, screening for AAA is indicated with an abdominal duplex. See **Abdominal Aortic Aneurysm (AAA) (PVD-6.3)**.
 - In an individual with a known AAA, screening for TAA is not supported by sufficient evidence.
- Screening in individuals with bicuspid aortic valve or familial TAA syndromes. See **Screening for TAA with bicuspid aortic valve (PVD-2.3)**. See **Screening for Vascular related genetic connective tissue Disorders (PVD-2.2)**

Background and Supporting Information

The thoracic aorta is generally divided into two segments: the ascending aorta, which includes the aortic root, aortic arch and ends just distal to the left subclavian artery and the descending aorta, which starts just distal to the left subclavian artery to the level of the diaphragm.

Abdominal Aortic Aneurysm (AAA) (PVD-6.3)

PVD.AD.0006.3.A

v1.0.2024

Screen for AAA

- Ultrasound abdominal aorta with any of the studies from the table of Duplex ultrasound for visceral vascular studies in **Aortic Disorders General Information (PVD-6.1)** is the preferred initial imaging study to screen for AAA.
- One-time screening recommendations for AAA (Ultrasound CPT® 76706)
 - Individuals 65 to 75 years of age with a history of tobacco use.
 - Individuals older than 75 years with a history of tobacco use and in otherwise good health who have not previously received a screening ultrasound examination.
 - All first-degree relatives of individuals who present with an AAA and are between 65 and 75, or in those older than 75 in good health.
- AAA screening is reasonable with ultrasound (CPT® 76706, 93975, 93976, 93978, or 93979) if there is a documented thoracic aortic aneurysm; however, there is insufficient evidence to support the use of advanced imaging to screen for a thoracic aortic aneurysm in individuals with known abdominal aortic aneurysm.

Survey known AAA

- Ultrasound abdominal aorta with any of the studies from the table of Duplex ultrasound for visceral vascular studies in **Aortic Disorders General Information (PVD-6.1)** is the preferred initial imaging study to survey known AAA.
- Surveillance recommendations for AAA (CPT® 76706, 93975, 93976, 93978, 93979)
 - >2.5 cm but <3.0 cm: 10 years
 - 3.0 cm to 3.9 cm: 3 year intervals
 - 4.0 cm to 4.9 cm: every 12 months
 - 5.0 cm to 5.4 cm: every 6 months
 - >5.4 cm or aortic diameter has increased in size by 0.5 cm in six months, or at least 1 cm in a year may undergo more frequent monitoring and should be evaluated by a Vascular Specialist
- Additional Imaging
 - CT Abdomen and Pelvis with contrast (CPT® 74177), CT Abdomen and Pelvis without contrast (CPT® 74176), or CTA Abdomen and Pelvis (CPT® 74174), or CTA Abdomen (CPT® 74175), or CTA Pelvis (CPT® 72191).
 - Suspected or known AAA with recent-onset abdominal or back pain, particularly in the presence of a pulsatile epigastric mass or significant risk factors for AAA
 - Pre-operative imaging for AAA repair

Evaluate a pulsatile abdominal mass

- Ultrasound abdominal aorta with any of the studies from the table of Duplex ultrasound for visceral vascular studies in **Aortic Disorders General Information (PVD-6.1)** is the preferred initial imaging study to evaluate a pulsatile abdominal mass.
- Additional Imaging
 - CT Abdomen and Pelvis with contrast (CPT® 74177), CT Abdomen and Pelvis without contrast (CPT® 74176), or CTA Abdomen and Pelvis (CPT® 74174), or CTA Abdomen (CPT® 74175), or CTA Pelvis (CPT® 72191).
 - Suspected or known AAA with recent-onset abdominal or back pain, particularly in the presence of a pulsatile epigastric mass or significant risk factors for AAA
 - Pre-operative imaging for AAA repair

Obese Individual (BMI ≥35)

- CT Abdomen and Pelvis with contrast (CPT® 74177) or without contrast (CPT® 74176) can be substituted for US using the same timeline as a non-obese individual. Ultrasound abdominal aorta should ideally first be attempted to see if the image quality is adequate.

Iliac Artery Aneurysm (IAA) (PVD-6.4)

PVD.AD.0006.4.A

v1.0.2024

- Ultrasound (CPT® 76882 or CPT® 93925) for evaluation of a suspected IAA
 - CT Pelvis with contrast (CPT® 72193) if ultrasound is equivocal.
 - Ultrasound for follow-up imaging annually if an aneurysm is ≥ 2 cm
- Additional Imaging
 - CT Abdomen and Pelvis with contrast (CPT® 74177), CT Abdomen and Pelvis without and with contrast (CPT® 74178), or CTA Abdomen and Pelvis (CPT® 74174) for preoperative imaging if endovascular or open repair is being considered

Background and Supporting Information

- Isolated IAA's are rare and are typically associated with AAA
- Approximately one third to one half of isolated IAA's are bilateral at time of presentation
- Abdominal Aortic aneurysm rupture usually occurs at a diameter of 5 cm or larger, whereas common iliac aneurysms that are less than 3 cm in diameter almost never rupture

Aortic and Arterial Dissection and Other Aortic Conditions (PVD-6.7)

PVD.AD.0006.7.A

v1.0.2024

Imaging for Aortic conditions	CPT [®]
CT Chest, and/or Abdomen, and/or Pelvis	71260
	74177
	74160
	72193
CTA Chest, and/or Abdomen, and/or Pelvis	71275
	74175
	72191
	74174
MRA Chest, and/or Abdomen, and/or Pelvis	71555
	74185
	72198

- CTA or MRA of the entire aorta (including arch branches) and extending through the femoral arteries for suspected aortic dissection. Any of the following studies can be used if acute dissection is suspected:
 - CT Chest (CPT[®] 71260 or CPT[®] 71270) and/or one of the following:
 - CT Abdomen (CPT[®] 74160 or CPT[®] 74170) with or without and with contrast
 - CT Pelvis (CPT[®] 72193 or CPT[®] 72194) with or without and with contrast
 - CT Abdomen and Pelvis (CPT[®] 74177 or CPT[®] 74178) with or without and with contrast
 - CTA Chest (CPT[®] 71275) and/or **one** of the following:
 - CTA Abdomen (CPT[®] 74175)
 - CTA Pelvis (CPT[®] 72191)
 - CTA Abdomen and Pelvis (CPT[®] 74174)
 - MRA Chest and/or Abdomen and/or Pelvis (CPT[®] 71555 and/or CPT[®] 74185 and/or CPT[®] 72198)
- Chronic Aortic Dissections- 1/3 of individuals with chronic type B dissections that were not treated via open or endovascular repair will go on to develop aneurysmal disease requiring subsequent intervention.

- Advanced imaging of the affected segment of the aorta with any of the studies in above table **Imaging for Aortic conditions** can be performed as follows:
 - In individuals with a persistent false lumen or initial aortic diameter of $\geq 4\text{cm}$:
 - Every 6 months for two years until stability has been reached
 - Then annually
 - In individuals with initial aortic diameter of $< 4\text{cm}$ and/or a thrombosed false lumen:
 - Annually
 - Any time if the individual is symptomatic with chest pain, back pain or has any evidence of end organ ischemia: renal dysfunction, mesenteric ischemia or acute limb ischemia
- In individuals with Marfan syndrome/Loeys-Dietz/Ehlers-Danlos
 - As aneurysmal expansion within a dissection can occur rapidly, post-dissection imaging in these individuals is indicated as follows:
 - 1 month
 - 3 months
 - 6 months
 - 12 months
 - yearly thereafter
 - Depending on the location of the dissection the following may be approved:
 - CTA or MRA Head (CPT® 70496 or CPT® 70544)
 - Carotid duplex or CTA Neck or MRA Neck (CPT® 93980, CPT® 70498, or CPT® 70547)
 - CTA or MRA Chest (CPT® 71275 or CPT® 71555)
 - CTA Abdomen and Pelvis (CPT® 74174); or CTA or MRA Abdomen (CPT® 74175 or CPT® 74185); or CTA or MRA Pelvis (CPT® 72191 or CPT® 72198)
- Asymptomatic incidentally found arterial dissections not affecting the aorta including but not excluded to iliac arteries, visceral arteries, extracranial arteries can be imaged according to the general schedule:
 - Within one month of discovery
 - Six months
 - 12 months
 - No further imaging after 12 months if noted to be stable
- Asymptomatic penetrating aortic ulcers can be imaged according to the following time intervals:
 - Within one month of discovery
 - Three months
 - Six months
 - Twelve months
 - Annually until decision made to intervene

Background and Supporting Information

Classic symptoms of sharp, severe acute onset of retrosternal or interscapular chest pain is seen in 96% and is best adapted to the emergent setting. Chest x-ray is imprecise; any suspicion should be considered since up to 10% of individuals with aortic dissection present without classic symptoms.

Post Aortic Endovascular/Open Surgery Surveillance Studies (PVD-6.8)

PVD.AD.0006.8.A

v1.0.2024

Post-operative surveillance after TEVAR for any indication (PVD-6.8.1)

Post-operative surveillance after abdominal EVAR (endovascular aneurysm repair) (PVD-6.8.2)

Endovascular (Stent) Iliac Repair (PVD-6.8.3)

References (PVD-6.8)

- Aortic root/ascending aortic aneurysm/aortic dissection repair - post-operative echocardiography (TEE/TTE) is indicated:
 - Every three months for the first year
 - Every six months during the second year
 - Annually thereafter
- Open descending thoracic aortic aneurysm repair - **One** of the following post-operative studies [CT Chest with contrast (CPT® 71260) **or** CT Chest without contrast (CPT® 71250) **or** CTA Chest (CPT® 71275)], is indicated as follows:
 - 3-6 months post-procedure
 - 12 months post-procedure
 - Every two years thereafter
- Open Aortic Abdominal Aneurysm Repair - contrast and non-contrast enhanced CT of the entire aorta (CPT® 74176, CPT® 74177, CPT® 74174):
 - Every 5-years
 - As requested to assess for suspected infection of the graft (see **Nuclear Medicine Imaging indications (PVD-10.1)** for nuclear medicine imaging for vascular graft infection).

Post-operative surveillance after TEVAR for any indication (PVD-6.8.1)

Imaging for post-operative TEVAR	CPT ®
CT Chest, and/or Abdomen, and/or Pelvis	71260
	74177
	74160
	72193

Imaging for post-operative TEVAR	CPT®
CTA Chest, and/or Abdomen, and/or Pelvis	71275 74175 72191 74174
MRA Chest, and/or Abdomen, and/or Pelvis	71555 74185 72198

- ANY of the above studies listed in the table can be performed at one month, six months, twelve months and then annually
- Abdomen and Pelvis imaging is indicated only if TEVAR performed for a dissection that extends into the abdomen or pelvis

Post-operative surveillance after abdominal EVAR (endovascular aneurysm repair) (PVD-6.8.2)

Imaging for post-operative abdominal EVAR	CPT®
CT Abdomen and/or Pelvis with contrast	74160 72193 74177
CT Abdomen and/or Pelvis without and with contrast	74170 72194 74178
CTA Abdomen and/or Pelvis	74175 72191 74174
MRA Abdomen and/or Pelvis	74185 72198

- CT as per above coding as requested and color duplex ultrasound (CPT® 93975, CPT® 93976, CPT® 93978, or CPT® 93979) one month after EVAR
- If no endoleak, or sac enlargement, repeat **either** preferred CT or duplex ultrasound (**but not both**) at 12 months
- If a type II endoleak is observed 1 month after EVAR, may approve **BOTH at 6 months**:

- Any of the above CT with contrast
- Color duplex US
- If no endoleak or AAA sac enlargement is detected at 1 year after EVAR annual surveillance with:
 - Color duplex US
 - If DGUS is not available, any of the above CT can be performed
- If a type II endoleak is associated with an aneurysm sac that is shrinking or stable in size:
 - Continue surveillance with color duplex US every 6 months for 2 years
 - Annually thereafter.
- If US detects a new endoleak, graft migration, or aneurysm sac growth > 5mm:
 - Any of the above CT scan as requested.
 - Non-contrast CT of the entire aorta at 5-year intervals (CPT®74176)

Post-endoleak intervention surveillance imaging

Surveillance imaging after EVAR or any subsequent endoleak intervention is based on the most recent intervention unless it increases the frequency of interval imaging of prior established interval

For any subsequent interventions for endoleak repair, imaging can be obtained at 1 month with CT and then follow protocol as above.

Endovascular (Stent) Iliac Repair (PVD-6.8.3)

Imaging for endovascular iliac repair (stent)	CPT®
CT Pelvis	72193
	72194
CTA Pelvis	72191
MRA Pelvis	72198

- One of the above studies can be performed for endovascular iliac repair (stent)
- If performed in conjunction with EVAR, surveillance can follow the same schedule as EVAR.
- For isolated iliac artery aneurysm repair, surveillance can be performed with an arterial duplex (CPT® 93975, CPT® 93976, CPT® 93978, or CPT® 93979) or CT or MR as above if duplex unavailable:
 - Post-operatively within the first month
 - 6 months after endovascular treatment
 - Annually

Large Vessel Vasculitis (PVD-6.9)

PVD.AD.0006.9.A

v1.0.2024

Guideline

Inflammatory Aortitis (PVD-6.9.1)

Giant Cell Arteritis (GCA) (PVD-6.9.2)

Takayasu Arteritis (PVD-6.9.3)

References (PVD-6.9)

- Large vessel vasculitis is generally sub-grouped into three areas
 - Aortitis (Inflammatory Aortitis)
 - Giant Cell Vasculitis
 - Takayasu Arteritis

Inflammatory Aortitis (PVD-6.9.1)

Imaging for Inflammatory Aortitis	CPT®
CTA Chest	71275
MRA Chest	71555
CTA Pelvis	72191
MRA Pelvis	72198
CTA Abdomen and Pelvis	74174
CTA Abdomen	74175
MRA Abdomen	74185

Initial imaging

- Initial imaging with CTA or MRA of the affected body region is considered medically necessary after the following workup:
 - Lab studies: CBC, CMP, elevated inflammatory markers such as ESR or CRP
 - Clinical history suggestive of disease listed below in **Background and Supporting information**
 - PET/CT is considered **not medically necessary** for management of pediatric vasculitis at this time.

Repeat imaging

- Follow-up imaging with CTA or MRA of the affected body region is considered medically necessary for:
 - Change in signs/symptoms

- Known aneurysm monitoring
 - See **Aneurysm and AVM (HD-12)** in the Head Imaging Guidelines
 - See **Thoracic Aortic Aneurysms (PVD-6.2)**
 - See **Abdominal Aortic Aneurysms (PVD-6.3)**

Background and Supporting Information

Aortitis may be congenital (Marfan's, Hypermobility Syndromes, others) or acquired, including traumatic, atherosclerotic (dissecting aneurysm, other), infectious (syphilis, tuberculosis, other), neoplastic or inflammatory (Ankylosing Spondylitis, Giant Cell Arteritis, Cogan's, Relapsing Polychondritis, Behcet's Syndrome, Polyarteritis Nodosa, Granulomatous Polyangiitis, Lupoid, idiopathic, other).

Giant Cell Arteritis (GCA) (PVD-6.9.2)

Imaging for Giant Cell Arteritis	CPT®
CTA Chest	71275
MRA Chest	71555
CTA Pelvis	72191
MRA Pelvis	72198
CTA Abdomen and Pelvis	74174
CTA Abdomen	74175
MRA Abdomen	74185
MRA Head without contrast	70544
MRA Head with contrast	70545
MRA Neck without contrast	70547
MRA Neck with contrast	70548
CTA Neck	70498
PET/CT skull base to mid-thigh	78815

Initial imaging

- GCA may be subdivided into two basic types; Cranial and Extra-cranial
 - **Cranial GCA** is the more common type with temporal artery involvement. For predominantly Cranial GCA:
 - US (CPT® 93880 or CPT® 93882) of the temporal (and or axillary) arteries is the preferred modality. Ultrasound should be considered prior to advanced imaging.
 - MRA Head and/or MRA Neck (CPT® 70544, or CPT® 70545, or CPT® 70547, or CPT® 70548) may be considered when:

- Vascular trained ultrasonography is not available
- US is negative or equivocal with a clinical suspicion of GCA
- CT and PET are **not** currently recommended for the assessment of inflammation of cranial arteries.

Note For suspected cerebral vasculitis in individuals with neurologic symptoms, see **Cerebral Vasculitis (HD-22)** in the Head Imaging Guidelines

- **Extra-cranial GCA:** less commonly encountered. None of the “classic” clinical signs or symptoms of cranial GCA are present initially but may develop later.
 - Extra-cranial GCA is characterized by at least two or more of the following:
 - Jaw and/or upper extremity claudication
 - Fever/weight loss or fever of unknown origin (FUO) symptoms
 - New murmurs
 - Pulse asymmetry
 - Abdominal pain
 - Pulsatile mass
 - High inflammatory markers such as CRP or ESR > 50 mm/h
 - Imaging for aortic root, arch or abdomen involvement:
 - MRA Chest (CPT® 71555), MRA Neck (CPT® 70547), MRA Abdomen (CPT® 74185), CTA Chest (CPT® 71275), CTA Neck (CPT® 70498) or CTA Abdomen (CPT® 74175)
 - PET (CPT® 78815) is indicated if MRA or CTA are non-diagnostic and there is still suspicion for aortic root, arch or abdomen involvement

Repeat imaging

- Follow-up imaging is indicated for **any** of the following:
 - One-time documentation of remission or disease control
 - Change in signs/symptoms suggesting progression of disease
 - Although individuals with GCA can develop aortic aneurysms over time screening in the absence of signs or symptoms is not medically necessary
 - In individuals with known thoracic or abdominal aortic aneurysm:
 - See **Thoracic Aortic Aneurysm (TAA) (PVD-6.2)** for thoracic aneurysm surveillance
 - See **Abdominal Aortic Aneurysm (AAA) (PVD-6.3)** for abdominal aneurysm surveillance.
- Follow-up imaging is not routinely recommended for individuals in clinical and biochemical remission or without aneurysm/complication.

Background and supporting information

Giant Cell Arteritis is the most commonly encountered vasculitis in adults. Although classically thought of as a disease of the temporal arteries, aortic arch involvement is now recognized as a frequent complication (up to 50% of individuals) and responsible for many of the more serious morbidities encountered such as blindness.

Takayasu Arteritis (PVD-6.9.3)

Imaging for Takayasu Arteritis	CPT®
CTA Chest	71275
CTA Pelvis	72191
CTA Abdomen and Pelvis	74174
CTA Abdomen	74175
MRA Chest	71555
MRA Pelvis	72198
MRA Abdomen	74185

Initial imaging

- Initial imaging is indicated for signs and symptoms suggestive of disease such as absent radial pulse, difficulty obtaining BP in one arm, or unexplained hypertension.
- Any of the following modalities may be indicated for evaluation of Takayasu arteritis:
 - MRA of the affected body area(s) (contrast as requested)
 - CTA of the affected body area(s) (contrast as requested)
 - Ultrasound with Doppler of the affected body area(s)

Repeat imaging

Repeat imaging is indicated at the following intervals:

- Every 3 months to monitor treatment response during active treatment with systemic therapy.
- Annually for surveillance of known involved body areas to detect progressive vascular damage that may require intervention

Medium Vessel Vasculitis (PVD-6.10)

PVD.AD.0006.10.A

v1.0.2024

- There are two main types of medium-size vessel vasculitis:
 - Polyarteritis nodosa
 - Kawasaki disease

Kawasaki disease

- Imaging guidelines for Kawasaki Disease are addressed in **Kawasaki Disease (PEDCD-6)** in the Pediatric Cardiac imaging guideline
- Long-term routine surveillance imaging in asymptomatic Kawasaki disease is indicated as follows:

AHA risk level	Largest Aneurysm At Any Point	Largest Current Aneurysm	Routine Echo	Routine Stress Imaging	Routine Coronary Imaging
All			All risk levels 4-6 weeks after acute illness		
1	Normal	Normal	One echo 2- 12 months after acute illness	none	none
2	Dilation	Dilation	6 months One year If dilation remains echo every 2-5 years until resolves	None	None

AHA risk level	Largest Aneurysm At Any Point	Largest Current Aneurysm	Routine Echo	Routine Stress Imaging	Routine Coronary Imaging
		Normal	After acute illness: 2-12 months One echocardiogram at one year No echocardiogram after one year		
3.1	Small	Small	6 months 12 months then yearly	2-3 years	3-5 years
3.2	Small	Normal or dilated	6 months 12 months Then yearly	3-5 years	none
4.1	Medium	Medium	3 months 6 months 12 months Every 6-12 months after that	1-3 years	2-5 years
4.2	Medium	Small	6 months and 12 months, every 1 year	2-3 years	3-5 years
4.3	Medium	Normal Or Dilated	Every 1-2 years	2-4 years	none

AHA risk level	Largest Aneurysm At Any Point	Largest Current Aneurysm	Routine Echo	Routine Stress Imaging	Routine Coronary Imaging
5.1	Large	Large	1 month 3 months 6 months 9 months 12 months Then every 3-6 months	6-12 months	at 2-6 months, every 1-5 years
5.2	Large	Medium	Every 6-12 months	yearly	2-5 years
5.3	Large	Small	6-12 month	1-2 years	2-5 years
5.4	Large	Normal Or Dilation	1-2 years	2-5 years	none

Polyarteritis Nodosa

Initial imaging

Any **ONE** of the following modalities is indicated for documented clinical suspicion of Polyarteritis Nodosa:

- MRA of the affected body area(s) (contrast as requested)
- CTA of the affected body area(s) (contrast as requested)
- Ultrasound (US) with Doppler of the affected body area(s)

Repeat imaging

Imaging with MRA, CTA, or US with Doppler of the affected body area(s) is indicated for established Polyarteritis Nodosa as follows:

- Every 3 months during active treatment with systemic therapy to evaluate treatment response
- Annually for surveillance of known involved body areas to detect progressive vascular damage that may require intervention

Background and supporting information

- Based on AHA recommendations, the following classifications are used in risk stratification of coronary artery abnormalities⁴

⁴ Mccrindle BW, Rowley AH, Newburger JW, et al. Diagnosis, Treatment, and Long-Term Management of Kawasaki Disease: A

- Z-Score classification accounts for the effects of body size and age through use of baseline coronary dimensions adjusted for body surface area. The Z score value represents the number of standard deviation above the mean. (e.g., $z=0$ pt. has coronary artery dimension value equal to mean, $z=2$ person has value 2 standard deviation above the mean, based on age, gender, BSA).
- Coronary Artery Abnormalities Risk Classification based on Z-Score:
 - 1 - No involvement at any time point (Z score always <2)
 - 2 - Dilation only (Z score 2 to <2.5)
 - 3 - Small aneurysm (Z score ≥ 2.5 to <5)
 - 3.1 - Current or persistent
 - 3.2 - Decreased to dilation only or normal luminal dimension
 - 4 - Medium aneurysm (Z score ≥ 5 to <10 , and absolute dimension <8 mm)
 - 4.1 - Current or persistent
 - 4.2 - Decreased to small aneurysm
 - 4.3 - Decreased to dilation only or normal luminal dimension
 - 5 - Large and giant aneurysm (Z score ≥ 10 , or absolute dimension ≥ 8 mm)
 - 5.1 - Current or persistent
 - 5.2 - Decreased to medium aneurysm
 - 5.3 - Decreased to small aneurysm
 - 5.4 - Decreased to dilation only or normal luminal dimension
- Additional clinical features that may increase the long-term risk of myocardial ischemia
 - Greater length and distal location of aneurysms that increase the risk of flow stasis
 - Greater total number of aneurysms
 - Greater number of branches affected
 - Presence of luminal irregularities
 - Abnormal characterization of the vessel walls (calcification, luminal myofibroblastic proliferation)
 - Presence of functional abnormalities (impaired vasodilation, impaired flow reserve)
 - Absence or poor quality of collateral vessels
 - Previous revascularization performed
 - Previous coronary artery thrombosis
 - Previous myocardial infarction
 - Presence of ventricular dysfunction

Scientific Statement for Health Professionals from the American Heart Association. Circulation. 2017;135(17).
doi:10.1161/cir.0000000000000484.

Small Vessel Vasculitis (PVD-6.11)

PVD.AD.0006.11.A

v1.0.2024

Guideline

IgA vasculitis Henoch-Schönlein Purpura (HSP)
Granulomatosis with polyangiitis (GPA) formerly Wegener's
granulomatosis
Eosinophilic granulomatosis with polyangiitis (EGPA) formerly
Churg-Strauss Syndrome
Immune complex associated small-vessel vasculitis
References (PVD-6.9)

- Advanced imaging is not sensitive enough to detect changes in small vessels, and is not indicated for primary assessment of any small vessel vasculitis.
- End-organ damage occurs with several of the small vessel vasculitides. Advanced imaging indicated for the following:
 - Henoch-Schönlein Purpura (HSP)
 - Granulomatosis with polyangiitis (GPA, formerly known as Wegener's granulomatosis)
 - Eosinophilic granulomatosis with polyangiitis (EGPA, formerly known as ChurgStrauss Syndrome)
 - Immune complex associated small-vessel vasculitis [immunoglobulin A–associated vasculitis (IgAV)]

IgA vasculitis Henoch-Schönlein Purpura (HSP)

Initial imaging

Ultrasound (US) Abdomen (CPT® 76700) is indicated to evaluate possible gastrointestinal complications of known or suspected HSP including **any** of the following:

- Bowel wall edema and hemorrhage
- Intussusception

CT Abdomen with contrast (CPT® 74160) if additional information is needed after ultrasound for management

Repeat imaging

US Abdomen (CPT® 76700) is indicated for known HSP to evaluate new or worsening gastrointestinal symptoms

Background and Supporting Information

Henoch-Schönlein Purpura (HSP) is the most common vasculitis of childhood, mainly involving small blood vessels. .

Granulomatosis with polyangiitis (GPA) formerly Wegener's granulomatosis**Initial imaging**

CT Sinuses (CPT® 70486) and/or CT Chest without contrast (CPT® 71250) or with contrast (CPT® 71260) is indicated to evaluate the extent of the disease

Repeat imaging

CT Sinuses (CPT® 70486) and/or CT Chest without contrast (CPT® 71250) or CT Chest with contrast (CPT® 71260) is indicated for **any** following:

- New or worsening clinical symptoms affecting the body area requested
- Assess response to medical therapy when a change in treatment regimen is being considered
- Annually-to evaluate the extent of disease

Eosinophilic granulomatosis with polyangiitis (EGPA) formerly Churg-Strauss Syndrome**Initial imaging**

- CT Chest without contrast (CPT® 71250) or CT Chest with contrast (CPT® 71260) is indicated in the initial evaluation of Eosinophilic granulomatosis with polyangiitis (EGPA) formerly known as Churg-Strauss Syndrome.

Repeat imaging

- CT Chest without contrast (CPT® 71250) or CT Chest with contrast (CPT® 71260) is indicated for any of the following:
 - New or worsening clinical symptoms affecting the body area requested
 - Assess response to medical therapy when a change in treatment regimen is being considered
 - Annually-to evaluate the extent of disease

Immune complex associated small-vessel vasculitis**Initial imaging**

- Doppler ultrasound (US) of the affected body part (most commonly abdomen) is indicated in the initial evaluation of immune complex associated small-vessel vasculitis

Repeat imaging

- Doppler ultrasound (US) of the affected body part (most commonly abdomen) is indicated in the following circumstances
 - New or worsening clinical symptoms affecting the body area requested
 - To assess response to medical therapy when a change in treatment is being considered
 - Annually-to evaluate the extent of disease

Peripheral Arterial Imaging

Guideline

Upper Extremity PVD – Imaging (PVD-4.1)
Renovascular Hypertension/Renal Artery Stenosis (PVD-6.6)
Visceral Artery Aneurysm (PVD-6.5)
Median Arcuate Ligament Syndrome, Nutcracker Syndrome and other Abdominal Vascular Compression Syndromes (PVD-18)
Lower Extremity Artery Aneurysms (PVD-7.4)
Claudication and Critical Limb Ischemia (PVD-7.1)
Popliteal Artery Entrapment Syndrome (PVD-7.2)
Post-Procedure Surveillance Studies (PVD-7.3)
Arterial Imaging for Free Flaps in Reconstructive Surgery (PVD-7.5)
Arteriovenous Malformations (AVMs) (PVD-9.1)

Upper Extremity PVD – Imaging (PVD-4.1)

PVD.AI.0004.1.A
v1.0.2024

Initial Imaging

- Arterial ultrasound upper extremities (CPT® 93930 or CPT® 93931) for signs and symptoms of arterial insufficiency including:
 - Arm or hand claudication, cramping or fatigue of the unilateral extremity with use or with raising limb overhead that is relieved with rest and is reproducible. See **Subclavian Steal Syndrome (CH-27)** in the Chest Imaging Guidelines
 - Systolic blood pressure differential between arms of >15mmHg. See **Subclavian Steal Syndrome (CH-27)** in the Chest Imaging Guidelines
 - Bluish discoloration of the hand or fingers
 - Unilateral cold, painful, pulseless hand
 - Non-healing wound (>2 weeks with no healing or evidence of healing) or frank gangrene
- CTA Upper extremity (CPT® 73206) or MRA of Upper extremity (CPT® 73225), **and/or** CTA Chest (CPT® 71275) or MRA Chest (CPT® 71555) for:
 - Abnormal results
 - Equivocal results
 - Pre-operative planning
- For suspected Fibromuscular Dysplasia of the brachial artery, appropriate studies include:
 - MRA Upper extremity (CPT® 73225)
 - CTA Upper extremity (CPT® 73206)
 - Arterial Ultrasound (CPT® 93930 bilateral study or CPT® 93931 unilateral study)

Post-revascularization

- Arterial Duplex (CPT® 93931) can be obtained following upper extremity arterial revascularization at:
 - Baseline (within one month)
 - 6 months
 - Then annually if stable
 - Anytime for new or worsening symptoms of arterial insufficiency

Renovascular Hypertension/Renal Artery Stenosis (PVD-6.6)

PVD.AI.0006.6.A

v1.0.2024

Initial imaging

- MRA Abdomen (CPT® 74185) or CTA Abdomen (CPT® 74175) or US kidney retroperitoneal (CPT® 76775) and/or Doppler (CPT® 93975, 93976, 93978, or 93979 if expertise is available) are indicated when there is documentation of **any** of the following:
 - Individual is adherent to full doses of three blood pressure medications (including a diuretic) yet has still not achieved goal
 - Sudden and persistent worsening of previously controlled hypertension
 - Onset of hypertension younger than 30 years of age
 - Malignant hypertension with coexistent evidence of acute end-organ damage (acute renal failure, new visual or neurological disturbance and/or advanced retinopathy) or flash pulmonary edema
 - Individuals who develop hypertension ($\geq 140/90$) within the first 20 weeks of pregnancy when hypertension persists >12 weeks post-partum
 - New or worsening renal function/increasing creatinine (especially after the administration of an ACE inhibitor or with angiotensin receptor blocking agent)
- Carotid duplex (CPT® 93880) is reasonable to screen for carotid involvement in individuals with documented or highly suspicious renal artery stenosis due to fibromuscular dysplasia (mostly women between 15 and 50 years of age).

Screening

CTA Abdomen (CPT® 74175) or MRA Abdomen (CPT® 74185) to screen for renovascular fibromuscular dysplasia in hypertensive individuals with documented cervicocephalic fibromuscular dysplasia. The assessment of other vascular beds should be considered if supported by suggestive symptoms or medical history.

Carotid duplex (CPT® 93880) is reasonable to screen for carotid involvement in individuals with documented or highly suspicious renal artery stenosis due to fibromuscular dysplasia (mostly women between 15 and 50 years of age)

Repeat imaging post revascularization

- CTA Abdomen (CPT® 74175), or MRA Abdomen (CPT® 74185), or CT Abdomen with contrast (CPT® 74160) is indicated after stent placement at the following intervals:
 - 1 month post-procedure

- 6 months post-procedure
- 12 months post-procedure
- Then annually

Background and Supporting Information

Renal artery revascularization has **not** been shown to be more effective than medical therapy in most situations and should not be pursued except in extreme cases, or if there is concern for Takayasu arteritis or fibromuscular dysplasia.

Gadolinium agents may be contraindicated in individuals with severe renal disease or on dialysis due to the risk of developing nephrogenic systemic sclerosis

Visceral Artery Aneurysm (PVD-6.5)

PVD.AD.0006.5.A

v1.0.2024

- Treatment is generally indicated for visceral aneurysms ≥ 2 cm.
- Workup for suspected visceral artery aneurysm (spleen, kidney, liver or intestines) if calcifications seen on plain film imaging can include:
 - Ultrasound (CPT® 76700, 76705, 93975, 93976, 93978, or 93979), or
 - CTA Abdomen (CPT® 74175), or
 - CT Abdomen with contrast (CPT® 74160).
- Ultrasound (CPT® 76700, 76705, 93975, 93976, 93978, or 93979) **or** CTA Abdomen (CPT® 74175) **or** CT Abdomen with contrast (CPT® 74160) for further monitoring based on the intervals below or as determined by a vascular specialist or any provider in consultation with a vascular specialist:
 - Splenic artery aneurysms:
 - < 20 mm can be imaged every three years
 - 20mm to 29mm can be imaged annually
 - If ≥ 30 mm, they should be referred for treatment, either stent, excision or splenectomy
 - For all other visceral artery aneurysms:
 - Initial evaluation with six-month follow-up for one year
 - Further follow-up annually if no significant enlargement is seen
- CTA Abdomen (CPT® 74175), MRA Abdomen (CPT® 74185), or CT Abdomen with contrast (CPT® 74160) are indicated following stent placement at:
 - 1 month
 - 6 months
 - 12 months
 - Then every year

Background and Supporting Information

- Splenic artery aneurysms, the most common (60%), tend to exhibit very slow rates of growth, while the other visceral artery aneurysms are more unpredictable in their rate of growth with a greater tendency to rupture.
- Visceral Artery Aneurysms are defined by an increase of more than 50% of the original arterial diameter and include hepatic, renal and intestinal artery aneurysms.
- Vascular specialty consultation is beneficial in order to determine the time-frame to intervention.

Median Arcuate Ligament Syndrome, Nutcracker Syndrome and other Abdominal Vascular Compression Syndromes (PVD-18)

PVD.AI.0018.A

v1.0.2024

Guideline

Median Arcuate Ligament Syndrome
Left Renal Vein Compression (“Nutcracker”) Syndrome

Median Arcuate Ligament Syndrome

Codes included

CPT®	Description
74175	Computed tomographic angiography, abdomen, with contrast material(s), including noncontrast images, if performed, and image postprocessing
74185	Magnetic resonance angiography, abdomen, with or without contrast material(s)
93975	Duplex scan of arterial inflow and venous outflow of abdominal, pelvic, scrotal contents and/or retroperitoneal organs; complete study
93976	Duplex scan of arterial inflow and venous outflow of abdominal, pelvic, scrotal contents and/or retroperitoneal organs; limited study

Initial Imaging

- Duplex Doppler Ultrasound of Mesenteric Arteries (CPT® 93975 or 93976) is indicated as the initial imaging
- CTA or MRA Abdomen (CPT® 74175 or 74185) is indicated for **either**:
 - US results are equivocal
 - Preoperative planning

Repeat imaging

- Surveillance imaging is not indicated post-operatively in the absence of abdominal symptoms.

Background and supporting information

A non-atherosclerotic cause of chronic mesenteric ischemia.

Patients are typically younger with an average age range of 30-50 years old and a female to male ratio of 4:1

Patients may have symptoms of postprandial abdominal pain, nausea, vomiting, food aversion, weight loss. Symptoms are nonspecific, so MALS may be considered a diagnosis of exclusion.

Imaging will demonstrate compression of the celiac artery by fibers of the median arcuate ligament, but this is a nonspecific finding and may be seen in the asymptomatic population.

Pathophysiologically related to foregut ischemic from compression of the celiac artery; may also be related to neuropathic pain secondary to compression of the celiac ganglion.

Treatment is generally surgical, via a variety of approaches.

Left Renal Vein Compression ("Nutcracker") Syndrome

Codes included

CPT®	description
93975	Duplex scan of arterial inflow and venous outflow of abdominal, pelvic, scrotal contents and/or retroperitoneal organs; complete study
93976	Duplex scan of arterial inflow and venous outflow of abdominal, pelvic, scrotal contents and/or retroperitoneal organs; limited study
74174	Computed tomographic angiography, abdomen and pelvis, with contrast material(s), including noncontrast images, if performed, and image postprocessing
72198	Magnetic resonance angiography, pelvis, with or without contrast material(s)

CPT®	description
74185	Magnetic resonance angiography, abdomen, with or without contrast material(s)

Initial Imaging

- Abdominal duplex (CPT® 93975 or 93976) is indicated as the initial imaging to confirm left renal vein compression syndrome.
- CTV or MRV Abdomen and Pelvis (CPT® 74174) or (CPT® 74185 and 72198) is indicated for preoperative planning when left renal vein compression syndrome is confirmed by duplex ultrasound.

Repeat imaging

- Postoperative follow up imaging is not indicated in the absence of symptomatology.

Background and supporting information

Patients may present with symptoms related to compression of the left renal vein between the aorta and superior mesenteric artery. A less common presentation (“posterior nutcracker syndrome”) is related to compression of a retroaortic (or circumaortic) left renal vein between the aorta and vertebral body.

The radiologic finding may be asymptomatic or considered a normal variant.

Signs/symptoms may include hematuria, proteinuria, flank pain, pelvic congestion/associated pain in females, varicocele in males.

There may be an overlap in symptom complex with patients who have pelvic congestion syndrome, iliac vein compression (May-Thurner).

There is no single accepted treatment modality. Approaches will range from conservative/medical (esp in younger patients), to endovascular, to open/laparoscopic/robotic surgical.

Lower Extremity Artery Aneurysms (PVD-7.4)

PVD.AI.0007.4.A

v1.0.2024

- For Iliac artery aneurysm see **Iliac Artery Aneurysm (IAA) (PVD-6.4)**
- Femoral artery aneurysm
 - Initial imaging
 - Ultrasound (CPT® 93925 bilateral study or CPT® 93926 unilateral study).
 - Surveillance imaging
 - Symptomatic true femoral aneurysms smaller than 2.5 cm in diameter
 - Ultrasound (CPT® 93926 unilateral study) annually
 - Symptomatic true femoral aneurysms larger than 2.5 cm
 - Ultrasound (CPT® 93926 unilateral study) every 6 months
 - Other imaging
 - CTA or MRA Lower extremity (CPT® 73706 or 73725 or 74198 or 75635):
 - Preoperative study for individuals with no plans for invasive angiography
 - Technically limited or abnormal ultrasound results
- Popliteal artery aneurysm
 - Initial imaging
 - Ultrasound (CPT® 93925 bilateral study or CPT® 93926 unilateral study) and Ultrasound to assess for a contralateral popliteal aneurysm and abdominal aortic aneurysm (CPT® 76770 or CPT® 76775)
 - Surveillance imaging
 - Ultrasound (CPT® 93926 unilateral study) annually
 - Post-interventional functional testing (ABI) (CPT® 93922) may be useful as clinically indicated
 - Other imaging
 - CTA or MRA (CPT® 73706 or 73725 or 74185 or 75635) for:
 - Preoperative study
 - Technically limited or abnormal ultrasound results

Claudication and Critical Limb Ischemia (PVD-7.1)

PVD.AI.0007.1.A

v1.0.2024

- Resting ABI for initial evaluation of suspected PAD. This can be accomplished at the bedside as part of the physical examination or requested as CPT® 93922 (limited Doppler ultrasound) or CPT® 93923 (multi-level complete Doppler ultrasound)
 - CPT® 93923 may be performed once
 - Follow-up studies may be performed with CPT® 93922
 - Post-exercise ABI (CPT® 93924) can be performed if the resting ABI is >0.89 and PAD is still highly suspected clinically.
- History and physical suggestive of PAD include:
 - History
 - Claudication- reproducible calf or thigh cramping with exertion that is relieved completely with rest
 - Critical limb ischemia
 - Rest pain suggestive of ischemia-pain in the ball of foot when the leg is in an elevated position particularly at night
 - Distal non-healing wound or punched out ulcer with sharply demarcated edges present for >2 weeks with no evidence of healing, i.e. presence of granulation tissue
 - Physical Examination
 - Abnormal lower extremity pulse examination
 - Vascular bruit
 - Non-healing lower extremity wound
 - Lower extremity gangrene
 - Other suggestive lower extremity physical findings (e.g., elevation pallor/dependent rubor)
 - Atrophic nails, hair loss, shiny skin
- If resting ABI (CPT® 93922) is normal (0.9 to 1.3) and disease is still suspected:
 - Differentiate from “pseudoclaudication”. See **Lumbar Spinal Stenosis (SP-9)** in the Spine Imaging Guidelines
 - Re-measure ABI after exercise (CPT® 93924)
 - A TBI (toe-brachial index) may be used as further screening in individuals with ABI's ≥ 1.4
 - Advanced imaging is necessary only if there is consideration for invasive therapy not to confirm diagnosis

- Duplex ultrasound (CPT® 93925 bilateral study or CPT® 93926 unilateral study) and Doppler studies are adjuncts to abnormal ABI that may be used to identify location and extent of disease once there has been a decision for revascularization.
- MRA Aorta and Pelvic vessels, and Lower extremities (CPT® 74185, CPT® 73725 and CPT® 73725), **or** CTA with run-off (CPT® 75635) to further evaluate the lower extremity arteries for **ANY** of the following:
 - Potentially limb-threatening vascular disease evidenced by:
 - Skin breakdown
 - Non-healing ischemic ulcers
 - Resting leg pain
 - Gangrene
 - Blue Toe Syndrome:
 - Emboli from aortic plaque or mural thrombus
 - Hyperviscosity syndrome
 - Hypercoagulable states
 - Vasculitis
 - Preoperative planning for Intermittent claudication (i.e., non-limb threatening ischemia) **AND** there is documentation of both of the following:
 - Failed 3-months' conservative medical therapy (physician supervised walking/exercise program plus medical therapy)
 - Functional disability (e.g., exercise impairment sufficient to threaten the individual's employment or to require significant alterations in the individual's lifestyle)
 - CTA lower extremity (CPT® 73706) OR MRA lower extremity (CPT® 73725) can be approved for evaluation of PVD when aortoiliac disease is not a concern or the state of the aorta and iliac arteries is already known as documented in the clinical history

Note MRA Pelvis (CPT® 72198) should not be requested/billed with CPT® 74185, CPT® 73725 and CPT® 73725

Background and Supporting Information

Claudication symptoms usually remain stable (70% to 80% of individuals) and do not worsen or improve at rapid rates. Repeat studies to assess the efficacy of medical therapy are not indicated unless there is a negative change in clinical status for the purpose of preoperative planning such as worsening claudication or progression to critical limb ischemia.

Popliteal Artery Entrapment Syndrome (PVD-7.2)

PVD.AI.0007.2.A

v1.0.2024

- Diagnosis of popliteal artery stenosis or occlusion due to compression by adjacent muscle and tendons:
 - Ultrasound (CPT® 93926 unilateral study), CTA Lower extremity (CPT® 73706), or MRA Lower extremity (CPT® 73725).
 - CT or MRI Lower Extremity (contrast as requested) if requested by the operating surgeon

Background and Supporting Information

Popliteal Artery Entrapment Syndrome is typically seen in young men (ages 20 to 40) but is not exclusive to this gender or age group.

Post-Procedure Surveillance Studies (PVD-7.3)

PVD.AI.0007.3.A

v1.0.2024

- Scheduled Interval
 - ABI (CPT® 93922) following any revascularization procedure
 - ABI (CPT® 93922) or Duplex ultrasound (CPT® 93926 unilateral study) at each routine follow up is indicated generally after a history/physical has been performed
 - Further imaging studies such as CTA or MRA are indicated for worsening symptoms, an abnormal duplex or a significant reduction (>0.15) in the ABI

Indication	Imaging
Suprainguinal Revascularization, both open and endovascular therapy, including Aortobifem/iliofem/fem-fem bypass/iliac angioplasty/stent	<ul style="list-style-type: none"> • Clinical examination and ABI (CPT® 93922) with arterial duplex (CPT® 93978 or CPT® 93979) at: <ul style="list-style-type: none"> • Within 1 month • 6 months • 12 months • Then annually
Infrainguinal Open Revascularization (Femoral-popliteal, femoral-tibial, femoral-distal bypass)	
<ul style="list-style-type: none"> • With vein or autologous conduit 	<ul style="list-style-type: none"> • Clinical exam and ABI (CPT® 93922) with arterial duplex (CPT® 93978 or CPT® 93979) <ul style="list-style-type: none"> • Post-operatively • 3 months • 6 months • 12 months • Then annually
<ul style="list-style-type: none"> • With Prosthetic conduit (PTFE/Dacron) 	<ul style="list-style-type: none"> • Clinical exam and ABI (CPT® 93922) with arterial duplex (CPT® 93978 or CPT® 93979) <ul style="list-style-type: none"> • Post-operatively • 6 months • 12 months • Then annually

Indication	Imaging
Infrainguinal Endovascular Revascularization Femoropopliteal angioplasty/stent	<ul style="list-style-type: none"> Clinical exam and ABI (CPT® 93922) with arterial duplex (CPT® 93978 or CPT® 93979): <ul style="list-style-type: none"> Within 1 month 3 month Every 6 months for two years Then annually

After suprainguinal intervention (PVD-7.3.1)

- One of the following studies: Arterial duplex, CTA Abdomen and Pelvis, CT Abdomen and Pelvis with contrast, CTA Aorta with lower extremity runoff, MRI Abdomen and Pelvis, MRA Abdomen and Pelvis, or MRA Aorta with lower extremity runoff for any **one** of the following:
 - Worsening signs or symptoms
 - Reduction of ABI >0.15
 - Peak systolic velocities or PSV ratio suggestive of high grade stenosis or in-stent re-stenosis

After infrainguinal intervention (PVD-7.3.2)

- CTA Lower Extremity (CPT® 73706) or MRA Lower Extremity (CPT® 73725) or CTA aorta with lower extremity runoff CPT® 75635) for any **one** of the following:
 - Worsening signs or symptoms
 - Reduction of ABI >0.15
 - Duplex suggestive of threatened graft
- If intervention was performed for a non-healing wound and wound has gone on to heal, no additional imaging is recommended for surveillance.
- Repeat arterial duplex imaging can be obtained for worsening clinical signs and symptoms such as the presence of a new wound or rest pain

Arterial Imaging for Free Flaps in Reconstructive Surgery (PVD-7.5)

PVD.AI.0007.5.A

v1.0.2024

- For breast reconstruction preoperative planning. See **Breast Reconstruction (BR-3)** in the Breast Imaging Guidelines
- For head and neck reconstruction, CTA or MRA unilateral lower extremity (CPT® 73706 or 73725) of the harvest site is indicated for evaluation of perforator anatomy for planned fibular flap

Arteriovenous Malformations (AVMs) (PVD-9.1)

PVD.AI.0009.1.A

v1.0.2024

- See **Pulmonary AVMs (CH-24.1)** in the Chest Imaging Guidelines
- See **Arteriovenous Malformations (AVMs) and Related Lesions (HD 12.2)** in the Head Imaging Guidelines
- See **Arteriovenous Malformations (AVMs) and Fistulas (PEDPVD-2.5)** in the Pediatric Peripheral Vascular Disease Imaging Guidelines
- See **Pelvic Pain/Dyspareunia, Female (PV-11.1)** in the Pelvis Imaging Guidelines

Initial imaging

- Ultrasound with Doppler is indicated as an initial examination for superficial lesions in the limbs.
 - Large lesion characterization may be limited by ultrasound imaging window.
 - Ultrasound is also limited in evaluating AVM relationship to airway or bony structures.

Evaluation and surveillance

- MRI without contrast or without and with contrast of the affected body part is the study of choice for abdominal AVMs and deep tissue (below the skin) AVM's in the limbs.
- MRA (contrast as requested) of the affected body part can be approved for evaluation and surveillance of known AVMs.
- It is unusual for both MRI and MRA to be necessary for routine treatment response or surveillance imaging of AVMs, but both may be approved for preoperative planning.
- CT and CTA can also be used to characterize AVMs and their relationship to normal structures but is generally not better than MRI and has associated radiation risks.
 - CT with contrast and/or CTA (contrast as requested) of the affected body part can be approved when MRI and/or MRA is inconclusive or contraindicated.

Post-embolization

- Advanced imaging can be approved one-time post-embolization to evaluate for successful resolution of the AVM.
- Additional imaging (same study performed pre-procedure or as requested by the treating provider) can be approved for treatment planning purposes if resolution of the AVM was not achieved.

Background and Supporting Information

Arteriovenous malformations are characterized by a network of multiple abnormal vascular channels interposed between enlarged feeding arteries and draining veins. The arteriovenous fistula has a single communication interposed between a feeding artery and a draining vein. The normal capillary bed is absent in both lesions. Both lesions may have an aggressive clinical course and are characterized by a reddish pulsatile mass which has a thrill or bruit. Though often recognized at birth, these lesions may grow and present near adolescence.

Venous imaging - General guidelines (PVD-11.2)

Procedure Coding (PVD-11.3)

References

Abbreviations and glossary (PVD-11.1)

Abbreviation	Definition
CTV	Computed Tomography Venography
DVT	Deep Venous Thrombosis
EVA	Endovenous ablation – a minimally invasive procedure using heat to obliterate the saphenous vein for the treatment of venous reflux
IVC	Inferior vena cava
May-Thurner's	Syndrome of compression of the left iliac vein via an overlying right common iliac artery. The pulsations of the artery into the vein against the 5 th lumbar vertebrae can predispose to DVT
MRV	Magnetic Resonance Venography
Phlebectomy	Removal of a vein usually through a small incision
Post-thrombotic syndrome	Constellation of symptoms including chronic edema and pain that develops after a DVT
Sclerotherapy	Injection of an irritant into a vein to obliterate it
SEPS	Sub-fascial endoscopic perforator surgery
SVT	Superficial venous thrombosis
VVI	Venous Valvular Insufficiency – a study utilizing ultrasound to assess for the presence of reflux within the superficial and deep veins of the lower extremity.

Venous imaging - General guidelines (PVD-11.2)

- A current clinical evaluation (within 60 days), including medical treatments, are required prior to considering advanced imaging, which includes:
 - Relevant history and physical examination including:
 - The affected limb(s), the extent of the edema (calf and/or thigh), pitting or non-pitting. With regard to venous insufficiency, presence or absence of

- hyperpigmentation or other skin changes, ulcerations if applicable, size of varicosities if present as well as distribution
- Arterial examination to rule out phlegmasia alba/cerulea dolens which is comprised arterial flow secondary to extensive DVT if applicable
- Appropriate laboratory studies, for example d-dimer, if applicable
- Non-advanced imaging modalities, such as a venous duplex or venous valvular insufficiency study (VVI) after symptoms started or worsened
- Other meaningful contact (telephone call, electronic mail or messaging) by an established patient can substitute for a face-to-face clinical evaluation.
- **General Guidelines-Imaging (PVD-11.4)**
 - Venous duplex (CPT® 93970, CPT® 93971) of the limb is the initial imaging of choice
 - Follow-up duplex imaging (CPT® 93970, CPT® 93971) is not generally indicated to document resolution and should only be obtained for new signs/symptoms or for concerns of propagation of thrombus when the treatment plan would change (Insertion of IVC filter, change of anticoagulation, etc.)
 - Imaging studies
 - Venous duplex (CPT® 93970, CPT® 93971) should visualize the veins, with demonstration of the presence or absence of compressibility and venous flow.
 - Venous valvular insufficiency studies (CPT® 93970, CPT® 93971) visualize the veins of the lower extremity, assess for reflux (reversal of venous antegrade flow after valve closure) and measure its duration.
 - CTV or MRV Abdomen and Pelvis (CPT® 74174) or (CPT® 74185 and 72198) images with contrast involves taking images from the diaphragm to just below the inguinal ligament after a delay of a few minutes after IV contrast is administered to optimize filling and therefore visualization of the venous vasculature

Background and Supporting Information

Venous disease can be classified into three categories:

- **Veno-occlusive disease**
 - Types of thrombotic disease
 - Superficial venous thrombosis
 - Deep venous thrombosis
 - Iliac vein obstruction, unilateral or bilateral
 - May-Thurner's syndrome
 - Signs/Symptoms of veno-occlusive disease is generally sudden onset of pain and edema in the limb.

- Risk factors include age >40, obesity, pregnancy, prolonged immobility, post-surgery, and malignancy among others.
- Procedures related to veno-occlusive disease include:
 - Thrombolysis
 - Thrombectomy
 - Post-iliac vein stent/angioplasty
- **Venous insufficiency**
 - Types of venous insufficiency:
 - Superficial and deep venous reflux
 - Varicose veins
 - Reticular and spider veins.
 - Signs/symptoms of venous insufficiency include:
 - Chronic swelling in the leg that is relieved with elevation
 - Chronic swelling in the leg that is worse in the evenings
 - Aching or sense of heaviness in the leg
 - Hyperpigmentation of the calf particularly around the ankle
 - Itchy skin on legs and feet
 - Leather appearance of the skin of the calves
 - Skin ulcers in the calf particularly around the medial malleolus
 - Varicose veins
 - Spider veins/reticular veins/telangiectasias
 - Procedures related to the venous insufficiency include:
 - Endovenous laser ablation utilizing either chemical, laser or radio-frequency
 - Saphenous vein high ligation and stripping
 - Phlebectomy, stab or powered
 - Sclerotherapy, liquid or foam
- **Venous malformations**
 - Types of venous malformations include:
 - Arterio-venous malformations which can occur throughout the body
 - See **Pulmonary AVM (CH-24)** in the Chest imaging guidelines
 - See **Aneurysm and AVM (HD-12)** in the Head imaging guidelines
 - See **Pelvic Pain/Dyspareunia, Female (PV-11)** in the Pelvic imaging guidelines
 - Klippel-Trenaunay which affects primarily the lower extremity venous circulation and is characterized by varicose veins, limb size discrepancies, and port-wine stains.
 - Treatment includes:
 - Primarily embolization
 - Sclerotherapy

- Klippel-Trenaunay: treatment can include phlebectomy and sclerotherapy of symptomatic varicose veins provided they meet the criteria for intervention.

Procedure Coding (PVD-11.3)

Venous Studies – Extremities	CPT®
CTV Abdomen and Pelvis involves obtaining images from the diaphragm to just below the inguinal ligament after a delay of a few minutes after IV contrast is administered to optimize filling and therefore visualization of the venous vasculature.	74174
CTV Pelvis involves obtaining images from the top of the pelvic brim to the upper thighs or just below the inguinal ligament. The venogram portion is performed by obtaining images after a delay of a few minutes after IV contrast is administered to optimize filling and therefore visualization of the venous vasculature.	72191
MRV Abdomen and Pelvis involves taking images from the diaphragm to just below the inguinal ligament after a delay of a few minutes after IV contrast is administered to optimize filling and therefore visualization of the venous vasculature.	74185 and 72198
MRV Pelvis involves obtaining images from the top of the pelvic brim to the upper thighs or just below the inguinal ligament. The venogram portion is performed by obtaining images after a delay of a few minutes after IV contrast is administered to optimize filling and therefore visualization of the venous vasculature.	72198
Duplex scan of extremity veins, including responses to compression and other maneuvers; complete bilateral study.	93970
Duplex scan of extremity veins, including responses to compression and other maneuvers; unilateral or limited study.	93971
<ul style="list-style-type: none"> • These codes are used to report studies of lower or upper extremity veins. • A complete bilateral study of the lower extremity veins includes examination of the external iliac veins, common femoral, proximal deep femoral, great saphenous and popliteal veins. Calf veins may also be included. • A complete bilateral study of upper extremity veins includes examination of the subclavian, jugular, axillary, brachial, basilic, and cephalic veins. Forearm veins may also be included. 	
Duplex scan of aorta, inferior vena cava, iliac vasculature, or bypass grafts; complete study	93978
Duplex scan of extremity veins, including responses to compression and other maneuvers; unilateral or limited study.	93979

Upper Extremity Venous – Imaging (PVD-4.2)

PVD.AI.0004.1.A

v1.0.2024

- For symptoms of venous insufficiency including but not limited to unilateral pain and swelling of the upper extremity
 - Venous duplex upper extremities (CPT® 93970 or CPT® 93971) should be performed initially
 - If duplex ultrasound is non-diagnostic:
 - MRV Upper extremity (CPT® 73225) and/or MRV Chest (CPT® 71555), or
 - CTV Upper extremity (CPT® 73206) and/or CTV Chest (CPT® 71275)
 - CTV Upper extremity (CPT® 73206) or MRV Upper extremity (CPT® 73225), and/or CTV Chest (CPT® 71275) or MRV Chest (CPT® 71555) can be performed if there is a history of exertion with the limb such as with weight lifting or in the presence of central venous access (port, PICC line, to name a few) with a negative venous duplex. See **Thoracic Outlet Syndrome (CH-31.1)** in the Chest Imaging Guidelines.
- For Superior Vena Cava Syndrome (upper extremity and facial symptoms) **one** of the following can be approved when stenting of the SVC is being considered:
 - CT Chest with contrast (CPT® 71260)
 - MRV Chest (CPT® 71555)
 - CTV Chest (CPT® 71275)

Acute Limb Swelling (PVD-12)

PVD.VI.0012.A

v1.0.2024

Guideline

Superficial venous thrombosis (SVT) (PVD-12.1)
Acute deep venous thrombosis (DVT) (PVD-12.2)
Follow-up imaging of known DVT (PVD-12.3)
Follow-up imaging after venous surgery (PVD-12.4)
Generalized bilateral lower extremity edema (PVD-12.5)
References

Superficial venous thrombosis (SVT) (PVD-12.1)

- The diagnosis of superficial venous thrombosis is generally made on the basis of physical examination.
 - Duplex ultrasound (CPT® 93970, CPT® 93971) is the initial imaging if the diagnosis is equivocal
 - Follow-up duplex ultrasound (CPT® 93970, CPT® 93971) is indicated only if thrombus in the superficial systems is encroaching onto the deep venous system (saphenofemoral or saphenopopliteal junction)

Background and Supporting Information

Superficial venous thrombosis (SVT) refers to acute or chronic thrombosis of the superficial veins in both the upper (cephalic and basilic veins) and lower extremities (greater [great] saphenous vein, lesser [small] saphenous vein, gastrocnemius and soleal veins). Treatment: Elevation and warm compresses until pain and swelling subsides.

Acute deep venous thrombosis (DVT) (PVD-12.2)

- Duplex ultrasound (CPT® 93970 bilateral study or CPT® 93971 unilateral study) is the initial imaging study for any suspected DVT
 - Deep venous thrombosis can present as
 - Symptomatic
 - Swelling
 - Pain
 - Warmth
 - Erythema
 - Pain with dorsiflexion of the foot (Homan's Sign)
 - Or with progression, such as phlegmasia cerulean dolens
 - Risk factors for DVT include age >40, obesity, malignancy, prolonged immobilization, hypercoagulability as well as those outlined in **Pulmonary Embolism (PE) (CH-25)** in Chest Imaging Guidelines.

- CTA/CTV Abdomen and pelvis with contrast can be performed to rule out IVC thrombus secondary to the filter when there is acute bilateral lower extremity swelling in an individual with a history of an IVC filter in place.
- When there is concern for proximal DVT (iliofemoral):
 - Focused abdominal duplex can generally visualize the iliac veins and IVC to determine the absence or presence of iliac vein thrombus in an individual. If the results are equivocal or indeterminate:
 - CTV or MRV Abdomen and Pelvis with contrast (CPT® 74174 or CPT® 74185 and CPT® 73725) can be performed.
- For request concerning abdominal vein thrombosis, see **Abdominal Veins other than Hepatic and Portal Veins (AB-43.2)** in the Abdomen Imaging Guidelines
- For proximal DVT's (iliac vein DVT's or in cases of phlegmasia (extensive DVT compromising arterial inflow), thrombectomy (rarely performed) or thrombolysis can be performed.
- If the cause of the DVT is found to be due to May-Thurner, iliac vein angioplasty followed by stenting of the left iliac vein is generally performed. See **May-Thurner Syndrome (PVD-13.3)**

Background and Supporting Information

Deep venous thrombosis is characterized by thrombosis of a deep vein in either the upper (brachial, axillary, subclavian veins) or the lower extremity (peroneal, posterior tibial, popliteal, femoral or iliac veins).

Follow-up imaging of known DVT (PVD-12.3)

- Duplex ultrasound (CPT® 93970 bilateral study or CPT® 93971 unilateral study) can be repeated in order to rule out proximal extension of a calf vein DVT in those individuals who cannot be anticoagulated, most commonly after recent surgery. Time interval for follow-up study includes:
 - One week after the initial diagnosis.
 - Serial imaging (up to 3 studies) over the first three weeks if calf DVT is not treated.
- Imaging during or to terminate long-term anticoagulation therapy to determine venous recanalization is not supported by evidence. Repeat imaging to make decisions on whether or not to continue or terminate anticoagulation is not indicated.

Follow-up imaging after venous surgery (PVD-12.4)

- Venous duplex (CPT® 93971 unilateral study) of the treated limb is indicated to rule out a DVT within seven days of endovenous ablation.
- Follow-up routine imaging is **not indicated** after other venous procedures including:
 - Saphenous vein ligation and stripping
 - Phlebectomy
 - Sclerotherapy

Generalized bilateral lower extremity edema (PVD-12.5)

Bilateral lower extremity edema is multifactorial. Prior to any request for advanced imaging, a workup for causes of the edema should be instituted including echocardiogram to rule out congestive heart failure and laboratory studies to exclude renal insufficiency and liver disease. The following imaging is indicated based on the suspected cause of the edema:

- Suspected abdominal or pelvic pathology
 - Abdominal ultrasound or duplex is the initial imaging
 - CT Abdomen and Pelvis or CT pelvis either with or without contrast can be performed if abdominal US is equivocal or indeterminate
- Suspected chronic venous insufficiency
 - A venous duplex CPT® 93970 (bilateral) or CPT® 93971 (unilateral) is indicated to evaluate for venous reflux.
- Suspected lymphedema
 - When initial noninvasive studies, such as ultrasound, are negative for venous valvular insufficiency **either** of the following advanced imaging studies is indicated:
 - Lymphoscintigraphy (CPT® 78195)
 - MRI lymphangiography (CPT® 73718)

Chronic limb swelling due to chronic deep venous thrombosis (DVT)/May-Thurner syndrome (PVD-13)

PVD.VI.0013.A

v1.0.2024

Guideline

Chronic DVT with incompletely lysed or residual DVT (PVD-13.1)

Post-thrombotic syndrome (PVD-13.2)

May-Thurner syndrome (PVD-13.3)

Pelvic congestion syndrome (PVD-13.4)

References

Chronic DVT with incompletely lysed or residual DVT (PVD-13.1)

Individuals with incompletely lysed or residual DVT can develop post-thrombotic syndrome that can be characterized as chronic edema, venous stasis changes, pain and in advanced cases venous stasis ulceration.

- Imaging is indicated to evaluate for iliac venous obstruction from incompletely lysed thrombus in individuals with a history of proximal (iliofemoral) DVT who have developed post thrombotic syndrome.
 - Initial imaging is duplex (CPT® 93970 bilateral study or CPT® 93971 unilateral study)
 - Either a CTV or MRV Abdomen and Pelvis (CPT® 74174) or (CPT® 74185 and 72198) OR CTV Pelvis (CPT® 72191) or MRV Pelvis (CPT® 72198), or venography for treatment planning purposes.
- Imaging for post-thrombotic syndrome is only indicated for **either**:
 - Signs and symptoms suggestive of a new acute DVT
 - Preoperative planning for iliac vein/stenting for suspected iliac vein stenosis or occlusion

Background and Supporting Information

- Chronic deep venous thrombosis is defined as an acute DVT that is greater than 14 days old.
- Incompletely lysed DVT can cause luminal narrowing of the vein restricting venous outflow leading to stenosis or occlusion and /or can lead to valve dysfunction resulting in reflux of venous blood retrograde towards gravity. Both pathologies ultimately lead to chronic edema which can cause chronic pain and venous stasis disease.
 - The mainstay of treatment for chronic deep venous thrombosis is compression stockings

- Selected individuals may be a candidate for iliac vein angioplasty/stenting.

Post-thrombotic syndrome (PVD-13.2)

- Imaging for post-thrombotic syndrome is indicated when:
 - There are signs and symptoms suggestive of a new acute DVT
 - For preoperative planning for iliac vein/stenting in the setting of known iliac venous obstruction in those with a history of a proximal (iliofemoral) DVT.
- Imaging for post-thrombotic syndrome is NOT indicated for chronic swelling that has not changed in severity or character

May-Thurner syndrome (PVD-13.3)

- CTV or MRV Abdomen and Pelvis (CPT® 74174, or 74185 and 72198) OR CTV Pelvis or MRV Pelvis (CPT® 72191 or 72198) can be approved in individuals with a history of **one** of the following:
 - Left lower extremity iliac DVT
 - Persistent left lower extremity edema OR varicose veins OR venous stasis ulcer despite treatment of superficial venous disease in that extremity
 - Persistent left lower extremity edema OR varicose vein OR venous stasis ulcer in the absence of saphenous vein reflux.
- Imaging and/or prophylactic treatment of May-Thurner syndrome, in the absence of acute or chronic DVT **OR** chronic left lower extremity edema and its sequelae such as varicose veins or venous stasis ulcers, is **NOT** considered medically necessary

Background and Supporting Information

In approximately 25% of people, the right iliac artery overlies the left iliac vein over the fifth lumbar vertebrae and its pulsations can compress the vein increasing the risk of DVT in the left extremity.

- Treatment is with iliac vein angioplasty/stenting

Pelvic congestion syndrome (PVD-13.4)

- Signs and symptoms of pelvic congestion syndrome include:
 - Chronic pelvic pain OR post-coital discomfort >6 months.
 - Associated symptoms can include the presence of labial varicosities OR heavy menstrual periods.
- Initial imaging is via transvaginal or pelvic ultrasound to exclude other pathologies of chronic pelvic pain
- CT Venogram of the abdomen/pelvis or MRA of the abdomen/pelvis is indicated if initial ultrasound is inconclusive or non-diagnostic.

Chronic limb swelling due to venous insufficiency/Venous stasis changes/Varicose veins (PVD-14)

PVD.VI.0014.A

v1.0.2024

Guideline

Venous Reflux (PVD-14.2)

References

Venous Reflux (PVD-14.2)

- Diagnosis is made with a venous valvular insufficiency study (CPT® 93970 bilateral study or CPT® 93971 unilateral study) which documents the presence of reflux (>500ms) in the greater saphenous vein as well as the size of the refluxing vein (3-15mm).
- Treatment of superficial venous reflux is amenable to intervention in selected individuals who are symptomatic and have failed conservative therapy. A duplex ultrasound (CPT® 93970 bilateral study or CPT® 93971 unilateral study) demonstrating the presence of pathologic reflux within the greater and lesser saphenous veins should be undertaken within the last six months. Vein size should be documented.
- A post-ablation venous ultrasound (CPT® 93970 bilateral study or CPT® 93971 unilateral study) is indicated within seven days post-procedure. If thrombus is noted within the saphenofemoral junction, repeat imaging can be performed within seven days to assess for propagation into the deep system.
- Ultrasound mapping or monitoring techniques are considered medically necessary only to initially determine the extent and configuration of symptomatic varicosities or valvular insufficiency. Post-procedure assessment by imaging techniques is inappropriate to confirm efficacy or outcome of the procedure.

Background and Supporting Information

Venous insufficiency — General information

- Venous insufficiency is characterized by failure of the venous blood to flow in its normal antegrade path of flow and instead reflux backwards by the force of gravity usually secondary to malfunction of the venous valves.
- Risk factors include previous DVT, obesity, female sex assigned at birth, hereditary, and environmental factors such as prolonged standing on a hard surface.
- Venous insufficiency loosely includes the diagnosis of venous reflux, varicose veins, venous stasis ulcers and spider/reticular veins.

Venous reflux

- Symptoms of venous reflux include chronic edema, pain, and venous stasis ulcerations. Symptoms of venous reflux can be ameliorated with compression therapy with graded compression stockings, elevation, avoidance of prolonged standing and weight loss. Venous reflux can be seen in both the deep and superficial venous systems. Reflux within the deep system is not amenable to intervention.
- Treatment of deep venous reflux is via active compression with compression stocks, pneumatic pumps or specialized dressings such as Unna boots.
- Treatment of symptomatic superficial venous reflux is via endovenous laser radiofrequency ablation of the greater or lesser saphenous vein resulting in closure of the vein allowing for venous blood to be rerouted to the deep venous system.
- Treatment of symptomatic superficial venous reflux can also be treated via saphenous vein ligation and stripping which has fallen out of favor but can be performed for a tortuous or enlarged (>15mm) greater or lesser saphenous vein. One complication of endovenous ablation is deep venous thrombosis.

Varicose Veins

- If the varicosities remain symptomatic despite conservative therapy, varicose veins are treated with sclerotherapy or phlebectomy generally on the basis of size.
- Varicose veins are defined as enlarged, tortuous veins visible under the skin. Symptoms associated with varicose veins include aching and heaviness of the legs and pain/discomfort over the varicosities. Varicose veins can exist both in the absence and presence of venous reflux.
- Treatment involves conservative therapy such as compression stockings, avoidance of prolonged standing, intermittent elevation, weight loss (if applicable) and exercise which relieves the distention of the varicose veins ameliorating the symptoms.

Spider veins/reticular veins

- Spider veins are formed by the dilation of a cluster of blood vessels within the dermis – generally <3mm in diameter. Diagnosis is via physical examination. Spider veins are usually asymptomatic but can cause aching, burning and tenderness in the area overlying the abnormal veins. Spider veins can exist in the absence or presence of venous reflux. The presence of spider veins should not be an indication for treatment of venous reflux.
- Treatment of spider veins is generally cosmetic except in certain cases and can be treated with sclerotherapy.

Imaging for Hemodialysis Access (PVD-8)

PVD.AI.0008.0.A

v1.0.2024

Guideline

Arterial Evaluation and Venous Mapping Prior to AV Fistula (PVD-8.1)

Hemodialysis access imaging (PVD-8.2)

References (PVD-8)

Arterial Evaluation and Venous Mapping Prior to AV Fistula (PVD-8.1)

- Imaging prior to AV fistula creation:
 - For vessel mapping CPT® 93985 or 93986
 - MRA Upper Extremity (CPT® 73225) may be needed if duplex imaging is equivocal
- Arterial evaluation to assess arterial suitability (size, degree of stenosis and calcification) prior to AV fistula creation may be indicated
 - CPT® 93930 or CPT® 93931 can be used to report upper extremity arterial evaluation
- Venous mapping (CPT® 93970 or CPT® 93971) to assess venous suitability prior to AV fistula creation may be indicated

Hemodialysis access imaging (PVD-8.2)

- Indications for Duplex ultrasound (CPT® 93990) of hemodialysis access include but are not limited to:
 - Individuals with decreased flow rates during hemodialysis.
 - Development of arm swelling or discomfort after access placement surgery or a hemodialysis session.
 - Prolonged immaturity of a surgically created AV fistula.
 - Suspected pseudoaneurysm.
 - Suspected AV fistula or graft stenosis.
 - Known or suspected fluid collection adjacent to an AV fistula or graft.
 - One Duplex US (CPT® 93990) can be performed after a surgically created AV fistula for assessment, although it is not generally needed.
- Central venous stenosis can cause new dialysis access to fail to mature or cause the premature failure of existing fistulas/grafts.
- CT Chest with contrast (CPT® 71260), or CTA Chest (CPT® 71275), or MRA Chest (CPT® 71555) is indicated when there is documentation of either:
 - Signs and symptoms of central venous stenosis including:
 - Arm swelling
 - Presence of numerous collateral veins

- Prolonged bleeding from dialysis puncture sites
- A history of pacemaker placement or previous tunneled dialysis graft, regardless of signs and symptoms.

IVC filters – Treatment (PVD-16.2)

PVD.VI.0016.A

v1.0.2024

- IVC filter insertion
 - An initial venous duplex can be performed to assess for the presence of thrombus in the femoral vein which would affect the approach (transjugular or transfemoral)
 - Advanced imaging is not indicated
- CT Abdomen and Pelvis with contrast CPT® 74177 for ANY of the following:
 - A KUB demonstrates tilting of the filter or malposition of one of the filter thongs
 - New **bilateral** lower extremity swelling (venous duplex should be performed first)
 - Filter present for >12 months, with documentation stating intent to remove

Background and Supporting Information

- IVC filters are placed in individuals with known DVT that cannot be anti-coagulated, individuals with poor pulmonary reserve and high risk for DVT, or prophylaxis in trauma and surgical individuals.
- Most IVC filters inserted are retrievable and should be removed as soon as clinically feasible. After 12 months, removal of IVC filters can become technically more difficult.

Post iliac vein stenting/angioplasty (PVD-17.1)

PVD.VI.0017.A

v1.0.2024

Iliac venous stents can be placed after thrombolysis for DVT associated with May-Thurner's syndrome, DVT associated with extrinsic compression or for post thrombotic iliac obstruction.

- Arterial duplex (CPT® 93975, 93976, 93978, 93979) can be obtained for:
 - Surveillance of iliac venous stents
 - Worsening signs or symptoms including increased edema when stent malfunction is suspected
 - Postoperatively within the first month, at six months, twelve months and then annually
- CTV or MRV Abdomen and Pelvis can be obtained for an abnormal or indeterminate duplex

MRI Pelvis without contrast	72195
MRI Pelvis with contrast	72196
MRI Pelvis without and with contrast	72197
MR Spectroscopy	76390
Magnetic resonance spectroscopy, determination and localization of discogenic pain (cervical, thoracic, or lumbar); acquisition of single voxel data, per disc, on biomarkers (ie, lactic acid, carbohydrate, alanine, laal, propionic acid, proteoglycan, and collagen) in at least 3 discs	0609T
Magnetic resonance spectroscopy, determination and localization of discogenic pain (cervical, thoracic, or lumbar); transmission of biomarker data for software analysis	0610T
Magnetic resonance spectroscopy, determination and localization of discogenic pain (cervical, thoracic, or lumbar); postprocessing for algorithmic analysis of biomarker data for determination of relative chemical differences between discs	0611T
Magnetic resonance spectroscopy, determination and localization of discogenic pain (cervical, thoracic, or lumbar); interpretation and report	0612T

CT	CPT®
CT Cervical without contrast	72125
CT Cervical with contrast (Post-Myelography CT)	72126
CT Cervical without and with contrast	72127
CT Thoracic without contrast	72128
CT Thoracic with contrast (Post-Myelography CT)	72129
CT Thoracic without and with contrast	72130
CT Lumbar without contrast (Post-Discography CT)	72131
CT Lumbar with contrast (Post-Myelography CT)	72132
CT Lumbar without and with contrast	72133
CT Pelvis without contrast	72192
CT Pelvis with contrast	72193
CT Pelvis without and with contrast	72194

Ultrasound	CPT®
Spinal canal ultrasound	76800

Nuclear Medicine	CPT®
Bone Marrow Imaging, Limited	78102
Bone Marrow Imaging, Multiple	78103
Bone Marrow Imaging, Whole Body	78104
Bone or Joint Imaging, Limited	78300
Bone or Joint Imaging, Multiple	78305
Bone Scan, Whole Body	78306
Bone Scan, 3 Phase Study	78315
Radiopharmaceutical localization of tumor, inflammatory process or distribution of radiopharmaceutical agent(s) (includes vascular flow and blood pool imaging, when performed); planar, single area (e.g., head, neck, chest, pelvis), single day imaging	78800
Radiopharmaceutical localization of tumor, inflammatory process or distribution of radiopharmaceutical agent(s) (includes vascular flow and blood pool imaging, when performed); planar, 2 or more areas (e.g., abdomen and pelvis, head and chest), 1 or more days imaging or single area imaging over 2 or more days	78801

Nuclear Medicine	CPT®
Radiopharmaceutical localization of tumor, inflammatory process or distribution of radiopharmaceutical agent(s) (includes vascular flow and blood pool imaging, when performed); planar, whole body, single day imaging	78802
Radiopharmaceutical localization of tumor, inflammatory process or distribution of radiopharmaceutical agent(s) (includes vascular flow and blood pool imaging, when performed); tomographic (SPECT), single area (e.g., head, neck, chest, pelvis), single day imaging	78803
Radiopharmaceutical localization of tumor, inflammatory process or distribution of radiopharmaceutical agent(s) (includes vascular flow and blood pool imaging, when performed); tomographic (SPECT) with concurrently acquired computed tomography (CT) transmission scan for anatomical review, localization and determination/detection of pathology, single area (e.g., head, neck, chest, pelvis), single day imaging	78830
Radiopharmaceutical localization of tumor, inflammatory process or distribution of radiopharmaceutical agent(s) (includes vascular flow and blood pool imaging, when performed); tomographic (SPECT), minimum 2 areas (e.g., pelvis and knees, abdomen and pelvis), single day imaging, or single area imaging over 2 or more days	78831

General Guidelines (SP-1.0)

SP.GG.0001.0.A

v2.0.2024

- Before advanced diagnostic imaging can be considered, there must be an in-person clinical evaluation as well as a clinical re-evaluation after a trial of failed conservative therapy; the clinical re-evaluation may consist of an in-person evaluation or other meaningful contact with the provider's office such as email, web or telephone communications.
- An in-person clinical evaluation for the current episode of the condition is required to have been performed before advanced imaging is considered. This may have been either the initial clinical evaluation or a clinical re-evaluation.
- The in-person clinical evaluation should include a relevant history and physical examination (including a detailed neurological examination), appropriate laboratory studies, non-advanced imaging modalities, results of manual motor testing, the specific dermatomal distribution of altered sensation, reflex examination, and nerve root tension signs (e.g., straight leg raise test, slump test, femoral nerve tension test). *The clinical evaluation must be in-person; other forms of meaningful contact (telephone call, electronic mail, telemedicine, or messaging) are not acceptable as an in-person evaluation.*
 - For those spinal conditions/disorders for which the Spine Imaging Guidelines require a plain x-ray of the spine prior to consideration of an advanced imaging study, the plain x-ray must be performed after the current episode of symptoms started or changed and results need to be available to the requesting provider of the advanced imaging study (see: **Anatomic Guidelines [SP-2.1]**).
- Clinical re-evaluation is required prior to consideration of advanced diagnostic imaging to document failure of significant clinical improvement following a recent (within 3 months) six week trial of provider-directed treatment. Clinical re-evaluation can include documentation of an in-person encounter or documentation of other meaningful contact with the requesting provider's office by the individual (e.g., telephone call, electronic mail, telemedicine, or messaging).
 - Provider-directed treatment may include education, activity modification, NSAIDs (non-steroidal anti-inflammatory drugs), narcotic and non-narcotic analgesic medications, oral or injectable corticosteroids, a provider-directed home exercise/stretching program, cross-training, avoidance of aggravating activities, physical/occupational therapy, spinal manipulation, interventional pain procedures and other pain management techniques.
- Any bowel/bladder abnormalities or emergent or urgent indications should be documented at the time of the initial clinical evaluation and clinical re-evaluation.
- Altered sensation to pressure, pain, and temperature should be documented by the specific anatomic distribution (e.g., dermatomal, stocking/glove or mixed distribution).
- Motor deficits (weakness) should be defined by the specific myotomal distribution (e.g., weakness of toe flexion/extension, knee flexion/extension, ankle dorsi/plantar

flexion, wrist dorsi/palmar flexion) and gradation of muscle testing should be documented as follows:

Grading of Manual Muscle Testing	
0	No muscle activation
1	Trace muscle activation, such as a twitch, without achieving full range of motion
2	Muscle activation with gravity eliminated, achieving full range of motion
3	Muscle activation against gravity, full range of motion
4	Muscle activity against gravity some resistance, full range of motion
5	Muscle activation against examiner's full resistance, full range of motion

- Pathological reflexes (e.g. Hoffmann's, Babinski, and Chaddock sign) should be reported as positive or negative.
- Asymmetric reflexes and reflex examination should be documented as follows:

Grading of Reflex Testing	
0	No response
1+	A slight but definitely present response
2+	A brisk response
3+	A very brisk response without clonus
4+	A tap elicits a repeating reflex (clonus)

- Advanced diagnostic imaging is often urgently indicated and may be necessary if serious underlying spinal and/or non-spinal disease is suggested by the presence of certain patient factors referred to as "red flags." See: **Red Flag Indications (SP-1.2)**.
- Spinal specialist evaluation can be helpful in determining the need for advanced diagnostic imaging, especially for individuals following spinal surgery.
- The need for repeat advanced diagnostic imaging should be carefully considered and may not be indicated if prior advanced diagnostic imaging has been performed. Requests for simultaneous, similar studies such as spinal MRI and CT need to be documented as required for preoperative surgical planning. These studies may be helpful in the evaluation of complex failed spinal fusion cases or needed for preoperative surgical planning when the determination of both soft tissue and bony anatomy is required.

- Serial advanced imaging, whether CT or MRI, for surveillance of healing or recovery from spinal disease is not supported by the currently available scientific evidence-based medicine for the majority of spinal disorders.
 - Requests for repeat imaging may be considered on a case-by-case basis (e.g. concern for delayed union or non-union of spinal fracture, pseudoarthrosis of fusion, etc.)
- Advanced imaging is generally unnecessary for resolved or improving spinal pain and/or radiculopathy.
- Advanced diagnostic imaging has not been shown to be of value in individuals with stable, longstanding spinal pain without neurological features or without clinically significant or relevant changes in symptoms or physical examination findings.
- Anatomic regions of the spine/pelvis that are included in the following MRI and CT advanced diagnostic imaging studies:
 - Cervical spine: from the skull base/foramen magnum through T1
 - Thoracic spine: from C7 through L1
 - Lumbar spine: from T12 through mid-sacrum
 - Pelvis: includes hips, sacroiliac joints, sacrum, coccyx
- CT or MRI of the cervical and thoracic spine will image the entire spinal cord since the end of the spinal cord or conus medullaris usually ends at L1 in adults. Therefore, lumbar spine imaging is not needed when the goal is to image only the spinal cord unless there is known or suspected low lying conus medullaris (e.g. tethered cord).

General Considerations (SP-1.1)

SP.GG.0001.1.A

v2.0.2024

- See: [General Guidelines \(SP-1.0\)](#)

Background and Supporting Information

Straight leg raise test (also known as the Lasegue's test) – With the individual in the supine position, the hip medially rotated and adducted, and the knee extended, the examiner flexes the hip until the individual complains of pain or tightness in the back or back of the leg. If the pain is primarily back pain, it is less specific whereas if the pain is primarily in the leg, it is more likely nerve root irritation/radiculopathy. Disc herniation or pathology causing pressure between the two extremes are more likely to cause pain in both areas. The examiner then slowly and carefully drops the leg back (extends it) slightly until the individual feels no pain or tightness. The individual is then asked to flex the neck so the chin is on the chest, or the examiner may dorsiflex the individual's foot, or both actions may be done simultaneously. Both of these maneuvers are considered to be provocative tests for neurological tissue.

Slump test – The individual is seated on the edge of the examination table with the legs supported, the hips in neutral position, and the hands behind the back. The examination is performed in sequential steps. First, the individual is asked to "slump" the back into thoracic and lumbar flexion. The examiner maintains the individual's chin in neutral position to prevent neck and head flexion. The examiner then uses one arm to apply overpressure across the shoulders to maintain flexion of the thoracic and lumbar spines. While this position is held, the individual is asked to actively flex the cervical spine and head as far as possible (i.e., chin to chest). The examiner then applies overpressure to maintain flexion of all three parts of the spine (cervical, thoracic, and lumbar) using the hand of the same arm to maintain overpressure in the cervical spine. With the other hand, the examiner then holds the individual's foot in maximum dorsiflexion. While the examiner holds these positions, the individual is asked to actively straighten the knee as much as possible. The test is repeated with the other leg and then with both legs at the same time. If the individual is unable to fully extend the knee because of pain, the examiner releases the overpressure to the cervical spine and the individual actively extends the neck. If the knee extends further, the symptoms decrease with neck extension, or the positioning of the individual increases the individual's symptoms, then the test is considered positive.

Femoral nerve tension test (also known as the prone knee bending test) – The individual lies prone while the examiner passively flexes the knee as far as possible so that the individual's heel rests against the buttock. At the same time, the examiner should ensure that the individual's hip is not rotated. If the examiner is unable to flex the individual's knee past 90 degrees because of a pathological condition in the hip, the test may be performed by passive extension of the hip while the knee is flexed as much as possible. The flexed knee position should be maintained for 45 to 60 seconds. Unilateral neurological pain in the lumbar area, buttock, and/or posterior thigh may

indicate an L2 or L3 nerve root lesion. Pain in the anterior thigh indicates tight quadriceps muscles or stretching of the femoral nerve.

Hoffmann's sign – The examiner holds the individual's middle finger and briskly flicks the distal phalanx. A positive test is noted if the interphalangeal joint of the thumb of the same hand flexes.

Babinski's sign – The examiner runs a sharp instrument along the plantar surface of the foot from the calcaneus along the lateral border to the forefoot. A positive test occurs with extension of the great toe with flexion and splaying of the other toes. A negative test occurs with no movement of the toes at all or uniform bunching up of the toes.

Chaddock sign – The examiner strokes the lateral malleolus. A positive test occurs with extension of the great toe.

Red Flag Indications (SP-1.2)

SP.GG.0001.2.A

v2.0.2024

Red Flag Indications are intended to represent the potential for life or limb threatening conditions. Red Flag Indications are clinical situations in which localized spine pain and associated neurological features are likely to reflect serious underlying spinal and/or non-spinal disease and warrant exception to the requirement for documented failure of six weeks of provider-directed treatment. Advanced diagnostic imaging of the symptomatic level is appropriate and/or work-up for a non-spinal source of spine pain for Red Flag Indications.

- Red Flag Indications include:
 - Motor Weakness
 - Aortic Aneurysm or Dissection
 - Cancer
 - Cauda Equina Syndrome
 - Fracture
 - Infection
 - Severe Radicular Pain

Motor Weakness

(See: Grading of Manual Muscle Testing and Reflex Testing in [General Guidelines \[SP-1.0\]](#))

History, Symptoms or Physical Exam Findings (Initial clinical evaluation required within the last 60 days)	Advanced Diagnostic Imaging
Clinical presentation including one or more of the following: <ul style="list-style-type: none"> • Motor weakness of grade 3/5 or less of specified muscle(s); • New onset foot drop; • Acute bilateral lower extremity weakness; • Progressive objective motor /sensory/deep tendon reflex deficits on clinical re-evaluation. 	MRI of the relevant spinal level without contrast or MRI of the relevant spinal level without and with contrast

Aortic Aneurysm or Dissection

History, Symptoms or Physical Exam Findings (Initial clinical evaluation required within the last 60 days)	Advanced Diagnostic Imaging
<ul style="list-style-type: none"> New onset of back and/or abdominal pain in an individual with a known AAA; or Acute dissection is suspected. 	No spine imaging indicated, see: <u>Aortic Disorders, Renal Vascular Disorders and Visceral Artery Aneurysms (PVD-6)</u> in the Peripheral Vascular Disease Imaging Guidelines

Cancer

History, Symptoms or Physical Exam Findings (Initial clinical evaluation required within the last 60 days)	Advanced Diagnostic Imaging
<p>There is clinical suspicion of spinal malignancy AND ONE or more of the following:</p> <ul style="list-style-type: none"> Night pain Uncontrolled or unintended weight loss Pain unrelieved by change in position Age >70 years Severe and worsening spinal pain despite a reasonable (generally after 1 week) trial of provider-directed treatment with re-evaluation 	<p>ONE of the following:</p> <ul style="list-style-type: none"> MRI of the relevant spinal level without contrast MRI of the relevant spinal level without and with contrast CT of the relevant spinal level without contrast CT Myelogram of the relevant spinal level

History, Symptoms or Physical Exam Findings (Initial clinical evaluation required within the last 60 days)	Advanced Diagnostic Imaging
<p>ANY of the following:</p> <p>Known malignancy(ies) and acute spinal cord compression from primary or metastatic spinal neoplastic disease is suspected by history and physical examination</p> <p>OR</p> <p>Individual with a known history of cancer AND metastatic or Stage IV cancer with new onset back pain</p> <p>OR</p> <p>Individual with known history of cancer AND back pain AND suspicion of spinal malignancy</p>	<p>See: <u>Spinal/Vertebral Metastases (ONC-31.6)</u> in the Oncology Imaging Guidelines</p>

Cauda Equina Syndrome

History, Symptoms or Physical Exam Findings (Initial clinical evaluation required within the last 60 days)	Advanced Diagnostic Imaging
<p>Clinical presentation including one or more of the following:</p> <ul style="list-style-type: none"> • Acute onset of bilateral sciatica; • Perineal sensory loss (“saddle anesthesia”); • Decreased anal sphincter tone; • New onset bowel/bladder incontinence; • Otherwise unexplained acute urinary retention. 	<p>MRI Lumbar Spine without contrast (CPT® 72148) or MRI Lumbar Spine without and with contrast (CPT® 72158)</p>

Fracture

History, Symptoms or Physical Exam Findings (Initial clinical evaluation required within the last 60 days)	Advanced Diagnostic Imaging
<ul style="list-style-type: none"> Clinical suspicion of a pathological spinal fracture. <ul style="list-style-type: none"> Advanced imaging is indicated after x-ray; no conservative treatment is needed. 	See: <u>Spinal Compression Fractures (SP-11.1)</u> for appropriate imaging studies
<ul style="list-style-type: none"> Clinical suspicion of a spinal fracture after trauma <ul style="list-style-type: none"> Advanced imaging is indicated after x-ray; no conservative treatment is needed. 	See: <u>Neck (Cervical Spine) Trauma (SP-3.2)</u> , <u>Upper Back (Thoracic Spine) Trauma (SP-4.2)</u> , or <u>Low Back (Lumbar Spine) Trauma (SP-6.2)</u> for appropriate imaging studies
<ul style="list-style-type: none"> Clinical suspicion of a spinal fracture related to ankylosing spondylitis or DISH <ul style="list-style-type: none"> Advanced imaging is indicated <i>without</i> x-ray or conservative treatment. 	See: <u>Neck (Cervical Spine) Trauma (SP-3.2)</u> , <u>Upper Back (Thoracic Spine) Trauma (SP-4.2)</u> , <u>Low Back (Lumbar Spine) Trauma (SP-6.2)</u> , or <u>Inflammatory Spondylitis (SP-10.2)</u> for appropriate imaging studies

Infection

History, Symptoms or Physical Exam Findings (Initial clinical evaluation required within the last 60 days)	Advanced Diagnostic Imaging
<p>There is a clinical suspicion of spinal infection (e.g., disc space infection, epidural abscess or spinal osteomyelitis) and one or more of the following:</p> <ul style="list-style-type: none"> • Fever; • History of IV drug use; • Recent bacterial infection (UTIs, pyelonephritis, pneumonia); • Recent spinal intervention (e.g., surgery, pain injection, or stimulator implantation); • Immunocompromised states; • Long term use of systemic glucocorticoids; • Organ transplant recipient taking anti-rejection medication; • Diabetes mellitus; • HIV/AIDS; • Chronic dialysis; • Immunosuppressant therapy; • Neoplastic involvement of the spine; • Laboratory values indicative of infection (e.g., elevated WBC, ESR, CRP, positive cultures); • Decubitus ulcer or wound overlying spine; • Abnormal x-ray or CT suspicious for infection 	<p>ONE of the following:</p> <ul style="list-style-type: none"> • MRI of the relevant spinal level without and with contrast • MRI without contrast • 3-phase bone scan complete spine • Gallium scan whole body • CT Spine area of interest with IV contrast • CT Spine area of interest without IV contrast
<p>There is a clinical suspicion of spinal infection (e.g., disc space infection, epidural abscess or spinal osteomyelitis) and one or more of the following:</p> <ul style="list-style-type: none"> • New neurologic deficit on physical examination • Cauda equina syndrome 	<p>ONE of the following:</p> <ul style="list-style-type: none"> • MRI of the relevant spinal level without and with contrast • MRI without contrast • CT Spine area of interest with IV contrast • CT Spine area of interest without IV contrast

Severe Radicular Pain

All of the following must be present (Initial clinical evaluation required within the last 60 days)	Advanced Diagnostic Imaging
<ul style="list-style-type: none">• Severe radicular pain in a specified spinal nerve root distribution (minimum 9/10 on the VAS); and• Documented significant functional loss at work or at home; and• Severity of pain unresponsive to a minimum of seven (7) days of provider-directed treatment; and• Treatment plan includes one of the following:<ul style="list-style-type: none">• Transforaminal epidural steroid injection (TFESI) at any level(s); or• Interlaminar epidural steroid injection (ILES) at the cervical or thoracic levels; or• A plan for urgent/emergent spinal surgery; or• A plan for an urgent/emergent referral to/consultation from a spine specialist (Interventional Pain physician or Spine Surgeon)	MRI of the relevant spinal level without contrast or MRI without and with contrast

Definitions (SP-1.3)

SP.GG.0001.3.A

v2.0.2024

- **Radiculopathy**, for the purpose of this policy, is defined as the presence of pain resulting in significant functional limitations (i.e., diminished quality of life and impaired, age-appropriate activities of daily living), dysaesthesia(s) or paraesthesia(s) reported by the individual in a specified dermatomal distribution of an involved named spinal root(s) and **ONE or MORE** of the following:
 - Loss of strength of specific named muscle(s) or myotomal distribution(s) or demonstrated on detailed neurologic examination (within the prior 3 months), concordant with nerve root compression of the involved named spinal nerve root(s).
 - Altered sensation to light touch, pressure, pin prick or temperature demonstrated on a detailed neurologic examination (within the prior 3 months) in the sensory distribution concordant with nerve root compression of the involved named spinal nerve root(s).
 - Diminished, absent or asymmetric reflex(es) on a detailed neurologic examination (within the prior 3 months) concordant with nerve root compression of the involved named spinal nerve root(s).
 - Either of the following:
 - A concordant radiologist's interpretation of an advanced diagnostic imaging study (MRI or CT) of the spine demonstrating compression of the involved named spinal nerve root(s) or foraminal stenosis at the concordant level(s) (Performed within the prior 12 months).
 - Electrodiagnostic studies (EMG/NCV's) diagnostic of nerve root compression of the involved named spinal nerve root(s). (Performed within the prior 12 months).
- **Radicular pain** is pain which radiates to the upper or lower extremity along the course of a spinal nerve root, typically resulting from compression, inflammation and/or injury to the nerve root.
- **Radiculitis** is defined, for the purpose of this policy, as radicular pain without objective neurological findings.

Anatomic Guidelines (SP-2.1)

SP.IM.0002.1.A

v2.0.2024

- Anatomic regions of the spine/pelvis that are included in the following MRI and CT advanced diagnostic imaging studies:
 - Cervical spine: from the skull base/foramen magnum through T1
 - Thoracic spine: from C7 through L1
 - Lumbar spine: from T12 through mid-sacrum
 - Pelvis: includes hips, sacroiliac joints, sacrum, coccyx
- CT or MRI cervical and thoracic spine will image the entire spinal cord since the end of the spinal cord or conus medullaris usually ends at L1 in adults. Therefore, lumbar spine imaging is not needed when the goal is to image only the spinal cord unless there is known or suspected low lying conus medullaris (e.g. tethered cord).
- The results of plain x-rays performed after the current episode of symptoms started or changed need to be available to the requesting provider of the advanced imaging study for the following conditions:
 - See: **Spinal Compression Fractures (SP-11)**
 - See: **Lumbar Spine Spondylolysis/Spondylolisthesis (SP-8)**
 - See: **Inflammatory Spondylitis (SP-10.2)**
 - See: **Neck (Cervical Spine) Trauma (SP-3.2)**, **Upper Back (Thoracic Spine) Trauma (SP-4.2)**, and **Low Back (Lumbar Spine) Trauma (SP-6.2)**
 - See: **Coccydynia without Neurological Features (SP-5.2)**
 - See: **Spinal Deformities (e.g. Scoliosis/Kyphosis) (SP-14)** and **Spinal Dysraphism (PEDSP-4)** in the Pediatric Spine Imaging Guidelines
 - See: **Sacro-Iliac (SI) Joint Pain, Inflammatory Spondylitis/Sacroiliitis and Fibromyalgia (SP-10)**
 - See: **Post-Operative Spinal Disorders (SP-15)**

MRI of the Spine (SP-2.2)

SP.IM.0002.2.A

v2.0.2024

- See: **Procedure Codes Associated with Spine Imaging**
- For MR Spectroscopy, all spine uses are considered experimental and investigational
 - See: **Imaging of Intervertebral Discs (SP-2.5)**
- MRI Spine is performed either without contrast, with contrast or without and with contrast. A “with contrast” study alone is appropriate only to complete a study begun without contrast. Contrast is generally not indicated for most disc and nerve root disorders, fractures and degenerative disease.
- MRI Spine indications include:
 - Evaluation of disc disease, spinal cord and nerve root disorders and most other spinal conditions including evaluation of congenital anomalies of the spine and spinal cord
 - Suspicion for or surveillance of known spine/spinal canal/spinal cord neoplastic disease
 - Suspicion, diagnosis of or surveillance of spinal infections, multiple sclerosis or other causes of myelitis, syringomyelia, cauda equina syndrome or other “red flag” indications. See: **Red Flag Indications (SP-1.2)**.
 - Preoperative evaluation to define abnormal or variant spinal anatomy that could influence the outcome of a potential surgical procedure. See: **Prior to Spine Surgery (SP-16.1)**.
 - Spinal imaging for individuals having undergone recent spinal surgery e.g., laminectomy, discectomy, spinal decompression, when history and physical examination is suspicious for hematoma, post-surgical infection, or cerebrospinal fluid (CSF) leak.

Positional MRI:

- Positional MRI is also referred to as dynamic, weight-bearing or kinetic MRI. Currently, there is inadequate scientific evidence to support the medical necessity of this study. As such, it should be considered experimental or investigational.

CT of the Spine (SP-2.3)

SP.IM.0002.3.A

v2.0.2024

- See: **Procedure Codes Associated with Spine Imaging**
- CT Spine indications include:
 - Contraindication to MRI
 - CT (contrast as requested) can be approved when ANY of the following MRI contraindications are documented:
 - Implanted ferromagnetic materials
 - Electronically, magnetically or mechanically activated implanted devices that are not determined by the manufacturer as MRI compatible/conditional
 - CT without contrast, or CT without and with contrast (even if MRI has already been performed), for any spinal trauma/fractures, especially spinal trauma/fractures that could result in spinal instability and spinal cord/spinal nerve compression
 - CT without contrast, or CT without and with contrast (even if MRI has already been performed), for spinal neoplastic disease – primary or metastatic
 - CT without contrast, or CT without and with contrast (even if MRI has already been performed), in conjunction with myelography or discography (see: **CT/Myelography [SP-2.4]** and **Imaging of Intervertebral Discs [SP-2.5]**)
 - CT without contrast, or CT without and with contrast (even if MRI has already been performed), for preoperative evaluation to define abnormal or variant bony spinal anatomy that could influence the outcome of a potential surgical procedure (see: **Prior to Spine Surgery [SP-16.1]**)
 - CT without contrast, or CT without and with contrast, (even if MRI has already been performed), to assess spinal fusions when pseudoarthrosis is suspected (not to be used for routine post-operative assessment where x-rays are sufficient and/or there are no concordant clinical signs or symptoms)
 - CT without contrast, or CT without and with contrast (even if MRI has already been performed), for congenital, developmental or acquired spinal deformity (see: **Spinal Deformities [e.g. Scoliosis/Kyphosis] [SP-14]**)
 - CT without contrast, or CT without and with contrast, for spondylolysis when routine x-rays are negative and/or MRI is equivocal, indeterminate or non-diagnostic (see: **Lumbar Spine Spondylolysis/Spondylolisthesis [SP-8]**)
 - CT without contrast, or CT without and with contrast, to evaluate calcified lesions, (e.g., osteophytes, ossification of the posterior longitudinal ligament [OPLL])

CT/Myelography (SP-2.4)

SP.IM.0002.4.U

v2.0.2024

- See: **Procedure Codes Associated with Spine Imaging**
- CT/Myelography is generally unnecessary as an initial study when a diagnostic quality MRI has been obtained.
- CT/Myelography indications include:
 - To clarify equivocal, indeterminate or non-diagnostic MRI findings or to further evaluate the significance of multiple spinal abnormalities.
 - When an MRI is contraindicated (see: **CT of the Spine [SP-2.3]**).
 - Preoperative planning for spine surgery, (e.g., multilevel spinal stenosis or when a previous MRI is insufficient, equivocal, indeterminate or non-diagnostic). (see: **Prior to Spine Surgery (SP-16.1)**)
 - Evaluation after previous spinal surgery when an MRI without and with contrast is contraindicated or MRI results are equivocal, indeterminate or non-diagnostic.
 - United Healthcare authorizes only the post-myelogram CT (i.e., CPT® 72126, CPT® 72129, and CPT® 72132) and not any other myelogram-related procedure codes (i.e., CPT® 72265 or CPT® 62284).

Imaging of Intervertebral Discs (SP-2.5)

SP.IM.0002.5.A

v2.0.2024

Post-lumbar Discography CT:

- eviCore authorizes only the post-lumbar discography CT procedure codes and not any other discography-related procedure codes. A post-lumbar discography CT is considered medically necessary following an approved discography and ALL of the following apply:
 - A post-discography CT is coded as without contrast.
 - A CT Lumbar Spine without contrast (CPT® 72131) is appropriate if verified to be performed as a post-discography CT.
 - When a post-discography CT is requested and the discography has already been approved eviCore will issue authorization for the post-discography CT procedure codes.

Magnetic Resonance Spectroscopy:

- Magnetic Resonance Spectroscopy (MRS) involves the analysis of the levels of certain chemicals in pre-selected voxels (small regions) on an MRI scan done at the same time.
 - MRS (CPT® 76390, 0609T, 0610T, 0611T, and 0612T) is considered experimental and investigational for all spine imaging uses at this time.

Background and Supporting Information

- Provocative Discography/CT and MR Spectroscopy lumbar spine are procedures purported to diagnose (or rule-out) a discogenic “pain generator” i.e., the source of non-specific axial spinal pain. These diagnostic studies, when reported as positive, are often used as an indication for spinal fusion in individuals with non-specific axial back pain.
- The following uses of discography are considered controversial:
 - To identify a symptomatic pseudoarthrosis in a failed spinal fusion
 - To identify which of two herniated discs seen on MRI is symptomatic when not determined clinically or otherwise
 - To confirm the discogenic nature of pain in an individual with an abnormal disc seen on MRI and to rule out pain from an adjacent disc level
 - To confirm the presumptive diagnosis of “internal disc disruption”
 - Discography of the cervical and/or thoracic spine
- The following uses of MR Spectroscopy lumbar spine are considered controversial:
 - To identify which of two herniated discs seen on MRI is symptomatic when not determined clinically or otherwise

- To confirm the discogenic nature of pain in an individual with an abnormal disc seen on MRI and to rule out pain from an adjacent disc level
- To confirm the presumptive diagnosis of “internal disc disruption”

Ultrasound of the Spinal Canal (SP-2.6)

SP.IM.0002.6.A

v2.0.2024

- Spinal canal ultrasound (CPT® 76800) describes the evaluation of the spinal cord (canal and contents) most often performed in newborns, infants, young children and intraoperatively.
- CPT® 76800 describes evaluation of the entire spine and should not be reported multiple times for imaging of different areas of the spinal canal.
- CPT® 76998, rather than CPT® 76800, should be used to report intraoperative spinal canal ultrasound (ultrasonic guidance). Intraoperative use of spinal ultrasound (CPT® 76998) would not require prior authorization by eviCore.

Indications for spinal canal ultrasound (CPT® 76800):

- This study is generally limited to infants, newborns and young children because of incomplete ossification of the vertebral segments surrounding the spinal cord, including the assessment of CSF in the spinal canal and for image-guided lumbar puncture.
- When ossification of the vertebral segments is incomplete for evaluation of suspected or known tethered cord (see: **Tethered Cord [PEDSP-5]** in the Pediatric Spine Imaging Guidelines).
- Evaluation of suspected occult and non-occult spinal dysraphism (see: **Spinal Dysraphism [PEDSP-4]** in the Pediatric Spine Imaging Guidelines).
- Evaluation of spinal cord tumors, vascular malformations and cases of birth-related trauma.
- Contraindicated for use in the adult spine for the assessment of spinal pain, radiculopathy, facet inflammation, nerve root inflammation, disc herniation, and soft tissue conditions surrounding the adult spine other than for superficial masses.

Limitations of Spinal Imaging in Degenerative Disorders (SP-2.7)

SP.IM.0002.7.A**v2.0.2024**

- Non-specific axial spinal pain is ubiquitous. Advanced diagnostic imaging infrequently identifies the source of the spinal pain (pain generator).
- Incidental findings on MRI and CT, including bulging, protruding, extruding or herniated discs, are often non-concordant, asymptomatic and increase in incidence as the spine ages.
- In individuals with poorly defined clinical presentations, “abnormal” spinal advanced diagnostic imaging results are infrequently clinically concordant, significant, material or substantive and may even lead to inappropriate treatment.
- Performing advanced spinal imaging based only on the presence of spinal degenerative findings identified on x-rays is not generally indicated in individuals who are either asymptomatic or present with non-specific axial spinal pain.

Miscellaneous Spinal Lesions (SP-2.8)

SP.IM.0002.8.A

v2.0.2024

Vertebral body hemangiomas:

- Vertebral body hemangiomas are common and are generally benign and incidental findings on plain x-rays and advanced diagnostic imaging studies.
- If the appearance of a vertebral body hemangioma is typical on plain x-ray, further spinal advanced diagnostic imaging is not usually required, unless there are associated neurologic symptoms or signs on physical examination.
- If the appearance of a vertebral body hemangioma is atypical on plain x-ray, with or without neurological signs or symptoms on physical exam, MRI without contrast or MRI without and with contrast is indicated.
- Occasionally, MRI may be equivocal, indeterminate or non-diagnostic and CT without contrast of the spinal area is indicated to help clarify the diagnosis.
- No follow-up imaging is necessary once the diagnosis of a vertebral body hemangioma is established without neurological features.

Tarlov cysts:

- Tarlov cysts are most often cystic dilatations of nerve root sleeves in the lumbar spine and sacrum.
- Controversy exists as to whether Tarlov cysts can result in neurologic signs and symptoms but they can result in erosion of the adjacent bone.
- Usually Tarlov cysts are benign, incidental findings on advanced diagnostic imaging studies. Further evaluation of a known or suspected Tarlov cyst can be performed with an MRI Lumbar Spine without and with contrast study (CPT® 72158) or CT/Myelography Lumbar Spine (CPT® 72132).

Other spinal lesions:

- MRI without and with contrast or a CT without contrast is appropriate if:
 - Other spinal lesions are seen on routine x-rays or a non-contrast MRI; **and**
 - These additional advanced imaging studies are recommended by a spine specialist or radiologist to further characterize or diagnose the lesion; **or**
 - Required for surgical planning.

MRA Spinal Canal (SP-2.9)

SP.IM.0002.9.A

v2.0.2024

- MRA Spine imaging is utilized infrequently.
- Cerebrospinal Fluid (CSF) flow studies using MRI are included in CPT® codes 70551, 70552, and 70553 and should not be coded or reported separately.

Indications may include:

- Suspected spinal cord arteriovenous malformation (AVM) or arteriovenous fistula (AVF):
 - MRI Spine of the relevant spine region without and with contrast should be the initial imaging study.
 - If suspicion for a spinal AVM or AVF is high based upon the results of the MRI Spine, catheter angiography is recommended (CPT® 72159 or CPT® 70496).
- Subarachnoid hemorrhage where no brain aneurysm has been previously identified
 - Catheter angiography (CPT® 70496) should be performed and is the most definitive study to define possible spinal pathology resulting in a spinal canal subarachnoid hemorrhage.
 - See: **General Guidelines – CT and MR Angiography (CTA and MRA) (HD-1.5)** in the Head Imaging Guidelines
 - See: **Intracranial Aneurysms (HD-12.1)** in the Head Imaging Guidelines
- Preoperative planning
 - MRA Spinal canal may be useful in identifying major intercostal feeder vessels to the spinal cord prior to surgical procedures that might interfere with this blood supply. However, catheter angiography (CPT® 72159) is generally a more definitive study for this purpose.

Spine PET/CT (SP-2.10)

SP.IM.0002.10.A

v2.0.2024

- At the present time there is controversy regarding spine PET/CT due to inadequate scientific evidence to support the medical necessity of PET/CT for the routine assessment of spinal disorders, other than for neoplastic disease.
- See: **Spinal/Vertebral Metastases (ONC-31.6)** in the Oncology Imaging Guidelines
- Spine PET/CT should be considered experimental or investigational.

Cone-beam CT (SP-2.11)

SP.IM.0002.11.A

v2.0.2024

- Cone-beam CT for imaging of the cervical spine should be considered experimental or investigational.

3D Rendering (SP-2.12)

SP.IM.0002.12.A

v2.0.2024

- See: **3D Rendering (MS-3)** in the Musculoskeletal Imaging Guidelines

Neck (Cervical Spine) Pain Without/With Neurological Features (Including Stenosis) and Trauma (SP-3)

Guideline

Neck (Cervical Spine) Pain without and with Neurological Features
(Including Stenosis) (SP-3.1)

Neck (Cervical Spine) Trauma (SP-3.2)

References (SP-3)

Neck (Cervical Spine) Pain without and with Neurological Features (Including Stenosis) (SP-3.1)

SP.NP.0003.1.A

v2.0.2024

All of the following are required prior to advanced imaging:

- Initial clinical evaluation performed.
- A face-to-face evaluation within the last 60 days.
- The initial evaluation is not required within the last 60 days if another face-to-face evaluation was performed in that time frame. This may be satisfied by the initial evaluation, re-evaluation or another visit.
- Failure of recent (within 3 months) 6-week trial of provider-directed treatment (unless presence of a red flag as defined in **Red Flag Indications [SP-1.2]**)
- Clinical re-evaluation after treatment period (may consist of a face-to-face evaluation or other meaningful contact (see also: **General Guidelines [SP-1.0]**)

Advanced Diagnostic Imaging:	MRI Cervical Spine, without contrast (CPT® 72141)
Comments:	CT Cervical Spine without contrast (CPT® 72125) OR CT Myelography (CPT® 72126) is appropriate when MRI is contraindicated.

Neck (Cervical Spine) Trauma (SP-3.2)

SP.NP.0003.2.A

v2.0.2024

All of the following are required prior to advanced imaging:

- Initial clinical evaluation performed.
- A face-to-face evaluation within the last 60 days.
- The initial evaluation is not required within the last 60 days if another face-to-face evaluation was performed in that time frame. This may be satisfied by the initial evaluation, re-evaluation or another visit.
- Failure of recent (within 3 months) 6-week trial of provider-directed treatment (unless presence of a red flag as defined in **Red Flag Indications [SP-1.2]**)
- Clinical re-evaluation after treatment period (may consist of a face-to-face evaluation or other meaningful contact (see also: **General Guidelines [SP-1.0]**)
- Results of plain x-rays of the cervical spine performed after the current episode of symptoms started or changed need to be available to the requesting provider (not required for high risk mechanisms as below**)

Advanced Diagnostic Imaging:	MRI Cervical Spine without contrast (CPT® 72141) OR CT Cervical Spine without contrast (CPT® 72125): For individuals with ankylosing spondylitis or DISH (diffuse idiopathic skeletal hyperostosis), both MRI of the whole spine (CPT® 72141, 72146, and/or 72148) and CT of the whole spine (CPT® 72125, 72128, and/or 72131) can be approved. Plain x-rays and a 6 week trial of provider-directed treatment and clinical evaluation are NOT required.
Comments:	<p>Plain x-rays are required for suspected fracture in non-high risk injuries.</p> <p>Plain x-rays and a 6 week trial of provider-directed treatment and clinical re-evaluation are NOT required for individuals with a high risk factor(s) for suspected cervical spine injury within the last 3 months (See below**).</p>

**High risk factors of suspected cervical spine injury may include:

- Long term use of systemic glucocorticoids
- History of prior low energy fractures
- History of low bone mineral density
- Age ≥65 years
- Head trauma and/or maxillofacial trauma
- Pedestrian in a motor vehicle accident
- Fall from elevation ≥3 feet/5 stairs

- Diving accident
- Head-on motor vehicle collision without/with airbag deployment
- Rollover motor vehicle collision
- Ejection from the vehicle in a motor vehicle collision
- High speed of the vehicle at the time of collision
- Not wearing a seatbelt/shoulder harness in a motor vehicle collision
- Minor direct/indirect trauma to the cervical spine/maxillofacial areas in individuals with ankylosing spondylitis or DISH

Background and Supporting Information

- Pain radiation patterns from the cervical spine area into the thoracic spine area do not necessarily justify the addition of thoracic spine advanced diagnostic imaging.
- Cervical radiculopathy is often confused with shoulder disorders, brachial plexopathy, peripheral nerve entrapment and/or motor/sensory neuropathies. Electrodiagnostic testing (EMGs/NCVs) is generally used to confirm, not establish, a diagnosis of peripheral nerve entrapment and/or a motor/sensory neuropathy based upon history and physical examination findings. Electrodiagnostic testing is often considered when advanced imaging of the spine does not reveal neurocompressive pathology and/or after 6 weeks of unimproved symptoms of extremity pain, weakness, numbness and/or tingling.
- Individuals with ankylosing spondylitis or DISH are at high risk of cervical spine fractures even with minor direct/indirect trauma to the cervical spine which can result in quadriparesis/quadriplegia

Upper Back (Thoracic Spine) Pain Without/With Neurological Features (Including Stenosis) and Trauma (SP-4)

Guideline

Upper Back (Thoracic Spine) Pain without and with Neurological Features (Including Stenosis) (SP-4.1)

Upper Back (Thoracic Spine) Trauma (SP-4.2)

References (SP-4)

Upper Back (Thoracic Spine) Pain without and with Neurological Features (Including Stenosis) (SP-4.1)

SP.TS.0004.1.A

v2.0.2024

All of the following are required prior to advanced imaging:

- Initial clinical evaluation performed.
- A face-to-face evaluation within the last 60 days.
- The initial evaluation is not required within the last 60 days if another face-to-face evaluation was performed in that time frame. This may be satisfied by the initial evaluation, re-evaluation or another visit.
- Failure of recent (within 3 months) 6-week trial of provider-directed treatment (unless presence of a red flag as defined in **Red Flag Indications [SP-1.2]**).
- Clinical re-evaluation after treatment period (may consist of a face-to-face evaluation or other meaningful contact (see also: **General Guidelines [SP-1.0]**).

Advanced Diagnostic Imaging:	MRI Thoracic Spine without contrast (CPT® 72146)
Comments:	A CT Thoracic spine without contrast (CPT® 72128) OR CT Myelography (CPT® 72129) is appropriate when MRI is contraindicated.

Upper Back (Thoracic Spine) Trauma (SP-4.2)

SP.TS.0004.2.A

v2.0.2024

All of the following are required prior to advanced imaging:

- Initial clinical evaluation performed.
- A face-to-face evaluation within the last 60 days.
- The initial evaluation is not required within the last 60 days if another face-to-face evaluation was performed in that time frame. This may be satisfied by the initial evaluation, re-evaluation or another visit.
- Failure of recent (within 3 months) 6-week trial of provider-directed treatment (unless presence of a red flag as defined in **Red Flag Indications (SP-1.2)**, e.g. fracture).
- Clinical re-evaluation after treatment period (may consist of a face-to-face evaluation or other meaningful contact (see also: **General Guidelines (SP-1.0)**).
- Results of plain x-rays of thoracic spine performed after the current episode of symptoms started or changed need to be available to the requesting provider

Advanced Diagnostic Imaging:	MRI Thoracic Spine without contrast (CPT® 72146) OR CT Thoracic Spine without contrast (CPT® 72128)
Comments:	For individuals with ankylosing spondylitis or DISH (diffuse idiopathic skeletal hyperostosis), both MRI of the whole spine (CPT® 72141, 72146, and/or 72148) and CT of the whole spine (CPT® 72125, 72128, and/or 72131) can be approved. Plain x-rays and a 6 week trial of provider-directed treatment and clinical evaluation are <u>NOT</u> required

Background and Supporting Information

- Thoracic radiculopathy presents with pain radiation from the thoracic spine around the trunk. At upper thoracic spine levels, the pain radiation is from the thoracic spine around the rib cage following the sensory distribution of an intercostal nerve.
- Advanced diagnostic imaging is generally not appropriate in evaluation of axial low back pain with radiation toward the thoracic region unless there are documented clinical features indicating a thoracic spine disorder.

Coccydynia without Neurological Features (SP-5.2)

SP.LB.0005.2.A

v2.0.2024

All of the following are required prior to advanced imaging:

- Initial clinical evaluation performed.
- A face-to-face evaluation within the last 60 days.
- The initial evaluation is not required within the last 60 days if another face-to-face evaluation was performed in that time frame. This may be satisfied by the initial evaluation, re-evaluation or another visit.
- Failure of recent (within 3 months) 6-week trial of provider-directed treatment (unless presence of a red flag as defined in **Red Flag Indications (SP-1.2)**, e.g. fracture).
- Clinical re-evaluation after treatment period (may consist of a face-to-face evaluation or other meaningful contact (see also: **General Guidelines (SP-1.0)**))
- Plain x-rays of the sacrum/coccyx are negative for fracture.

Advanced Diagnostic Imaging:	MRI Pelvis without contrast (CPT® 72195)
Comments:	A CT Pelvis without contrast (CPT® 72192) when MRI is contraindicated.

Background and Supporting Information

Coccydynia is often reported by individuals as “tailbone” pain that is usually idiopathic or post-traumatic and generally follows a benign course.

Lower Extremity Pain with Neurological Features (Radiculopathy, Radiculitis, or Plexopathy and Neuropathy) With or Without Low Back (Lumbar Spine) Pain (SP-6)

Guideline

Lower Extremity Pain with Neurological Features (Radiculopathy, Radiculitis, or Plexopathy and Neuropathy) with or without Low Back (Lumbar Spine) Pain (SP-6.1)

Low Back (Lumbar Spine) Trauma (SP-6.2)

References (SP-6)

Lower Extremity Pain with Neurological Features (Radiculopathy, Radiculitis, or Plexopathy and Neuropathy) with or without Low Back (Lumbar Spine) Pain (SP-6.1)

SP.LE.0006.1.A

v2.0.2024

All of the following are required prior to advanced imaging:

- Initial clinical evaluation performed.
- A face-to-face evaluation within the last 60 days.
- The initial evaluation is not required within the last 60 days if another face-to-face evaluation was performed in that time frame. This may be satisfied by the initial evaluation, re-evaluation or another visit.
- Failure of recent (within 3 months) 6-week trial of provider-directed treatment (unless presence of a red flag as defined in **Red Flag Indications (SP-1.2)**).
- Clinical re-evaluation after treatment period (may consist of a face-to-face evaluation or other meaningful contact (see also: **General Guidelines (SP-1.0)**).

Advanced Diagnostic Imaging:	MRI Lumbar Spine without contrast (CPT® 72148)
Comments:	<p>A CT Lumbar spine without contrast (CPT® 72131) OR CT Myelography (CPT® 72132) is appropriate when MRI is contraindicated.</p> <p>See also: Lumbar Spinal Stenosis (SP-9.1)</p>

Low Back (Lumbar Spine) Trauma (SP-6.2)

SP.LE.0006.2.A

v2.0.2024

All of the following are required prior to advanced imaging:

- Initial clinical evaluation performed.
- A face-to-face evaluation within the last 60 days.
- The initial evaluation is not required within the last 60 days if another face-to-face evaluation was performed in that time frame. This may be satisfied by the initial evaluation, re-evaluation or another visit.
- Failure of recent (within 3 months) 6-week trial of provider-directed treatment (unless presence of a red flag as defined in **Red Flag Indications (SP-1.2)**).
- Clinical re-evaluation after treatment period (may consist of a face-to-face evaluation or other meaningful contact (see also: **General Guidelines (SP-1.0)**).
- Results of plain x-rays of the lumbar spine performed after the current episode of symptoms started or changed need to be available to the requesting provider

Advanced Diagnostic Imaging:	MRI Lumbar Spine without contrast (CPT® 72148) OR MRI Lumbar Spine without and with contrast (CPT® 72158) OR CT Lumbar Spine without contrast (CPT® 72131) OR CT myelogram (CPT® 72132)
Comments:	For individuals with ankylosing spondylitis or DISH (diffuse idiopathic skeletal hyperostosis), both MRI of the whole spine (CPT® 72141, 72146, and/or 72148) and CT of the whole spine (CPT® 72125, 72128, and/or 72131) can be approved. Plain x-rays and a 6 week trial of provider-directed treatment and clinical evaluation are NOT required.

- Definitions of radiculopathy, radiculitis and radicular pain: See **Definitions (SP-1.3)**
- Sciatic Neuropathy, Femoral Neuropathy, Peroneal Neuropathy and Meralgia Paresthetica: See **Focal Neuropathy (PN-2)** in the Peripheral Nerve Disorders Imaging Guidelines
- Lumbar and/or Lumbosacral Plexopathy: See **Lumbar and Lumbosacral Plexus (PN-5)** in the Peripheral Nerve Disorders Imaging Guidelines
- Advanced imaging of the hip or pelvis is not generally required in the evaluation of apparent lumbar radiculopathy unless a separate recognized indication for such studies is documented. See: **Hip (MS-24)** in the Musculoskeletal Imaging Guidelines.

Myelopathy (SP-7)

Guideline

Myelopathy (SP-7.1)

References (SP-7)

Myelopathy (SP-7.1)

SP.MI.0007.1.A

v2.0.2024

- Myelopathy is the development of abnormal spinal cord function with long tract signs usually secondary to spinal cord compression, but also inflammation (transverse myelitis, MS, etc.), neoplastic disease or spinal cord infarction.
 - For imaging of transverse myelitis, see: **Transverse Myelitis (HD-16.4)** in the Head Imaging Guidelines
- Examination findings may include loss of manual dexterity, spastic legs, ataxia with hyperreflexia, upgoing toes (positive Babinski), Hoffmann's sign, sustained clonus, Lhermitte's sign, crossed radial reflex, inverted radial reflex, and/or finger escape sign. Sensory level and urinary incontinence/retention may be seen.
 - Advanced imaging is generally appropriate in the initial evaluation of documented or reasonably suspected myelopathy.
- X-rays are not required for advanced imaging in individuals with potential myelopathy regardless of any history of spine surgery, trauma, or other reasons which may otherwise require x-rays (e.g., **Neck (Cervical Spine) Trauma (SP-3.2)**, **Upper Back (Thoracic Spine) Trauma (SP-4.2)**, **Post-Operative Spinal Disorders (SP-15)**).
- Conservative treatment is not a requirement for advanced imaging in individuals with potential myelopathy.
- MRI Cervical and Thoracic Spine without contrast, or without and with contrast, are appropriate for:
 - Evaluation of reasonably suspected myelopathy
 - Post-traumatic syrinx with increased spinal pain or a worsening neurological symptoms
 - Sustained, prominent, and unexplained Lhermitte's sign
 - Unexplained Babinski's or Hoffmann's signs
 - Unexplained hyperreflexia
 - Unexplained bilateral motor weakness
- MRI Cervical, Thoracic, and Lumbar Spine without contrast, or without and with contrast, are appropriate for:
 - Suspected tethered cord and/or low lying conus medullaris.
- CT without contrast, or CT with contrast (myelography), can also be considered for either of the following:
 - An alternative to MRI, when MRI is contraindicated
 - In addition to MRI, for surgical planning

Background and Supporting Information

Lhermitte's sign – With the individual in the long leg sitting position on the examination table, the examiner passively flexes the individual's head and one hip simultaneously with the leg kept straight. A positive test occurs if there is sharp pain down the spine and into the upper or lower extremities.

Babinski's sign – The examiner runs a sharp instrument along the plantar surface of the foot from the calcaneus along the lateral border to the forefoot. A positive test occurs with extension of the great toe with flexion and splaying of the other toes. A negative test occurs with no movement of the toes at all or uniform bunching up of the toes.

Hoffman's sign – The examiner holds the individual's middle finger and briskly flicks the distal phalanx. A positive test is noted if the interphalangeal joint of the thumb of the same hand flexes.

Lumbar Spine Spondylolysis/ Spondylolisthesis (SP-8)

Guideline

Spondylolysis (SP-8.1)

Spondylolisthesis (SP-8.2)

References (SP-8)

Spondylolysis (SP-8.1)

SP.SP.0008.1.A

v2.0.2024

Results of plain x-rays performed after the current episode of symptoms started or changed need to be available to the requesting provider, unless otherwise specified below.

Indication	Imaging Study
<ul style="list-style-type: none"> Plain x-rays are negative, equivocal, or indeterminate AND Clinical suspicion of spondylolysis is high 	99mTc-MDP SPECT bone scan (CPT® 78803)
<ul style="list-style-type: none"> Negative SPECT bone scan, OR evaluation of a lesion seen on SPECT bone scan 	MRI Lumbar Spine without contrast (CPT® 72148) OR CT Lumbar Spine without contrast (CPT® 72131)
<ul style="list-style-type: none"> Documented need for preoperative planning 	MRI Lumbar Spine without contrast (CPT® 72148) AND/OR CT Lumbar Spine without contrast (CPT® 72131)
<ul style="list-style-type: none"> Failure of 6 weeks of provider-directed conservative treatment (which may include immobilization with a spinal orthosis) with clinical re-evaluation 	MRI Lumbar Spine without contrast (CPT® 72148) OR CT Lumbar Spine without contrast (CPT® 72131)
<ul style="list-style-type: none"> Evaluation for stress reaction in bone, to visualize nerve roots 	MRI Lumbar Spine without contrast (CPT® 72148)
<ul style="list-style-type: none"> Any of the above indications, and MRI is contraindicated 	CT Lumbar Spine without contrast (CPT® 72131)
<ul style="list-style-type: none"> Evaluation of bony anatomy 	CT Lumbar Spine without contrast (CPT® 72131)
<ul style="list-style-type: none"> Monitor healing of a pars interarticularis fracture that was determined to have healing potential on a prior CT (i.e., non-sclerotic lesion) 	CT Lumbar Spine without contrast (CPT® 72131) of the symptomatic spinal level

- For pediatric spondylolysis, see: **Spondylolysis (PEDSP-2.4)** in the Pediatric Spine Imaging Guidelines
- Bony healing cannot be achieved non-surgically in an established well defined isthmic pars interarticularis defect whether it is developmental or the result of a pars interarticularis fracture non-union. Repeat advanced diagnostic imaging is not medically necessary in this setting.

Background and Supporting Information

- Spondylolysis is most often an incidental finding on plain x-rays, and advanced imaging is generally not indicated.
- MRI is not appropriate in the early diagnosis of spondylolysis due to the potential for false negative results.

Spondylolisthesis (SP-8.2)

SP.SP.0008.2.A

v2.0.2024

- CT Lumbar Spine without contrast (CPT® 72131) or MRI Lumbar Spine without contrast (CPT® 72148) can be considered after plain x-ray (results of plain x-rays performed after the current episode of symptoms started or changed need to be available to the requesting provider) for the following:
 - Failure of 6 week trial of provider-directed treatment and clinical re-evaluation (see also: **General Guidelines [SP-1.0]**); **or**
 - Preoperative evaluation; **or**
 - See: **Red Flag Indications (SP-1.2)**

Background and Supporting Information

- Stress reactions and stress fractures of the pars interarticularis are most common in athletes and others whose activities involve repetitive flexion/extension loading of the lumbar spine and may be acute or chronic and unilateral or bilateral. Pars interarticularis defects can be an incidental finding on plain x-rays and is frequently asymptomatic.
- Spondylolisthesis is the forward (anterolisthesis) or backward (retrolisthesis, usually not clinically significant) displacement of one vertebra in relation to an adjacent vertebra, most commonly at L4-5 and L5-S1, although other levels of the spine may be involved. Spondylolisthesis is often an incidental finding on plain x-ray and is frequently asymptomatic.

Lumbar Spinal Stenosis (SP-9)

Guideline

Lumbar Spinal Stenosis (SP-9.1)

References (SP-9)

Lumbar Spinal Stenosis (SP-9.1)

SP.ST.0009.1.A

v2.0.2024

- MRI Lumbar Spine without contrast (CPT® 72148) or CT Lumbar Spine without contrast (CPT® 72131) is appropriate for those individuals with clinical suspicion of lumbar spinal stenosis if:
 - Failure of 6 week trial of provider-directed treatment and clinical re-evaluation (see also: **General Guidelines (SP-1.0)**); **or**
 - Red Flag Indications (see: **Red Flag Indications (SP-1.2)**); **or**
 - Severe symptoms of neurogenic claudication restricting normal activity or requiring the frequent use of narcotic analgesics
- A CT/Myelogram Lumbar Spine (CPT® 72132) may also be considered for individuals who have failed 6-weeks of provider-directed treatment if requested by the operating surgeon for surgical planning, especially for multi-level lumbar spinal stenosis.

Background and Supporting Information

Lumbar spinal stenosis refers to a decrease in the space available for the neural elements within the spinal canal that include spinal nerve roots and the cauda equina. It is usually a degenerative condition of the aging spine which can be asymptomatic or a common cause of buttock/low back and/or leg pain (neurogenic claudication) in this population. Neurogenic claudication is a common symptom of lumbar spinal stenosis that is aggravated by walking, especially down hills or stairs, with prolonged standing and is often relieved by sitting and bending forward. Neurogenic claudication should be differentiated from vascular claudication (leg/calf pain) that is often aggravated by walking and relieved fairly rapidly by stopping and rest. The differential diagnosis for lumbar spinal stenosis should include peripheral vascular disease, hip disorders and peripheral neuropathy.

Sacro-Iliac (SI) Joint Pain, Inflammatory Spondylitis/Sacroiliitis and Fibromyalgia (SP-10)

Guideline

Sacro-Iliac (SI) Joint Pain/Sacroiliitis (SP-10.1)

Inflammatory Spondylitis (SP-10.2)

Fibromyalgia (SP-10.3)

References (SP-10)

Sacro-Iliac (SI) Joint Pain/Sacroiliitis (SP-10.1)

SP.SI.0010.1.A

v2.0.2024

- CT Pelvis without contrast (CPT® 72192) or MRI Pelvis without contrast (CPT® 72195) is appropriate if:
 - Initial plain x-rays are equivocal or not diagnostic; **and**
 - Failure of 6 weeks of provider-directed treatment and clinical re-evaluation (see also: **General Guidelines (SP-1.0)**); **or**
 - Any ONE of the following:
 - Fractures of the sacrum or sacroiliac joint(s); **or**
 - See: **Red Flag Indications (SP-1.2)**; **or**
 - Preoperative planning
- MRI Pelvis without and with contrast as indicated for pediatric individuals with juvenile idiopathic arthritis.
- Suspicion of neoplastic, inflammatory, or infectious disease:
 - MRI Pelvis without and with contrast (CPT® 72197) or MRI Pelvis without contrast (CPT® 72195)
 - CT Pelvis without contrast (CPT® 72192) if MRI is contraindicated
- See: **Rheumatoid Arthritis (RA) and Inflammatory Arthritis (MS-15.1)** in the Musculoskeletal Imaging Guidelines

Inflammatory Spondylitis (SP-10.2)

SP.SI.0010.2.A

v2.0.2024

- Initial plain x-rays are equivocal or not diagnostic:
 - MRI without and with contrast or MRI without contrast of the affected spinal region
 - CT without contrast of the affected spinal region if MRI is contraindicated
- Follow up imaging for treatment response or disease progression:
 - Repeat plain x-rays of the SI joints, or SI joints and spine area of interest
 - MRI without and with contrast of spine area of interest, or MRI SI joints without contrast, or MRI SI joints and MRI without and with contrast spine area of interest if x-rays show no progression of disease
- For those with documented ankylosing spondylitis or DISH (diffuse idiopathic skeletal hyperostosis) and spine pain following trauma, plain x-rays are not required prior to advanced imaging.
 - See: **Neck Trauma (SP-3.2)**, **Upper Back Trauma (SP-4.2)**, **Low Back Trauma (SP-6.2)**

Fibromyalgia (SP-10.3)

SP.DI.0010.3.A

v2.0.2024

- Advanced diagnostic imaging is not supported by the scientific evidence for the evaluation and treatment of fibromyalgia.

Background and Supporting Information

- Sacroiliitis can present with pain localized to the SI joint or referred pain to the buttock and/or posterior thigh without neurologic signs or symptoms. Affected individuals can often point to the SI joint as the pain source. Provocative and/or therapeutic SI joint anesthetic/corticosteroid injections can have diagnostic value.
- There is no evidence demonstrating that advanced diagnostic imaging substantiates changes to individual management decisions in individuals with proven SI joint disorders when visible on routine plain x-rays.
- MRI has shown inflammatory changes in the SI joints prior to visible x-ray changes in several studies. However, the ability of MRI to characterize inflammation in early ankylosing spondylitis, the ability of MRI to predict erosive changes, and the value of monitoring treatment effects using serial MRI studies remains controversial and investigational in adults.

Spinal Compression Fractures (SP-11)

Guideline

Spinal Compression Fractures (SP-11.1)

References (SP-11)

Spinal Compression Fractures (SP-11.1)

SP.FX.0011.1.A

v2.0.2024

Individuals with no history of malignancy

- MRI without contrast, CT without contrast, or whole body bone scan (CPT® 78306), SPECT (CPT® 78803), or SPECT/CT (CPT® 78830) of the affected spinal region is indicated after plain x-ray evaluation **and** the location of the individual's spinal pain is concordant with the spinal x-rays for any ONE of the following:
 - X-rays reveal a new spinal compression fracture; **or**
 - X-rays are non-diagnostic and severe spinal pain persists for more than one week in an individual already predisposed to low energy/insufficiency fractures; **or**
 - The acuity of the spinal compression fracture deformity on plain x-ray is indeterminate, **or**
 - Surgical planning following known insufficiency spinal compression fractures in individuals who are candidates for kyphoplasty, vertebroplasty or other spine surgical procedures

Individuals with a history of malignancy

- For individuals with new symptomatic or asymptomatic vertebral compression fractures on radiographs, please refer to the cancer-specific guidelines within the General Oncology Imaging Guidelines for appropriate imaging studies.
- See also: **Red Flag Indications (SP-1.2)**

Background and Supporting Information

Insufficiency/low energy spinal compression fractures of the spine occur due to the lack of structural integrity to withstand physiologic loads and minor spinal trauma. Low bone mineral density is the primary etiology for most of these fractures but could also occur in the setting of other bone disease and medical conditions, in addition to neoplastic disease and infection. Sudden localized back pain, with or without trauma, is a typical presentation of insufficiency/low energy spinal compression fractures and can often be an incidental finding on plain x-rays and can be asymptomatic.

Spinal Pain in Cancer Patients (SP-12)

Guideline

Spinal Pain in Cancer Patients (SP-12)

Spinal Pain in Cancer Patients (SP-12)

SP.CA.0012.A

v2.0.2024

- For guidelines regarding advanced diagnostic imaging in this clinical setting, See **Spinal/Vertebral Metastases (ONC-31.6)**

Spinal Canal/Cord Disorders (e.g. Syringomyelia) (SP-13)

Guideline

Initial Imaging Pathway (SP-13.1)

Follow-up Imaging (SP-13.2)

References (SP-13)

Initial Imaging Pathway (SP-13.1)

SP.CD.0013.1.A**v2.0.2024**

- MRI Cervical Spine without contrast or without and with contrast (CPT® 72141 or CPT® 72156) and MRI Thoracic Spine without contrast or without and with contrast (CPT® 72146 or CPT® 72157) is appropriate when syringomyelia is suspected.
- Once a syrinx is identified by prior imaging, the following are appropriate:
 - MRI Brain without contrast (CPT® 70551) to evaluate for syringobulbia **AND**
 - MRI Cervical Spine without contrast or without and with contrast (CPT® 72141 or CPT® 72156) if not already performed **AND**
 - MRI Thoracic Spine without contrast or without and with contrast (CPT® 72146 or CPT® 72157) and MRI Lumbar Spine without contrast or without and with contrast (CPT® 72148 or CPT® 72158) to define the lower most extent of the syrinx or to identify a skip lesion.

Follow-up Imaging (SP-13.2)

SP.CD.0013.2.A

v2.0.2024

- MRI Cervical Spine without contrast (CPT® 72141) and MRI Brain without contrast (CPT® 70551) and/or MRI Thoracic Spine without contrast (CPT® 72146) when involved
 - If there is a concern for malignancy, imaging can be performed without and with contrast
 - Annual imaging until non-progression of the syringomyelia is established
 - Following surgical treatment (including posterior fossa decompression)
 - Advanced diagnostic imaging every three years for life can be performed once non-progression of the syringomyelia is established
 - Repeat advanced diagnostic imaging is appropriate when there is evidence of neurologic deterioration

Background and Supporting Information

Syringomyelia may begin to form in childhood but rarely becomes symptomatic before the adult years.

Spinal Deformities (e.g. Scoliosis/Kyphosis) (SP-14)

Guideline

Spinal Deformities (e.g. Scoliosis/Kyphosis) (SP-14.1)

Revision Anterior Spinal Deformity Surgery (SP-14.2)

References (SP-14)

Spinal Deformities (e.g. Scoliosis/Kyphosis) (SP-14.1)

SP.SC.0014.1.A

v2.0.2024

- MRI without contrast, MRI without and with contrast, or CT/Myelography if MRI is contraindicated of the affected spinal regions is appropriate after plain x-rays (e.g., Cobb radiographs) of the affected spinal regions have been performed and results are available to the requesting provider:
 - For preoperative evaluation; **or**
 - For cases of congenital scoliosis and other atypical curves that may be associated with spinal canal/cord pathology such as tethered cord, syringomyelia, diastematomyelia, or tumors; **or**
 - For cases of scoliosis and/or kyphosis when there are associated neurologic signs and symptoms on physical examination; **or**
 - Scoliosis with a convex left thoracic curve due to a high association of a convex left thoracic curve with underlying spinal canal/cord pathology
- CT of the affected spinal regions (contrast as requested) is appropriate in cases with a complex osseous deformity for preoperative evaluation
- CTA or MRA is not medically necessary for preoperative planning for initial anterior spinal surgery for surgical correction of spinal deformities

Revision Anterior Spinal Deformity Surgery (SP-14.2)

SP.SC.0014.2.A

v2.0.2024

- If requested by the operating surgeon, the following studies can be performed for preoperative planning for revision of anterior thoracic or lumbar spinal surgery:
 - CTA Pelvis (CPT® 72191) and/or CTA Abdomen (CPT® 74175); **or**
 - MRA Pelvis (CPT® 72198) and/or MRA Abdomen (CPT® 74185)

Background and Supporting Information

- Scoliosis is defined as a curvature of the spine in the coronal plane. Scoliosis can involve any or all levels of the spine but generally involves the thoracic and/or lumbar spine. Scoliosis initially occurs in the pediatric and adolescent population and persists throughout life. If scoliosis begins in adulthood, it is usually secondary to neurologic disorders (e.g., posttraumatic paralysis) or degenerative spondylosis. Sagittal plane spinal deformity (e.g., kyphosis, hyperlordosis) may be associated with scoliosis.

Post-Operative Spinal Disorders (SP-15)

Guideline

Greater than Six Months Post-Operative (SP-15.1)

Routine Post-Fusion Imaging (SP-15.2)

Prolonged Intractable Pain Following Spinal Surgery Within Six Months (SP-15.3)

Revision Anterior Fusion Surgery (SP-15.4)

References (SP-15)

Greater than Six Months Post-Operative (SP-15.1)

SP.OP.0015.1.A**v2.0.2024**

- Following plain x-rays of the affected spinal regions post-surgical with results available to the requesting provider, MRI without and with contrast, MRI without contrast, or CT without contrast of the affected spinal region(s) is appropriate when:
 - Individual is more than six months post-operative; **and**
 - No significant improvement after a recent (within 3 months) six week trial of provider-directed treatment with clinical re-evaluation; **or**
 - See: **Red Flag Indications (SP-1.2)**
- See: **Nuclear Medicine (SP-17)** for nuclear medicine imaging when MRI/CT are nondiagnostic in back pain with suspected failed fusion surgery

Routine Post-Fusion Imaging (SP-15.2)

SP.OP.0015.2.A

v2.0.2024

- Following a clinically successful spinal fusion, advanced diagnostic imaging is generally not indicated.
- **PET** is not currently indicated for the routine assessment of spinal fusions or unsuccessful spine surgery (see also: **Spine PET (SP-2.10)**).

Prolonged Intractable Pain Following Spinal Surgery Within Six Months (SP-15.3)

SP.OP.0015.3.A

v2.0.2024

- Following plain x-rays of the affected spinal regions post-surgical with results available to the requesting provider, MRI without and with contrast of the affected spinal region(s) is appropriate if there are residual, new, recurrent, or worsening symptoms related to the surgical site.
 - CT without contrast, or CT with contrast (Myelography) of the affected spinal region(s) if MRI is contraindicated.

Revision Anterior Fusion Surgery (SP-15.4)

SP.OP.0015.4.A

v2.0.2024

- If requested by the operating surgeon, the following studies for preoperative planning prior to surgical revision of a thoracic or lumbar anterior spinal arthrodesis:
 - CTA Pelvis (CPT® 72191) and/or CTA Abdomen (CPT® 74175); *or*
 - MRA Pelvis (CPT® 72198) and/or MRA Abdomen (CPT® 74185)

Other Imaging Studies and Procedures Related to the Spine Imaging Guidelines (SP-16)

Guideline

Prior to Spine Surgery (SP-16.1)

Prior to Interventional Spinal Injections (SP-16.2)

Prior to Spinal Cord Stimulator (SCS) Placement/Removal (SP-16.3)

Following Vertebral Augmentation Procedures (SP-16.4)

References (SP-16)

Prior to Spine Surgery (SP-16.1)

SP.OI.0016.1.A**v2.0.2024**

- Advanced imaging needed for surgical planning (e.g., MRI and/or CT) should be performed within the past six (6) months for preoperative planning prior to spine surgery when the criteria for advanced imaging studies of the spine are met as otherwise stated in the Spine Imaging Guidelines. (See: **MRI of the Spine [SP-2.2]**, **CT of the Spine [SP-2.3]**, **CT/Myelography [SP-2.4]**)
- MRA and CTA are generally not indicated for preoperative planning of initial anterior spinal surgery unless abnormal vasculature is known or reasonably anticipated.

Prior to Interventional Spinal Injections (SP-16.2)

SP.OI.0016.2.A

v2.0.2024

- Advanced diagnostic imaging studies of the spine are not required prior to facet joint injections, medial branch blocks or radiofrequency ablations unless the criteria for advanced imaging studies of the spine are met as otherwise stated in the Spine Imaging Guidelines.
- Advanced diagnostic imaging studies of the cervical spine and/or thoracic spine are indicated within twenty-four (24) months prior to interlaminar or transforaminal epidural steroid injections of the cervical and/or thoracic spine when the criteria for advanced imaging studies of the spine are met as otherwise stated in the Spine Imaging Guidelines.
- Advanced diagnostic imaging studies of the lumbar spine are indicated prior to transforaminal epidural steroid injections of the lumbar spine when the criteria for advanced imaging studies of the spine are met as otherwise stated in the Spine Imaging Guidelines.
- Advanced diagnostic imaging studies of the lumbar spine are not required prior to lumbar spine interlaminar or caudal epidural steroid injections unless the criteria for advanced imaging studies of the spine are met as otherwise stated in the Spine Imaging Guidelines.
- For an individual with evidence of symptomatic spinal stenosis, MRI or CT with or without myelography demonstrating severe spinal stenosis at the level to be treated within the past twenty-four (24) months is required for an initial trial of a transforaminal, interlaminar or caudal epidural steroid injection when ALL of the following criteria are met:
 - Diagnostic evaluation has ruled out other potential causes of pain
 - Significant functional limitations resulting in diminished quality of life and impaired age-appropriate activities of daily living (ADLs)
 - Failure of at least four (4) weeks of conservative treatment (e.g., exercise, physical methods including physical therapy and/or chiropractic care, NSAIDs, and/or muscle relaxants)
- See: **Red Flag Indications (SP-1.2)** for severe radicular pain

Prior to Spinal Cord Stimulator (SCS) Placement/Removal (SP-16.3)

SP.OI.0016.3.A

v2.0.2024

- MRI Thoracic Spine without contrast (CPT® 72146) is generally the study of choice prior to SCS placement. CT Thoracic Spine without contrast (CPT® 72128) **OR** CT/Myelography Thoracic Spine (CPT® 72129) are acceptable alternatives.
- Imaging of the lumbar spine is not indicated for placement nor removal of spinal cord stimulators.

Following Vertebral Augmentation Procedures (SP-16.4)

SP.OI.0016.4.A

v2.0.2024

- CT without contrast of the affected spinal region(s) within 24 hours post-procedure to evaluate neurologic sequelae resulting from cement extravasation

Background and Supporting Information

- MRI has not been shown to change the outcome of interventional pain procedures in recent scientific evidence-based studies and without substantial change in the clinical picture or intervening surgery. Repeat advanced diagnostic imaging studies are not necessary with each spinal injection or series of spinal injections.

Nuclear Medicine (SP-17)

Guideline

Nuclear Medicine (SP-17)

Reference (SP-17)

Nuclear Medicine (SP-17)

SP.FX.0017.A

v2.0.2024

- For evaluation of suspected loosening of orthopedic implants, when recent plain x-ray is nondiagnostic:
 - Bone scan (CPT® 78315) **OR**
 - Distribution of Radiopharmaceutical Agent SPECT (CPT® 78803, or 78831) **OR**
 - SPECT/CT (CPT® 78830)
- Back pain with suspected failed fusion surgery, with suspected painful pseudoarthrosis and MRI/CT are nondiagnostic:
 - Radiopharmaceutical Localization SPECT (CPT® 78803, or 78831) **OR**
 - SPECT/CT (CPT® 78830)
- Any of the following studies are indicated for initial evaluation of suspected osteomyelitis:
 - Bone scan (one of CPT® codes: 78300, 78305, 78306, or 78315) **OR**
 - Distribution of Radiopharmaceutical Agent SPECT (CPT® 78803) **OR**
 - Nuclear Bone Marrow imaging (one of CPT® codes: 78102, 78103, or 78104) **OR**
 - Radiopharmaceutical inflammatory imaging (one of CPT® codes: 78800, 78801, 78802) **OR**
 - Distribution Of Radiopharmaceutical Agent SPECT (CPT® 78803 or 78831) **OR**
 - SPECT/CT (CPT® 78830 or 78832)
- For follow-up imaging, any of the following studies are indicated for evaluation of response to treatment in established osteomyelitis. The appropriate follow-up advanced imaging time frame will depend on the nature of the underlying disease and prior imaging:
 - Bone scan (one of CPT® codes: 78300, 78305, 78306, or 78315) **OR**
 - Nuclear Bone Marrow imaging (one of CPT® codes: 78102, 78103, or 78104)
- For evaluation of facet arthropathy in individuals with ankylosing spondylitis, osteoarthritis, or rheumatoid arthritis:
 - Radiopharmaceutical Localization Inflammatory Imaging (one of CPT® codes: 78800, 78801, 78802, or 78803) **OR**
 - Distribution Of Radiopharmaceutical Agent SPECT (CPT® 78803) **OR**
 - SPECT/CT (CPT® 78830)
- For the evaluation of back pain and suspected spondylolysis:
 - Radiopharmaceutical Agent SPECT (CPT® 78803 or 78831) **OR**
 - SPECT/CT (CPT® 78830)

- SPECT has been described to identify spinal pain generators, pseudoarthrosis of spinal fusion or hardware failure when conventional advanced diagnostic imaging studies are inconclusive, non-diagnostic or equivocal.
 - Requests for SPECT for these indications will be reviewed on a case-by-case basis.
- For the evaluation of a new symptomatic compression fracture identified on radiographs or CT, and no known malignancy:
 - Whole body bone scan with add on SPECT (CPT® 78803) or SPECT/CT (CPT® 78830)
 - See also: **Spinal Compression Fractures (SP-11.1)**

Nuclear Medicine	CPT®
PET Imaging; limited area (this code not used in pediatrics)	78811
PET Imaging; skull base to mid-thigh (this code not used in pediatrics)	78812
PET Imaging; whole body (this code not used in pediatrics)	78813
PET with concurrently acquired CT; limited area (this code rarely used in pediatrics)	78814
PET with concurrently acquired CT; skull base to mid-thigh	78815
PET with concurrently acquired CT; whole body	78816
Adrenal Nuclear Imaging Cortex and/or Medulla	78075
Spleen Imaging Only with or without Vascular Flow	78185
Liver Imaging Static	78201
Liver Imaging with Vascular Flow	78202
Liver and Spleen Imaging Static	78215
Liver and Spleen Imaging with Vascular Flow	78216
Hepatobiliary System Imaging, Including Gallbladder When Present	78226

Hepatobiliary System Imaging, Including Gallbladder When Present; with Pharmacologic Intervention, Including Quantitative Measurement(s) When Performed	78227
Gastric Mucosa Imaging	78261
Gastroesophageal Reflux Study	78262
Gastric Emptying Study	78264
GI Bleeding Scintigraphy	78278
Gastrointestinal Protein Loss	78282
Intestinal Imaging	78290
Peritoneal-Venous Shunt Patency	78291
Kidney Imaging (Nuclear) Static	78700
Kidney Imaging (Nuclear) with Vascular Flow	78701
Kidney Flow and Function, Single Study without Pharmacologic Intervention	78707
Kidney Imaging with Vascular Flow and Function with Pharmacological Intervention, Single	78708
Kidney Imaging with Vascular Flow and Function with and without Pharmacological Intervention, Multiple	78709
Nuclear Non-imaging Renal Function	78725
Ureteral Reflux Study (Radiopharmaceutical Voiding Cystogram)	78740
Radiopharmaceutical Localization Imaging Limited area	78800
Radiopharmaceutical Localization Imaging Whole Body	78802
Radiopharmaceutical Localization Imaging SPECT	78803
Ultrasound	CPT®
Ultrasound, abdomen; complete	76700
Ultrasound, abdomen; limited	76705
Ultrasound, abdominal wall	76705
Ultrasound, retroperitoneal; complete	76770
Ultrasound, retroperitoneal; limited	76775
Ultrasound, transplanted kidney (with duplex Doppler)	76776
Duplex scan of arterial inflow and venous outflow of abdominal, pelvic, scrotal contents and/or retroperitoneal organs; complete study	93975
Duplex scan of arterial inflow and venous outflow of abdominal, pelvic, scrotal contents and/or retroperitoneal organs; limited study	93976
Duplex scan of aorta, inferior vena cava, iliac vasculature, or bypass grafts; complete	93978
Duplex scan of aorta, inferior vena cava, iliac vasculature, or bypass grafts; limited	93979

General Guidelines (PEDAB-1)

General Guidelines (PEDAB-1.0)

Pediatric Abdominal Imaging Age Considerations (PEDAB-1.1)

Pediatric Abdomen Imaging Appropriate Clinical Evaluation and Conservative Treatment (PEDAB-1.2)

Pediatric Abdomen Imaging Modality General Considerations (PEDAB-1.3)

General Guidelines (PEDAB-1.0)

- A pertinent clinical evaluation since the onset or change in symptoms including a detailed history, physical examination, appropriate laboratory studies and basic imaging such as plain radiography or ultrasound should be performed prior to considering advanced imaging (CT, MR, Nuclear Medicine), unless the individual is undergoing guideline-supported scheduled imaging evaluation. A meaningful technological contact (telehealth visit, telephone call, electronic mail or messaging) since the onset or change in symptoms can serve as a pertinent clinical evaluation.
- These guidelines are based upon using advanced imaging to answer specific clinical questions that will affect individual management. Imaging is not indicated if the results will not affect individual management decisions. Standard medical practice would dictate continuing conservative therapy prior to advanced imaging in individuals who are improving on current treatment programs.
- Unless otherwise stated in a specific guideline section, the use of advanced imaging to screen asymptomatic individuals for disorders involving the abdomen is not supported. Advanced imaging should only be approved in individuals who have documented active clinical signs or symptoms of disease.
- Unless otherwise stated in a specific guideline section, repeat imaging studies of the same body area are not necessary unless there is evidence for progression of disease, new onset of disease, and/or documentation of how repeat imaging will affect individual management or treatment decisions.
- Ultrasound should be the initial imaging study of choice in most children with abdominal conditions and should be done prior to advanced imaging.
 - ◆ For those individuals who do require advanced imaging after ultrasound, ultrasound can be very beneficial in selecting the proper modality, body area, image sequences, and contrast level that will provide the most definitive information for the individual.
 - ◆ CPT® codes vary by body area and presence or absence of Doppler imaging and are included in the table at the beginning of this guideline.

Red Flags

- Children with abdominal pain AND ANY of the following red flag signs or symptoms require additional investigation. The initial ultrasound is not required. Additional labs may be helpful but are not required.
 - ◆ Pain that wakes the child from sleep
 - ◆ Unexplained fever (T >100.4°F)
 - ◆ History of malignancy with a likelihood or propensity to metastasize to abdomen
 - ◆ Dysphagia
 - ◆ GI bleeding
 - ◆ Significant vomiting
 - ◆ Elevated WBC per the testing laboratory's range
 - ◆ Low WBC (absolute neutrophil count <1000)
 - ◆ Guarding, rebound tenderness, or other peritoneal signs
 - ◆ Severe chronic diarrhea or nocturnal diarrhea in a toilet-trained child
 - ◆ Failure to thrive, involuntary weight loss, or delay in linear growth or pubertal development
 - ◆ Family history of inflammatory bowel disease, familial polyposis syndrome, celiac disease, or peptic ulcer disease
 - ◆ Abdominal mass, hepatomegaly, and/or splenomegaly on exam
 - ◆ Jaundice
 - ◆ Perianal disease
 - ◆ Suspected or confirmed COVID-19 infection with concern for multisystem inflammatory syndrome in children (MIS-C)
 - ◆ Failure to respond to 4 weeks of recent (within 60 days) provider directed conservative care
- See the condition-specific sections for when the above list of exclusionary criteria apply and lead directly to advanced imaging.
- The appropriate advanced imaging for the condition is listed in the condition-specific section.

Pediatric Abdominal Imaging Age Considerations (PEDAB-1.1)

- Many conditions affecting the abdomen in the pediatric population are different diagnoses than those occurring in the adult population. For those diseases that occur in both pediatric and adult populations, differences may exist in management due to individual age, comorbidities, and differences in disease natural history between children and adults.
- Individuals age 18 years old and younger¹³ should be imaged according to the Pediatric Abdomen Imaging Guidelines if discussed. Any conditions not specifically discussed in the Pediatric Abdomen Imaging Guidelines should be imaged according to the General Abdomen Imaging Guidelines. Individuals age >18 years old should be imaged according to the General Abdomen Imaging Guidelines, except where directed otherwise by a specific guideline section.

Pediatric Abdomen Imaging Appropriate Clinical Evaluation and Conservative Treatment (PEDAB-1.2)

- See: **General Guidelines (PEDAB-1.0)**

Pediatric Abdomen Imaging Modality General Considerations (PEDAB-1.3)

➤ Ultrasound

- ◆ See: **General Guidelines (PEDAB-1.0)**

➤ MRI

- ◆ MRI Abdomen is generally performed without and with contrast (CPT® 74183) unless the individual has a documented contraindication to gadolinium or otherwise stated in a specific guideline section.
- ◆ Due to the length of time required for MRI acquisition and the need to minimize individual movement, anesthesia is usually required for almost all infants (except neonates) and young children (age <7 years) as well as older children with delays in development or maturity. This anesthesia may be administered via oral or intravenous routes. In this individual population, MRI sessions should be planned with a goal of minimizing anesthesia exposure by adhering to the following considerations:
 - MRI procedures can be performed without and/or with contrast use as supported by these condition-based guidelines. If intravenous access will already be present for anesthesia administration and there is no contraindication for using contrast, imaging without and with contrast may be appropriate if requested. By doing so, the requesting provider may avoid repetitive anesthesia administration to perform an MRI with contrast if the initial study without contrast is inconclusive.
 - Recent evidence-based literature demonstrates the potential for gadolinium deposition in various organs including the brain, after the use of MRI contrast.
 - The U.S. Food and Drug Administration (FDA) has noted that there is currently no evidence to suggest that gadolinium retention in the brain is harmful and restricting gadolinium-based contrast agents (GBCAs) use is not warranted at this time. It has been recommended that GBCA use should be limited to circumstances in which additional information provided by the contrast agent is necessary and the necessity of repetitive MRIs with GBCAs should be assessed.
 - If multiple body areas are supported by eviCore's guidelines for the clinical condition being evaluated, MRI of all necessary body areas should be obtained concurrently in the same session.
- ◆ The presence of surgical hardware or implanted devices may preclude MRI.
 - The selection of best examination may require coordination between the provider and the imaging service. CT may be the procedure of choice in these cases.

➤ CT

- ◆ CT Abdomen typically extends from the dome of the diaphragm to the upper margin of the sacroiliac joints, and CT Abdomen and Pelvis extends from the dome of the diaphragm through the ischial tuberosities.
 - In general, CT Abdomen is appropriate when evaluating solid abdominal organs.
 - In general, CT Abdomen and Pelvis is appropriate when evaluating inflammatory or infectious processes, hematuria, or conditions that appear to involve both the abdomen and the pelvis.
 - In some cases, especially in follow-up of a known finding, it may be appropriate to limit the exam to the region of concern to reduce radiation exposure.
- ◆ The contrast level in pediatric CT imaging is specific to the clinical indication, as listed in the specific guideline sections.
- ◆ CT Abdomen or Abdomen and Pelvis may be indicated for further evaluation of abnormalities suggested on prior US or MRI studies.
- ◆ CT may be indicated without prior MRI or US as indicated in specific sections of these guidelines.
- ◆ CT should not be used to replace MRI in an attempt to avoid sedation unless listed as a recommended study in a specific guideline section.
- ◆ The selection of the best examination may require coordination between the provider and the imaging service.

➤ Nuclear Medicine

- ◆ Nuclear medicine studies are commonly used in evaluation of the pediatric kidney and gallbladder. Other less common indications exist as well:
 - Esophageal motility study (CPT® 78258) and/or Gastroesophageal reflux study (CPT® 78262) is indicated in the evaluation of gastroesophageal reflux.
- ◆ Nuclear intestinal imaging (preferred code for Meckel's Scan, CPT® 78290) or Gastric mucosa imaging (alternate code for Meckel's scan, CPT® 78261) is indicated for the following:
 - Suspected Meckel's diverticulum
 - Gastric mucosa imaging (CPT® 78261) is also indicated for:
 - Barrett's esophagus
 - Thoracic masses suspected of containing gastric mucosa
- ◆ Gastric emptying study (CPT® 78264) is indicated for evaluation of either suspected delayed or rapid gastric emptying.
- ◆ Gastric emptying study with small bowel transit (CPT® 78265) is indicated for evaluation of suspected abnormalities in both total and regional times for gastrointestinal transit of the small bowel.
- ◆ Gastric emptying study with small bowel and colon transit (CPT® 78266) is indicated for evaluation of suspected abnormalities in both total and regional times for gastrointestinal transit to the colon.
- ◆ Gastrointestinal bleeding scintigraphy (CPT® 78278) is indicated for evaluation of brisk active GI bleeding with indeterminate endoscopy.
- ◆ Gastrointestinal protein loss study (CPT® 78282) is indicated for decreased serum albumin or globulins and no evidence of GI bleeding.

- ◆ Peritoneal-venous shunt patency study (CPT® 78291) is indicated for evaluation of shunt patency and function in a individual with ascites.
- ◆ Nuclear renal imaging (CPT® 78701, CPT® 78707, CPT® 78708, or CPT® 78709) is indicated for evaluation of the following:
 - Renal transplant follow-up
 - Kidney salvage vs. nephrectomy surgical decisions
 - Acute renal failure with no evidence of obstruction on recent ultrasound
 - Chronic renal failure to estimate prognosis for recovery
- 3D Rendering
 - ◆ 3D Rendering indications in pediatric abdomen imaging are identical to those in the general imaging guidelines. See: **3D Rendering (Preface-4.1)** in the Preface Imaging Guidelines.

The guidelines listed in this section for certain specific indications are not intended to be all-inclusive; clinical judgment remains paramount and variance from these guidelines may be appropriate and warranted for specific clinical situations.

Generalized Abdominal Pain (PEDAB-2)

- Chronic abdominal pain is a common complaint among children and adolescents. Functional abdominal pain disorders, including functional abdominal pain and functional dyspepsia (including symptoms of epigastric pain, burning, postprandial fullness, early satiety), are conditions in which there is no structural or organic disease.
- Children with no red flag signs or symptoms, normal physical examination, and normal laboratory studies (preliminary labs may include CBC, electrolytes, lipase, amylase, urinalysis, ESR, CRP, LFTs, and/or stool for blood and stool culture if diarrhea) should initially be evaluated by ultrasound (CPT® 76700 or CPT® 76705) and treated conservatively.
 - ◆ Gastroenterology (GI) specialist evaluation or consultation is helpful in determining the need for advanced imaging in these cases.
 - ◆ CT Abdomen (CPT® 74160) or Abdomen and Pelvis (CPT® 74177) with contrast are indicated if there are any red flag signs or symptoms (as listed in **General Guidelines (AB-1.0)**)
- Children with abdominal pain that can be localized to a particular area of the abdomen should be imaged according to the relevant guideline section:
 - ◆ **Right Lower Quadrant Pain (PEDAB-3)**
 - ◆ **Flank Pain, Renal Stone (PEDAB-4)**
 - ◆ **Right Upper Quadrant Pain (PEDAB-8)**
 - ◆ **Left Upper Quadrant Pain (PEDAB-25)**
 - ◆ **Left Lower Quadrant Pain (PEDAB-29)**

Right Lower Quadrant Pain (PEDAB-3)

- The presence of any red flag findings per **PEDAB-1.0: General Guidelines** precludes adjudication based on any other criteria.
- Ultrasound (CPT® 76700 or CPT® 76705) is indicated as the initial examination. If positive or negative for appendicitis, no further imaging is necessary.
 - ◆ If the appendix is not visualized on ultrasound and the white blood cell count is not elevated, no further imaging is necessary in nearly all cases, although the referring physician should make the final determination of the need for advanced imaging.
- CT Abdomen and Pelvis with contrast (CPT® 74177), CT Abdomen and Pelvis without contrast (CPT® 74176), MRI Abdomen and Pelvis without contrast (CPT® 74181 and CPT® 72195), or MRI Abdomen and Pelvis without and with contrast (CPT® 74183 and CPT® 72197) is indicated for any of the following:
 - ◆ Individuals who are overweight (BMI ≥85th percentile for age)
 - ◆ Insufficient local ultrasound expertise exists
 - ◆ Ultrasound findings are inconclusive¹⁴
- If the appendix is absent, follow guidelines in: **Generalized Abdominal Pain (PEDAB-2)**

Flank Pain, Renal Stone (PEDAB-4)

- The presence of any red flag findings per **PEDAB-1.0: General Guidelines** precludes adjudication based on any other criteria.
- Flank Pain imaging indications in pediatric individuals are very similar to those for adult individuals. See: **Flank Pain, Rule Out or Known Renal/Ureteral Stone (AB-4)** in the Abdomen Imaging Guidelines.
 - ◆ Ultrasound (CPT® 76770 or CPT® 76775) is the preferred initial study in children
 - ◆ CT Abdomen and Pelvis without contrast (CPT® 74176) is indicated if ultrasound is inconclusive.
 - ◆ MRI Abdomen (CPT® 74183) and Pelvis (CPT® 72197) without and with contrast is indicated if CT is inconclusive or if significant concern for radiation exposure from frequent CT use for a particular individual.
 - ◆ If hematuria is present, see: **Hematuria (PEDAB-7)** for imaging guidelines.
- Nuclear kidney imaging (CPT® 78707, CPT® 78708, CPT® 78709, or CPT® 78803) is indicated for evaluation of recurrent flank pain when CT and ultrasound are non-diagnostic, or for suspected obstructive uropathy.

Urinary Tract Infection (UTI) (PEDAB-5)

Upper Urinary Tract (PEDAB-5.1)

Lower Urinary Tract (PEDAB-5.2)

Upper Urinary Tract (PEDAB-5.1)

- Ultrasound evaluation (CPT® 76770 or CPT® 76775) is initial imaging for all children with first time to diagnose hydronephrosis, pyelonephritis, or congenital renal anomaly.
 - ◆ If hydronephrosis is present, this should be further evaluated with voiding cystourethrography (VCUG), to evaluate for vesicoureteral reflux.
 - In boys, this is generally accomplished using fluoroscopic imaging and iodinated contrast to exclude urethral abnormalities.
 - In girls, Ureteral Reflux Study (Radiopharmaceutical Voiding Cystogram) (CPT® 78740) or fluoroscopic VCUG may be performed.¹⁵
 - Contrast Enhanced Voiding Urosonography (CeVUS) may also be utilized at institutions with expertise in this modality.¹⁵
- Diuretic renography using Tc-99m MAG 3 (CPT® 78707, CPT® 78708, or CPT® 78709) for:¹
 - ◆ Differentiating a dilated non-obstructed urinary system from a true stenosis (e.g., UPJ obstruction; ureteral-vesical junction [UVJ] obstruction).
 - ◆ Quantifying renal parenchymal function.
 - ◆ Ultrasound findings that are compatible with a multicystic dysplastic kidney to evaluate function of the affected kidney or a ureteral-pelvic junction (UPJ) obstruction of the contralateral kidney.
 - ◆ Diagnostic evaluation of upper tract dilatation when VCUG is negative.
 - ◆ Renal function evaluation in individuals with hydronephrosis.
- CT is sensitive in diagnosing pyelonephritis and has a role in evaluation of renal abscess or unusual complications such as xanthogranulomatous pyelonephritis but has no role in the routine evaluation of UTI.
 - ◆ CT Abdomen and Pelvis with contrast (CPT® 74177) is appropriate to evaluate the entire genitourinary tract for congenital abnormalities of distal tracts in complicated pyelonephritis.¹⁵
- Magnetic resonance urography (MRU) (CPT® 74183 and CPT® 72197), is not a first-line test for the routine evaluation of a UTI, but may be appropriate (where available) for investigation of a dilated upper urinary tract.
 - ◆ NOTE: MRU requires sedation in young children.
 - ◆ MRU can also quantitate renal function.
- Technetium-99m-dimercaptosuccinic acid (Tc-99m DMSA) scintigraphy (CPT® 78700, CPT® 78701, or CPT® 78803), is sensitive for evaluation of renal cortical damage.^{11, 13}
 - ◆ DMSA scintigraphy is indicated for:
 - Individuals with atypical or recurrent febrile acute urinary tract infections.¹¹
 - Atypical findings may include poor response to antibiotics, elevated creatinine, poor urine stream, or non E-coli organism.
 - Individuals with febrile urinary tract infections older than 5 years of age with known vesicoureteral reflux.¹⁴
 - For detection of post-pyelonephritic renal scarring at least 6 months after the documented upper tract UTI in high-risk individuals with recurrent UTIs.¹³

- Radiopharmaceutical nuclear medicine imaging (CPT® 78800, CPT® 78801, CPT® 78802, CPT® 78803, CPT® 78830, CPT® 78831, or CPT® 78832) is indicated for evaluation of suspected pyelonephritis or diffuse interstitial nephritis.
- Nuclear non-imaging renal function study (CPT® 78725) is a quantitative study that can be used to evaluate renal function.
- Children with atypical (poor response to antibiotics within 48 hours, sepsis, poor urine stream, raised creatinine, or non-E. coli UTI) or recurrent febrile UTI may be imaged with US kidneys and bladder (CPT® 76770 or CPT® 76775) (preferred) and/or Voiding cystourethrography (CPT® 78740).

Lower Urinary Tract (PEDAB-5.2)

- Ultrasound evaluation (CPT® 76770 or CPT® 76775) is initial imaging for all children with first time UTI to diagnose hydronephrosis, pyelonephritis, or congenital renal anomaly.
 - ◆ Fluoroscopic Voiding cystourethrography (VCUG) is indicated for detection of possible vesico-ureteral reflux (VUR) in neonates or young children when hydronephrosis is seen on ultrasound.
- The American Academy of Pediatrics clinical practice guidelines no longer recommend routine VCUG for infants and young children from 2 to 24 months of age after the first febrile UTI.
 - ◆ The current recommendation is to postpone the VCUG until the second febrile UTI UNLESS there are:
 - Atypical or complex clinical circumstances.
 - Renal/bladder ultrasound reveals hydronephrosis, scarring, or obstructive uropathy.
- Vesicoureteral Reflux (VUR)
 - ◆ Fluoroscopic VCUG is typically performed for diagnosis and grading of VUR, and should be the first modality used for diagnosis.
 - ◆ Ureteral Reflux Study (Radiopharmaceutical Voiding Cystogram) (CPT® 78740), fluoroscopic VCUG, or CeVUS may be used for follow up imaging of VUR¹⁵
- Male individuals with first UTI should be evaluated with fluoroscopic VCUG studies rather than radionuclide cystography, to visualize the male urethra for possible abnormalities such as posterior urethral valves, strictures, or diverticula.
- For female individuals, radionuclide cystography (CPT® 78740) or fluoroscopic VCUG, may be used as the initial study.
- MR urography is indicated for evaluation of ectopic distal ureteral insertion, or other complex lower urinary tract anatomy.
- Siblings of individuals with known vesicoureteral reflux can undergo Ureteral Reflux Study (Radiopharmaceutical Voiding Cystogram) (CPT® 78740) if they have renal scarring on ultrasound or history of UTI and no prior evaluation for VUR.

Pediatric Acute Gastroenteritis (PEDAB-6)

- Advanced imaging is not indicated in pediatric acute gastroenteritis, unless there is a concern for diagnosis other than acute gastroenteritis. See specific symptom/diagnosis sections listed below.
- CT Abdomen and Pelvis with contrast (CPT® 74177) is indicated if abdominal red flag symptoms are present as listed in **General Guidelines (PEDAB-1.0)**.
- Additional imaging studies will depend on the specific symptoms. See the following sections for additional imaging guidelines:
 - ◆ **Generalized Abdominal Pain (PEDAB-2)** in the Pediatric Abdomen Imaging Guidelines
 - ◆ **Right Lower Quadrant Pain (PEDAB-3)** in the Pediatric Abdomen Imaging Guidelines
 - ◆ **Right Upper Quadrant Pain (PEDAB-8)** in the Pediatric Abdomen Imaging Guidelines
 - ◆ **Inflammatory Bowel Disease, Crohn Disease, or Ulcerative Colitis (PEDAB-9)** in the Pediatric Abdomen Imaging Guidelines
 - ◆ **Constipation, Diarrhea, and Irritable Bowel Syndrome (PEDAB-12)** in the Pediatric Abdomen Imaging Guidelines
 - ◆ **Abdominal mass (PEDAB-13)** in the Pediatric Abdomen Imaging Guidelines
 - ◆ **Left Upper Quadrant (PEDAB-25)** in the Pediatric Abdomen Imaging Guidelines
 - ◆ **Intussusception (PEDAB-27)** in the Pediatric Abdomen Imaging Guidelines
 - ◆ **Bowel Obstruction (PEDAB-28)** in the Pediatric Abdomen Imaging Guidelines
 - ◆ **Left Lower Quadrant Pain (PEDAB-29)** in the Pediatric Abdomen Imaging Guidelines

Hematuria (PEDAB-7)

Hematuria is a relatively common complaint in pediatric individuals, and the imaging considerations are different from those occurring in adult individuals.

- Ultrasound kidneys (CPT® 76770 or CPT® 76775) and bladder (CPT® 76856 or CPT® 76857) for asymptomatic gross hematuria or microscopic hematuria with proteinuria present.
- No imaging is appropriate for asymptomatic microscopic hematuria without proteinuria.
- For painful hematuria and no recent trauma, ANY of the following studies can be approved:
 - ◆ CT Abdomen and Pelvis without contrast (CPT® 74176)
 - ◆ Ultrasound kidneys (CPT® 76770 or CPT® 76775)
 - ◆ Ultrasound bladder (CPT® 76856 or CPT® 76857)
- For hematuria and recent trauma, the following studies are indicated:
 - ◆ CT Abdomen and Pelvis with contrast (CPT® 74177)
 - ◆ CT Cystography (CT Pelvis with bladder contrast – CPT® 72193), if gross hematuria is present and pelvic fracture or traumatic bladder injury is suspected.

Right Upper Quadrant Pain (PEDAB-8)

- The presence of any red flag findings per **General Guidelines (PEDAB-1.0)** precludes adjudication based on any other criteria.
- Right upper quadrant pain imaging indications in pediatric individuals are very similar to those for adult individuals. See: **Abdominal Pain (AB-2)** in the Abdomen Imaging Guidelines.
 - ◆ US abdomen (CPT® 76700) and/or Nuclear medicine imaging of the hepatobiliary system (HIDA scan, CPT® 78226 or CPT® 78227) for initial diagnosis for:
 - Suspicion of acute cholecystitis or acalculous cholecystitis (symptoms may include RUQ pain with fever, elevated white blood cell count, positive Murphy sign).
 - Suspicion of stones and bile duct obstruction (symptoms may include RUQ pain, no fever, normal white blood cell count)
 - Ultrasound results are not needed prior to nuclear medicine imaging of the hepatobiliary system (HIDA scan, CPT® 78226)¹
 - ◆ MRI Abdomen with and without contrast (CPT® 74183) or CT Abdomen with contrast (CPT® 74160) when either US or NM is equivocal.
 - ◆ In individuals with complaints of RUQ pain with no fever and an ultrasound shows only gallstones, MRI Abdomen without contrast (CPT® 74181), MRI Abdomen without and with contrast (CPT® 74183) or Nuclear medicine imaging of the hepatobiliary system (HIDA scan, CPT® 78226) is indicated to exclude other sources of pain.

Inflammatory Bowel Disease, Crohn Disease, or Ulcerative Colitis (PEDAB-9)

- Enterography is the most appropriate advanced imaging study for individuals with inflammatory bowel disease (IBD).
 - ◆ MR enterography (CPT® 74183 and CPT® 72197) is generally preferred over CT when possible to avoid radiation exposure for children

Children with Suspected Crohn Disease

Clinical features including weight loss, loose stools, vomiting, and intermittent abdominal pain. Small bowel imaging can provide important information to guide treatment relating to presence, severity, and extent of Crohn's disease and its complications. Initial evaluation typically includes laboratory evaluation and upper and lower endoscopy.

- MR Enterography (CPT® 74183 and CPT® 72197), CT Enterography (CPT® 74177), or MRI Abdomen and Pelvis without and with contrast (CPT® 74183 and CPT® 72197) for ANY of the following:¹
 - ◆ To detect severity and distribution of inflammatory changes
 - ◆ Identify complications (such as fistulizing disease or abscess formation)
- MR Enterography (CPT® 74183 and CPT® 72197) or CT Enterography (CPT® 74177) for evaluation of chronic abdominal pain associated with diarrhea due to concern for inflammatory bowel disease if:
 - ◆ There is a positive family history of inflammatory bowel disease **OR**
 - ◆ There are endoscopy or colonoscopy findings suggestive of inflammatory bowel disease **OR**
 - ◆ Elevated inflammatory markers (fecal lactoferrin $\leq 4.0\text{ug/g}$, CRP $>0.5\text{mg/dL}$, or fecal calprotectin $\geq 50\text{ug/g}$) **OR**
 - ◆ Diagnosis is still in doubt after colonoscopy and evaluation of inflammatory markers, and Crohn's disease is suspected
- MR Enterography (CPT® 74183 and CPT® 72197) or CT Enterography (CPT® 74177) is indicated prior to endoscopy if requested by or in consultation with the physician who will be performing the endoscopy.⁶
- MRI Pelvis with contrast (CPT® 72196) or MRI Pelvis without and with contrast (CPT® 72197) is indicated for the following:¹
 - ◆ Concern for perianal fistula or abscess
- See: **IBD (Crohn's Disease or Ulcerative Colitis) (AB-23.1)** in the Abdomen Imaging Guidelines for additional information regarding serologic markers

Children with Established IBD

- MR Enterography (CPT® 74183 and CPT® 72197), CT Enterography (CPT® 74177), or MRI Abdomen and Pelvis without and with contrast (CPT® 74183 and CPT® 72197), is indicated for ANY of the following:¹
 - ◆ Monitoring response to disease-modifying treatment on an annual basis or when treatment change is being considered
 - ◆ Individuals with new or worsening symptoms or suspected complications including abscess, perforation, fistula, or obstruction
- CT Abdomen and Pelvis with contrast (CPT® 74177) is indicated if requested (instead of CTE or MRE) for ANY of the following:¹
 - ◆ New or worsening symptoms
 - ◆ Suspected complications including abscess, perforation, fistula, or obstruction
- MRI Pelvis with contrast (CPT® 72196) or MRI Pelvis without and with contrast (CPT® 72197) is indicated for the following:¹
 - ◆ Concern for perianal fistula or abscess

Abdominal Sepsis (Suspected Abdominal Abscess) (PEDAB-10)

- Abdominal sepsis imaging indications in pediatric individuals are identical to those for adult individuals.
 - ◆ See: **Abdominal Sepsis (Suspected Abdominal Abscess) (AB-3)** in the Abdomen Imaging Guidelines.

Postoperative Pain within 60 Days Following Abdominal Surgery (PEDAB-11)

- CT Abdomen and Pelvis with contrast (CPT® 74177) is indicated in individuals with suspected postoperative complications (e.g. bowel obstruction, abscess, anastomotic leak, etc.).
 - ◆ Children can also be evaluated with ultrasound (CPT® 76700 or CPT® 76705) initially (especially in small children or in thin older children) or MRI Abdomen and Pelvis without and with contrast (CPT® 74183 and CPT® 72197).
 - ◆ Because MRI may not be practical for the timely evaluation of post-operative abscesses, MRI should only replace CT when the study can be completed in a similar time frame as CT.
- Radiopharmaceutical nuclear medicine imaging (CPT® 78800, CPT® 78801, CPT® 78802, CPT® 78803, CPT® 78830, CPT® 78831, or CPT® 78832) is indicated for evaluation of any of the following:
 - ◆ Peritonitis
 - ◆ Postoperative fever without localizing signs or symptoms
- Beyond 60 days postoperatively, see: **Generalized Abdominal Pain (PEDAB-2)**.

Constipation, Diarrhea, and Irritable Bowel Syndrome (PEDAB-12)

- Constipation and diarrhea are extremely common complaints in children. The overwhelming majority of individuals do not require advanced imaging for evaluation of constipation or diarrhea.
- Irritable bowel is rare in young children, but more common in adolescents. The overwhelming majority of individuals do not require advanced imaging for evaluation of irritable bowel syndrome.
 - ◆ In most cases, causes of constipation can be excluded based on a careful history and physical examination. Advanced Imaging should be performed if warning signs of other diseases are present.
- Constipation associated with additional signs or symptoms:
 - ◆ CT Abdomen (CPT® 74160) or Abdomen and Pelvis (CPT® 74177) with contrast are indicated if there are any red flag signs or symptoms (as listed in **General Guidelines (AB-1.0)**)
 - ◆ Clinical suspicion of tethered cord based on abnormal physical findings over the spine, abnormal neurological exam, or symptoms refractory to provider-directed treatment for at least 3 months⁶ (See: **Tethered Cord (PEDSP-5)** in the Pediatric Spine Imaging Guidelines).
- Diarrhea associated with additional signs or symptoms:
 - ◆ CT Abdomen (CPT® 74160) or Abdomen and Pelvis (CPT® 74177) with contrast are indicated if there are any red flag signs or symptoms (as listed in **General Guidelines (AB-1.0)**)
- Irritable bowel syndrome associated with additional signs or symptoms:
 - ◆ CT Abdomen (CPT® 74160) or Abdomen and Pelvis (CPT® 74177) with contrast are indicated if there are any red flag signs or symptoms (as listed in **General Guidelines (AB-1.0)**)
- A barium enema and rectal biopsy are indicated for diagnosis of Hirschsprung disease in children with features suggestive of this disorder. MRI Pelvis without and with contrast (CPT® 72197) may be indicated in post-operative patients who have signs of complications related to treatment to assess the position of the pulled-through bowel, the sphincter muscles, and the area of the posterior urethra.

Abdominal Mass (PEDAB-13)

Abdominal Wall Mass (PEDAB-13.1)

Intra-Abdominal Mass (PEDAB-13.2)

Abdominal Wall Mass (PEDAB-13.1)

- For initial imaging of a newly discovered abdominal wall mass, ANY of the following studies are indicated:
 - ◆ Ultrasound (CPT® 76700 or CPT® 76705)
 - ◆ MRI Abdomen without contrast (CPT® 74181) or without and with contrast (CPT® 74183)
 - ◆ MRI Pelvis without contrast (CPT® 72195) or without and with contrast (CPT® 72197) may be added to MRI Abdomen if below the umbilicus
- If ultrasound and/or MRI are inconclusive or insufficient for preoperative planning, ANY of the following studies are indicated:
 - ◆ CT Abdomen with contrast (CPT® 74160) or without contrast (CPT® 74150)
 - ◆ CT Abdomen and Pelvis with contrast (CPT® 74177) or without contrast (CPT® 74176) if below the umbilicus

Intra-Abdominal Mass (PEDAB-13.2)

- Ultrasound (CPT® 76700) should be the initial imaging study for children with an intra-abdominal mass.
 - ◆ US with Doppler (CPT® 93975) can also be used to evaluate vascular supply.⁵
- Additional imaging studies will be determined by the results of the ultrasound, and will depend on the location and organ involvement associated with the mass as well as history, physical exam, and laboratory findings. See the following sections for additional imaging guidelines:
 - ◆ **General Guidelines (PEDONC-1)** in the Pediatric Oncology Imaging Guidelines
 - ◆ **Pediatric Lymphomas (PEDONC-5)** in the Pediatric Oncology Imaging Guidelines

Renovascular Hypertension and Other Secondary Causes of Hypertension (PEDAB-14)

- Clinical evaluation for suspected hypertension should include repeated blood pressure measurements (generally ≥ 3 measurements).
 - ◆ Trained health care professionals in the office setting should make a diagnosis of hypertension (HTN) if a child or adolescent has auscultatory-confirmed blood pressure (BP) readings ≥ 95 th percentile at 3 different visits.¹³
 - ◆ Blood pressure may be obtained in-clinic, at home, or by using a wearable ambulatory blood pressure measurement (ABPM) device that records blood pressure at frequent intervals during normal activities and is downloaded later for computer analysis.

For Children Aged 1-<13 years	For Children Aged ≥ 13 years
Normal BP: <90 th Percentile	Normal BP: <120/<80 mm Hg
Elevated BP: ≥ 90 th percentile to <95th percentile or 120/80 mm Hg to <95th percentile (whichever is lower)	Elevated BP: 120/<80 to 129/<80 mm Hg
Stage 1 HTN: ≥ 95 th percentile to <95th percentile + 12 mmHg, or 130/80 to 139/89 mm Hg (whichever is lower)	Stage 1 HTN: 130/80 to 139/89 mm Hg
Stage 2 HTN: ≥ 95 th percentile + 12 mm Hg, or $\geq 140/90$ mm Hg (whichever is lower)	Stage 2 HTN: $\geq 140/90$ mm Hg

Table from [13]

- ANY of the following studies are indicated for initial evaluation of a pediatric individual with suspected secondary hypertension:
 - ◆ Doppler or Duplex Ultrasound (CPT® 93975 or CPT® 93976)
 - ◆ Complete retroperitoneal Ultrasound (CPT® 76770)
 - ◆ Captopril renography (CPT® 78709) has largely been abandoned in clinical practice, replaced by CTA and MRA Abdomen, but may be supported for unusual circumstances.

Other considerations for imaging evaluation:

- CTA Abdomen (CPT® 74175) or MRA Abdomen (CPT® 74185)¹⁴ is indicated for pediatric individuals with hypertension to exclude fibromuscular dysplasia or other blood-flow restricting lesions of the renal arteries and suprarenal aorta.³
- Children with high clinical suspicion for renin-mediated hypertension should undergo additional imaging whether Doppler US findings are positive or negative due to poor sensitivity for detecting distal intrarenal or accessory renal artery stenosis.³ CTA has high sensitivity and specificity.¹⁴
- Echocardiography (CPT® 93306) is indicated at initial evaluation to screen for cardiac abnormalities, coarctation of the aorta, and end-organ damage such as left ventricular hypertrophy.
- Nuclear renal imaging (CPT® 78707, CPT® 78708, or CPT® 78709) is indicated for evaluation of the following:
 - ◆ Severe hypertension with progressive renal insufficiency or failure to respond to three-drug therapy
 - ◆ Malignant or accelerated hypertension

- ◆ Acute worsening of previously stable hypertension
- ◆ Diastolic BP >100 in an individual <35 years old
- ◆ New onset severe hypertension
- ◆ Hypertension in presence of asymmetric kidneys
- ◆ Hypertension in presence of acute elevation in creatinine either unexplained or after treatment with ACE inhibitor
- ◆ Abdominal bruit
- ◆ Recurrent acute pulmonary edema and hypertension
- ◆ Hypokalemia with normal or elevated plasma renin level in absence of diuretic therapy
- ◆ Hypertension with known neurofibromatosis

Liver Lesion Characterization (PEDAB-15)

- ***High risk individuals⁹:**
 - ◆ Prematurity
 - ◆ Low birth weight
 - ◆ Underlying chronic liver disease
 - ◆ Beckwith Weidman syndrome
 - ◆ Familial adenomatous polyposis
 - ◆ Trisomy 18
 - ◆ Portosystemic shunts
 - ◆ Aicardi syndrome
 - ◆ Hereditary tyrosinemia
 - ◆ Bile salt export pump deficiency
- Pediatric-specific imaging considerations includes:
 - ◆ US Abdomen (CPT[®] 76700 or CPT[®] 76705) is the initial study of choice in children. MRI is preferred over CT when possible to reduce radiation exposure.
- Liver lesion discovered on US:
 - ◆ Any high risk individual*
 - MRI Abdomen without and with contrast (CPT[®] 74183) or CT Abdomen with contrast (CPT[®] 74160)
 - ◆ Indeterminate liver lesion <3cm
 - Contrast-Enhanced US (CEUS, CPT[®] 76978, CPT[®] 76979)
 - If after Contrast-Enhanced US the lesion remains indeterminate or not fully characterized:
 - MRI Abdomen without and with contrast (CPT[®] 74183) or CT Abdomen with contrast (CPT[®] 74160)
 - ◆ Indeterminate liver lesion >3cm
 - MRI Abdomen without and with contrast (CPT[®] 74183) or CT Abdomen with contrast (CPT[®] 74160)
- Liver lesion discovered on CT (non-contrast or single-contrast) or non-contrast MRI
 - ◆ Indeterminate Liver Lesion <3cm
 - Contrast-Enhanced US (CEUS, CPT[®] 76978, CPT[®] 76979)
 - If, after Contrast-Enhanced US, the lesion remains indeterminate or not fully characterized
 - MRI Abdomen without and with contrast (CPT[®] 74183) or CT Abdomen with contrast (CPT[®] 74160)
 - ◆ Indeterminate Liver Lesion >3cm
 - MRI Abdomen without and with contrast (CPT[®] 74183) or CT Abdomen with contrast (CPT[®] 74160)
- For the imaging of specific focal liver lesions:
 - ◆ Suspected hepatic adenoma:
 - MRI is considered the best technique for characterization. Follow-up imaging can be CT Abdomen (CPT[®] 74160 or CPT[®] 74170) or MRI Abdomen (CPT[®]

- 74183) every 6 months for 2 years, and then annually, to establish any growth patterns and assess for malignant transformation.
- ◆ Hepatic Hemangioma
 - Limited abdominal US in 6-12 months
 - If stable or decreasing in size: Surveillance 6-12 months until 2 years. After 2 years, no further follow-up is indicated unless it becomes symptomatic
 - If increasing in size: follow-up 3-6 months or biopsy
 - See below for pre-operative considerations
 - ◆ Focal Nodular Hyperplasia (FNH):
 - MRI Abdomen (CPT® 74183) or CT Abdomen (CPT® 74160 or CPT® 74170) to confirm a diagnosis of FNH. The use of Eovist contrast is often diagnostic in differentiating FNH from other lesions seen on MRI or CT.
 - Additional follow-up is limited abdominal US in 6-12 months
 - If stable or decreasing in size: Surveillance 6-12 months until 2 years. After 2 years, no further follow-up is indicated unless it becomes symptomatic.
 - In adolescent females diagnosed with FNH who are continuing to use oral contraceptives: Additional follow-up is annual US for 2 to 3 years. Follow-up with CT or MRI can be done if the lesion is not adequately visualized on US.
 - If increasing in size: follow-up 3-6 months or biopsy
 - ◆ Hepatic cysts:
 - Asymptomatic, simple cysts
 - Limited abdominal US in 6-12 months
 - If stable or decreasing in size: Surveillance 6-12 months until 2 years. After 2 years, no further follow-up is indicated unless it becomes symptomatic
 - If increasing in size: follow-up 3-6 months or biopsy
 - For complicated cysts (US shows internal septations, fenestrations, calcifications, irregular walls, as well as the presence of daughter cysts):
 - MRI Abdomen (CPT® 74183) or CT Abdomen (CPT® 74160 or CPT® 74170) can be performed

- Additional scenarios and follow-up imaging for an Indeterminate lesion:
 - ◆ Indeterminate lesion <1cm in high-risk individuals* on US, CT, or unenhanced MRI not specifically dealt with in the above guidelines:
 - If **biopsy cannot be performed**, follow-up MRI can be obtained in 3-6 months. Additional imaging in this setting can be considered on an individual basis. This timeframe would also apply if the lesion is indeterminate and an MRI with Eovist is requested for further evaluation in this setting
- Nuclear medicine liver imaging (ONE of CPT® codes: CPT® 78201, CPT® 78202, CPT® 78803, CPT® 78215, or CPT® 78216) is rarely performed, but can be approved for the following when ultrasound, CT, and MRI are unavailable or contraindicated:
 - ◆ Evaluation of liver mass, trauma, or suspected focal nodular hyperplasia (FNH)
 - ◆ Differentiation of hepatic hemangioma from FNH
 - ◆ Diffuse hepatic disease or elevated liver function tests
 - ◆ Suspected accessory spleen (CPT® 78215 or CPT® 78216 only)

Background and Supporting Information

- For liver lesions in children, it is important to differentiate between benign incidental versus malignant lesions.

TABLE 1. Risk factors for malignant liver tumors in children [7-9]

◆ <u>Hepatoblastoma</u>	◆ <u>Hepatocellular carcinoma</u>
◆ Prematurity	◆ Liver cirrhosis
◆ Low birth weight	◆ Chronic hepatitis B and C
◆ BWS and other overgrowth syndromes	◆ Hereditary tyrosinemia
◆ Familial adenomatous polyposis	◆ Portosystemic shunts
◆ Trisomy 18	◆ Bile salt export pump deficiency
◆ Portosystemic shunts	
◆ Aicardi syndrome	

Data from [7–9]. BWS = Beckwith-Wiedemann syndrome

Liver Disease (PEDAB-16)

Pediatric Liver Failure and Cirrhosis (PEDAB 16.1)

Biliary Disease (PEDAB 16.2)

Pediatric Liver Failure and Cirrhosis (PEDAB 16.1)

- Elevated liver function testing imaging indications in pediatric individuals are very similar to those for adult individuals. See: **Abnormal Liver Chemistries (AB-30)** in the Abdomen Imaging Guidelines.
- Causes of liver failure or cirrhosis in pediatric individuals are different from adults, and are frequently idiopathic, but commonly due to ONE of the following:
 - ◆ Biliary dysfunction (biliary atresia, cystic fibrosis, etc.)
 - ◆ Metabolic disease
 - ◆ Post-infectious
- Liver ultrasound (CPT® 76700) with duplex Doppler (CPT® 93975) is indicated as an initial study for individuals prior to approving CT or MRI for pediatric individuals.
 - ◆ MRI Abdomen without and with contrast (CPT® 74183) is indicated for evaluation of ultrasound findings that are inconclusive or technically limited, and is preferred over CT when possible to reduce radiation exposure.
- Repeat liver ultrasound (CPT® 76705) with duplex Doppler (CPT® 93975) is indicated in pediatric individuals in the following circumstances:
 - ◆ Known chronic liver dysfunction or cirrhosis of any cause may be reimaged on an annual basis in the absence of new or worsening findings
 - ◆ New or worsening findings on history, physical exam, or laboratory results that suggest progression of liver disease
 - ◆ Doppler ultrasound liver (CPT® 93975 or CPT® 93976) is indicated when portal venous congestion or portal hypertension is suspected
- Nuclear medicine liver imaging (ONE of CPT® codes: CPT® 78201, CPT® 78202, CPT® 78803, CPT® 78215, or CPT® 78216) is rarely performed, but can be approved for the following when ultrasound, CT, and MRI are unavailable or contraindicated:
 - ◆ Diffuse hepatic disease or elevated liver function tests

Biliary Disease (PEDAB 16.2)

- The definition of conjugated hyperbilirubinemia is serum conjugated bilirubin >1mg/dL if total bilirubin <5.0 or greater than 20 percent of total bilirubin if total bilirubin >5.0mg/dL. Obstructive causes of liver disease need to be evaluated. Additional labs may include total and fractionated bilirubin, AST, ALT, Alk Phos, GGT, and/or urinalysis.
- Ultrasound Abdomen (CPT® 76700 or CPT® 76705) is initial imaging study of choice
- Advanced imaging such as CT, MRI is rarely indicated unless otherwise indicated below.
- After initial ultrasound:
 - ◆ If Biliary Atresia is suspected:
 - Hepatobiliary System imaging (HIDA scan) can be approved if requested by surgeon before liver biopsy
 - Liver biopsy is diagnostic
 - Advanced imaging such as CT, MRI is rarely indicated
 - ◆ If Choledochal cyst is suspected:
 - CT Abdomen with contrast (CPT® 74160) or MRI/MRCP (CPT® 74183 or CPT® 74181) can be approved.
 - For preoperative assessment: MRI/MRCP (CPT® 74183 or CPT® 74181) can be approved
 - ◆ If primary biliary disease such as Primary sclerosing cholangitis or primary biliary cholangitis is suspected:
 - CT Abdomen with contrast (CPT® 74160) or MRI/MRCP (CPT® 74183 or CPT® 74181) can be approved.

Adrenal Lesions (PEDAB-17)

- Adrenal masses in infants and young children usually present as palpable abdominal masses or are detected on in utero US. In the neonates, the common masses are adrenal hemorrhage and neuroblastoma. Abdominal US is the initial imaging study of choice.
 - ◆ If an adrenal mass is detected, it can often be adequately evaluated with short interval follow-up retroperitoneal ultrasound (CPT® 76770) in 7 to 10 days.
 - If repeat ultrasound is concerning for neuroblastoma or there is high clinical concern for neuroblastoma, MRI Abdomen without and with contrast (CPT® 74183) or CT Abdomen without and with contrast (CPT® 74170) are indicated to confirm the diagnosis. MRI is preferred over CT when possible to reduce radiation exposure. If these studies, confirm neuroblastoma ¹²³I-Metaiodobenzylguanidine (MIBG) scintigraphy is indicated for staging.
 - ◆ Neuroblastoma is the most common primary adrenal tumor in pediatric individuals between day 1 and 5 years of age. See: **Neuroblastoma (PEDONC-6)** in the Pediatric Oncology Imaging Guidelines.
- Additional adrenal imaging considerations include the following:
 - ◆ Adrenal Nuclear Imaging of the cortex and/or medulla (CPT® 78075) is indicated for the following:
 - Distinguishing adrenal adenoma from adrenal hyperplasia.
 - Evaluation of suspected pheochromocytoma or paraganglioma.
 - MIBG preferred (ONE of CPT® codes: CPT® 78800, CPT® 78801, CPT® 78802, CPT® 78803, or CPT® 78804).
 - For known pheochromocytoma or paraganglioma, see: **Neuroendocrine Cancers and Adrenal Tumors (ONC-15)** in the Oncology Imaging Guidelines.
 - Evaluation of suspected neuroblastoma, ganglioneuroblastoma, or ganglioneuroma.
 - MIBG preferred (ONE of CPT® codes: CPT® 78800, CPT® 78801, CPT® 78802, CPT® 78803, or CPT® 78804 or hybrid SPECT/CT CPT® 78830, CPT® 78831, or CPT® 78832), see: **Neuroblastoma (PEDONC-6)** in the Pediatric Oncology Imaging Guidelines.

Hemochromatosis (PEDAB-18)

Hereditary (Primary) Hemochromatosis (PEDAB-18.1)

Transfusion-Associated (Secondary) Hemochromatosis (PEDAB-18.2)

Hereditary (Primary) Hemochromatosis (PEDAB-18.1)

- Hereditary hemochromatosis imaging indications in pediatric individuals are identical to those for adult individuals. See: **Hereditary (Primary) Hemochromatosis (HH) and Other Iron Storage Diseases (AB-11.2)** in the Abdomen Imaging Guidelines.

Transfusion-Associated (Secondary) Hemochromatosis (PEDAB-18.2)

- Transfusion-associated hemochromatosis is a common complication of exposure to repeated red blood cell transfusions. This can occur in any individual with exposure to >20 transfusion episodes, but is most common among sickle cell disease, thalassemia, bone marrow failure (aplastic anemia, Fanconi anemia, etc.), oncology patients, and hematopoietic stem cell transplant patients.
- T2* MRI has been well established in the determination of organ iron burden in transfusion-associated hemochromatosis. Contrast use is not necessary for evaluation of iron burden. The following studies are indicated for evaluation of transfusion-associated hemochromatosis:
 - ◆ MRI Abdomen without contrast (CPT® 74181) for liver iron evaluation.
 - ◆ MRI Cardiac without contrast (CPT® 75557) for cardiac iron evaluation.
 - ◆ MRI Chest without contrast (CPT® 71550) can be approved as a single study to evaluate both heart and liver iron burden.
 - ◆ CPT® 74181 and CPT® 75557 can be approved alone, or together.
 - ◆ If requested, CPT® 71550 will evaluate both heart and liver and should not be approved with any other codes.
- Screening MRI is indicated every 12 months for chronically transfused individuals at risk of hemochromatosis.
- Imaging is indicated every 3 months for treatment response in individuals receiving active treatment (chelation and/or phlebotomy).

Indeterminate Renal Lesion (PEDAB-19)

- Indeterminate renal lesion characterization imaging indications in pediatric individuals are very similar to those for adult individuals. See: **Indeterminate Renal Lesion (AB-35)** in the Abdomen Imaging Guidelines.
- Indeterminate renal lesion imaging indications in pediatric individuals are uncommon and are usually cysts or congenital anomalies.
- Pediatric-specific imaging considerations include the following:
 - ◆ Pediatric renal cysts have a lower risk of malignant progression than do renal cysts in adults.
 - ◆ CT Abdomen with contrast (CPT® 74160) or MRI Abdomen without and with contrast (CPT® 74183) is indicated for individuals who have simple cysts but are symptomatic and surgical intervention is being considered.
 - ◆ CT Abdomen without and with contrast (CPT® 74170) or MRI Abdomen without and with contrast (CPT® 74183) is indicated for pediatric individuals with complex renal cyst identified on ultrasound.
 - ◆ For individuals with congenital anomalies, nuclear medicine studies with diuretic renography (CPT® 78708 or CPT® 78709) can be performed to determine function and cystography to determine presence of associated reflux.
 - ◆ Individuals with solid renal masses should be imaged according to guidelines in section **Pediatric Renal Tumors (PEDONC-7)** in the Pediatric Oncology Imaging Guidelines.

Hydronephrosis (PEDAB-20)

Hydronephrosis is a relatively common finding in pediatric individuals, with the following imaging considerations:

- Retroperitoneal ultrasound (CPT® 76770) for:
 - ◆ Prenatal hydronephrosis within the first week of life, and again at 1-6 months of age.
 - ◆ Known hydronephrosis every 3 to 12 months
 - This imaging represents a guideline-supported, scheduled follow-up imaging evaluation, as described in **Clinical Information (PREFACE-3)** in the Preface Imaging Guidelines. A current evaluation (within 60 days) would not be required for authorization.
- Hydronephrosis associated with urinary tract infection or vesicoureteral reflux, see: **Urinary Tract Infection (UTI) (PEDAB-5)** for imaging guidelines.
- Individuals with obstructive uropathy (including ureteropelvic junction obstruction (UPJO), ureterovesical junction obstruction (UVJO), and bladder outlet obstruction) can be evaluated with retroperitoneal ultrasound (CPT® 76770), and diuretic renography (CPT® 78707, CPT® 78708, or CPT® 78709) for preoperative planning and postoperatively at 3 to 12 months.
 - ◆ If hydronephrosis has resolved on postoperative imaging then no further routine imaging is indicated.
- Magnetic resonance urography (MRU) (CPT® 74183 and CPT® 72197) is rarely indicated, but can be approved in individuals with inconclusive ultrasound and diuretic renography.
- CT Abdomen with contrast (CPT® 74160) is rarely indicated, but can be approved in individuals with inconclusive ultrasound and a suspected vascular cause of UPJO.

Blunt Abdominal Trauma (PEDAB-22)

- Blunt abdominal trauma imaging indications in pediatric individuals are identical to those for adult individuals. See: **Blunt Abdominal Trauma (AB-10.1)** in the Abdomen Imaging Guidelines.

Hernias (PEDAB-23)

- Hernia imaging indications in pediatric individuals are identical to those for adult individuals. See: **Hernias (AB-12)** in the Abdomen Imaging Guidelines.

Abdominal Lymphadenopathy (PEDAB-24)

- Abdominal lymphadenopathy imaging indications in pediatric individuals are identical to those for adult individuals. See: **Abdominal Lymphadenopathy (AB-8)** in the Abdomen Imaging Guidelines.

Left Upper Quadrant Pain (PEDAB-25)

- Left upper quadrant pain imaging indications in pediatric individuals are identical to those for adult individuals. See: **Abdominal Pain (AB-2)** in the Abdomen Imaging Guidelines.
- Nuclear medicine spleen imaging (CPT® 78185) is rarely performed, but can be approved for left upper quadrant pain when neither ultrasound nor CT is available.

References

1. Royal HD, Brown ML, Drum DE, et al. Society of Nuclear Medicine Procedure guideline for hepatic and splenic imaging 3.0, version 3.0, approved July 20, 2003.

Spleen (PEDAB-26)

- Spleen imaging indications in pediatric individuals are very similar to those for adult individuals. See: **Spleen (AB-34)** in the Abdomen Imaging Guidelines.
- Nuclear medicine spleen imaging (CPT® 78185) is rarely performed, but can be approved for the following indications when CT is unavailable:
 - ◆ Splenic trauma.
 - ◆ Evaluation of splenic function.
 - ◆ Suspected splenic mass, cyst, abscess, infarct, or metastasis.
 - ◆ Radiation treatment planning.
 - ◆ Asplenia.
 - ◆ Suspected functional accessory spleen:
 - Can approve CPT® 78215 or CPT® 78216 instead of CPT® 78185, if requested.
- Pediatric-specific imaging considerations include the following:
 - ◆ MRI is preferred over CT when possible to reduce radiation exposure.

Intussusception (PEDAB-27)

- Intussusception, telescoping of one bowel loop into another, is a frequent cause of abdominal pain in young children. It may be associated with bloody stool. Plain x-rays (supine and left lateral decubitus views) should be performed initially to exclude mass or bowel obstruction from other causes and to detect possible bowel perforation, which may be an indication for emergent surgical intervention.
 - ◆ Ultrasound (CPT® 76700 or CPT® 76705) is indicated as an initial study if there is a strong suspicion for intussusception, but if negative, plain x-rays of the abdomen should follow.
 - ◆ In some institutions, Ultrasound guidance (CPT® 76942) may be used for reduction of colonic or ileocolic intussusception. Generally, this is an urgent or emergent procedure and may not require prior authorization.

Bowel Obstruction (PEDAB-28)

Bowel Obstruction (PEDAB-28.1)

- Suspected high-grade obstruction
 - ◆ MRI Abdomen and Pelvis without and with contrast (CPT® 74183 and CPT® 72197) is preferred to avoid unnecessary radiation exposure
 - ◆ CT Abdomen and Pelvis with contrast (CPT® 74177) can be approved if MRI is not readily available
- Suspected intermittent or low-grade small bowel obstruction
 - ◆ MRI Abdomen and Pelvis without and with contrast (CPT® 74183 and CPT® 72197) is preferred to avoid unnecessary radiation exposure
 - ◆ CT Abdomen and Pelvis with contrast (CPT® 74177) can be approved if MRI is not readily available
 - ◆ If the etiology or level of suspected intermittent or low-grade small bowel obstruction remains undetermined and additional imaging is needed after CT Abdomen and Pelvis:
 - CT Enteroclysis (CPT® 74176 or 74177) or
 - CT Enterography (CPT® 74177) or
 - MR Enteroclysis (CPT® 74183 and CPT® 72197) or
 - MR Enterography (CPT® 74183 and CPT® 72197)
- Small bowel obstruction suspected to be secondary to Crohn's Disease
 - ◆ See: **Inflammatory Bowel Disease, Crohn Disease, or Ulcerative Colitis (PEDAB-9)**

Left Lower Quadrant Pain (PEDAB-29)

Diverticulitis is the most common cause of left lower quadrant pain in adults but is extremely rare in children.

- CT Abdomen and Pelvis (CPT® 74177) with contrast is indicated if there are any red flag signs or symptoms (as listed in **General Guidelines (AB-1.0)**)
- In the absence of red flags, advanced imaging is rarely helpful in the initial evaluation of these individuals. Consultation with gastroenterologist can be helpful in determining the appropriate diagnostic pathway.
 - ◆ Pelvic ultrasound (CPT® 76856) is the initial imaging study of choice for children for detecting gynecologic abnormalities that may cause left lower quadrant pain.
 - ◆ For male individuals or if ultrasound is inconclusive, advanced imaging may be appropriate for management as directed by gastroenterological evaluation or consultation

See: **Gaucher Disease (PEDPN-4)** in the Pediatric Peripheral Nerve Disorders Imaging Guidelines.

Vomiting Infant, Malrotation, and Hypertrophic Pyloric Stenosis (PEDAB-33)

- Vomiting in infants is generally classified as either bilious (implying obstruction distal to the Sphincter of Oddi) or non-bilious.
- Bilious vomiting may be a true emergency, as some of the conditions causing this could result in compromise of blood supply to the intestines, a potentially life-threatening situation.
- Nonbilious vomiting in otherwise healthy infants may be imaged with Upper GI series (UGI)
- Suspected malrotation is an indication for emergent imaging. If malrotation with mid-gut volvulus is suspected, acute abdominal series (Chest X-ray and abdominal views, including supine and upright or supine and left lateral decubitus views), followed by UGI series (preferred) and/or Ultrasound abdomen, limited (CPT® 76705) should be performed. If the abdominal X-rays suggest distal bowel obstruction, water soluble contrast enema should be considered.
- Hypertrophic Pyloric Stenosis is an idiopathic condition wherein the circular muscle controlling emptying of the stomach thickens causing a relative obstruction of the gastric outlet. The condition can occur at any age (including occasionally in adults), but the typical child is male, aged 2 to 6 weeks. Projectile non-bilious vomiting is the most common presenting complaint, but the description of projectile vomiting is subjective. The differential diagnosis for non-bilious vomiting includes common conditions such as viral gastroenteritis and gastro-esophageal reflux.
 - ◆ Infants with projectile non-bilious vomiting should be evaluated with Ultrasound abdomen, limited (CPT® 76705). If initial studies are not diagnostic, repeat studies should be performed, as frequently as daily until the vomiting resolves or the diagnosis is made. UGI series may be useful as a confirmatory test, may be preferred if ultrasound expertise is not available for this condition, or if the clinical presentation is atypical for Hypertrophic Pyloric Stenosis. Ultrasound is preferred when available, as it involves no contrast or ionizing radiation use.

Pancreatitis (PEDAB-34)

Acute Pancreatitis (PEDAB 34.1)

Chronic Pancreatitis (PEDAB 34.2)

Acute Pancreatitis (PEDAB 34.1)

- The presence of any red flag findings per **General Guidelines (PEDAB-1.0)** precludes adjudication based on any other criteria.
 - ◆ If red flag is present (as per **General Guidelines (PEDAB-1.0)**), then CT Abdomen and Pelvis with contrast (CPT® 74177), CT Abdomen with contrast (CPT® 74160), or MRI/MRCP (CPT® 74183 or CPT® 74181) is indicated²
- Initial imaging
 - ◆ Abdominal US (CPT® 76700 or CPT® 76705) can be approved
 - ◆ If ultrasound performed and is nondiagnostic due to technical limitation (obesity, overlying gas, etc.), or if ultrasound is negative and there is continued clinical suspicion of acute pancreatitis MRI/MRCP (CPT® 74183 or CPT® 74181) can be approved.
 - CT Abdomen and Pelvis with contrast (CPT® 74177) or CT Abdomen with contrast (CPT® 74160) if MRI/MRCP cannot be performed
 - ◆ CT Abdomen and Pelvis with contrast (CPT® 74177) can be approved for management of acute pancreatitis in the following situations:
 - Evaluation of known or suspected complications of acute pancreatitis
 - To characterize degree of organization of collections before intervention
- Abdominal US (CPT® 76700 or CPT® 76705) can be used to follow known fluid collections for resolution or progression
- Acute Recurrent Pancreatitis (ARP)
 - ◆ MRI/MRCP (CPT® 74183 or CPT® 74181) can be approved
 - To identify structural or obstructive causes.
 - To assess for progression to chronic pancreatitis
 - ◆ In a child who requires sedation for imaging, it is reasonable to alternate MRI/MRCP with Abdominal US (CPT® 76700 or CPT® 76705) or CT Abdomen with contrast (CPT® 74160) for serial monitoring of acute recurrent pancreatitis as recommended by or in consultation with a gastroenterologist or pancreatic specialist.

Background and Supporting Information

- The role of imaging is to identify findings at diagnosis, assess for local complications, identify potential etiologies, monitor evolution of local complications, plan and guide interventions.

Chronic Pancreatitis (PEDAB 34.2)

- The role of imaging is to contribute to or establish initial diagnosis, stage/monitor disease, assess for superimposed acute pancreatitis, identify potential etiologies of chronic pancreatitis, characterize secretory function, and/or plan for surgical intervention
- If chronic pancreatitis is suspected:
 - ◆ MRI Abdomen without and with contrast (CPT® 74183) may be approved.
 - CT Abdomen and Pelvis with contrast (CPT® 74177) or CT Abdomen with contrast (CPT® 74160) may be approved if MRI cannot be performed
- Abdominal US (CPT® 76700 or CPT® 76705) may be approved to evaluate suspected or known episode of acute pancreatitis in a child with chronic pancreatitis.
 - ◆ CT Abdomen and Pelvis with contrast (CPT® 74177) or CT Abdomen with contrast (CPT® 74160) or MRI/MRCP (CPT® 74183 or CPT® 74181) may be approved in the following situations:
 - If ultrasound is negative and imaging diagnosis of acute pancreatitis is needed
 - If planning endoscopic or surgical interventions

General Guidelines (PEDCD-1.0)

CDP.GG.0001.0.A

v1.0.2024

Heart disease in the pediatric population involves predominantly congenital lesions. Pediatric individuals can have acquired heart disease unique to children. For those diseases which occur in both pediatric and adult populations, differences exist in management due to individual age, comorbidities, and differences in disease natural history between children and adults.

Pediatric Cardiac Imaging Appropriate Clinical Evaluation

- Prior to considering advanced imaging (CT, MR, Nuclear Medicine) or echocardiogram, a pertinent clinical evaluation should be performed, including the following (both):
 - A detailed history, physical examination or meaningful technological contact (telehealth visit, telephone call, electronic mail or messaging)
 - A review of appropriate diagnostic studies (laboratory, EKG, echo, and other diagnostic imaging)
- A recent clinical evaluation is not needed prior to advanced imaging (CT, MR, Nuclear Medicine) or echocardiogram if **any** of the following apply:
 - Individual is undergoing guideline-supported scheduled imaging evaluation
 - Echocardiogram is being performed at the first cardiology visit for an appropriate indication as stated in these guidelines
 - Routine imaging is anticipated at the next visit (e.g., one year follow-up echo for a 10 year old with a VSD)
- Advanced imaging of the heart and echocardiogram are medically necessary in any of the following:
 - Individuals who have documented active clinical signs or symptoms of disease involving the heart
 - As follow-up for findings on echocardiograms.
 - See **Initial Transthoracic Echocardiography (TTE) Indications (PEDCD-8.2)** for indications for initial echos in asymptomatic individuals
- Repeat imaging studies of the heart are **not** indicated unless one of the following applies:
 - Repeat imaging is indicated in a specific guideline section
 - There is evidence for progression of disease
 - There is new onset of disease with documentation of how repeat imaging will affect individual management or treatment decisions
 - See **Repeat Transthoracic Echocardiography Indications (PEDCD-8.3)** for indications for repeat echos in asymptomatic individuals

- Asymptomatic individuals with exposure to cardiotoxic drugs can have serial echocardiograms as per **Cardiotoxicity and Echocardiography (PEDONC-19.2)** in the Pediatric Oncology Imaging Guideline
- Advanced imaging and echocardiogram is **not** indicated, in the absence of other appropriate indications listed in these guidelines, for **any** of the following:
 - Individuals starting ADHD medications
 - To screen asymptomatic individuals for disorders involving the heart

Pediatric Cardiac Imaging Modality General Considerations

- MRI
 - MRI and MRA studies are frequently indicated for evaluation of congenital heart defects not well visualized on echocardiography, thoracic arteries and veins not visualized on echocardiography, cardiomyopathies, and right ventricular disease, as well as in follow-up for these indications.
 - Due to the length of time for image acquisition and the need for the individual to be motionless during the acquisition, anesthesia is required for almost all infants and young children (age <7 years), as well as older children with delays in development or maturity. In this population, MRI imaging sessions should be planned with a goal of avoiding a short-interval repeat anesthesia exposure due to insufficient information using the following considerations:
 - MRI is typically performed without and with contrast.
 - If multiple body areas are supported for the clinical condition being evaluated, MRI of all necessary body areas should be obtained concurrently in the same anesthesia session.
- CT
 - CT is primarily used to evaluate the coronary and great vessels in congenital heart disease if cardiac MR is contraindicated.
 - Coding considerations are listed in **CT Heart and Coronary Computed Tomography Angiography (CCTA) – Other Indications (PEDCD-10)**
- Ultrasound
 - Echocardiography is the primary modality used to evaluate the anatomy and function of the pediatric heart, and is generally indicated before considering other imaging modalities.
 - Coding considerations are listed in **Echocardiography - Other Indications (PEDCD-8)**
- Nuclear Medicine
 - SPECT, PET stress may be indicated for individuals with anomalous CA, angina chest pain, and follow-up for Kawasaki and MIS-C. See specific sections for those indications.
 - Multi Gated Acquisition (MUGA) studies (CPT® 78472, CPT® 78473, CPT® 78481, CPT® 78483, CPT® 78494, or CPT® 78496) are rarely performed in pediatrics, but can be approved for the following:

- Certain pediatric oncology individuals when echocardiography is insufficient: See: for imaging guidelines.
- Quantitation of left ventricular function when recent echocardiogram shows ejection fraction of <50% and MUGA results will impact acute patient care decisions.
- SPECT/CT fusion imaging involves SPECT (MPI) imaging and CT for optimizing location, accuracy, and attenuation correction combines functional and anatomic information.
 - There is currently no evidence-based data to formulate appropriateness criteria for SPECT/CT fusion imaging.
 - Combined use of nuclear imaging, including SPECT, along with diagnostic CT (fused SPECT/CT) is considered investigational.
- Central C-V Hemodynamics (CPT® 78414) is not an imaging study and is an outdated examination
- Cardiac Shunt Detection (CPT® 78428) is rarely performed in pediatrics but can be approved for individuals in whom Cardiac MR is not diagnostic
 - Calculation of left and right ventricular ejection fractions
 - Assessment of wall motion
 - Quantitation of right to left shunts
- Myocardial Tc-99m Pyrophosphate Imaging
 - Infarct Avid Myocardial Imaging studies (CPT® 78466, CPT® 78468, and CPT® 78469), historically this method of imaging the myocardium, Myocardial Tc-99m Pyrophosphate Imaging, was used to identify recent infarction, hence, the term "infarct-avid scan." Although still available, the sensitivity and specificity for identifying infarcted myocardial tissue is variable and the current use for this indication is limited
 - CPT® 78466, CPT® 78468, and CPT® 78469, CPT® 78800 or CPT® 78803 may be used, for identification of myocardial ATTR (transthyretin) amyloidosis. See **Myocardial Tc-99m Pyrophosphate Imaging (CD-3.7)** and **Cardiac Amyloidosis (CD-3.8)**

MUGA (Multi Gated Acquisition) – Blood Pool Imaging	CPT®
Myocardial Imaging, infarct avid, planar, qualitative or quantitative	78466
Myocardial Imaging, infarct avid, planar, qualitative or quantitative with ejection fraction by first pass technique	78468
Myocardial Imaging, infarct avid, planar, qualitative or quantitative tomographic SPECT with or without quantification	78469
Radiopharmaceutical Localization Imaging Limited area	78800
Radiopharmaceutical Localization Imaging SPECT	78803
Note: When reporting CPT® 78803, planar imaging of a limited area or multiple areas should be included with the SPECT	

Supporting Information

Individuals who are <18 years old should be imaged according to the Pediatric Cardiac Imaging Guidelines and the general Cardiac Imaging Guidelines. Individuals who are age ≥18 years should be imaged according to the Cardiac Imaging Guidelines, except where directed otherwise by a specific guideline section. Adult individuals who also have congenital heart disease should be imaged by **Adult Congenital Heart Disease (CD-11)** in the general Cardiac Imaging Guidelines.

The guidelines listed in this section for certain specific indications are not intended to be all-inclusive; clinical judgment remains paramount and variance from these guidelines may be appropriate and warranted for specific clinical situations.

Procedure Codes Associated with Cardiac or PVD Imaging

MRI/MRA	CPT®
Cardiac magnetic resonance imaging for morphology and function without contrast material	75557
Cardiac magnetic resonance imaging for morphology and function without contrast material; with stress imaging	75559
Cardiac magnetic resonance imaging for morphology and function without contrast material(s), followed by contrast material(s) and further sequences	75561
Cardiac magnetic resonance imaging for morphology and function without contrast material(s), followed by contrast material(s) and further sequences; with stress imaging	75563
Cardiac magnetic resonance imaging for velocity flow mapping (List separately in addition to code for primary procedure)	75565

CT	CPT®
Computed tomography, heart, without contrast material, with quantitative evaluation of coronary calcium	75571
Computed tomography, heart, with contrast material, for evaluation of cardiac structure and morphology (including 3D image postprocessing, assessment of cardiac function, and evaluation of venous structures, if performed)	75572
Computed tomography, heart, with contrast material, for evaluation of cardiac structure and morphology in the setting of congenital heart disease (including 3D image postprocessing, assessment of LV cardiac function, RV structure and function and evaluation of venous structures, if performed)	75573

CT	CPT®
Noninvasive estimated coronary fractional flow reserve (FFR) derived from coronary computed tomography angiography data using computation fluid dynamics physiologic simulation software analysis of functional data to assess the severity of coronary artery disease; data preparation and transmission, analysis of fluid dynamics and simulated maximal coronary hyperemia, generation of estimated FFR model, with anatomical data review in comparison with estimated FFR model to reconcile discordant data, interpretation and report	0501T
Noninvasive estimated coronary fractional flow reserve (FFR) derived from coronary computed tomography angiography data using computation fluid dynamics physiologic simulation software analysis of functional data to assess the severity of coronary artery disease; data preparation and transmission	0502T
Noninvasive estimated coronary fractional flow reserve (FFR) derived from coronary computed tomography angiography data using computation fluid dynamics physiologic simulation software analysis of functional data to assess the severity of coronary artery disease; analysis of fluid dynamics and simulated maximal coronary hyperemia, and generation of estimated FFR model	0503T
Noninvasive estimated coronary fractional flow reserve (FFR) derived from coronary computed tomography angiography data using computation fluid dynamics physiologic simulation software analysis of functional data to assess the severity of coronary artery disease; anatomical data review in comparison with estimated FFR model to reconcile discordant data, interpretation and report	0504T
CTA	CPT®
Computed tomographic angiography, heart, coronary arteries and bypass grafts (when present), with contrast material, including 3D image postprocessing (including evaluation of cardiac structure and morphology, assessment of cardiac function, and evaluation of venous structures, if performed)	75574
Computed tomographic angiography, abdominal aorta and bilateral iliofemoral lower extremity runoff, with contrast material(s), including noncontrast images, if performed, and image postprocessing	75635
Nuclear Medicine	CPT®
Determination of central c-v hemodynamics (non-imaging) (eg, ejection fraction with probe technique) with or without pharmacologic intervention or exercise, single or multiple determinations	78414
Cardiac shunt detection	78428

Nuclear Medicine	CPT [®]
Myocardial imaging, positron emission tomography (PET), metabolic evaluation study (including ventricular wall motion[s] and/or ejection fraction[s], when performed), single study; with concurrently acquired computed tomography transmission scan	78429
Myocardial imaging, positron emission tomography (PET), perfusion study (including ventricular wall motion[s] and/or ejection fraction[s], when performed); single study, at rest or stress (exercise or pharmacologic), with concurrently acquired computed tomography transmission scan	78430
Myocardial imaging, positron emission tomography (PET), perfusion study (including ventricular wall motion[s] and/or ejection fraction[s], when performed); multiple studies at rest and stress (exercise or pharmacologic), with concurrently acquired computed tomography transmission scan	78431
Myocardial imaging, positron emission tomography (PET), combined perfusion with metabolic evaluation study (including ventricular wall motion[s] and/or ejection fraction[s], when performed), dual radiotracer (eg, myocardial viability);	78432
Myocardial imaging, positron emission tomography (PET), combined perfusion with metabolic evaluation study (including ventricular wall motion[s] and/or ejection fraction[s], when performed), dual radiotracer (eg, myocardial viability); with concurrently acquired computed tomography transmission scan	78433
Absolute quantitation of myocardial blood flow (AQMBF), positron emission tomography (PET), rest and pharmacologic stress (List separately in addition to code for primary procedure)	78434
Myocardial perfusion imaging, tomographic (SPECT) (including attenuation correction, qualitative or quantitative wall motion, ejection fraction by first pass or gated technique, additional quantification, when performed); single study, at rest or stress (exercise or pharmacologic)	78451
Myocardial perfusion imaging, tomographic (SPECT) (including attenuation correction, qualitative or quantitative wall motion, ejection fraction by first pass or gated technique, additional quantification, when performed); multiple studies, at rest and/or stress (exercise or pharmacologic) and/or redistribution and/or rest reinjection	78452
Myocardial perfusion imaging, planar (including qualitative or quantitative wall motion, ejection fraction by first pass or gated technique, additional quantification, when performed); single study, at rest or stress (exercise or pharmacologic)	78453
Myocardial perfusion imaging, planar (including qualitative or quantitative wall motion, ejection fraction by first pass or gated technique, additional quantification, when performed); multiple studies, at rest and/or stress (exercise or pharmacologic) and/or redistribution and/or rest reinjection	78454

Nuclear Medicine	CPT®
Myocardial imaging, positron emission tomography (PET), metabolic evaluation study (including ventricular wall motion and/or ejection fraction, when performed), single study	78459
Myocardial imaging, infarct avid, planar; qualitative or quantitative	78466
Myocardial imaging, infarct avid, planar; with ejection fraction by first pass technique	78468
Myocardial imaging, infarct avid, planar; tomographic SPECT with or without quantification	78469
Cardiac blood pool imaging, gated equilibrium; planar, single study at rest or stress (exercise and/or pharmacologic), wall motion study plus ejection fraction, with or without additional quantitative processing	78472
Cardiac blood pool imaging, gated equilibrium; multiple studies, wall motion study plus ejection fraction, at rest and stress (exercise and/or pharmacologic), with or without additional quantification	78473
Cardiac blood pool imaging (planar), first pass technique; single study, at rest or with stress (exercise and/or pharmacologic), wall motion study plus ejection fraction, with or without quantification	78481
Cardiac blood pool imaging (planar), first pass technique; multiple studies, at rest and with stress (exercise and/or pharmacologic), wall motion study plus ejection fraction, with or without quantification	78483
Myocardial imaging, positron emission tomography (PET), perfusion (including ventricular wall motion and/or ejection fraction, when performed); single study at rest or stress (exercise or pharmacologic)	78491
Myocardial imaging, positron emission tomography (PET), perfusion (including ventricular wall motion and/or ejection fraction, when performed); multiple studies at rest and/or stress (exercise or pharmacologic)	78492
Cardiac blood pool imaging, gated equilibrium, SPECT, at rest, wall motion study plus ejection fraction, with or without quantitative processing	78494
Cardiac blood pool imaging, gated equilibrium, single study, at rest, with right ventricular ejection fraction by first pass technique (List separately in addition to code for primary procedure)	78496
Quantitative differential pulmonary perfusion, including imaging when performed	78597
Quantitative differential pulmonary perfusion and ventilation (eg, aerosol or gas), including imaging when performed	78598
Radiopharmaceutical localization of tumor, inflammatory process or distribution of radiopharmaceutical agent(s) (includes vascular flow and blood pool imaging, when performed); planar, single area (eg, head, neck, chest, pelvis), single day imaging	78800

Nuclear Medicine	CPT®
Radiopharmaceutical localization of tumor, inflammatory process or distribution of radiopharmaceutical agent(s) (includes vascular flow and blood pool imaging, when performed); planar, 2 or more areas (eg, abdomen and pelvis, head and chest), 1 or more days imaging or single area imaging over 2 or more days	78801
Radiopharmaceutical localization of tumor, inflammatory process or distribution of radiopharmaceutical agent(s) (includes vascular flow and blood pool imaging, when performed); planar, whole body, single day imaging	78802
Radiopharmaceutical localization of tumor, inflammatory process or distribution of radiopharmaceutical agent(s) (includes vascular flow and blood pool imaging, when performed); tomographic (SPECT), single area (eg, head, neck, chest, pelvis), single day imaging	78803
Radiopharmaceutical localization of tumor, inflammatory process or distribution of radiopharmaceutical agent(s) (includes vascular flow and blood pool imaging, when performed); planar, whole body, requiring 2 or more days imaging	78804
Radiopharmaceutical localization of tumor, inflammatory process or distribution of radiopharmaceutical agent(s) (includes vascular flow and blood pool imaging, when performed); tomographic (SPECT) with concurrently acquired computed tomography (CT) transmission scan for anatomical review, localization and determination/detection of pathology, single area (eg, head, neck, chest, pelvis), single day imaging	78830
Myocardial sympathetic innervation imaging, planar qualitative and quantitative assessment	0331T
Myocardial sympathetic innervation imaging, planar qualitative and quantitative assessment; with tomographic SPECT	0332T

Ultrasound	CPT®
Transthoracic echocardiography for congenital cardiac anomalies; complete	93303
Transthoracic echocardiography for congenital cardiac anomalies; follow-up or limited study	93304
Echocardiography, transthoracic, real-time with image documentation (2D), includes M-mode recording, when performed, complete, with spectral Doppler echocardiography, and with color flow Doppler echocardiography	93306
Echocardiography, transthoracic, real-time with image documentation (2D), includes M-mode recording, when performed, complete, without spectral or color Doppler echocardiography	93307
Echocardiography, transthoracic, real-time with image documentation (2D), includes M-mode recording, when performed, follow-up or limited study	93308

Ultrasound	CPT®
Echocardiography, transesophageal, real-time with image documentation (2D) (with or without M-mode recording); including probe placement, image acquisition, interpretation and report	93312
Echocardiography, transesophageal, real-time with image documentation (2D) (with or without M-mode recording); placement of transesophageal probe only	93313
Echocardiography, transesophageal, real-time with image documentation (2D) (with or without M-mode recording); image acquisition, interpretation and report only	93314
Transesophageal echocardiography for congenital cardiac anomalies; including probe placement, image acquisition, interpretation and report	93315
Transesophageal echocardiography (TEE) for congenital cardiac anomalies; placement of transesophageal probe only	93316
Transesophageal echocardiography for congenital cardiac anomalies; placement of transesophageal probe only	93317
3D echocardiographic imaging and postprocessing during transesophageal echocardiography, or during transthoracic echocardiography for congenital cardiac anomalies, for the assessment of cardiac structure(s) (eg, cardiac chambers and valves, left atrial appendage, interatrial septum, interventricular septum) and function, when performed (List separately in addition to code for echocardiographic imaging) Code with (93303-93304, 93312, 93314, 93315, 93317, 93350-93351)	+93319
Doppler echocardiography, pulsed wave and/or continuous wave with spectral display (List separately in addition to codes for echocardiographic imaging); complete	+93320
Doppler echocardiography, pulsed wave and/or continuous wave with spectral display (List separately in addition to codes for echocardiographic imaging); follow-up or limited study (List separately in addition to codes for echocardiographic imaging)	+93321
Doppler echocardiography color flow velocity mapping (List separately in addition to codes for echocardiography)	+93325
Echocardiography, transthoracic, real-time with image documentation (2D), includes M-mode recording, when performed, during rest and cardiovascular stress test using treadmill, bicycle exercise and/or pharmacologically induced stress, with interpretation and report;	93350

Ultrasound	CPT®
Echocardiography, transthoracic, real-time with image documentation (2D), includes M-mode recording, when performed, during rest and cardiovascular stress test using treadmill, bicycle exercise and/or pharmacologically induced stress, with interpretation and report; including performance of continuous electrocardiographic monitoring, with supervision by a physician or other qualified health care professional	93351
Use of echocardiographic contrast agent during stress echocardiography (List separately in addition to code for primary procedure)	+93352
Myocardial strain imaging using speckle tracking-derived assessment of myocardial mechanics (List separately in addition to codes for echocardiography imaging)	+93356
Transthoracic echocardiography with contrast, or without contrast followed by with contrast, for congenital cardiac anomalies; complete	C8921
Transthoracic echocardiography with contrast, or without contrast followed by with contrast, for congenital cardiac anomalies; follow-up or limited study	C8922
Transthoracic echocardiography with contrast, or without contrast followed by with contrast, real-time with image documentation (2D), includes M-mode recording, when performed, complete, without spectral or color doppler echocardiography	C8923
Transthoracic echocardiography with contrast, or without contrast followed by with contrast, real-time with image documentation (2D), includes M-mode recording when performed, follow-up or limited study	C8924
Transesophageal echocardiography (TEE) with contrast, or without contrast followed by with contrast, real time with image documentation (2D) (with or without M-mode recording); including probe placement, image acquisition, interpretation and report	C8925
Transesophageal echocardiography (TEE) with contrast, or without contrast followed by with contrast, for congenital cardiac anomalies; including probe placement, image acquisition, interpretation and report	C8926
Transthoracic echocardiography with contrast, or without contrast followed by with contrast, real-time with image documentation (2D), includes M-mode recording, when performed, during rest and cardiovascular stress test using treadmill, bicycle exercise and/or pharmacologically induced stress, with interpretation and report	C8928
Transthoracic echocardiography with contrast, or without contrast followed by with contrast, real-time with image documentation (2D), includes M-mode recording, when performed, complete, with spectral doppler echocardiography, and with color flow doppler echocardiography	C8929

Ultrasound	CPT®
Transthoracic echocardiography, with contrast, or without contrast followed by with contrast, real-time with image documentation (2D), includes M-mode recording, when performed, during rest and cardiovascular stress test using treadmill, bicycle exercise and/or pharmacologically induced stress, with interpretation and report; including performance of continuous electrocardiographic monitoring, with physician supervision	C8930
Myocardial contrast perfusion echocardiography, at rest or with stress, for assessment of myocardial ischemia or viability (List separately in addition to code for primary procedure)	+0439T

Cardiac Cath Procedure	CPT®
Congenital Heart Disease Code "Set"	93593-93597
Right heart catheterization for congenital heart defect(s) including imaging guidance by the proceduralist to advance the catheter to the target zone; normal native connections	93593
Right heart catheterization for congenital heart defect(s) including imaging guidance by the proceduralist to advance the catheter to the target zone; abnormal native connections	93594
Left heart catheterization for congenital heart defect(s) including imaging guidance by the proceduralist to advance the catheter to the target zone, normal or abnormal native connections	93595
Right and left heart catheterization for congenital heart defect(s) including imaging guidance by the proceduralist to advance the catheter to the target zone(s); normal native connections	93596
Right and left heart catheterization for congenital heart defect(s) including imaging guidance by the proceduralist to advance the catheter to the target zone(s); abnormal native connections	93597
Anomalous coronary arteries, patent foramen ovale, mitral valve prolapse, and bicuspid aortic valve	93451-93464, 93566-93568
RHC without LHC or coronaries	93451
LHC without RHC or coronaries	93452
RHC and retrograde LHC without coronaries	93453
Native coronary artery catheterization;	93454
with bypass grafts	93455

Cardiac Cath Procedure	CPT®
with RHC	93456
with RHC and bypass grafts	93457
with LHC	93458
with LHC and bypass grafts	93459
with RHC and LHC	93460
with RHC and LHC and bypass grafts	93461
LHC by trans-septal or apical puncture	+93462
Angiography of non-coronary arteries and veins performed as a distinct service	Select appropriate codes from the Radiology and Vascular Injection Procedures sections.

Congenital Heart Disease General Information (PEDCD-2.1)

CDP.CHD.0002.1.A

v1.0.2024

- Congenital heart disease accounts for the majority of cardiac problems occurring in the pediatric population. Individuals may be diagnosed any time spanning prenatal evaluation to adolescence. For individuals over 18 years of age, see **Adult Congenital Heart Disease (CD-11)** in the Cardiac Imaging Guidelines.
- There are a number of variables that influence the modality and timing of imaging individuals with congenital heart disease, which results in a high degree of individuality in determining the schedule for imaging these individuals, including:
 - Gestational age
 - Individual's age
 - Physiologic effects of the defect
 - Status of interventions (catheterization and surgical)
 - Rate of individual's growth
 - Stability of the defect on serial imaging
 - Comorbid conditions
 - Activity level
- Age definitions for pediatric individuals (for purpose of these guidelines)
 - Infant 0-12 months
 - Subcategory of infant: Neonate or newborn 0-28 days
 - Child 1-18 years
 - Subcategory of child: Adolescent 11-18 years
 - "Children" refers to all pediatric individuals ages 0-18 years
- Newborns (neonates) have special considerations as they have potentially rapidly changing physiology
 - Newborns with any concerns for ductal dependent lesion can have echocardiograms at any frequency
 - Newborns have changes in pulmonary vascular resistance that can affect clinical status rapidly, and may require more frequent imaging.
 - Neonatal physiology can extend to the first couple of months of life.
 - Newborns can have one repeat echo, if prior echocardiogram is abnormal or equivocal (either in the hospital or as newborn outpatient)
- Individuals can have an echocardiogram at that time for **Change in clinical status and/or new concerning signs or symptoms**. This can include:
 - Shortness of breath
 - Fatigue
 - Chest discomfort

- Percentile weight loss
- Weight gain
- Poor feeding
- Tachypnea
- Tachycardia
- CHF signs on exam
- Change in EKG, Pulse ox, laboratory values
- An additional study can be approved prior to the next routine interval, to assess for more rapid change, if the change in clinical status involves the echocardiogram itself, such as:
 - Increasing stenosis gradient
 - Increasing regurgitation amount
 - Increasing pulmonary vascular resistance
 - Decreased ventricular function
 - Change in ductal status
- In individuals that can have both Cardiac MR or Cardiac CT and/or MRA Chest or CTA Chest, this is abbreviated as CMR/CT-MRA/CCTA
- Individuals with medication adjustments may require additional imaging at that time.
 - Pediatric dosing tends to be mg/kg or mcg/kg. Adjusting the dose to the same mg/kg would not be considering a dosing change for imaging.
 - Because dose adjustments are done by weight, and infants are growing rapidly, they can have changing physiology, pulmonary vascular resistance, ductal size and weight changes, dose response and may require more than one echo during a medication adjustment.
- Heart surgery
 - TTE is indicated one month prior to heart surgery. Depending on lesion, MR/CT Cardiac and/or Chest may also be included.
 - Can have an echocardiogram within one month post-operative
 - Cardiac MRI/CCT if prior echo is equivocal
- MRA/CTA Chest can be performed if prior echo is equivocal and there are issues regarding aortic arch or pulmonary arteries or veins
- In individuals who have a documented equivocal echocardiogram due to a technical factor (i.e., poor acoustic windows due to body habitus) which will likely be present on subsequent echocardiograms, a Cardiac MR/CT, or MRA/CTA Chest, may be done with the frequency of echoes, if done instead of an echo.
- MRA/CTA Chest if thoracic issue not seen on echo
- For routine non-invasive imaging for a specific lesion see **Imaging and Surveillance per Congenital lesion (PEDCD-2.4)**
- For catheterizations see section **Cardiac Catheterization (PEDCD-11)**
- **Individuals with Pulmonary hypertension with CHD** should be reviewed for both their lesion and for PHT in section **Pediatric Pulmonary Hypertension (PEDCD-7)**

Congenital Heart Disease Coding (PEDCD-2.2)

CDP.CHD.0002.2.A
v1.0.2024

Congenital Heart Disease Echocardiography Coding (PEDCD-2.2.1)

- **Any** of the following echocardiography code combinations are appropriate for re-evaluation of individuals with known congenital heart disease:
 - CPT® 93303, CPT® 93320, and CPT® 93325
 - CPT® 93304, CPT® 93321, and CPT® 93325
 - CPT® 93303
 - CPT® 93304
- CPT® 93306 is not indicated in the evaluation of known congenital heart disease.

Congenital Heart Disease imaging per modality (PEDCD-2.2.2)

Echocardiogram

- Transthoracic echocardiogram (TTE)
 - TTE for congenital cardiac anomalies; complete (CPT® 93303)
 - TTE for congenital cardiac anomalies; limited study (CPT® 93304)
 - TTE (2D) m-mode recording, complete, with spectral and color flow doppler echocardiography (CPT® 93306)
 - TTE (2D) with or without m-mode recording; complete (CPT® 93307)
 - TTE (2D) with or without m-mode recording; limited study (CPT® 93308)
- Transesophageal echocardiogram (TEE)
 - TEE (2D) including probe placement, imaging, interpretation, and report (CPT® 93312)
 - TEE for congenital cardiac anomalies; including probe placement, imaging, interpretation, and report (CPT® 93315)

MRI

- Cardiac (CMR)
 - Cardiac MRI for morphology and function without contrast (CPT® 75557)
 - Cardiac MRI for morphology and function without and with contrast (CPT® 75561)
 - Cardiac magnetic resonance imaging for velocity flow mapping (List separately in addition to code for primary procedure) (CPT® 75565)
- MRI Chest
 - MRI Chest without contrast (CPT® 71550)

- MRI Chest with contrast (CPT® 71551)
- MRI Chest with & without contrast (CPT® 71552)
- MRI Angiography (MRA)
 - MRA Chest (excluding myocardium) with or without contrast (CPT® 71555)

CT

- Cardiac (CCT)
 - CT, Heart, with contrast material, for evaluation of cardiac structure and morphology (CPT® 75572)
 - CT, Heart, with contrast material, for evaluation of cardiac structure and morphology in the setting of congenital heart disease (CPT® 75573)
- CT Angiography-Cardiac (CCTA)
 - CTA Heart, coronary arteries and bypass grafts (when present), with contrast, including 3D image post processing (CPT® 75574)
- CT-Chest
 - CT Thorax without contrast (CPT® 71250)
 - CT Thorax with contrast (CPT® 71260)
 - CT Thorax without & with contrast (CPT® 71270)
- CT Angiography-Chest (CTA Chest)
 - CTA Chest without and with contrast (CPT® 71275)

Stress Imaging (echo, MRI, MPI)

- Stress echo
 - Echocardiography (TTE), (2D), with or without m-mode, during rest and cardiovascular stress, with interpretation and report (CPT® 93350)
 - Echocardiography (TTE), (2D), m-mode, during rest and cardiovascular stress test using treadmill, bicycle exercise and/or pharmacologically induced stress, with interpretation (CPT® 93351)
- Stress MRI
 - Cardiac MRI for morphology and function without contrast, with stress imaging (CPT® 75559)
 - Cardiac MRI for morphology and function without and with contrast, with stress imaging (CPT® 75563)
- Myocardial perfusion imaging (MPI)
 - MPI, tomographic (SPECT) including attenuation correction, qualitative or quantitative wall motion, ejection fraction by first pass or gated technique, additional quantification, when performed); single study, at rest or stress (exercise or pharmacologic) (CPT® 78451)
 - MPI, tomographic (SPECT) (including attenuation correction, qualitative or quantitative wall motion, ejection fraction by first pass or gated technique, additional quantification, when performed); multiple studies, at rest and/or stress

(exercise or pharmacologic) and/or redistribution and/or rest reinjection (CPT® 78452)

Pulmonary perfusion imaging

- Pulmonary perfusion imaging (e.g., particulate) (CPT® 78580)
- Pulmonary ventilation (e.g., aerosol or gas) and perfusion imaging (CPT® 78582)
- Quantitative differential pulmonary perfusion, including imaging when performed (CPT® 78597)
- Quantitative differential pulmonary perfusion and ventilation (e.g., aerosol or gas), including imaging when performed (CPT® 78598)

Congenital Heart Disease Modality Considerations (PEDCD-2.3)

CDP.CHD.0002.3.A

v1.0.2024

- Echocardiography is the primary imaging modality used for diagnosing and monitoring congenital heart disease and is generally required before other imaging modalities are indicated unless otherwise indicated in a specific guideline section.
- Cardiac MRI either without contrast (CPT® 75557) or without and with contrast (CPT® 75561) is indicated, when a recent echocardiogram is inconclusive, needs confirmation of findings, or does not completely define the disease (for subsequent follow-up studies, a recent echocardiogram is not a requirement):
 - CPT® 75565 is also indicated for individuals with valvular disease or a need to evaluate intracardiac blood flow. These individuals will usually have CPT® 93320 and CPT® 93325 performed with their echocardiography studies.
 - MRA Chest (CPT® 71555) may be added if the aorta or pulmonary artery needs to be visualized beyond the root, or if aortopulmonary collaterals, pulmonary veins, or systemic veins need to be visualized.
 - MRA Chest alone (CPT® 71555) should be performed if the individual cannot cooperate with full cardiac MRI exam.
- MRA Chest (CPT® 71555) is indicated for assessment of the great arteries, pulmonary veins, and systemic chest veins with inconclusive recent echocardiography findings, including the following:
 - Coarctation of the aorta
 - Tetralogy of Fallot
 - Anomalous pulmonary veins
 - Transposition of the great arteries
 - Truncus arteriosus
 - Vascular rings and other lesions of the great arteries, with inconclusive recent echocardiography findings
- CT imaging is indicated when recent echocardiogram is inconclusive:
 - Report CPT® 75574 for evaluating coronary artery anomalies
 - Report CPT® 75573 for congenital heart disease
 - CPT® 71275 Determination of vascular extra-cardiac anatomy in individuals with complex congenital heart disease
 - Pulmonary artery (PA) and Pulmonary vein (PV) assessment
- CTA Chest (CPT® 71275) is indicated with inconclusive recent echocardiography findings to assess:
 - Coarctation of the aorta
 - Tetralogy of Fallot
 - Anomalous pulmonary veins and other lesions of the great arteries

- Vascular rings
- Pulmonary perfusion imaging
 - Pulmonary perfusion imaging (e.g., particulate) (CPT® 78580)(CPT® 78582) (CPT® 78597)(CPT® 78598)
 - In individuals with congenital heart disease or suspected congenital heart diseases, who have clinical questions regarding relative pulmonary blood flow, can have perfusion imaging

Imaging and Surveillance per Congenital lesion (PEDCD-2.4)

CDP.CHD.0002.4.A

v1.0.2024

- Echocardiography is often repeated frequently throughout a pediatric individual's life, and can generally be approved regardless of symptoms based on the lesion and age of the individual. These are listed in sections below.
 - Modifiers following guidelines.
 - Some congenital conditions may require more frequent testing, especially with more complex heart disease, congestive heart failure, obstructive heart lesions, ductal dependent lesions, changes in clinical status, repeat interventions, and/or in neonates
 - Any individual being treated for heart failure, with consideration for changing medical regimen can have an echocardiogram
- Echocardiography is performed during the physician office visit, and these studies should not be denied because of lack of contact within 60 days.
- Adults 18 years and older who also have congenital heart disease should be imaged according to **Adult Congenital Heart Disease (CD-11)** and the general Cardiac Imaging Guidelines.

Atrial Defects-Secundum ASD, PFO, and Partial anomalous pulmonary venous return (PAPVR), Sinus Venosus defect (PEDCD-2.4.1)

CDP.CHD.0241.A

v1.0.2024

See section on AVSD in **AVSD (Atrioventricular canal, Endocardial cushion defect) (PEDCD-2.4.3) for primum ASD**

PFO (Patent Foramen Ovale)

- Routine surveillance in an asymptomatic individual with PFO is not indicated
 - PFO is a normal variant
 - In infants, a PFO that is difficult to distinguish from an ASD can be imaged with the same guidelines as used in a small unrepaired ASD (with congenital echo).
 - Individuals with PFOs may have an additional indication for an echo and can be imaged according to the echocardiogram guidelines in **Repeat Transthoracic Echocardiography Indications (PEDCD-8.3)** and **Frequency of echocardiography testing (CD-2.3)** in the general Cardiac Imaging Guidelines.
- Follow-up imaging with an echocardiogram is indicated when there is documentation of the following:
 - New cardiac symptoms
 - A concern that the last echo was equivocal for other cardiac issues
 - Question of a clot/embolism that has gone across the PFO
 - Prior echo did not differentiate the PFO from a secundum ASD
- TTE (CPT® 93306- non congenital echocardiogram) is indicated when an individual with a prior history of PFO requires an echocardiogram for any new reason
- Preoperative for PFO closure
 - TTE or TEE
 - Closure is rare in children but may be indicated in individuals with transient ischemic attacks or strokes with suspected atrial level shunt
 - CMR/CT-CMRA/CTA if unclear findings from echocardiogram.
- Intra-procedural PFO
 - Intra-procedural TEE (CPT® 93355) is not in scope for this program
- Post procedure PFO closure
 - Post-surgical imaging as follows (PFO generally requires less frequent monitoring post device than ASDs):
 - TTE one time within 30 days of closure

- TTE one time within 6 months of PFO closure
- TTE or TEE is indicated at any time post procedure when there is concern for **any** of the following:
 - Infection
 - Malposition
 - Embolization
 - Persistent shunt
- If persistent shunt TTE is indicated every 3 months until the finding is stable or there is a need for intervention

ASD and PAPVR asymptomatic isolated atrial septal defect (ASD)

This section reference secundum ASD, sinus Venosus, ASD and unobstructed partial anomalous pulmonary venous return

- Any surgical status
 - TTE is indicated for any of the following:
 - Initial evaluation of a change in clinical status and/or new concerning signs or symptoms
 - Prior to planned cardiac intervention
 - Repeat any time prior to next allowed study if concern for elevated pulmonary vascular resistance/Pulmonary hypertension
 - CMR/CT-CMRA/CTA
 - If anomalous vein or SV defect cannot be assessed on echo
 - To assess shunt or RV for considering of surgery, or if echocardiogram equivocal
- Unrepaired
 - Newborn with isolated ASD can have one repeat TTE within 2 months
 - Small asymptomatic isolated ASD with no pulmonary hypertension can have TTE as follows:
 - Infant <6 months every three months
 - Infant ≥6 months, repeat at one year.
 - Child Every 3 years
 - Routine surveillance for ≥moderate ASD or PAPVR >1 vein
 - Infant every 3 months
 - Echo (TTE) every 1 year
- Prior to planned repair of ASD
 - TTE and/or TEE
 - MRI if any residual issues unanswered by echo
- Prior to planned SV defect or PAPVR
 - TTE and/or TEE

- CMR/CT-CMRA/CTA
- Post- ASD closure with device
 - TTE post device closure
 - 1 week
 - 1 month
 - Every 3 months
 - 1 year
 - Every 2 years
 - May repeat TTE every 3 months until the finding is stable or there is a need for intervention if there is significant residual shunt, valvular or ventricular dysfunction, arrhythmias, and/or pulmonary hypertension
- Post-surgical closure of ASD
 - TTE
 - Within the first month
 - Within the 1st year
 - Every 2 years after the first year study
 - May repeat TTE every 3 months until the finding is stable or there is a need for intervention if significant residual shunt, valvular or ventricular dysfunction, arrhythmias, and/or pulmonary hypertension.

VSD (PEDCD-2.4.2)

CDP.CHD.0242.A

v1.0.2024

All

TTE is indicated for any of the following:

- with change in clinical status and/or new concerning signs or symptoms
- Prior to planned cardiac intervention

Unrepaired

TTE

- Small muscular VSD, No Symptoms, No pulmonary hypertension
 - Newborn 1 repeat within 2 months
 - Infancy every 6 months
 - Childhood every 3 years
- Small VSD in location other than muscular
 - Newborn 1 repeat TTE within 2 months
 - Infant TTE every 6 months
 - Child TTE every year.
- Moderate or large VSD on medical management
 - Newborn TTE every 2 weeks
 - infant every 1 month
 - Child <2 years old TTE every 3 months
 - Child >2 years old TTE every year.

Post Repair VSD

TTE

- One study within one month of surgery
- One study within one year of surgery,
- After first year of surgery, every 2 years
- Following surgical or device closure in an individual with significant residual shunt, valvular or ventricular dysfunction, arrhythmias, and/or pulmonary hypertension.
 - Child –TTE every 3 months
 - Adolescent- TTE every 6 months

AVSD (Atrioventricular canal, endocardial cushion defect) (PEDCD-2.4.3)

CDP.CHD.0243.A

v1.0.2024

Any surgical status

TTE is indicated for any of the following:

- Change in clinical status and/or new concerning signs or symptoms
- Prior to planned cardiac intervention

Unrepaired

- Partial/transitional Atrioventricular canal (AVC)
 - Newborn one addition study next 2 months.
 - TTE
 - Infancy every 3 months in infancy
 - Child <2 years every 6 months
 - Child ≥2 years, 1 year
- Complete AVC
 - TTE
 - Newborn, TTE repeat within first month
 - Infant <6 weeks, TTE every 2 weeks.
 - Infant ≥6 weeks, TTE monthly

Repaired (TTE)

- Within one month of surgery
- Within 1 year
- Then annually
- May repeat TTE every 3 months until the finding is stable or there is a need for intervention if residual shunt, valvular LV dysfunction, LVOT obstruction, arrhythmia, arrhythmia or PHT, symptoms of heart failure

PDA (Patent ductus arteriosus) (PEDCD-2.4.4)

CDP.CHD.0244.A

v1.0.2024

Any surgical status

TTE is indicated for any of the following:

- Initial evaluation of a change in clinical status and/or new concerning signs or symptoms
- Prior to planned cardiac intervention

Unrepaired

- Newborn, one repeat TTE in newborn period
 - None, if spontaneously closed
- >1-year-old
 - No Routine surveillance in an asymptomatic individual with a trivial, silent PDA
- Infant
 - Small PDA: TTE every 3 months
 - \geq Moderate PDA: TTE every month
- Child
 - Small PDA: every 1 year
 - Moderate PDA: every 6 months
- Adolescent every 3 years

Post PDA device

- Post procedure surveillance (TTE)
 - One echo in first 30 days
 - Annually for first 2 years
 - Every 5 years after first 2 years
- Post procedure LPA stenosis or aortic obstruction
 - Child
 - TTE annually
 - MRA/CTA Chest, or (lung perfusion for LPA stenosis) if questions remain unanswered after TTE
 - Adolescents
 - Every two years TTE and

- MRA/CTA Chest, or (lung perfusion for LPA stenosis) if questions remain unanswered after TTE

TAPVR Total anomalous pulmonary venous return (PEDCD-2.4.5)

CDP.CHD.0245.A

v1.0.2024

Any surgical status

- TTE, TEE, CMR/CT-CMRA/CTA, Lung perfusion scan are indicated for any of the following:
 - Change in clinical status and/or new concerning signs or symptoms
 - Prior to planned cardiac intervention

Unrepaired

- No restrictions

Repaired

- TTE one Post procedure evaluation first 30 days
- TTE every 3 months in infancy
- Child: every 1 year
- Adolescence: TTE every 2 years

Ebstein anomaly and TV dysplasia (PEDCD-2.4.6)

CDP.CHD.0246.A

v1.0.2024

Any surgical status

- TTE, TEE, CMR/CT-CMRA/CTA are indicated for any of the following:
 - Change in clinical status and/or new concerning signs or symptoms
 - Prior to planned repair or intervention

Unrepaired

- Newborn Repeat study within 30 days.
- Infant
 - Trivial TR is a normal finding
 - Mild TR- TTE every year
 - \geq Moderate TR- TTE every 3 months
- Child
 - Mild TR every year TTE
 - \geq Moderate every 6 months

Repaired (TTE)

- Post-op within 30 days
- TTE once a year
- TTE every 6 months if valvular or ventricular dysfunction, or arrhythmias
- Child: every year
- Adolescent: every 2 years
- Every 3 months if CHF or atrial arrhythmias

Pulmonary Stenosis (PS) (PEDCD-2.4.7)

CDP.CHD.0247.A

v1.0.2024

Any surgical status

- TTE is indicated for any of the following:
 - Change in clinical status and/or new concerning signs or symptoms
 - Prior to planned cardiac procedure
 - If increasing gradient, 1 additional study prior to next allowed study
 - PS in Williams syndrome: See LVOT lesions (PEDCD-2.4.10)

Unrepaired

- Neonate
 - TTE repeat study within 30 days
- Infant PS asymptotic (any severity)
 - TTE every 3 months
- Child
 - TTE every 1 year
- Adolescent
 - TTE every 2 years
 - MRA/CTA Chest if pulmonary artery dilation every 3 years

Post procedure (TTE)

- Within 30 days
- Infant
 - TTE every 3 months
- Child
 - TTE 1 year
 - Moderate or severe sequelae TTE every 6 months
- Adolescent
 - TTE every 2 years
- Any individual with heart failure, TTE every 3 months

Pulmonary Atresia with intact septum (PAIVS) (PEDCD-2.4.8)

CDP.CHD.0248.A

v1.0.2024

Any surgical status

TTE is indicated for any of the following:

- Prior to planned repair
- Change in clinical status and/or new concerning signs or symptoms

Post procedural: Palliation

- TTE
 - 1 within 30 days
 - Every 1 month until repaired

Post procedural: Complete Repair

- TTE within 30 days post-op
- Any age
 - TTE every three months for CHF
- Infant
 - TTE at 3 months in asymptomatic infant
- Child
 - TTE annually
 - Every 6 months if moderate sequelae
- Adolescent
 - CMR/CT and/or CMRA/CTA every 3 years

Mitral valve disease (PEDCD-2.4.9)

CDP.CHD.0249.A

v1.0.2024

Any surgical status

- TTE is indicated for any of the following:
 - Prior to planned surgery
 - Initial evaluation of change in clinical status and/or new concerning signs or symptoms

Unrepaired congenital mitral valve stenosis

- Infant in first three months of life
 - Weekly TTE
- After 3 months (TTE)
 - Every 3 months if mild MS
 - Every month if \geq moderate MS
- Child (TTE)
 - With moderate MS every 3 months until a decision is made to intervene
 - Child with mild symptoms annually

Unrepaired: Congenital Mitral Regurgitation (MR) including Mitral Valve Prolapse

- Infant
 - TTE every 6 months an asymptomatic infant with mild MR
 - TTE every month in asymptomatic infant with \geq moderate MR
- Child
 - TTE every 2 years with mild MR, normal LV size and systolic function
 - TTE every 6 months with \geq moderate MR
 - TTE every 3 years in an asymptomatic with MVP and mild MR

Post procedure, surgical or catheter based

- TTE within 30 days
- Infant
 - TTE every 3 months, mild MS or MR, and no LV dysfunction
 - TTE every month in \geq moderate MS or MR, dilated LV, and no LV dysfunction
- Child
 - TTE annually
 - In a child with normal prosthetic mitral valve function and no LV dysfunction

- In a child with mild MS or MR, and no LV dysfunction
- TTE every 3 months
 - In a child with \geq moderate MS or MR, dilated LV, and no LV dysfunction
 - In a child with prosthetic mitral valve or ventricular dysfunction, and/or arrhythmias

LVOT lesions (PEDCD-2.4.10)

CDP.CHD.2410.A

v1.0.2024

Subvalvular Aortic stenosis

Any surgical status

- TTE, TEE, Cardiac MR/CT are indicated for any of the following:
 - Initial evaluation of change in clinical status and/or new concerning signs or symptoms
 - Preoperative
- If aortic dimension z score >2
 - TTE or Chest CTA/MRA every 2 years if stable z score
 - TTE or Chest CTA/MRA every 6 months if increasing z score

Unrepaired

- Newborn- No restrictions
- Infant TTE
 - 1 monthly for any subvalvular AS, but \leq mild AR
- Child
 - TTE one per year if mild AS and no AR
 - TTE every 6 months \geq moderate subvalvular AS and/or mild AR
 - Routine surveillance (6–12 months) in an asymptomatic child with \geq moderate AS and/or \geq moderate AR

Repaired

- Infant
 - TTE within 30 days
 - TTE every 3 months \leq mild MS and or AR
 - TTE every 1 month \geq moderate AS or AR
- Child
 - TTE every 1 year \leq Mild AS or AR
 - TTE every 6 months \geq moderate AS or AR
 - TTE every 3 months if heart failure

Aortic Valve Stenosis and/or regurgitation/ BAV (Bicuspid Aortic Valve)**Any surgical status**

- TTE, TEE, Cardiac MR/CT are indicated for any of the following:
 - Initial evaluation of change in clinical status and/or new concerning signs or symptoms
 - Preoperative

Unrepaired

- Infant <3 months
 - TTE 1 per week
- Infant >3 months
 - TTE every 3 months
 - TTE every 1 month, if ≥moderate AS or AR
- Child
 - TTE every 1 year with mild AS/AR and no aortic dilation
 - TTE every 6 months with moderate AS/AR, or aortic dilation.
 - TTE every 3 years if BAV with trivial or mild valvular dysfunction and no aortic root dilation
 - Every 6 months in any as with increasing z-score aortic root ascending aorta

Post procedural

- Within 30 days TTE
- Infant
 - Every 1 month following neonatal intervention with ≥moderate AS or AR or LV dysfunction
 - Every 3 months ≤mild AS/AR and no LV dysfunction
- Child (TTE)
 - 6 months echo if ≥moderate AS or AR
 - 1-year echo if ≤mild AS or AR, and/or normal prosthetic valve
 - Every 3 months if CHF or Ventricular dysfunction

Supravalvular AS

Any surgical status

- TTE, TEE, Cardiac MR/CT, Chest MRA/CTA are indicated for any of the following:
 - Initial evaluation of change in clinical status and/or new concerning signs or symptoms
 - Preoperative
 - Williams syndrome
 - Individuals with Williams syndrome can be screened/evaluated for arch abnormalities and pulmonary artery abnormalities and coronary artery abnormalities with the same intervals as TTE referenced below.
 - Stress imaging can be done at initial evaluation and for cardiac symptoms, change in clinical status and/or new concerning signs or symptoms

Unrepaired

- Infant
 - TTE every 3 months
- Child
 - TTE every 1 year
 - TTE every 6 months if moderate AS

Post-operative (TTE)

- Within 30 days
- Every 2 years in mild to moderate AS
- Every 6 months if \geq moderate AS

Aortic Coarctation and IAA (interrupted aortic arch) (PEDCD- 2.4.11)

CDP.CHD.2411.A

v1.0.2024

All individuals

- TTE, MRA/CTA Chest are indicated for any of the following:
 - Initial evaluation of change in clinical status and/or new concerning signs or symptoms
 - Prior to planned surgery/intervention
- Cardiac MR/CT is indicated for any of the following:
 - Initial evaluation of change in clinical status and/or new concerning signs or symptoms
 - Prior to planned surgery/intervention if any issues remain not answered on echo

Unrepaired Aortic Coarctation

- Newborn, TTE weekly if assessing for ductal closure
- Infant with mild coarctation in absence of PDA
 - Echo every 3 months
- Child with mild coarctation
 - Echo every 1 year
 - MRA Chest, CTA Chest every 3 years

Post procedure: surgical or catheter based

- TTE
 - Within 30 days of procedure
 - Every 3 months if mild or no sequelae in first year
 - Every 6 months if mild or no sequelae in the second year
 - Every 1 year after the second year
 - Every 3 months at any time if CHF symptoms or \geq moderate sequelae
 - MRA/CTA Chest every 3 years (include Cardiac MR/CT if issues not clarified on echo)

Coronary Anomalies (PEDCD-2.4.12)

CDP.CHD.2412.A

v1.0.2024

- CCTA or cardiac MRI is indicated for evaluating coronary artery anomalies and other complex congenital heart disease of cardiac chambers or great vessels
 - CPT® 75574 for evaluating coronary artery anomalies
 - CPT® 75573 for congenital heart disease
 - CTA Chest (CPT® 71275) can be added to evaluate great vessels
- Congenital anomalies of the coronary arteries are an important cause of sudden death in pediatric individuals. Coronary arteries may arise from the wrong coronary artery cusp leading to ischemic changes during exercise. These lesions may be found incidentally during a murmur evaluation. Anomalous coronary arteries may be seen on echocardiogram during an evaluation for chest pain or syncope or palpitations. In addition, individuals with no echocardiographic findings but symptoms concerning for angina chest pain may require stress testing.
 - Individuals who have positive echocardiographic findings, regardless of symptoms, and individuals who have classical typical angina chest pain regardless of echocardiographic findings, may require treadmill stress testing, stress imaging, of advanced imaging such as Cardiac MRI, Stress echocardiogram, PET, Cardiac CT, and/or cardiac catheterization.
- Congenital coronary anomalies include abnormal origin of a coronary artery from the PA, anomalous aortic origin of a coronary artery from a different aortic sinus of Valsalva (left coronary artery from the right sinus of Valsalva or right coronary artery from the left sinus of Valsalva), coronary arteriovenous fistula, and coronary artery ostial atresia, all in the setting of normal conotruncal anatomy.
 - Any surgical status
 - Prior to planned surgery, or change in clinical status and/or new concerning signs or symptoms
 - TTE
 - CMR or CCT
 - Can initially include MRA/CTA Chest.
 - If the origin of the coronaries arteries is below the sinus of Valsalva then a chest study is not needed on subsequent imaging.
 - If the origin of the coronary artery is not at the level of the sinus of Valsalva, a MRA/CTA Chest can be included when MR/CT imaging is required
 - Stress imaging- to assess the need for surgery
 - Unrepaired
 - Routine surveillance every 2 years in an asymptomatic individual with anomalous right coronary artery from the left aortic sinus
 - TTE
 - Stress imaging

- Although typically repaired, in the event that a repair is not completed, anomalous left coronary artery from the right coronary sinus can have imaging
 - TTE annually
 - Stress imaging annually
- Routine surveillance in an asymptomatic individual with small coronary fistula
 - TTE- every 2 years
- Routine surveillance in an asymptomatic individual with moderate or large coronary fistula
 - TTE annually
- Post-procedural: surgical or catheter
 - TTE
 - Within 30 days of procedure
 - Monthly the first year following repair
 - Every 3 months after first year of surgery
 - Annually after the second year of surgery
 - Every 3 months if ventricular dysfunction
 - Stress testing
 - EKG stress testing without imaging may be indicated in the first post year, and every 1-2 years depending on level of activity.
 - Stress testing with imaging
 - First postoperative year
 - If EKG stress test positive or equivocal
- Change in clinical status and/or new concerning signs or symptoms
- Individuals with congenital heart disease such as TOF, Truncus Arteriosus, and TGA have increased incidence of coronary artery anomalies
- Individuals with Williams syndrome can have coronary artery stenosis
- Individuals with confirmed coronary artery anomalies may require repeat imaging based on the clinical scenario
- CCTA to rule out anomalous coronary artery should be limited to one of the following:
 - Individuals who need to have an anomalous coronary artery mapped prior to an invasive procedure.
 - Individuals who have not had a previous imaging study that clearly demonstrates an anomalous coronary artery
 - Individuals with a history that includes one or more of the indications in **Indications for CCTA (CPT® 75574) (PEDCD-10.3)**

Tetralogy of Fallot (TOF) (PEDCD-2.4.13)

CDP.CHD.2413.A
v1.0.2024

Any surgical status

- TTE, CMR/CT-CMRA/CTA
 - Initial evaluation of change in clinical status and/or new concerning signs or symptoms
 - Evaluation prior to planned pulmonary valve replacement, cardiac intervention, or surgery

Unrepaired

- Newborn-TTE no limits
- Infant
 - 1 per month

Post procedure palliation

- 1 per month following palliative procedure prior to complete repair, valvuloplasty, PDA and/or RVOT stenting, or shunt placement before complete repair

Post-operative TOF (initial repair)

- TTE
 - Within 30 days of repair
 - Child-12 months
 - Adolescence every 24 months
 - Every 6 months in an individual with valvular dysfunction other than pulmonary valve, RVOT obstruction, branch pulmonary artery stenosis, arrhythmias, or presence of an RV-to-PA conduit
 - TTE every 3 months if CHF
- Cardiac MR/CT, MRA/CTA Chest every
 - Routine surveillance (36 months) in an individual with PR and preserved ventricular function
 - 12 months if moderate (≥ 150 mL/m²) or progressive (increase of >25 mL/m²) RV dilatation or dysfunction (RVEF $\leq 48\%$ or $\geq 6\%$ decrease in EF) or nearing imaging criteria for PVR.

Post-surgical or catheter based pulmonary valve replacement

- TTE
 - Within 30 days follow-up
 - 1 and 6 months after replacement
 - One year post procedure
 - Annually after replacement
 - Every 6 months if RV-to-PA conduit dysfunction, valvular or ventricular dysfunction, branch pulmonary artery stenosis, or arrhythmias
 - Every 3 months if CHF symptoms
- CMR/CT-CMRA/CTA every 2 years

Double Outlet Right Ventricle (DORV) (PEDCD-2.4.14)

CDP.CHD.2414.A

v1.0.2024

Any surgical status

- TTE, CMR/CT-CMRA/CTA are indicated for any of the following:
 - Initial evaluation of change in clinical status and/or new concerning signs or symptoms
 - Evaluation prior to repair

Unrepaired

- TTE
 - Newborn no limit
 - Monthly infant with balanced systemic and pulmonary circulation
 - Every 3 months child with balanced circulation

Postoperative

- TTE
 - Within 30 days
 - First year post-op every 6 months
 - After one year, TTE every 1 year
 - TTE 3 months in an individual with valvular or ventricular dysfunction, right or left ventricular outflow tract obstruction, branch pulmonary artery stenosis, arrhythmias, or presence of an RV-to-PA conduit, heart failure.
- Cardiac MR/CT, MRA/CTA Chest
 - 3 years for asymptomatic individual

D-Loop Transposition of the Great Arteries (D-Loop TGA) (PEDCD-2.4.15)

CDP.CHD.2415.A

v1.0.2024

Any surgical status

- **TTE, CMR/CT-CMRA/CTA, stress imaging** are indicated for any of the following:
 - Initial evaluation of change in clinical status and/or new concerning signs or symptoms
 - Any time after procedure involving coronary arteries
- **CMR/CT-CMRA/CTA** every 5 years.

Unrepaired (TTE)

- No Limits

Post arterial switch

- TTE
 - Within 30 days of repair
 - Infant: every one month
 - Child: every 3 months
 - Child with \geq moderate sequelae: TTE every three 3 months (moderate valvular or ventricular dysfunction, right or left ventricular outflow tract obstruction, branch pulmonary artery stenosis, or arrhythmias)
- Routine CMR/CT
 - Every 3 years
 - Every year if neo AI
- MRA/CTA Chest
 - Every 3 years
 - Every year if neo AI or aortic dilation
- Stress imaging
 - 1 routine test after arterial switch at any time

Post Rastelli

- TTE
 - Within 30 days
 - Every three months following procedure for one year
 - Child Every 6 months following the first year after repair if no or mild sequelae
 - Adolescent annually
 - Every three months if moderate valvular dysfunction, LVOT obstruction, presence of an RV-to-PA conduit, branch, pulmonary artery stenosis, or arrhythmias, or heart failure
- CMR/CT-CMRA/CTA every 3 years

Post atrial switch

- TTE Every 1 year if mild to no symptoms
 - Every 3 months TTE, and CMR MRA CCT CTA if ≥moderate systemic AV, valve regurgitation, systemic RV dysfunction, LVOT obstruction, or arrhythmias, or CHF.
 - Routine **CMR/CT-CMRA/CTA** every 3 years

Congenitally Corrected Transposition of the Great Arteries (ccTGA, LTGA) (PEDCD-2.4.16)

CDP.CHD.2416.A

v1.0.2024

Any surgical status

- TTE, TEE, **CMR/CT-CMRA/CTA** are indicated for any of the following:
 - Change clinical status and/or new concerning signs or symptoms
 - Preoperative evaluation (typically within one month)
- CMR/CT-CMRA/CTA every 3 years

Unrepaired

- TTE
 - Newborn-Weekly
 - Infant
 - Every 3 months if no cardiac symptoms and only mild findings
 - Every 1 month if cardiac symptoms and moderate findings
 - Child
 - <2 years every 3 months
 - >2 years every 1 year
 - Every 6 months if ≥moderate AV regurg
 - Every 3 months if CHF symptoms
- CMR/CT-CMRA/CTA
 - Every 3 years

Postoperative: Anatomic Repair

- TTE
 - Post-operative evaluation (within 30 days)
 - Every 3 months within a year following repair in an asymptomatic individual with no or mild sequelae
 - Every 1 year after the first year following repair in an asymptomatic individual with no or mild sequelae
 - Every 6 months if valvular or ventricular dysfunction, right or left ventricular outflow tract obstruction, or presence of a RV-to-PA conduit
 - Every 3 months if CHF symptoms
- CMR/CT-CMRA/CTA
 - Every 3 years

Postoperative: Physiological Repair with VSD Closure and/or LV-to-PA Conduit

- TTE
 - Postoperative evaluation (within 30 days)
 - Every 3 months within a year following repair in an asymptomatic individual with no or mild sequelae
 - Annually in an asymptomatic individual with no or mild sequelae
 - Every 3 months if in an individual with \geq moderate systemic AV valve regurgitation, systemic RV dysfunction, and/or LV-to-PA conduit dysfunction, or with CHF symptoms
- CMR/CT-CMRA/CTA every 3 months in an individual with \geq moderate systemic AV valve regurgitation, systemic RV dysfunction, and/or LV-to-PA conduit dysfunction, or with CHF symptoms

Truncus Arteriosus (PEDCD-2.4.17)

CDP.CHD.2417.A

v1.0.2024

Any surgical status

- TTE, CMR/CT-CMRA/CTA are indicated for any of the following:
 - Initial evaluation of change in clinical status and/or new concerning signs or symptoms
 - Prior to planned intervention or surgery

Postoperative

- TTE
 - Within 30 days
 - Monthly in first year after surgery
 - After first year every 6 months
 - Every 3 months if
 - ≥moderate truncal stenosis or regurgitation
 - Residual VSD or RV to PA conduit or Branch PA obstruction
 - Symptoms of CHF
- CMR/CT-CMRA/CTA
 - Annually if ≥moderate Truncal stenosis or regurgitation

Single Ventricle (SV) (PEDCD-2.4.18)

CDP.CHD.2418.A

v1.0.2024

SV references individuals not amenable to biventricular repair, including but not limited to hypoplastic left heart syndrome, tricuspid atresia, Double inlet left ventricle, mitral atresia, unbalanced AVSD, and forms of PA/IVS

Any surgical status

- Any/All: **TTE, TEE, CMR/CT-CMRA/CTA, and cardiac catheterization (CPT® 93593, 93594, 93595, or 93597)** are indicated for any of the following:
 - Change clinical status and/or new concerning signs or symptoms
 - Preoperative evaluation (typically within one month)

Unrepaired SV

- TTE allowed one study per week

Stage 1 palliation (TTE)

- Often called Norwood or Sano, or hybrid cath procedure
- Routine weekly TTE

Stage 2 palliation (TTE)

- Often referred to as Glenn procedure
- Within 30 days after surgical or cath intervention
- 1 per month in infant or child

Stage III, also called Fontan

- TTE within 30 days
- TTE every three months within first post-op year
- Every 6 months after first year
- Every 3 years allow **CMR/CCT-MRA/CTA**
- TTE every 3 months until the finding is stable or there is a need for intervention if there is valvular dysfunction, arrhythmias, heart failure

Surveillance

Cardiac catheterization is indicated for all Single Ventricles once every 10 years

Eisenmenger and PHT (with CHD)- (PEDCD-2.4.19)

CDP.CHD.2419.A

v1.0.2024

PHT without CHD is covered in section **Pediatric Pulmonary Hypertension (PEDCD-7)**

These are in addition to studies supported by lesion

Any surgical status

- TTE, CMR/CT-CMRA/CTA are indicated for any of the following:
 - Change clinical status and/or new concerning signs or symptoms
 - Preoperative evaluation (typically within one month)

Initial evaluation (TTE)

- Change in clinical status and/or new concerning signs or symptoms
- Before and after PHT therapy

Eisenmenger Syndrome (ES) individual

- TTE every 6 months

PHT associate with CHD

- Unrepaired individuals with evidence of elevated pulmonary vascular resistance can have echocardiograms based on the frequency requested by the provider
- TTE and Cardiac CMR/CCT for changes in change in pulmonary arterial hypertension-targeted therapy in an individual with postoperative PH
- TTE every 3 months in postoperative stable child with PHT

Condition Specific Imaging

Guideline

Multisystem Inflammatory Syndrome in Children (MIS-C) (PEDCD-12)
Heart Murmur (PEDCD-3.1)
Chest Pain General (PEDCD-4.1)
Syncope (PEDCD-5.1)
Pediatric Pulmonary Hypertension General (PEDCD-7.1)
Evaluation of Pericardial Effusion or Diagnosis of Pericardial Tamponade (PEDCD-9.5)
Kawasaki Disease (PEDCD-6)

Multisystem Inflammatory Syndrome in Children (MIS-C) (PEDCD-12)

CDP.CS.0012.A

v1.0.2024

MIS-C General Information (PEDCD-12.1)

SARS-CoV-2 (COVID 19) is usually mild in children. Some children develop a severe inflammatory disease that can present in a similar way to Kawasaki disease or toxic shock syndrome. This syndrome has been defined by the US Centers for Disease Control and Prevention as multisystem inflammatory syndrome in children (MIS-C).

These guidelines are intended for use in the outpatient management of cardiac findings of MIS-C. Additional information can be found in [PEDHD-12.7](#) for the outpatient management of head imaging.

MIS-C Indications for Cardiac Imaging (PEDCD-12.2)

MIS-C Initial Cardiac Imaging (PEDCD-12.2.1)

- When there is concern for MIS-C, as in atypical or incomplete Kawasaki (see [Kawasaki Disease - Acute Phase \(PEDCD-6.2\)](#)) echo (TTE) can be approved
- A cardiac MRI can be approved at the time of diagnosis when there are issues that can affect treatment management not answered by other testing
- Cardiac CCTA can be done if there is incomplete visualization of the coronary arteries
- Repeat echocardiograms may be required and approved if either:
 - Treatment decisions will be affected by results (e.g., treating with IVIg)
 - There are new signs or symptoms

MIS-C Repeat Cardiac Imaging (PEDCD-12.2.2)

The following imaging guidelines reference outpatient management of individuals who have been discharged from the hospital after stability for MIS-C has been established.

- An echo (TTE) can be approved at the time of presentation and followed by serial echos (TTE) until stabilization has been achieved for any of the following:
 - New cardiac signs, symptoms, or findings
 - Evidence of recurrence of MIS-C
 - Changes in medication
- Serial echos can be approved based on the ordering cardiologist's discretion or the treating medical provider in consultation with a cardiologist when there is documented cardiac dysfunction.

- Individuals who are discharged from the hospital after MIS-C and have stable findings can have an echo (TTE):
 - Within 1 week of discharge
 - 4 weeks post-discharge
 - At 6 months post-discharge
 - One year post-discharge
- Cardiac CCTA can be done if there is incomplete visualization of the coronary arteries
- A routine cardiac MRI can be done once after 3 months in an individual with evidence of cardiac involvement (e.g., symptoms, EKG, labs, or echocardiogram)
- Individuals with changes, or unanswered questions, on echo (TTE) may have a Cardiac MRI based on **Cardiac MRI and MRA Chest – Indications (excluding Stress MRI) (CD-5.2)** in the cardiac imaging guidelines

Individuals with dilated coronary arteries can have imaging based on the AHA Kawasaki guidelines.

AHA risk level	Largest Aneurysm At Any Point	Largest Current Aneurysm	Routine Echo	Routine Stress Imaging	Routine Coronary Imaging
All			All risk levels 4-6 weeks after acute illness		
1	Normal	Normal	One echo 2-12 months after acute illness	none	none
2	Dilation	Dilation	6 months One year If dilation remains echo every 2-5 years until resolves	None	None
		Normal	After acute illness: 2-12 months One echocardiogram at one year No echocardiogram after one year		
3.1	Small	Small	6 months 12 months Then yearly	2-3 years	3-5 years

AHA risk level	Largest Aneurysm At Any Point	Largest Current Aneurysm	Routine Echo	Routine Stress Imaging	Routine Coronary Imaging
3.2	Small	Normal or dilated	6 months 12 months Then yearly	3-5 years	none
4.1	Medium	Medium	3 months 6 months 12 months Every 6-12 months after that	1-3 years	2-5 years
4.2	Medium	Small	6 months and 12 months, every 1 year	2-3 years	3-5 years
4.3	Medium	Normal Or Dilated	Every 1-2 years	2-4 years	none
5.1	Large	Large	1 month 3 months 6 months 9 months 12 months Then every 3-6 months	6-12 months	at 2-6 months, every 1-5 years
5.2	Large	Medium	Every 6-12 months	yearly	2-5 years
5.3	Large	Small	6-12 month	1-2 years	2-5 years
5.4	Large	Normal Or Dilation	1-2 years	2-5 years	none

Symptomatic individuals

- Echocardiogram can be performed at any time with new or progressing cardiac symptoms
- Stress imaging when there are new or progressing symptoms of ischemia or ventricular dysfunction
- Invasive or coronary imaging coronary angiography (CT, MRI, invasive) when the above studies are positive, inconclusive, or otherwise lead to a conclusion that intervention is needed

Heart Murmur (PEDCD-3.1)

CDP.CS.003.1.A

v1.0.2024

When evaluating an individual with a murmur for the first time, it will not be known whether the individual has congenital heart disease or not.

Initial pediatric TTE combinations

Cardiologist only submits charges for the procedure actually performed
CPT® 93303, CPT® 93306, CPT® 93320, and CPT® 93325
CPT® 93303, CPT® 93320, and CPT® 93325
CPT® 93303, CPT® 93306
CPT® 93306 (CPT® 93320 and CPT® 93325 are included with CPT® 93306 and should not be approved separately)

- Any one of the above echocardiography code combinations is indicated for evaluation of either:
 - Any pathologic murmur
 - Any innocent murmur with associated cardiac signs or symptoms
- Repeat echocardiography is not indicated if the initial echocardiogram was normal and the murmur has not changed in quality.

Background and supporting information

- Heart murmurs are extremely common in pediatric individuals. The thinner chest wall in children allows clearer auscultation of blood flowing through the chambers of the heart, which may result in a murmur on physical exam.
- The majority of murmurs are innocent and do not require further evaluation. More than 30% of children may have an innocent murmur detected during physical examination. Innocent murmurs are typically systolic ejection murmurs with a vibratory or musical quality, and generally change in quality when the individual changes position.
- Other types of murmurs can be pathologic and require additional evaluation, usually by a pediatric cardiologist. Echocardiography is indicated, and is performed as part of the office visit.

Chest Pain General (PEDCD-4.1)

CDP.CS.0004.1.A

v1.0.2024

Initial pediatric TTE combinations

Cardiologist only submits charges for the procedure actually performed
CPT® 93303, CPT® 93306, CPT® 93320, and CPT® 93325
CPT® 93303, CPT® 93320, and CPT® 93325
CPT® 93303, CPT® 93306
CPT® 93306 (CPT® 93320 and CPT® 93325 are included with CPT® 93306 and should not be approved separately)

- Any one of the TTE combinations above is indicated for pediatric individuals with chest pain and one or more of the following:
 - Exertional chest pain
 - Non-exertional chest pain with abnormal EKG
 - Chest pain with signs or symptoms of pericarditis
 - First-degree relative with sudden unexplained death or cardiomyopathy
 - Recent onset of fever
 - Recent illicit drug use
 - Other signs or symptoms of cardiovascular disease
- Repeat echocardiography is not indicated if the initial echocardiogram is normal unless one of the following conditions is present:
 - Increased severity or change in quality of the chest pain
 - New signs or symptoms of cardiovascular disease other than pain
 - New abnormality on EKG
- Cardiac MR or cardiac CT is indicated for chest pain if prior evaluation suggests:
 - Any coronary artery abnormalities
 - Cardiomyopathy
 - Myocarditis
- Chest MRA or CTA if pulmonary embolism or aortic dissection is suspected
- Stress imaging is indicated if other imaging suggests coronary artery abnormality, or ETT suggests ischemia. EKG is uninterpretable. Any indication in section **Stress Testing with Imaging – Indications (CD 1.4)** in the Cardiac Imaging Guidelines. This can include Stress SPECT, echo or MR

Background and supporting information

Chest pain in pediatric individuals is caused by a cardiac etiology in <5% of cases, yet causes great anxiety for parents resulting in requests for testing.

Individuals with CP may undergo an exercise stress test without imaging.

Echocardiography is performed as part of the office visit. When evaluating an individual for the first time, it will not be known whether the individual has congenital heart disease or not. The cardiologist only submits charges for the procedure actually performed.

Syncope (PEDCD-5.1)

CDP.CS.0005.1.A

v1.0.2024

Initial pediatric TTE combinations

Cardiologist only submits charges for the procedure actually performed
CPT® 93303, CPT® 93306, CPT® 93320, and CPT® 93325
CPT® 93303, CPT® 93320, and CPT® 93325
CPT® 93303, CPT® 93306
CPT® 93306 (CPT® 93320 and CPT® 93325 are included with CPT® 93306 and should not be approved separately)

- Echocardiography is not indicated for most individuals with isolated syncope.
- Echocardiography is indicated for pediatric individuals with syncope and one or more of the following:
 - Exertional syncope
 - Unexplained post-exertional syncope
 - Abnormal EKG
 - Absence of prodromal symptoms
 - Presence of preceding palpitations within seconds of loss of consciousness
 - Lack of a prolonged upright posture
 - Syncope in response to auditory or emotional
 - First-degree relative with any of the following before age 50:
 - Sudden cardiac arrest or death
 - Pacemaker or implantable defibrillator placement
 - First-degree relative with cardiomyopathy
 - Known congenital heart disease
 - History of Kawasaki disease, or other coronary pathology.
 - Pathologic murmur, irregular rhythm, gallop, or click on physical examination
- Repeat echocardiography is not indicated if the initial echocardiogram is normal unless one of the following conditions is present:
 - Increased severity or change in quality of the syncope
 - New signs or symptoms of cardiovascular disease other than syncope
 - Family of history of sudden death, cardiomyopathy
 - New abnormality on EKG
- Cardiac MR or Cardiac CT is indicated for chest pain if prior evaluation suggests any coronary artery abnormalities, cardiomyopathy, myocarditis
- MRA or CTA Chest if pulmonary embolism or aortic dissection is suspected

- Stress imaging (SPECT, echo or MR) is indicated (any);
 - If other imaging suggests coronary artery abnormality
 - ETT suggests ischemia
 - EKG is uninterpretable
 - Any indication in section **Stress Testing with Imaging – Indications (CD 1.4)** in the Cardiac Imaging Guidelines

Background and supporting information

Syncope in pediatric individuals is common, with up to 15% of individuals experiencing at least one episode by age 21. Syncope is caused by neurocardiogenic syndrome (vasovagal syncope) in 75% to 80% of cases, which is a benign and self-limiting condition. Despite this, syncope causes great anxiety for parents resulting in requests for testing.

Individuals with CP may undergo an exercise stress test without imaging.

Pediatric Pulmonary Hypertension General (PEDCD-7.1)

CDP.CS.0007.1.A

v1.0.2024

- Pulmonary hypertension in children can be caused by cardiac, pulmonary, or systemic diseases, and idiopathic disease occurs as well.
- Chest x-ray, EKG, and echocardiography (CPT® 93306, or CPT® 93303, with CPT® 93320, and CPT® 93325, see: **Transthoracic Echocardiography (TTE) Coding (PEDCD-8.1)** for echocardiography coding considerations) for initial evaluation if pulmonary hypertension is suspected.
- Repeat echocardiography intervals are variable depending on age of individual, etiology, and severity.
 - After a comprehensive initial evaluation, echocardiograms using PH-specific protocols may be performed every 4 to 6 months.
 - Echocardiography is indicated at any time for new or worsening symptoms or to evaluate a recent change in therapy.
 - Right heart and /or left heart catheterization may be utilized for PAH individuals, including before and after initiation of PAH-targeted therapy, and for individuals with concomitant congenital heart disease
- CT Chest (CPT® 71250) may be indicated in addition to CTA Chest (CPT® 71275) or MRA Chest (CPT® 71555) for initial evaluation of all pediatric individuals with pulmonary hypertension to evaluate for pulmonary vascular or interstitial disease, or other intrathoracic causes.
- Cardiac MRI without and with contrast (CPT® 75561) is indicated for evaluation of inconclusive echocardiogram findings, or for monitoring right ventricular function during follow-up.
- Stress echocardiograms may be indicated (as in the general cardiac imaging guidelines) see **Stress Echocardiography – Indications other than ruling out CAD (CD-2.7)** in the Cardiac Imaging Guidelines.

Evaluation of Pericardial Effusion or Diagnosis of Pericardial Tamponade (PEDCD-9.5)

CDP.CS.0009.5.A

v1.0.2024

- Echocardiogram is the initial imaging study of choice to evaluate pericardial effusions or diagnose pericardial tamponade.
- If a specific clinical question is left unanswered by another recent imaging study **and** the answer to the clinical question will affect the management of the individual's clinical condition, contrast-enhanced cardiac MRI is useful for evaluating:
 - Pericarditis
 - Neoplastic effusion
 - Tamponade
 - Myocardial infiltration
- Cancers that can metastasize to the pericardium or myocardium and can cause a malignant effusion include lung, breast, renal cell, lymphoma and melanoma.

Kawasaki Disease (PEDCD-6)

CDP.CS.0006.A

v1.0.2024

Guideline

Kawasaki Disease Initial Imaging (PEDCD-6.1)

Kawasaki Disease - Acute Phase (PEDCD-6.2)

Kawasaki Disease - Chronic Phase (PEDCD-6.3)

Kawasaki Disease Initial Imaging (PEDCD-6.1)

- Echocardiography (CPT® 93306) is indicated for initial assessment for suspected or known Kawasaki disease
 - Coronary CTA (CPT® 75574), Cardiac MRI without contrast (CPT® 75557), Cardiac MRI without and with contrast (CPT® 75561), or MRA Chest (CPT® 71555) are indicated for evaluation of inconclusive echocardiogram findings, or significant coronary artery abnormalities.
 - Screening of other body areas for aneurysms is not routinely indicated in Kawasaki disease, but MRA or CTA (contrast as requested) of the affected body area can be approved for evaluation of signs or symptoms suggesting aneurysm development.
 - See acute and chronic phase for imaging

Background and supporting information

- Kawasaki disease (KD) is the leading cause of acquired pediatric cardiac disease in the developed world. It is an acute febrile illness characterized by a medium vessel vasculitis, which predominantly affects the coronary arteries.
 - Individuals who do not fulfill the diagnostic criteria for classic KD may be considered to have incomplete (atypical) KD.
 - If Kawasaki disease is strongly suspected, treatment will often begin even before cardiac evaluation, since early treatment is associated with a lower risk for coronary aneurysm development.

Kawasaki Disease - Acute Phase (PEDCD-6.2)

- Echocardiography should be performed when the diagnosis of KD is considered
 - Uncomplicated individuals, echocardiography can be repeated after treatment **both:**
 - Within 1 to 2 weeks
 - Within 4 to 6 weeks
 - For individuals with important and evolving coronary artery abnormalities (Z score >2.5) detected during the acute illness, more frequent echocardiography

- (at least twice per week) should be performed until luminal dimensions have stopped progressing to determine the risk for and presence of thrombosis.
- Expanding large or giant aneurysms:
 - Twice per week while dimensions are expanding rapidly
 - Once weekly after dimension is stabilized for the first 45 days of illness
 - Then monthly until the third month after illness onset
 - It is reasonable to obtain advanced imaging studies such as computed tomographic angiography (CTA), cardiac magnetic resonance imaging (CMRI), or invasive angiography on individuals' severe proximal coronary artery abnormalities in the acute phase when results will impact management decisions.
 - Transesophageal echocardiography, invasive angiography, CMRI, and CTA can be of value in the assessment of selected individuals but are not routinely indicated for diagnosis and management of the acute illness.
 - Invasive angiography is rarely performed during the acute illness.
 - Transesophageal echocardiography, CTA, and CMRI can be useful for the evaluation of older children and adolescents when both:
 - Visualization of the coronary arteries with Transthoracic echocardiography (TTE) is inadequate and
 - Results will impact immediate management decisions.
 - Evaluation of potential aneurysmal involvement in other arterial beds can be assessed with CMRI, CTA, and, rarely, invasive angiography after recovery from the acute illness for individuals with severe coronary artery involvement or symptoms or signs, such as the presence of a pulsatile axillary mass.
 - Atypical or incomplete Kawasaki. Echo is indicated when atypical KD is being considered, may require repeat echocardiograms if treatment decisions will be affected by results (e.g., treating with IVIg), if new signs or symptoms (such as typical peeling) develop.

Background and supporting information

- The acute phase of Kawasaki disease (KD) can last up to 4-6 weeks from the onset of fever until acute systemic inflammation has resolved and coronary artery dimensions are no longer expanding
- Based on AHA recommendations, the following classifications are used in risk stratification of coronary artery abnormalities¹
 - Z-Score classification accounts for the effects of body size and age through use of baseline coronary dimensions adjusted for body surface area. The Z score value represents the number of standard deviation above the mean. (e.g., z=0 pt. has coronary artery dimension value equal to mean, z=2 person has value 2 standard deviation above the mean, based on age, gender, BSA).
 - Coronary Artery Abnormalities Risk Classification based on Z-Score:

¹ Mccrindle BW, Rowley AH, Newburger JW, et al. Diagnosis, Treatment, and Long-Term Management of Kawasaki Disease: A Scientific Statement for Health Professionals from the American Heart Association. *Circulation*. 2017;135(17). doi:10.1161/cir.0000000000000484.

- 1 - No involvement at any time point (Z score always <2)
- 2 - Dilation only (Z score 2 to <2.5)
- 3 - Small aneurysm (Z score ≥ 2.5 to <5)
 - 3.1 - Current or persistent
 - 3.2 - Decreased to dilation only or normal luminal dimension
- 4 - Medium aneurysm (Z score ≥ 5 to <10, and absolute dimension <8 mm)
 - 4.1 - Current or persistent
 - 4.2 - Decreased to small aneurysm
 - 4.3 - Decreased to dilation only or normal luminal dimension
- 5 - Large and giant aneurysm (Z score ≥ 10 , or absolute dimension ≥ 8 mm)
 - 5.1 - Current or persistent
 - 5.2 - Decreased to medium aneurysm
 - 5.3 - Decreased to small aneurysm
 - 5.4 - Decreased to dilation only or normal luminal dimension
- Additional clinical features that may increase the long-term risk of myocardial ischemia
 - Greater length and distal location of aneurysms that increase the risk of flow stasis
 - Greater total number of aneurysms
 - Greater number of branches affected
 - Presence of luminal irregularities
 - Abnormal characterization of the vessel walls (calcification, luminal myofibroblastic proliferation)
 - Presence of functional abnormalities (impaired vasodilation, impaired flow reserve)
 - Absence or poor quality of collateral vessels
 - Previous revascularization performed
 - Previous coronary artery thrombosis
 - Previous myocardial infarction
 - Presence of ventricular dysfunction

Kawasaki Disease - Chronic Phase (PEDCD-6.3)

- Long-term management begins at the end of the acute illness, usually at 4 to 6 weeks after fever onset. Management is based on two pieces of data:
 - The dimensions of the largest aneurysm at any point during the disease
 - The dimensions of the largest current aneurysm
- Additional risk factors that may be considered for imaging
 - Greater length and distal location of aneurysms that increase the risk of flow stasis
 - Greater total number of aneurysms
 - Greater number of branches affected

- Presence of luminal irregularities
- Abnormal characterization of the vessel wall (calcification, luminal myofibroblastic proliferation)
- Presence of functional abnormalities (impaired vasodilation, impaired flow reserve)
- Absence or poor quality of collateral vessels
- Previous revascularization performed
- Previous coronary artery thrombosis
- Previous myocardial infarction
- Presence of ventricular dysfunction
- Long term routine surveillance in asymptomatic imaging for Kawasaki disease- see chart

Long term routine surveillance in asymptomatic imaging for Kawasaki disease

AHA risk level	Largest Aneurysm At Any Point	Largest Current Aneurysm	Routine Echo	Routine Stress Imaging	Routine Coronary Imaging
All			All risk levels 4-6 weeks after acute illness		
1	Normal	Normal	One echo 2-12 months after acute illness	none	none
2	Dilation	Dilation	6 months One year If dilation remains echo every 2-5 years until resolves	None	None

AHA risk level	Largest Aneurysm At Any Point	Largest Current Aneurysm	Routine Echo	Routine Stress Imaging	Routine Coronary Imaging
		Normal	After acute illness: 2-12 months One echocardiogram at one year No echocardiogram after one year		
3.1	Small	Small	6 months 12 months then yearly	2-3 years	3-5 years
3.2	Small	Normal or dilated	6 months 12 months Then yearly	3-5 years	none
4.1	Medium	Medium	3 months 6 months 12 months Every 6-12 months after that	1-3 years	2-5 years
4.2	Medium	Small	6 months and 12 months, every 1 year	2-3 years	3-5 years
4.3	Medium	Normal Or Dilated	Every 1-2 years	2-4 years	none

AHA risk level	Largest Aneurysm At Any Point	Largest Current Aneurysm	Routine Echo	Routine Stress Imaging	Routine Coronary Imaging
5.1	Large	Large	1 month 3 months 6 months 9 months 12 months Then every 3-6 months	6-12 months	at 2-6 months, every 1-5 years
5.2	Large	Medium	Every 6-12 months	yearly	2-5 years
5.3	Large	Small	6-12 month	1-2 years	2-5 years
5.4	Large	Normal Or Dilation	1-2 years	2-5 years	none

Symptomatic individuals

- Echocardiogram can be performed at any time with new or progressing cardiac symptoms
- Stress imaging when there are new or progressing symptoms of ischemia or ventricular dysfunction
- Invasive or coronary imaging Coronary angiography (CT, MRI, invasive) when the above studies are positive, inconclusive, or otherwise lead to a conclusion that intervention is needed

Echocardiography

Guideline

Transthoracic Echocardiography (TTE) Coding (PEDCD-8.1)

Initial Transthoracic Echocardiography (TTE) Indications (PEDCD-8.2)

Repeat Transthoracic Echocardiography Indications (PEDCD-8.3)

Transesophageal Echocardiography (TEE) (PEDCD-8.4)

Fetal Echo (PEDCD-8.5)

References (PEDCD-8)

Transthoracic Echocardiography (TTE) Coding (PEDCD-8.1)

CDP.000.8.2.A

v1.0.2024

- CPT® codes for echocardiography are listed in **General Guidelines (PEDCD-1)**

Echocardiogram coding notes	CPT ®
<ul style="list-style-type: none"> The most commonly performed study is a complete transthoracic echocardiogram with spectral and color flow Doppler (CPT® 93306). <ul style="list-style-type: none"> CPT® 93306 includes CPT® 93320 and CPT® 93325, so those codes should not be approved along with CPT® 93306. 	93306
<ul style="list-style-type: none"> Doppler codes (CPT® 93320, CPT® 93321, and CPT® 93325) are add-on codes and are assigned in addition to code for the primary procedure, and should not be approved alone. 	+93320 +93321 +93325
<ul style="list-style-type: none"> For a 2D transthoracic echocardiogram without Doppler, report CPT® 93307. 	93307
<ul style="list-style-type: none"> A limited transthoracic echocardiogram is reported with CPT® 93308. <ul style="list-style-type: none"> Limited transthoracic echocardiogram should be billed if the report does not “evaluate or document the attempt to evaluate” all of the required structures. Unlike CPT® 93306, the Doppler CPT® 93321 and CPT® 93325 are not included with CPT® 93308. CPT® 93321 (not CPT® 93320) should be reported with CPT® 93308 if Doppler is included in the study. CPT® 93325 should also be reported with CPT® 93308 if color flow Doppler is included in the study. 	93308
<ul style="list-style-type: none"> For individuals with known congenital heart disease, a limited transthoracic echocardiogram is reported with CPT® 93304, +/- CPT® 93321 and CPT® 93325. 	93304

- Providers performing an **initial** echo on a pediatric individual will not know what procedure codes they will be reporting until the initial study is completed.
 - If congenital heart disease is found on the initial echo, a complete echo is reported with codes CPT® 93303, CPT® 93320, and CPT® 93325 because CPT® 93303 does NOT include Doppler and color flow mapping.
 - If no congenital issue is discovered, then CPT® 93306 is reported alone and includes 2-D, Doppler and color flow mapping.
- Since providers may not know the appropriate code/s that will be reported at the time of the pre-authorization request, they may request multiple codes.

- The following echocardiography code combinations for any **initial** echocardiogram:
 - CPT® 93303, CPT® 93306, CPT® 93320, and CPT® 93325
 - CPT® 93303, CPT® 93306
 - CPT® 93306
 - CPT® 93320 and CPT® 93325 are included with CPT® 93306 and should not be approved separately.
- Post-service audits may be completed to ensure proper claims submission.
- Correct coding for subsequent echocardiograms
 - If an individual is being followed for known congenital heart disease, and an echocardiogram is indicated, the appropriate codes are (CPT® 93303 or 93304) in addition to appropriate doppler codes (CPT® 93320 or 93321) and CPT® 93325
 - If an individual has documented normal anatomy, or acquired heart disease, and an echocardiogram is indicated, non-congenital codes are appropriate CPT® 93306 (includes all Doppler codes) or CPT® 93308 with CPT® 93321 and CPT® 93325
 - For individuals with newborn physiology (e.g., ASD versus PFO, or PDA) the final echocardiogram that documents normal anatomy can be coded as congenital. However, any subsequent echocardiograms after that, which would be completed for a new indication, (e.g., shortness of breath) would be coded as non-congenital

Initial Transthoracic Echocardiography (TTE) Indications (PEDCD-8.2)

CDP.000.8.2.A

v1.0.2024

- In addition to indications listed in previous guideline sections, initial TTE evaluation is indicated for any of the following:
 - Any signs/symptoms that are possibly cardiac in nature, including (but not limited to) central cyanosis, dyspnea, edema, poor peripheral pulses, feeding difficulty, decreased urine output, hepatomegaly, or desaturation on pulse oximetry.
 - Abnormal EKG or cardiac biomarkers
 - Abnormal chest x-ray suggesting cardiovascular disease
 - First-degree relative with any of the following before age 50:
 - Sudden cardiac arrest or death
 - Pacemaker or implantable defibrillator placement
 - First-degree relative with cardiomyopathy
 - Supraventricular Tachycardia (SVT), Ventricular Tachycardia, or Premature Ventricular Contractions (PVCs)
 - Known or suspected valvular dysfunction
 - Persistent systemic hypertension
 - Individuals with new onset hypertension
 - TTE indicated to assess for cardiac target organ damage (LV mass, geometry, and function) at the time of consideration of pharmacologic treatment of systemic hypertension
 - Obesity (BMI >30) with additional cardiovascular risk factors
 - Stroke
 - Renal failure
 - Preoperative evaluation of individuals with chest wall deformities or scoliosis
 - Known or suspected vascular ring
 - Planned administration of cardiotoxic chemotherapy
 - Generally anthracyclines (doxorubicin, daunorubicin, mitoxantrone, idarubicin, epirubicin)
 - Planned radiation therapy involving heart muscle or hematopoietic stem cell transplant
 - Sickle cell disease or other hemoglobinopathy causing chronic anemia
 - Known or suspected vasculitis, acute rheumatic fever, or other systemic autoimmune disease
 - Aortopathy (such as Marfan, Ehlers-Danlos, Loeys-Dietz)
 - Positive personal diagnosis

- First degree relative
- Positive gene
- Finding suggestive of aortopathy such as x-ray showing aortic dilation
- Muscular dystrophy
 - Positive personal diagnosis
 - First degree relative
 - Positive gene
 - Any findings suggestive of MD, such as neurological exam
- Cardiomyopathy
 - Diagnosed by other modality (such as cardiac MR)
 - First degree relative
 - Positive genetic testing
 - Findings suggestive of, such as cardiomegaly on x-ray
- Metabolic, mitochondrial, and storage disorders
 - Positive personal diagnosis
 - First degree relative
 - Positive genetic testing
 - Findings suggestive of on exam or lab findings
- Abnormalities of cardiac or other viscera situs
- Signs, symptoms, or blood culture suggestive of endocarditis
- Known or suspected mass lesion involving the heart or great vessels
- Known or suspected clot in atrium or ventricle
- Known or suspected pulmonary hypertension
- Known or suspected pericardial effusion
- Complications during prenatal development:
 - Known or suspected cardiovascular abnormality on fetal echocardiogram
 - Maternal phenylketonuria (PKU)
 - Maternal diabetes with no fetal echo
 - Maternal teratogen exposure
 - Maternal infection during pregnancy with potential cardiac sequelae
- Genetic abnormality known to be associated with cardiovascular disease such as
 - Down syndrome
 - Turner syndrome
 - 22q11 deletion syndrome
 - Williams syndrome
 - Noonan syndrome
- First-degree relative family history of:
 - Unexplained sudden death before age 50
 - Hypertrophic cardiomyopathy

- Non-ischemic dilated cardiomyopathy
- Genetic abnormality known to be associated with cardiovascular disease
- Congenital left-sided heart lesion
- Heritable pulmonary arterial hypertension

Repeat Transthoracic Echocardiography Indications (PEDCD-8.3)

CDP.EC.0008.3.A

v1.0.2024

- Repeat echocardiograms may be required for individuals with no new symptoms.
- In addition to indications listed in previous guideline sections, repeat TTE evaluation is indicated for any of the following:
 - In an individual with known cardiac disease and a previously normal echocardiogram when there is documentation of any of the following:
 - New or worsening cardiac symptoms
 - New EKG abnormality
 - Newly recognized family history suggestive of heritable heart disease
 - In an individual with prior normal evaluation
 - New or worsening symptoms
 - New EKG finding
 - New murmur
 - New finding of inheritable disease in first-degree relative
 - Individuals with first-degree family history of cardiomyopathy (such as, hypertrophic, dilated, arrhythmogenic) or aortopathy.
 - Repeat echo every 12 months
 - Repeat echo can be done at the additional intervals when the family history or gene mutation is associated with neonatal or fetal disease:
 - At birth
 - Within the first 6 weeks
 - At 3 months
 - At 6 months
 - At one year
 - Then yearly
 - Repeat imaging is **not** indicated in individuals with first degree relative with known mutation when **both** of the following apply:
 - Individual has been tested and does not have that mutation
 - Individual has a normal echocardiogram
 - If there are abnormal findings on screening/surveillance imaging, a repeat echo is allowed to assess stability of findings
 - Individual with a phenotype positive cardiomyopathy (with or without a positive gene) can be imaged as follows:
 - Infants (under one year)

- TTE is indicated at frequency requested by pediatric cardiology or provider in consultation with pediatric cardiology
- Children (over one year) yearly testing is indicated as follows:
 - Repeat TTE every 12 months
 - Repeat TTE to assess stability at discretion of pediatric cardiology, or provider in consultation with pediatric cardiology, after any new or changed clinical finding.
 - TTE at any time with documented new or changing symptoms.
- Individual with a known mutation associated with cardiomyopathy or aortopathy and no previous abnormal imaging
 - Repeat echo every 12 months
 - Individuals whose gene mutation is associated with neonatal or fetal disease or there is a family history of neonatal or fetal disease can have repeat echo at the following intervals:
 - At birth
 - Within the first 6 weeks
 - Then at 3 months
 - At 6 months
 - At one year
 - Then yearly
 - If there are abnormal findings on screening/surveillance imaging, a repeat echo is allowed to assess stability of findings.
- Individuals who are status post heart transplant can have echocardiograms repeated as often as requested by heart transplant team.
- Every 12 months for individuals receiving active therapy for ventricular hypertrophy, valvular dysfunction, cardiomyopathy
 - One time repeat TTE can be approved at 6 months to assess response to a change in therapy
- Every 12 months for individuals with chronic pericardial effusions
- Every 12 months routine surveillance in asymptomatic individuals with muscular dystrophy (may be replaced by cardiac MRI CPT® 75557 or 75561 at 6 years of life)
- Every 12 months for sickle cell disease or other hemoglobinopathy causing chronic anemia and one of the following:
 - High-risk genotype (Hgb SS or Sβ⁰, severe thalassemia, etc.)
 - History of acute chest syndrome or intrinsic lung disease
 - History of stroke
 - Receiving chronic transfusion therapy
- As needed for monitoring cardiotoxicity during chemotherapy administration
- After completion of chemotherapy and/or radiation therapy. See **Cardiotoxicity and Echocardiography (PEDONC-19.2)** for imaging guidelines.

- Aortopathies- see **Thoracic Aortic Disease (PEDPVD-4.1)** in the Pediatric Peripheral Vascular Disease Imaging Guidelines
- TTE follow-up for systemic hypertension
 - Individuals with evidence of end organ damage (Includes LVH, or decreased EF) can have echo every 6 months until echocardiogram normalizes.
 - Individuals without LV target organ injury (no LVH, normal EF) at initial echocardiographic assessment, repeat echocardiography at yearly intervals may be considered in those with persistent hypertension. (stage 2 HTN, or chronic stage 1 HTN incompletely treated (noncompliance or drug resistance))

Transesophageal Echocardiography (TEE) (PEDCD-8.4)

CDP.EC.0008.4.A

v1.0.2024

- Transesophageal echocardiography imaging indications in pediatric individuals are identical to those for adult individuals. See **Transesophageal Echocardiography (TEE) – Indications (CD-2.5)** in the Cardiac Imaging Guidelines.

Fetal Echo (PEDCD-8.5)

CDP.EC.0008.5.A

v1.0.2024

Fetal Echocardiography - coding

- Supported fetal echocardiography (echo) codes include:
 - Initial Fetal Echo, CPT® 76825 and Doppler Echo CPT® 76827 are performed only once per fetus/per facility (i.e. Maternal Fetal Medicine versus Pediatric Cardiology request)
 - Follow-up-Fetal echo and/or Follow-up Doppler echo (CPT® 76826/CPT® 76828)
 - CPT® 93325 for Doppler color flow velocity mapping
- An initial fetal echo is usually not performed prior to 16 weeks.
- Doppler echo procedure codes (CPT® 76827 or CPT® 76828) include the evaluation of veins, arteries, and valves. Guidelines do not support the billing of additional codes (CPT® 76820 and/or CPT® 76821)

Background and Supporting Information

- The minimal use of color Doppler (CPT® 93325) alone, when performed for anatomical structure identification during a standard ultrasound procedure, is not separately reimbursable

Fetal Echocardiography - Indications for Fetal Conditions

Initial Fetal echocardiography (CPT® 76825) and/or Doppler echocardiography (CPT® 76827) with or without Doppler color flow velocity mapping (CPT® 93325) can be performed if ≥16 weeks, for the indications listed below (See **Fetal Echocardiography – Coding (OB-12.1)**):

Fetal Echocardiography - Indications for Fetal Conditions

- Known or suspected abnormal fetal cardiac evaluation on fetal anatomic scan.
 - Known or suspected abnormality must be documented as hard copy or acknowledged verbally by provider of known or suspected fetal cardiac evaluation
 - Suboptimal cardiac evaluation alone is not an indication for fetal echogram. If the 4-chamber view is adequate and there is no other suspicion of a cardiac abnormality, a fetal echocardiogram is not considered medically necessary. A follow up ultrasound (CPT® 76815 or CPT® 76816) is indicated for suboptimal visualization. If the follow-up ultrasound fails to show a 4-chamber view or there is suspicion of a cardiac abnormality, fetal echocardiogram is indicated.
- Fetal cardiac arrhythmia; persistent fetal tachycardia or bradycardia

Fetal Echocardiography - Indications for Fetal Conditions

- Major fetal extra-cardiac anomaly
- Fetal Echo is NOT indicated for an isolated soft marker found on routine imaging including:
 - Choroid plexus cyst, or
 - Echogenic intra-cardiac foci, or
 - Thickened nuchal fold ($\geq 6\text{mm}$ at 15 to 20 weeks), or
 - Absent or hypoplastic nasal bone, or
 - Echogenic bowel, or
 - Shortened long bones, or
 - Pyelectasis
- Congenital heart disease (CHD) in a 1st degree relative of the fetus (i.e. CHD in the mother, father, or sibling of the fetus) or a half-sibling of the fetus
- Known fetal chromosomal abnormalities (fetal aneuploidy) or ultrasound findings of a suspected chromosomal abnormality (excluding soft markers as only ultrasound findings)
 - Early onset FGR (< 32 weeks) may be a sign of fetal aneuploidy^{11,12}
- Single umbilical artery
- Chorioangioma or Umbilical cord varix (if suspicion of fetal hydrops)
- Fetal intra-abdominal venous anomaly (persistent right umbilical vein)
- Fetal effusion (pericardial, pleural effusion, ascites, etc.)
- Fetal hydrops, See **Alloimmunization/Rh Isoimmunization/Other Causes of Fetal Anemia/Parvo/Hydrops (OB-16)**
- Monochorionic twins/TTTS
- Abnormal Fetal Nuchal Translucency scan (NT $\geq 3.0\text{mm}$ or above the 95th percentile for the CRL) during current pregnancy.
- Abnormal ductus venosus waveform⁵
- Fetal echocardiography may be indicated with severe or unexplained polyhydramnios, or if there are also other suspicious findings on an anatomy scan

Fetal Echocardiography - Indications for Maternal Conditions

Initial Fetal echocardiography (CPT® 76825) and/or Doppler echocardiography (CPT® 76827) with or without Doppler color flow velocity mapping (CPT® 93325) can be performed if ≥ 16 weeks, for the indications listed below (See **Fetal Echocardiography – Coding (OB-12.1)**):

Maternal Conditions:

- Maternal pre-gestational DM or early diagnosed GDM (1st or early 2nd trimester)
- Maternal gestational diabetes mellitus, if HbA1C >6% [in the third trimester (≥32 weeks)]
- Maternal connective tissue disease (SLE, RA, Sjogrens) with Anti-Ro/SSA or anti-La/SSB antibodies present
 - Weekly follow-up Fetal echocardiography (CPT® 76826) and/or Doppler fetal echocardiography (CPT® 76828) or CPT® 76815 from the 18th through the 26th week of pregnancy and then every other week until 30 weeks
- Phenylketonuria
- Infections associated with cardiac anomalies (such as parvovirus, Rubella, Coxsackie virus)
- Genetic conditions associated with CHD in a first degree relative of the fetus (e.g. Marfan syndrome, 22q11.2 deletion syndrome (DiGeorge Syndrome) or Noonan syndrome)
- Prior child with CHD born to mother and/or father of the fetus⁵
- Pregnancy conceived by assisted reproductive technology:¹
 - In Vitro Fertilization (IVF)
 - Intracytoplasmic sperm injection (ICSI)¹

Background and supporting information

If diabetes is diagnosed prior to pregnancy or in the first or early second trimester (typically before 20 weeks gestation) with standard diagnostic criteria of: HbA1C ≥6.5%, fasting plasma glucose ≥126 mg/dL, or 2-hour glucose ≥200 mg/dL on a 75-g oral glucose tolerance test, then image as above

For those with GDM on medication, if HbA1c levels are >6%, fetal echocardiogram in the third trimester to assess for ventricular hypertrophy can be performed.

In cases of extreme obesity (BMI≥40-50) where the 4-chamber view is inadequately documented after 2 separate ultrasound visits with MFM, fetal echo can be performed.

With positive SSA/SSB antibodies, the most vulnerable period for the fetus is during the period from 18 to 24 weeks gestation. Normal sinus rhythm can progress to complete block in seven days during this high-risk period. New onset of heart block is less likely during the 26th through the 30th week, and it rarely develops after 30 weeks of pregnancy.

Fetal Echocardiography - Indications for Medication or Drug Exposure

Initial Fetal echocardiography (CPT® 76825) and/or Doppler echocardiography (CPT® 76827) with or without Doppler color flow velocity mapping (CPT® 93325) can be performed if ≥16 weeks, for the indications listed below (See **Fetal Echocardiography – Coding (OB-12.1)**):

- Ace inhibitors
- Alcohol (excessive quantities)
- Anti-seizure medication, e.g. carbamazepine, hydantoin, valproate
- Folate antagonists (methotrexate)
- Lithium
- NSAIDS (Ibuprofen, Indomethacin) 2nd and 3rd trimester
- Paroxetine (Paxil)
- Retinoids (e.g Isotretinoin, Retinoic acid, Vitamin A -over 10,000 IU per day, etc.)
- Thalidomide
- Venlafaxine (Effexor)
- This may not be an all-inclusive list, however, exposure to other potential teratogens associated with cardiac anomalies in the fetus are typically adequately assessed with a detailed fetal anatomy ultrasound. (CPT® 76811) (See **Potentially Teratogenic Medications/Substances (OB 10.1)**)

Computed Tomography

Guideline

CT Heart and Coronary Computed Tomography Angiography (CCTA)

General Considerations (PEDCD-10.1)

Indications for CCTA (CPT® 75574) (PEDCD-10.3)

Indications for Cardiac CT (CPT® 75572) (PEDCD-10.4)

Indications for Chest CTA with Cardiac CT or CTA (PEDCD-10.5)

References (PEDCD-10)

CT Heart and Coronary Computed Tomography Angiography (CCTA)

General Considerations (PEDCD-10.1)

CDP.CT.0010.1.A

v1.0.2024

- Metal artifact reduces the accuracy of CCTA. Devices that can cause this issue include but are not limited to:
 - Surgical clips
 - Pacemaker devices
 - Defibrillator devices
 - Tissue expanders
- Cardiac testing that does not involve exposure to ionizing radiation should be strongly considered.

Radiation Dose (PEDCD-10.2)

- ACR–NASCI–SPR Practice Parameter for the Performance and Interpretation of Cardiac Computed Tomography (CT) states “Cardiac CT should be performed only for a valid medical indication and with the minimum radiation exposure that provides diagnostic image quality”
- ACR–NASCI–SPR Practice Parameter for the Performance of Quantification of Cardiovascular Computed Tomography (Ct) And Magnetic Resonance Imaging (MRI) states, “In younger patients, MRI may be the preferred modality, particularly when functional assessment with CT would require retrospective ECG gating and relatively high radiation doses. Further, the use of time-resolved MRA and phase contrast MRI methods offer significant advantages whose relative importance will depend on the specific application”
 - See table: Practice Estimate of Effective Radiation Dose chart for Selected Imaging Studies in **General Guidelines (CD-1)** in the general Cardiac Imaging Guidelines

Indications for CCTA (CPT® 75574) (PEDCD-10.3)

CDP.CT.0010.3.A

v1.0.2024

- In addition to indications listed in previous guideline sections, CCTA is indicated for any of the following, when a recent TTE and/or MRI is inconclusive:
 - Persistent exertional chest pain and normal stress test
 - Full sibling(s) with history of sudden death syndrome before age 30 or with documented anomalous coronary artery
 - Resuscitated sudden death and contraindication to conventional coronary angiography
 - Unexplained new onset of heart failure if CCTA will replace conventional invasive coronary angiography
 - Documented ventricular tachycardia (6 beat runs or greater) if CCTA will replace conventional invasive coronary angiography
 - Equivocal coronary artery anatomy on conventional cardiac catheterization
 - In infants: otherwise unexplained dyspnea, tachypnea, wheezing, episodic pallor, irritability, sweating, poor feeding, and/or failure to thrive
 - The presence of other congenital heart disease is not a separate indication for CCTA to rule out anomalous coronary artery (except when coronary artery surgery is pending, i.e., Transposition of the great arteries, Tetralogy of Fallot, Truncus arteriosus, aortic root surgery)
 - Evaluation of the arterial supply and venous drainage in children with bronchopulmonary sequestration
- See **Coronary Anomalies (PEDCD-2.4.12)**

Indications for Cardiac CT (CPT® 75572) (PEDCD-10.4)

CDP.CT.0010.4.A

v1.0.2024

- In addition to indications listed in previous guideline sections, CCT is indicated for any of the following, when a recent TTE and/or MRI is inconclusive:
 - Cardiac or pericardial mass
 - Pericarditis
 - Complications of cardiac surgery or evaluation of post-operative anatomy
 - Cardiac thrombus in individuals with technically limited TTE, TEE, or MRI
 - Clinical suspicion of arrhythmogenic right ventricular dysplasia (ARVD) or arrhythmogenic cardiomyopathy (ARVC)
 - Native aortic abnormalities if echocardiogram is indeterminate
 - Intracardiac anatomy unclear after TTE or CMRI
 - A CTA Chest may also be indicated during a Cardiac CT if there are issues regarding the chest vessels that are inconclusive after echocardiogram or Cardiac MRI

Indications for Chest CTA with Cardiac CT or CTA (PEDCD-10.5)

CDP.CT.0010.5.A

v1.0.2024

- A Chest CTA may be indicated in individuals who require Cardiac CT or Cardiac CTA when:
 - A TTE or MRI is inconclusive for issues regarding chest vasculature
 - Routine imaging is indicated based on **Imaging and Surveillance per Congenital lesion (PEDCD-2.4)**

References (PEDCD-10)

Magnetic Resonance Imaging

Guideline

Cardiac MRI Coding (PEDCD-9.2)

Indications for Cardiac MRI (PEDCD-9.3)

Indications for Chest MRA for Congenital heart disease (PEDCD-9.4)

References (PEDCD-9)

Cardiac MRI Coding (PEDCD-9.2)

CDP.MR.0009.2.A

v1.0.2024

Cardiac Imaging Procedure Codes	
Cardiac MRI	CPT [®]
Cardiac magnetic resonance imaging for morphology and function without contrast.	75557
Cardiac magnetic resonance imaging for morphology and function without and with contrast and further sequences.	75561
Cardiac magnetic resonance imaging for morphology and function without contrast; with stress imaging (rarely used in pediatrics).	75559
Cardiac magnetic resonance imaging for morphology and function without and with contrast and further sequences; with stress imaging (rarely used in pediatrics).	75563
Cardiac magnetic resonance imaging for velocity flow mapping (List separately in addition to code for primary procedure).	+75565

- Only one procedure code from the set: CPT[®] 75557, CPT[®] 75559, CPT[®] 75561, and CPT[®] 75563 should be reported per session.
- Only one flow velocity measurement (CPT[®] +75565) should be reported per session.

Indications for Cardiac MRI (PEDCD-9.3)

CDP.MR.0009.3.A

v1.0.2024

- In addition to indications listed in previous guideline sections, Cardiac MRI (CPT® 75557 or 75561) evaluation is indicated for any of the following, when a recent TTE is inconclusive:
 - Assessment of global ventricular function and mass if a specific clinical question is left unanswered by recent TTE and the MRI results will affect management of the individual's condition
 - Individuals with complex congenital heart disease (e.g., Tetralogy of Fallot [TOF], single ventricle, truncus arteriosus, Transposition of the Great Arteries [TGA]) may require a baseline MRI, or routine Cardiac MRI, especially as they approach their teenage years, due to poor imaging windows on echocardiogram, and the need for specific clinical information not seen on prior echocardiograms due to these known limitations. Once these individuals reach age 18, they can be imaged by adult congenital heart disease guideline.
 - Clinical suspicion of arrhythmogenic right ventricular dysplasia (ARVD) or arrhythmogenic cardiomyopathy (ARVC).
 - For pericardial disease (including constrictive pericarditis, restrictive pericarditis, and perimyocarditis), MRI should not be utilized to diagnose pericarditis but only to answer the question regarding possible constriction or restriction suggested clinically or by other techniques (TTE, etc.)
 - MRI without and with contrast (CPT® 75561) is considered the optimal test for this disorder.
 - Evaluate cardiac tumor or mass
 - MRI without and with contrast (CPT® 75561) is considered the optimal test for this disorder.
 - Evaluate anomalous coronary artery
 - MRI without and with contrast (CPT® 75561) or CCTA (CPT® 75574) after echocardiogram is considered the optimal test for this disorder.
 - For Fabry's disease, late enhancement MRI may predict the effect of enzyme replacement therapy on myocardial changes that occur with this disease.
 - MRI without and with contrast (CPT® 75561) is considered the preferred test for this disorder.
 - Cardiac MRI (CPT® 75557 or 75561) can be performed to evaluate individuals with congenital cardiomyopathy (muscular dystrophy, glycogen storage disease, fatty acid oxidation disorders, mitochondrial disorders, etc.) or unexplained cases of cardiomyopathy in order to characterize the myocardium.
 - Cardiac stress perfusion study (CPT® 75559 or CPT® 75563) can be considered on a case by case basis for individuals with any of the following:

- Anomalous coronary artery
- Kawasaki disease
- TGA
- Ross operation
- Other disorder with the potential for coronary ischemia
- Individuals in whom an exercise stress test (EST) without imaging is indicated but the individual is not able to perform an EST.
- Individuals in whom an exercise stress test (EST) is equivocal, positive, or concern for a false negative
- Assessment of cardiac iron overload such as in hemochromatosis, thalassemia, sickle cell (either CPT® 75557 or CPT® 71550, T2* MRI, contrast not necessary).
 - Screening imaging may be approved every 12 months
 - Imaging may be approved every 3 months for treatment response in individuals receiving active treatment (chelation +/- phlebotomy)
 - Frequently performed along with MRI Abdomen (CPT® 74181) to assess liver iron deposition. See **Transfusion-Associated (Secondary) Hemochromatosis (PEDAB-18.2)** in the Pediatric Abdomen Imaging Guidelines.
- Asymptomatic individuals with Duchenne Muscular Dystrophy (DMD)
 - MRI Cardiac for DMD **either** CPT® 75557 or CPT® 75561 is indicated for surveillance if done in place of TTE every year starting at 6 years of age
 - Female carriers would not typically be imaged until ≥18 years of age and should be imaged according to general Cardiac Imaging Guidelines
 - CPT® 75565 or CPT® 71555 would not be indicated unless there was an independent indication for either of those codes.

Indications for Chest MRA for Congenital heart disease (PEDCD-9.4)

CDP.00.A

v1.0.2024

- For Familial Aortopathies see **Thoracic Aortic Disease (PEDPVD-4.1)** in the Pediatric Peripheral Vascular Disease Imaging Guidelines
- For individuals with known CHD for routine imaging **Imaging and Surveillance per Congenital lesion (PEDCD-2.4)**
- For individuals who have both cardiac and ascending aorta abnormalities (e.g., truncus arteriosus), the following studies may be indicated following an inconclusive TTE:
 - Cardiac MRI (CPT® 75557 or CPT® 75561)
 - And MRI Chest (CPT® 71552) or MRA Chest (CPT® 71555) if aorta is involved
- For individuals with aortic abnormalities without cardiac abnormalities (i.e. normal intracardiac anatomy, but coarctation or peripheral pulmonary artery stenosis), the following studies may be indicated following an inconclusive TTE:
 - MRI Chest (CPT® 71552)
 - MRA Chest (CPT® 71555)
- MRA Chest (CPT® 71555) is indicated for individuals with cardiomyopathy or isolated abnormal intracardiac anatomy, when there are inconclusive images on echocardiogram related to chest vessels (e.g. aortic arch, pulmonary arteries, pulmonary veins, systemic veins).

Diagnostic Heart Catheterization

Guideline

Cardiac Catheterization General Information (PEDCD-11.1)

Cardiac Catheterization Indications (PEDCD-11.2)

References (PEDCD-11)

Cardiac Catheterization General Information (PEDCD-11.1)

CDP.DHC.0011.1.A

v1.0.2024

Cardiac Catheterization Procedure Codes	
Cardiac Cath Procedures	CPT [®]
Congenital Heart Disease Code "Set"	93593-93597
Right heart catheterization for congenital heart defect(s) including imaging guidance by the proceduralist to advance the catheter to the target zone; normal native connections	93593
Right heart catheterization for congenital heart defect(s) including imaging guidance by the proceduralist to advance the catheter to the target zone; abnormal native connections	93594
Left heart catheterization for congenital heart defect(s) including imaging guidance by the proceduralist to advance the catheter to the target zone, normal or abnormal native connections	93595
Right and left heart catheterization for congenital heart defect(s) including imaging guidance by the proceduralist to advance the catheter to the target zone(s); normal native connections	93596
Right and left heart catheterization for congenital heart defect(s) including imaging guidance by the proceduralist to advance the catheter to the target zone(s); abnormal native connections	93597
Anomalous coronary arteries, patent foramen ovale, mitral valve prolapse, and bicuspid aortic valve	93451-93464, 93566-93568
RHC without LHC or coronaries	93451
LHC without RHC or coronaries	93452
RHC and retrograde LHC without coronaries	93453

Cardiac Catheterization Procedure Codes	
Cardiac Cath Procedures	CPT®
Native coronary artery catheterization;	93454
with bypass grafts	93455
with RHC	93456
with RHC and bypass grafts	93457
with LHC	93458
with LHC and bypass grafts	93459
with RHC and LHC	93460
with RHC and LHC and bypass grafts	93461
LHC by trans-septal or apical puncture	+93462
Angiography of non-coronary arteries and veins performed as a distinct service	Select appropriate codes from the Radiology and Vascular Injection Procedures sections.
CPT® 93593 to 93597 are appropriate for invasive evaluation of congenital heart disease	

- These guidelines apply to individuals with stable conditions and who are not in the acute setting. Individuals in acute settings or with unstable angina should be handled as medical emergencies.
- Pediatric catheterizations are done for many purposes, including diagnosis and intervention of congenital and acquired heart disease.
- When device placement is planned (ASD/VSD device, transcatheter valve implantation, PDA device), the procedure codes for those devices include all cardiac catheterization(s), intraprocedural contrast injection(s), fluoroscopic radiological supervision and interpretation, and imaging guidance performed to complete the procedure. A diagnostic cath may be considered on a case-by-case basis if there are unanswered issues via noninvasive imaging.
- A right heart cath can be approved for pulmonary artery interventions (e.g., stents, coils).

Cardiac Catheterization Indications (PEDCD-11.2)

CDP.DHC.0011.2.A

v1.0.2024

- Diagnostic catheterization is indicated:
 - When other advanced imaging has failed to resolve a clinical issue and results will impact the individual's management
 - For example, a cath to assess ventricular pressures and shunt to determine if VSD surgery is required
 - For preoperative assessment in complex heart disease
 - Norwood procedure
 - Bidirectional Glenn shunt
 - Fontan procedure
 - Pulmonary atresia
 - Pulmonary hypertension
 - During some interventions such as:
 - Valvuloplasty
 - Pulmonary artery or vein stents
 - Assessment of individuals who are status post heart transplant
 - See **Kawasaki Disease Initial Imaging (PEDCD-6.1)** for specific intervals in Kawasaki Disease
 - On an individual who is having a device placed when:
 - A diagnostic catheterization, or stenting is needed in addition to the device
 - The diagnostic catheterization is indicated separate from the device placement
 - Individuals with anomalous coronary arteries, or with syndromes associated with abnormal coronary arteries (i.e., Williams syndrome) or acquired CAD (i.e., KD-see **Kawasaki Disease Initial Imaging (PEDCD-6.1)**)
 - When diagnostic images are not adequate or evaluation or treatment decision
 - Preoperative for cardiac surgery
 - New symptoms concerning for ischemia

Quantitative Differential Pulmonary Perfusion, Including Imaging When Performed	78597
Quantitative Differential Pulmonary Perfusion and Ventilation (e.g., Aerosol or Gas), Including Imaging When Performed	78598

Ultrasound	CPT [®]
Ultrasound, chest (includes mediastinum, chest wall, and upper back)	76604
Ultrasound, axilla	76882
Ultrasound, breast; <i>unilateral</i> , including axilla when performed; complete	76641
Ultrasound, breast; <i>unilateral</i> , including axilla when performed; limited	76642

General Guidelines (PEDCH-1.0)

CHP.GG.0001.0.A

v1.0.2024

- A pertinent clinical evaluation since the onset or change in symptoms, including a detailed history, physical examination, and appropriate laboratory, and basic imaging such as plain radiography or ultrasound should be performed prior to considering advanced imaging (CT, MRI, Nuclear Medicine), unless the individual is undergoing guideline-supported scheduled imaging evaluation. A meaningful technological contact (telehealth visit, telephone call, electronic mail or messaging) since the onset or change in symptoms can serve as a pertinent clinical evaluation.
- Unless otherwise stated in a specific guideline section, the use of advanced imaging to screen asymptomatic individuals for disorders involving the chest is not supported. Advanced imaging of the chest is only supported in individuals who have documented active clinical signs or symptoms of disease involving the chest.
- Unless otherwise stated in a specific guideline section, repeat imaging studies of the chest are not necessary unless there is evidence for progression of disease, new onset of disease, and/or documentation of how repeat imaging will affect individual management or treatment decisions.

Pediatric Chest Imaging Age Considerations (PEDCH-1.1)

CHP.GG.0001.1.A

v1.0.2024

- Many conditions affecting the chest in the pediatric population are different diagnoses than those occurring in the adult population. For those diseases which occur in both pediatric and adult populations, differences may exist in management due to individual age, comorbidities, and differences in disease natural history between children and adults.
- Individuals who are 18 years old or younger¹⁵ should be imaged according to the Pediatric Chest Imaging Guidelines if discussed. Any conditions not specifically discussed in the Pediatric Chest Imaging Guidelines should be imaged according to the General Chest Imaging Guidelines. Individuals who are >18 years old should be imaged according to the General Chest Imaging Guidelines, except where directed otherwise by a specific guideline section.

Pediatric Chest Imaging Modality

General Considerations (PEDCH-1.3)

CHP.GG.0001.3.A

v1.0.2024

- MRI
 - MRI Chest is generally performed without and with contrast (CPT® 71552) unless the individual has a documented contraindication to gadolinium or otherwise stated in a specific guideline section.
 - Due to the length of time required for MRI acquisition and the need to minimize individual movement, anesthesia is usually required for almost all infants (except neonate) and young children (age <7 years), as well as older children with delays in development or maturity. This anesthesia may be administered via oral or intravenous routes. In this individual population, MRI sessions should be planned with a goal of minimizing anesthesia exposure by adhering to the following considerations:
 - MRI procedures can be performed without and/or with contrast use as supported by these condition-based guidelines. If intravenous access will already be present for anesthesia administration and there is no contraindication for using contrast, imaging without and with contrast may be appropriate if requested. By doing so, the requesting provider may avoid repetitive anesthesia administration to perform an MRI with contrast if the initial study without contrast is inconclusive.
 - Recent evidence-based literature demonstrates the potential for gadolinium deposition in various organs including the brain, after the use of MRI contrast.
 - The U.S. Food and Drug Administration (FDA) has noted that there is currently no evidence to suggest that gadolinium retention in the brain is harmful and restricting gadolinium-based contrast agents (GBCAs) use is not warranted at this time. It has been recommended that GBCA use should be limited to circumstances in which additional information provided by the contrast agent is necessary and the necessity of repetitive MRIs with GBCAs should be assessed.
 - If multiple body areas are supported by the guidelines for the clinical condition being evaluated, MRI of all necessary body areas should be obtained concurrently.
 - The presence of surgical hardware or implanted devices may preclude MRI.
 - The selection of best examination may require coordination between the provider and the imaging service.
- CT
 - CT Chest is generally performed either with contrast (CPT® 71260) or without contrast (CPT® 71250).

- There are no generally accepted pediatric indications for CT Chest without and with contrast (CPT® 71270).
- CT should not be used to replace MRI in an attempt to avoid sedation unless listed as a recommended study in a specific guideline section.
- The selection of best examination may require coordination between the provider and the imaging service.
- Ultrasound
 - Ultrasound chest (CPT® 76604) or axilla (CPT® 76882) is indicated as an initial study for evaluating adenopathy, palpable chest wall lesions, pleural effusion or thickening, patency of thoracic vasculature, and diaphragm motion abnormalities.
 - For those individuals who do require advanced imaging, ultrasound can be very beneficial in selecting the proper modality, body area, image sequences, and contrast level that will provide the most definitive information for the individual.
- Nuclear Medicine
 - Nuclear medicine studies other than PET/CT are rarely used in evaluation of the pediatric chest.
 - Pulmonary Ventilation-Perfusion Imaging (CPT® 78582) has been replaced by CTA Chest (CPT® 71275) or CT Chest with contrast (CPT® 71260), but are appropriate for evaluation of suspected pulmonary embolism if CT is unavailable.
 - See **Pulmonary Embolism (PE) (CH-25.1)** in the Chest Imaging Guidelines.
 - Pulmonary Perfusion Imaging (CPT® 78580) are generally not appropriate in lieu of CPT® 78582 for initial evaluation of suspected pulmonary embolism, but is appropriate for follow up of an equivocal or positive recent ventilation-perfusion lung scan (CPT® 78582) to evaluate for interval change.
 - Pulmonary Ventilation Imaging (CPT® 78579) are not appropriate in lieu of CPT® 78582 for evaluation of suspected pulmonary embolism, but is appropriate for additional evaluation of an abnormal perfusion-only scan (CPT® 78580).
 - Pulmonary split crystal function study (CPT® 78597 or CPT® 78598), also known as Quantitative Differential Pulmonary Perfusion, is indicated for preoperative planning of segmental, lobar, or lung resection.
 - Quantitative Differential Pulmonary Perfusion Lung Scan (CPT® 78597 or CPT® 78598), can be performed for post lung transplant individuals to detect regional perfusion abnormalities.
 - Radiopharmaceutical nuclear medicine imaging of an inflammatory process (CPT® 78800, CPT® 78801, CPT® 78802, or CPT® 78803) is rarely performed, but is indicated for evaluation of sarcoidosis or toxicity from drug toxicity (cyclophosphamide, busulfan, bleomycin, amiodarone, or nitrofurantoin).
- 3D Rendering
 - 3D Rendering indications in pediatric chest imaging are identical to those in the general imaging guidelines. See **3D Rendering (Preface-4.1)** in the Preface Imaging Guidelines.

The guidelines listed in this section for certain specific indications are not intended to be all-inclusive; clinical judgment remains paramount and variance from these guidelines may be appropriate and warranted for specific clinical situations.

Lymphadenopathy (PEDCH-2)

Guideline

Lymphadenopathy (PEDCH-2.1)

Reference (PEDCH-2)

Lymphadenopathy (PEDCH-2.1)

CHP.LY.0002.1.A

v1.0.2024

- Axillary lymphadenopathy imaging indications in pediatric individuals are identical to those for adult individuals. See **Axillary Lymphadenopathy (and Mass) (CH-2.2)** in the Chest Imaging Guidelines.
- Supraclavicular adenopathy in pediatric individuals is almost always pathologic, and advanced imaging is indicated prior to excisional biopsy. Fine needle aspiration, while common in adults prior to advanced imaging, is inappropriate for evaluating lymphadenopathy in pediatric individuals. ANY of the following studies are appropriate for evaluation of supraclavicular adenopathy in children:
 - CT Chest with contrast (CPT® 71260)
 - MRI Chest without and with contrast (CPT® 71552)
 - Ultrasound Chest (CPT® 76604)
- If malignancy is suspected, see the appropriate imaging guidelines as below:
 - Lymphoma: **Pediatric Lymphomas (PEDONC-5)** in the Pediatric Oncology Imaging Guidelines.
 - Soft tissue sarcoma: **Pediatric Soft Tissue Sarcomas (PEDONC-8)** in the Pediatric Oncology Imaging Guidelines.
 - Neuroblastoma: **Neuroblastoma (PEDONC-6)** in the Pediatric Oncology Imaging Guidelines.

Mediastinal Mass (PEDCH-3)

Guideline

Mediastinal Mass (PEDCH-3.1)

References (PEDCH-3)

Mediastinal Mass (PEDCH-3.1)

CHP.MM.0003.1.A

v1.0.2024

- The causes of mediastinal masses in children are generally different than those in adults, and the imaging considerations are different. Up to half of all pediatric mediastinal masses are malignant.⁷
- Chest x-ray is indicated as an initial study for all individuals with suspected mediastinal mass.
- CT Chest with contrast (CPT® 71260) is indicated for any pediatric individual with a mediastinal mass identified on chest x-ray.
 - Masses can be very large and anterior masses frequently cause compression of the trachea and/or mediastinal blood vessels.
- MRI Chest without and with contrast (CPT® 71552) is indicated for any pediatric individual with:
 - A posterior (paravertebral) mediastinal mass on CT Chest that invades the spinal canal
 - CT findings are inconclusive regarding specific anatomy
 - MRI should not be used for individuals with large anterior mediastinal masses if anesthesia is necessary to complete the study.
- PET/CT (CPT® 78815) is indicated prior to biopsy in pediatric individuals if lymphoma is known or strongly suspected or there is evidence of tracheal compression on CT imaging. See **Pediatric Lymphoma (PEDONC-5)** in the Pediatric Oncology Imaging Guidelines.
- MIBG (CPT® 78800, CPT® 78802, CPT® 78803, or CPT® 78804) is indicated and is supported prior to biopsy in pediatric individuals if neuroblastoma is known or strongly suspected. See **Neuroblastoma (PEDONC-6)** in the Pediatric Oncology Imaging Guidelines.
- Ultrasound chest (CPT® 76604) is appropriate in children younger than 5 years old to distinguish prominent but otherwise normal thymus from true mediastinal mass.
- A single repeat CT Chest with contrast (CPT® 71260) is appropriate to confirm stability and avoid biopsy for individuals with NONE of the following features:
 - Anterior mediastinal mass
 - Enlarged lymph nodes anywhere in the imaging field
 - Lymphopenia
 - Pleural effusion

Hemoptysis (PEDCH-4)

Guideline

Hemoptysis – Imaging (PEDCH-4.1)

References (PEDCH-4)

Hemoptysis – Imaging (PEDCH-4.1)

CHP.BL.0004.1.A

v1.0.2024

- True hemoptysis is rare in pediatric individuals, and a detailed history, physical examination, and appropriate laboratory studies should be performed prior to considering advanced imaging.
 - Aspirated blood from epistaxis or emesis frequently presents as hemoptysis, and history and physical examination will aid in this assessment.
- Chest x-ray is indicated as an initial study for stable individuals.
 - Advanced imaging is not indicated for individuals with epistaxis and a normal chest radiograph and no personal or family history of underlying lung disease or bleeding disorder.
 - CT Chest with contrast (CPT® 71260) is indicated for all other pediatric individuals with hemoptysis.
 - CT Chest without contrast (CPT® 71250) for individuals with a documented allergy to CT contrast or significant renal dysfunction.
- MRI is not indicated in the evaluation of pediatric hemoptysis.

Cystic Fibrosis and Bronchiectasis (PEDCH-5)

Guideline

Cystic Fibrosis (PEDCH-5.1)

Bronchiectasis Not Associated with Cystic Fibrosis (PEDCH-5.2)

References (PEDCH-5)

Cystic Fibrosis (PEDCH-5.1)

CHP.CF.0005.1.A

v1.0.2024

- Chest x-ray is the primary study for initial evaluation of acute clinical symptoms in individuals with cystic fibrosis.
- CT Chest without contrast (CPT® 71250) or with contrast (CPT® 71260) is indicated for the following (without initial chest x-ray):
 - Hemoptysis
 - Pneumonia worsening despite antibiotic therapy
 - Pleural effusion or empyema
 - Suspected fungal pneumonia
 - Monitoring treatment changes on bronchiectasis
 - Expiratory CT for evaluating small airways disease
 - Pre- and post-lung transplant evaluation
- Low dose CT Chest without contrast (CPT® 71250) is indicated **every 2 years** for monitoring of bronchiectasis and small airways disease.
- Cystic fibrosis associated liver disease develops in 5-10% of individuals with cystic fibrosis. Advanced imaging may be appropriate if concerned for liver disease. See **Liver Disease (PEDAB-16)** in the Pediatric Abdomen Imaging Guidelines.

Bronchiectasis Not Associated with Cystic Fibrosis (PEDCH-5.2)

CHP.CF.0005.2.A

v1.0.2024

- Bronchiectasis not associated with cystic fibrosis is rare in pediatric individuals, and imaging indications are identical to those for adult individuals. See **Bronchiectasis (CH-7.1)** in the Chest Imaging Guidelines.

Bronchiolitis (PEDCH-6)

Guideline

Bronchiolitis (PEDCH-6.1)

References (PEDCH-6)

Bronchiolitis (PEDCH-6.1)

CHP.BR.0006.1.A

v1.0.2024

Bronchiolitis is a self-limiting viral infection causing inflammation of the small airways, most common in infants under 12 months of age.

- Chest x-rays are indicated when there is a clinical suspicion of pneumonia or other complications.
- Advanced imaging is not indicated for routine evaluation or monitoring of bronchiolitis, but CT Chest with contrast (CPT® 71260) is appropriate for the following:
 - Pleural effusion or empyema on recent chest x-ray
 - Immunocompromised individual with acute pulmonary symptoms
 - Abnormality on recent chest x-ray suggesting condition other than bronchiolitis

Pneumonia (PEDCH-7)

Guideline

Pneumonia (PEDCH-7.1)

Coronavirus Disease 2019 (COVID-19) (PEDCH-7.2)

References (PEDCH-7)

Pneumonia (PEDCH-7.1)

CHP.PN.0007.1.A

v1.0.2024

- Pneumonia imaging indications in pediatric individuals are very similar to those for adult individuals. See **Pneumonia (CH-13.1)** in the Chest Imaging Guidelines.
- Pediatric-specific imaging considerations include the following:
 - Chest x-ray and/or Ultrasound chest (CPT® 76604) is indicated when the individual's condition does not respond to standard therapy.
 - CT Chest with contrast (CPT® 71260) for immunocompromised individuals with acute pulmonary symptoms.
 - CT Chest without contrast (CPT® 71250) or with contrast (CPT® 71260) for individuals with recurrent lower respiratory tract infections.
 - Ultrasound chest (CPT® 76604) for evaluation of complicated or recurrent childhood pneumonia.

Coronavirus Disease 2019 (COVID-19) (PEDCH-7.2)

CHP.PN.0007.2.A

v1.0.2024

- Pediatric imaging for COVID-19 positive individuals are similar to those for adult individuals. See **Coronavirus Disease 2019 (COVID-19) (CH-13.2)** in the Chest Imaging Guidelines.
- Pediatric-specific imaging considerations include the following:
 - Chest x-ray is the initial imaging test for all pediatric individuals
 - For concerns involving **Multisystem Inflammatory Syndrome in Children (MIS-C)** see **(PEDCD-12)**

Solitary Pulmonary Nodule (PEDCH-8)

Guideline

Solitary Pulmonary Nodule (PEDCH-8.1)

References (PEDCH-8)

Solitary Pulmonary Nodule (PEDCH-8.1)

CHP.PM.0008.1.A

v1.0.2024

The Fleischner Society guidelines for solitary pulmonary nodule management do not apply to pediatric individuals. An incidental solitary pulmonary nodule in a child representing a primary lung carcinoma has never been reported in the literature. Similarly, an extrathoracic malignancy presenting with an incidental solitary pulmonary nodule in an otherwise healthy child is very rare.

- CT Chest with contrast (CPT® 71260) as a one-time evaluation for all children with a pulmonary nodule incidentally discovered on other imaging.
- Follow up imaging of incidental solitary pulmonary nodules in asymptomatic healthy children is not necessary.⁶
 - Follow up imaging is indicated for the following:
 - Immunocompromised individuals
 - Malignancy (see below)
 - Invasive infection
 - New or worsening pulmonary symptoms
- Children with a malignant solid tumor who have pulmonary nodules of any size should have imaging according to the guideline section for the specific cancer type. See **Pediatric Oncology Imaging Guidelines** for specific imaging indications.
- This guideline section does not apply to multiple pulmonary nodules, which are imaged according to the underlying disorder in pediatric individuals.

Background and Supporting Information

A **nodule** is any pulmonary or pleural lesion that is a discrete, spherical opacity 2-30 mm in diameter surrounded by normal lung tissue. A larger nodule is called a mass. Entities that are not nodules, and are considered benign, include non-spherical linear, sheet-like, two-dimensional or scarring opacities.

Positive PPD or Tuberculosis (PEDCH-9)

Guideline

Positive PPD or Tuberculosis (PEDCH-9.1)

References (PEDCH-9)

Positive PPD or Tuberculosis (PEDCH-9.1)

CHP.TB.0009.1.A

v1.0.2024

- Positive PPD and tuberculosis imaging indications in pediatric individuals are similar to those for adult individuals.
 - See **PPD or TB (Mycobacterium tuberculosis and Nontuberculous Mycobacterial Pulmonary Disease [NTM-PD]) (CH-14.1)** in the Chest Imaging Guidelines.
- Pediatric-specific imaging considerations include the following:
 - MRI Spine with and without contrast is appropriate at symptomatic levels in individuals with concern for spinal involvement of tuberculosis.

Background and Supporting Information

- Chest x-ray can be useful as the initial imaging study when TB is suspected⁵

Asthma (PEDCH-10)

Guideline

Asthma (PEDCH-10.1)

References (PEDCH-10)

Asthma (PEDCH-10.1)

CHP.AS.0010.1.A

v1.0.2024

- Chest x-ray and/or Ultrasound chest (CPT® 76604) is indicated when the individual's condition does not respond to standard therapy, to identify complications, such as pneumonia or to rule out other causes of respiratory distress.
- Advanced imaging is not indicated for routine evaluation or monitoring of asthma, but CT Chest without (CPT® 71250) or with (CPT® 71260) contrast is appropriate for the following:
 - Pleural effusion or empyema on recent chest x-ray
 - Immunocompromised individual with acute pulmonary symptoms
 - Abnormality on recent chest x-ray suggesting condition other than asthma, including suspected foreign body
 - Asthma and poor response to bronchodilators or conventional inhaled corticosteroid therapy in whom associated conditions, such as allergic bronchopulmonary aspergillosis and eosinophilic pneumonia can mimic asthma

Pectus Deformities (PEDCH-11)

Guideline

Pectus Deformities (PEDCH-11.1)

References (PEDCH-11)

Pectus Deformities (PEDCH-11.1)

CHP.PD.0011.1.A

v1.0.2024

- CT Chest without contrast (CPT® 71250), MRI Chest with and without contrast (CPT® 71552), or MRI Chest without contrast (CPT® 71550) is indicated in individuals with a pectus deformity for:
 - Preoperative planning
 - Significant cardiac displacement after chest x-ray and echocardiography (CPT® 93306)
 - Evidence of pulmonary impingement after chest x-ray and pulmonary function tests (PFTs) if there is increasing shortness of breath
 - Note: It may not be possible to obtain PFTs in children younger than 9 years old.
 - Evaluation of congenital heart disease or Marfan's syndrome when suspected in those individuals with pectus deformities

Breast Masses (PEDCH-12)

Guideline

Breast Masses (PEDCH-12.1)

Breast Masses (PEDCH-12.1)

CHP.MS.0012.1.A

v1.0.2024

See **Pediatric Breast Masses (PEDONC-17)** in the Pediatric Oncology Imaging Guidelines.

Vascular Malformations (PEDCH-13)

Guideline

Vascular Ring (PEDCH-13.1)

Other Vascular Malformations (PEDCH-13.2)

References (PEDCH-13)

Vascular Ring (PEDCH-13.1)

CHP.VM.0013.1.A

v1.0.2024

Vascular rings generally present with either respiratory symptoms (stridor, wheezing, tachypnea, cough) or feeding difficulties (dysphagia, slow feeding, hyperextension of the head while feeding, weight loss, failure to thrive), but can also be discovered incidentally on imaging obtained for other purposes.

- Chest x-ray is the recommended initial study in individuals with respiratory symptoms. A chest x-ray is not needed for individuals diagnosed with a vascular ring on prenatal imaging studies.
- Barium esophagram is the recommended initial study in individuals with feeding difficulties.
- CT Chest with contrast (CPT® 71260), CTA Chest (CPT® 71275) or MRA Chest (CPT® 71555) in individuals with known or suspected vascular ring after prenatal imaging studies, chest x-ray, or barium esophagram.
- Echocardiogram is appropriate to rule out associated congenital heart disease.
 - CPT® 93303, CPT® 93306, CPT® 93320, and CPT® 93325 is appropriate for initial evaluation of individuals with vascular ring and no prior echocardiograms.

Other Vascular Malformations (PEDCH-13.2)

CHP.VM.0013.2.A
v1.0.2024

See **Pulmonary Arteriovenous Malformations (PEDCH-14.2)** for Pulmonary AVMs.

See **Vascular Anomalies (PEDPVD-2)** in the Pediatric Peripheral Vascular Disease Imaging Guidelines.

Congenital Chest Diseases (PEDCH-14)

Guideline

Congenital Cystic Lung Diseases (PEDCH-14.1)

Pulmonary Arteriovenous Malformations (PEDCH-14.2)

Congenital Diaphragmatic Hernia (PEDCH-14.3)

References (PEDCH-14)

Congenital Cystic Lung Diseases (PEDCH-14.1)

CHP.CD.0014.1.A

v1.0.2024

- This section includes common congenital cystic lung lesions such as:
 - Bronchogenic cyst
 - Congenital pulmonary airway malformation (congenital cystic adenomatoid malformation)
 - Congenital lobar overinflation
- CT Chest with contrast (CPT® 71260) is appropriate when a cystic lung lesion is suspected.
- MRI Chest with and without contrast (CPT® 71552) is appropriate if CT is inconclusive or if requested for pre-operative planning.

Background and Supporting Information

- Cystic lung disease may be first identified on prenatal ultrasound, or discovered incidentally on chest x-ray.

Pulmonary Arteriovenous Malformations (PEDCH-14.2)

CHP.CD.0014.2.A

v1.0.2024

- Pulmonary arteriovenous malformations (PAVMs) are vascular structures that most commonly result from abnormal communication between pulmonary arteries and pulmonary veins.
 - Chest x-ray are indicated as an initial imaging modality for individuals with known AVMs, or individuals presenting with hypoxemia and/or hemoptysis.
 - CTA or MRA is appropriate in individuals with known AVM or abnormal chest x-ray suggesting AVM for treatment planning.

Congenital Diaphragmatic Hernia (PEDCH-14.3)

CHP.CD.0014.3.A

v1.0.2024

- Congenital Diaphragmatic hernia (CDH) is a defect in the diaphragm which may allow the abdominal organs to enter the chest cavity, and may lead to compromised pulmonary function or may be associated with congenital heart disease.
 - Over 90% of the hernias occur in the posterolateral diaphragm (Bochdalek hernia) typically on the left side.
 - Most of the rest of the hernias are in the anteromedial diaphragm (Morgagni hernia).
- The vast majority of CDH are diagnosed prenatally (see **Fetal MRI [PV-15.1]**) in the Pelvis Imaging Guidelines), or as an inpatient shortly after delivery.
- If there is clinical concern for CDH, chest x-ray and/or US Chest (CPT® 76604) is indicated as the initial imaging study.
- CT Chest with contrast (CPT® 71260) or MRI Chest with and without contrast (CPT® 71552) is appropriate when chest x-ray and/or US are inconclusive, or if requested for treatment planning.¹¹

Ophthalmic ultrasound, diagnostic; quantitative A-scan only	76511
Ophthalmic ultrasound, diagnostic; B-scan	76512
Ophthalmic ultrasound, diagnostic; anterior segment ultrasound, immersion (water bath) B-scan	76513
Ophthalmic ultrasound, diagnostic; corneal pachymetry, unilateral or bilateral	76514
Ophthalmic biometry by ultrasound, A-scan	76516
Ophthalmic biometry by ultrasound, A-scan, with lens power calculation	76519
Ophthalmic ultrasonic foreign body localization	76529
Soft tissues of head and neck Ultrasound (thyroid, parathyroid, parotid, etc.)	76536
Transcranial Doppler study of the intracranial arteries; complete study	93886
Transcranial Doppler study of the intracranial arteries; limited study	93888
Transcranial Doppler study of the intracranial arteries; vasoreactive study	93890
Transcranial Doppler study of the intracranial arteries; emboli detection without intravenous microbubble injection	93892
Transcranial Doppler study of the intracranial arteries;; emboli detection with intravenous microbubble injection	93893
Duplex scan of extracranial arteries; complete bilateral study	93880
Duplex scan of extracranial arteries; unilateral or limited study	93882

Non-invasive physiologic studies of extracranial arteries, complete bilateral study	93875
---	-------

General Guidelines (PEDHD-1.0)

HDP.GG.0001.0.A

v1.0.2024

- A pertinent clinical evaluation including a detailed history, physical examination with a thorough neurologic examination since the onset or change in signs and/or symptoms²⁹, appropriate laboratory studies and basic imaging such as plain radiography or ultrasound should be performed prior to considering advanced imaging (CT, MR, Nuclear Medicine), unless the individual is undergoing guideline-supported scheduled imaging evaluation. A meaningful technological contact (telehealth visit, telephone call, electronic mail or messaging) since the onset or change in signs and/or symptoms²⁹, can serve as a pertinent clinical evaluation.
 - A detailed neurological exam is required prior to advanced imaging except in the following scenarios:
 - Individual is undergoing a guideline-supported scheduled follow-up imaging evaluation
 - Tinnitus, TMJ, Sinus or mastoid disease, ear pain, hearing loss, eye disease, papilledema³⁰, dental requests and epistaxis. (A relevant physical exam is still required.)
 - The request is from a neurologist, neurosurgeon, endocrinologist, otolaryngologist, or ophthalmologist who has evaluated the individual since onset of symptoms.
- Unless otherwise stated in a specific guideline section, the use of advanced imaging to screen asymptomatic individuals for disorders involving the head is not supported. Advanced imaging of the head is only indicated in individuals who have documented active clinical signs or symptoms of disease involving the head.
- Unless otherwise stated in a specific guideline section, repeat imaging studies of the head are not necessary unless there is evidence for progression of disease, new onset of disease, and/or documentation of how repeat imaging will affect individual management or treatment decisions.

Pediatric Head Imaging Age Considerations (PEDHD-1.1)

HDP.GG.0001.1.A

v1.0.2024

- Many conditions affecting the head in the pediatric population are different diagnoses than those occurring in the adult population. For those diseases which occur in both pediatric and adult populations, minor differences may exist in management due to individual age, comorbidities, and differences in disease natural history between children and adults.
- Individuals who are 18 years old or younger³¹ and any conditions not specifically discussed in the General Head Imaging Guidelines should be imaged according to the Pediatric Head Imaging Guidelines. Any conditions not specifically discussed in the Pediatric Head Imaging Guidelines should be imaged according to the General Head Imaging Guidelines. Individuals who are >18 years old should be imaged according to the General Head Imaging Guidelines, except where directed otherwise by a specific guideline section.

Pediatric Head Imaging Appropriate Clinical Evaluation (PEDHD-1.2)

HDP.GG.0001.2.A

v1.0.2024

Requests for Studies with Overlapping Fields

- There are many CPT® codes for imaging the head that have significantly overlapping fields. In the majority of cases where multiple head CPT® codes are requested, only one CPT® code is appropriate unless there is clear documentation of a need for the additional codes to cover all necessary body areas.
- See **General Guidelines - Anatomic Issues (HD-1.1)** in the Head Imaging Guidelines for the correct coding of these studies.

Pediatric Head Imaging Modality

General Considerations (PEDHD-1.3)

HDP.GG.0001.3.A

v1.0.2024

- MRI
 - MRI is the preferred modality for imaging the pediatric head unless otherwise stated in a specific guideline section.
 - Due to the length of time required for MRI acquisition and the need to minimize individual movement, anesthesia is usually required for almost all infants (except neonates) and young children (age <7 years) as well as older children with delays in development or maturity. This anesthesia may be administered via oral or intravenous routes. In this individual population, MRI sessions should be planned with a goal of minimizing anesthesia exposure by adhering to the following considerations:
 - MRI procedures can be performed without and/or with contrast use as supported by these condition based guidelines. If intravenous access will already be present for anesthesia administration and there is no contraindication for using contrast, imaging without and with contrast may be appropriate if requested. By doing so, the requesting provider may avoid repetitive anesthesia administration to perform an MRI with contrast if the initial study without contrast is inconclusive.
 - Recent evidence based literature demonstrates the potential for gadolinium deposition in various organs including the brain, after the use of MRI contrast.
 - The U.S. Food and Drug Administration (FDA) has noted that there is currently no evidence to suggest that gadolinium retention in the brain is harmful and restricting gadolinium-based contrast agents (GBCAs) use is not warranted at this time. It has been recommended that GBCA use should be limited to circumstances in which additional information provided by the contrast agent is necessary and the necessity of repetitive MRIs with GBCAs should be assessed.
 - If multiple body areas are supported by eviCore guidelines for the clinical condition being evaluated, MRI/MRA of all necessary body areas should be obtained concurrently in the same anesthesia session.
- CT
 - CT is generally inferior to MRI for imaging the pediatric head, but has specific indications in which it is the preferred modality listed in specific sections of these guidelines.
 - CT should not be used to replace MRI in an attempt to avoid sedation unless listed as a recommended study in a specific guideline section.
 - CT Head without contrast (CPT® 70450) may be indicated for:
 - Mass effect

- Blood/blood products
- Urgent/emergent settings due to availability and speed of CT
- Trauma
- Recent hemorrhage, whether traumatic or spontaneous
- Bony structures of the head evaluations including dystrophic calcifications
- Hydrocephalus evaluation and follow-up
 - Some centers use limited non-contrast “fast or rapid MRI” (CPT® 70551) to minimize radiation exposure in children - these requests are appropriate.
- Prior to lumbar puncture in individuals with cranial complaints
- Scenarios in which MRI is contraindicated (i.e. pacemakers, ICDs, cochlear implants, aneurysm clips, orbital metallic fragments, etc.)
- CT and MR Angiography (CTA and MRA) Head and Neck
 - MRA Head may be performed without contrast (CPT® 70544), with contrast (CPT® 70545), or without and with contrast (CPT® 70546).
 - CTA Head is performed without and with contrast (CPT® 70496).
 - MRA Neck may be done either without contrast (CPT® 70547), with contrast (CPT® 70548), or without and with contrast (CPT® 70549), depending on facility preference and protocols and type of scanner.
 - CTA Neck is done with and without contrast (CPT® 70496)
- Indications for CTA and MRA Head and Neck vessels include, but are not limited to the following:
 - MRA is the preferred study in children unless contraindicated:
 - Pulsatile tinnitus
 - Hemifacial spasm if consideration for surgical decompression
 - Evaluation of stroke or TIA (See **Pediatric Stroke Initial Imaging (PEDHD-12.2)**, **Pediatric Stroke Subsequent Imaging (PEDHD-12.3)**, **Moyamoya Disease (PEDHD-12.4)**, **Sickle Cell Disease (PEDHD-12.5)** and **CNS Vasculitis and Stroke (PEDHD-12.6)** including collateral assessment)
 - Follow up of known cerebral artery stenosis
 - Trigeminal neuralgia failed medical therapy
 - Cerebral sinus thrombosis suspected with increased intracranial pressure (refractory headaches, papilledema, diagnosis of pseudotumor cerebri)
 - Aneurysm suspected with acute “thunderclap” headache syndrome and appropriate screening or evaluation of known subarachnoid hemorrhage and pseudoaneurysms (may be appropriate to limit CTA to include only the head to avoid unnecessary radiation to the individual) (See **Pediatric Intracranial Aneurysms (PEDHD-10.1)**)
 - Noninflammatory vasculopathy, including radiation vasculopathy (See **Long Term Pediatric Cancer Survivors (PEDONC-19)** in the Pediatric Oncology Imaging Guidelines)
 - Traumatic vascular injuries

- Vascular malformations, vascular anatomic variants and fistulas (See **Pediatric Intracranial Arteriovenous Malformations (AVM) (PEDHD-10.2)**)
- Arterial, including carotid dissections
- Tumors of vascular origin or involving vascular structures
- Surgical and radiation therapy localization, planning and neuronavigation
- Evaluation for vascular intervention and follow-up including postsurgical/posttreatment vascular complications
- Intra-cranial pre-operative planning if there is concern of possible vascular involvement or risk for vascular complication from procedure
- Vasculitis and collagen vascular disease (See **CNS Vasculitis and Stroke (PEDHD-12.6)**)
- Sick cell disease (See **Sickle Cell Disease (PEDHD-12.5)**)
- Moyamoya disease (See **Moyamoya Disease (PEDHD-12.4)**)
- MRA Head without contrast (CPT® 70544), MRA Head with contrast (CPT® 70545), **OR** MRA Head without and with contrast (CPT® 70546) **OR** CTA Head (CPT® 70496) for follow up of aneurysm clipping or coiling procedures (See **Intracranial Aneurysms (HD-12.1)** in the Head Imaging Guidelines)
- CT and MR Venography (CTV and MRV) are reported with the same codes as the CTA/MRA counterpart (there is no specific code for CT/MR venography):
 - If arterial and venous CT or MR studies are both performed in the same session, only one CPT® code should be used to report both procedures
- MRA without and with contrast with venous sinus thrombosis to differentiate total from subtotal occlusion
- NOTE: Evaluation of posterior circulation disease requires both neck and head MRA/CTA to visualize the entire vertebral-basilar system.
- Ultrasound
 - Cranial ultrasound (CPT® 76506) is a non-invasive means of evaluating for intracranial abnormalities in infants with an open anterior fontanelle.
 - Transcranial Doppler ultrasonography has some utility in select populations of older children with known or suspected intracranial vascular disease.
- Nuclear Medicine
 - Nuclear medicine studies other than metabolic PET imaging on the pediatric brain or head are rarely performed in an elective outpatient setting, but the following studies are supported for the following indications:
 - Brain Scintigraphy with or without vascular flow (any one of CPT® codes: CPT® 78600, CPT® 78601, CPT® 78605, or CPT® 78606)
 - Radiopharmaceutical Localization Imaging SPECT (CPT® 78803)
 - Immunocompromised individuals with mass lesion detected on CT or MRI for differentiation between lymphoma and infection.

- Radiopharmaceutical Localization Imaging SPECT (CPT® 78803) with vasodilating agent acetazolamide (Diamox) challenge when surgery or other vascular intervention is being considered (i.e. Moyamoya).
- Brain Imaging Vascular Flow (CPT® 78610)
 - Cerebral ischemia.
 - Establish brain death (rarely done in outpatient setting).
- CSF Leakage Detection (CPT® 78650)
 - Evaluation of CSF rhinorrhea or otorrhea, or refractory post-lumbar puncture headache.
- Radiopharmaceutical Dacryocystography (CPT® 78660)
 - Suspected obstruction of nasolacrimal duct due to excessive tearing.
- 3D Rendering
 - CPT® 76377 (3D rendering requiring image post-processing on an independent workstation) or CPT® 76376 (3D rendering not requiring image post-processing on an independent workstation) can be considered in the following clinical scenarios:
 - Bony conditions:
 - Evaluation of congenital skull abnormalities in newborns, infants, and toddler (usually for preoperative planning)
 - Complex joint fractures or pelvis fractures
 - Spine fractures (usually for preoperative planning)
 - Complex facial fractures
 - Preoperative planning for other complex surgical cases
 - Cerebral angiography
 - 3D Rendering (CPT® 76377 or CPT® 76376) may be used for surgical planning and surgical follow up after craniotomy when ordered by surgical specialist.
 - 3D Rendering indications in pediatric head imaging are identical to those in the general imaging guidelines. See **3D Rendering (Preface-4.1)** in the Preface Imaging Guidelines
- The guidelines listed in this section for certain specific indications are not intended to be all-inclusive; clinical judgment remains paramount and variance from these guidelines may be appropriate and warranted for specific clinical situations.

Background and Supporting Information

- “The U.S. Food and Drug Administration (FDA) is warning that repeated or lengthy use of general anesthetic and sedation drugs during surgeries or procedures in children younger than 3 years or in pregnant women during their third trimester may affect the development of children’s brains. ... Published studies in pregnant animals and young animals have shown the use of general anesthetic and sedation drugs for more than 3 hours caused widespread loss of nerve cells in the brain. ... All the studies in children had limitations, and it is unclear whether any negative effects seen in children’s learning or behavior were due to the drugs or to other

factors, such as the underlying medical condition that led to the need for the surgery or procedure.”²⁸

General Guidelines-Other Imaging Situations (PEDHD-1.4)

HDP.GG.0001.4.A

v1.0.2024

- MRI Brain without contrast (CPT® 70551) or MRI Brain with and without contrast (CPT® 70553) can be performed for nausea and vomiting, persistent, unexplained and a negative GI evaluation
- Screening for metallic fragments before MRI should be done initially with Plain x-ray.
 - The use of CT Orbital to rule out orbital metallic fragments prior to MRI is rarely necessary
 - Plain x-rays are generally sufficient; x-ray detects fragments of 0.12 mm or more, and CT detects those of 0.07 mm or more
 - Plain x-ray is generally sufficient to screen for aneurysm clips
- CPT® 76377 (3D rendering requiring image post-processing on an independent workstation) or CPT® 76376 (3D) can be considered when performed in conjunction with conventional angiography (i.e.: conventional 4 vessel cerebral angiography).
- MRI Brain with and without contrast (CPT® 70553) is appropriate in consideration of neurosarcoidosis
- CT or MRI Perfusion (See **CT or MRI Perfusion (HD-24.5)** in the Head Imaging Guidelines)
 - Performed as part of a CT Head or MRI Brain examination in the evaluation of individuals with very new strokes or brain tumors.
 - Category III 0042T - “cerebral perfusion analysis using CT”. The study is generally limited to evaluation of acute stroke (<24 hours), to help identify individuals with stroke-like symptoms most likely to benefit from thrombolysis or thrombectomy, to assist in planning and evaluating the effectiveness of therapy for cervical or intracranial arterial occlusive disease and/or chronic cerebral ischemia, identifying cerebral hyperperfusion syndrome following revascularization and following aneurysmal subarachnoid hemorrhage. Other indications are usually regarded as investigational and experimental. Individual health plan policies should be confirmed. (See **Moyamoya Disease (PEDHD-12.4)**)
 - There is no specific CPT® code for MRI Perfusion. Perfusion weighted images are not coded separately from a MRI Brain examination. If MRI Brain is planned, no additional CPT® codes are necessary or appropriate to perform MRI perfusion.
- MRI Perfusion may be obtained with MRI Brain (CPT® 70551 **OR** CPT® 70552 **OR** CPT® 70553), no additional CPT® codes are necessary or appropriate to perform MRI perfusion.³¹

Specialized Imaging Techniques (PEDHD-2)

Guideline

Magnetic Resonance Spectroscopy (MRS, CPT® 76390) (PEDHD-2.1)
Functional Magnetic Resonance Imaging (fMRI, CPT® 70554 and CPT® 70555) (PEDHD-2.2)
PET Brain Imaging (CPT® 78608) (PEDHD-2.3)
References (HDP-2)

Magnetic Resonance Spectroscopy (MRS, CPT[®] 76390) (PEDHD-2.1)

HDP.SI.0002.1.U

v1.0.2024

- Magnetic Resonance Spectroscopy involves the analysis of the levels of certain chemicals in pre-selected voxels (small regions) on an MRI scan done at the same time.
- Uses in pediatric neuro-oncology: See **Pediatric CNS Tumors (PEDONC-4)** in the Pediatric Oncology Imaging Guidelines.
- MRS is indicated in individuals with neonatal hypoxic ischemic encephalopathy to help estimate the age of the injury.
- Uses in Metabolic Disorders:
 - See **Neurometabolic and Neurogenetic Disorders (PEDHD-19.4)**
- MRS is considered investigational for all other pediatric indications at this time.

Functional Magnetic Resonance Imaging (fMRI, CPT® 70554 and CPT® 70555) (PEDHD-2.2)

HDP.SI.0002.2.A

v1.0.2024

- MRI is indicated to define eloquent areas of the brain as part of preoperative planning for epilepsy surgery or removal of a mass lesion.
 - The documentation should be clear that brain surgery is planned.
 - Can be performed concurrently with MRI Brain (CPT® 70551 or CPT® 70553) and/or PET Brain Metabolic (CPT® 78608 or CPT® 78609).
- fMRI is considered investigational for all other pediatric indications at this time.

PET Brain Imaging (CPT® 78608) (PEDHD-2.3)

HDP.SI.0002.3.A

v1.0.2024

- Uses in pediatric neuro-oncology: See **Pediatric CNS Tumors (PEDONC-4)** in the Pediatric Oncology Imaging Guidelines.
- Metabolic (FDG) PET Brain is indicated to define active areas of the brain as part of preoperative planning for epilepsy surgery. The documentation should be clear that brain surgery is planned.
 - Can be appropriate concurrently with MRI Brain (CPT® 70551 or CPT® 70553) and/or fMRI (CPT® 70554 or CPT® 70555).
- Metabolic (FDG) PET Brain/MRI is generally not supported for neurologic conditions due to lack of standardization in imaging technique and interpretation. However, it can be appropriate in certain pediatric individuals when ALL of the following criteria are met:
 - The individual meets guideline criteria for Metabolic (FDG) PET/CT Brain AND
 - Metabolic (FDG) PET/CT Brain is not available at the treating institution AND
 - The provider requests Metabolic (FDG) PET Brain/MRI in lieu of Metabolic (FDG) PET/CT Brain
- Metabolic (FDG) PET Brain/MRI, when the above criteria are met, are reported using the code combination of Metabolic (FDG) PET Brain (CPT® 78608) and MRI Brain (CPT® 70551 or CPT® 70553). All other methods of reporting Metabolic (FDG) PET Brain/MRI are inappropriate
 - When clinically appropriate, diagnostic MRI codes can be appropriate at the same time as the Metabolic (FDG) PET Brain/MRI code combination.
- Metabolic (FDG) PET Brain is considered investigational for all other pediatric indications at this time.

Pediatric Headache (PEDHD-3)

Guideline

Pediatric Headache (PEDHD-3.1)

References (HDP-3)

Pediatric Headache (PEDHD-3.1)

HDP.PH.0003.1.A

v1.0.2024

- Headache is a very common complaint in school aged children and adolescents. Many of these children have a family history of one of the primary headache disorders, such as migraine or tension headache.
- A pertinent clinical evaluation including a detailed history, physical examination with a thorough neurologic examination, since the onset or change in signs and/or symptoms, and appropriate laboratory studies should be performed prior to considering advanced imaging.
- Advanced imaging is not indicated for pediatric individuals with headache in the absence of red flag symptoms.
- Sensitivity and specificity of MRI are greater than that of CT for intracranial lesions.
- MRI Brain without contrast (CPT® 70551) **OR** MRI Brain without and with contrast (CPT® 70553) is indicated for children with headaches and at least ONE of the following red flags:
 - Age ≤ 5 years.
 - Headaches awakening from sleep or always present in the morning.
 - Focal findings, and/or symptoms on neurologic examination including diplopia.
 - Clumsiness (common description of gait or coordination problems in young children).
 - Headaches associated with morning nausea/vomiting.
 - Seizures
 - Papilledema on physical exam.
 - Headache precipitated by coughing, sneezing, physical exertion¹² or Valsalva.
 - Thunderclap headache.
 - Progressive worsening in headache frequency and severity without period of temporary improvement.
 - Systemic symptoms such as persistent fever, weight loss, rash, or joint pain.
 - Immunocompromised individual.
 - Individual with hypercoagulable state or bleeding disorder.
 - Known history of cancer of any type.
 - Known autoimmune or rheumatologic disease.
 - Known genetic disorder with predisposition to intracranial mass lesions.
 - History of stable chronic headaches with recent significant change in frequency or severity.
 - Focal neurological complaints including dizziness, visual change, acute hypertension or altered mental status.

- MRI Brain without contrast (CPT® 70551) **OR** MRI Brain without and with contrast (CPT® 70553) is appropriate in the presence of neurological signs and/or symptoms, including headache, after COVID-19 infection
- If concern for CNS infection – See **CNS Infection (PEDHD-29)**
- CT Head poorly visualizes the posterior fossa in children and is generally insufficient to evaluate pediatric headaches with red flag symptoms. CT is not supported in lieu of MRI solely to avoid sedation.
- CT Head without contrast (CPT® 70450) is indicated for pediatric headache with one or more of the following:
 - Sudden severe headache including thunderclap headache
 - Acute setting of suspected intracranial infection prior to lumbar puncture (CT Head with contrast CPT® 70460 if intracranial spread of disease is suspected to detect suppurative fluid collections) (See **General Guidelines-Other Imaging Situations (PEDHD-1.4)**)
 - To exclude new hemorrhage, significant mass effect, or hydrocephalus in cases including rapid clinical deterioration.
 - Recent head trauma.
 - Suspected skull or other bony involvement.
 - If MRI is contraindicated
 - Ventriculoperitoneal shunt with suspected shunt malfunction. See **Macrocephaly, Microcephaly, and Hydrocephalus (PEDHD-7)** for additional imaging.
- MRI Brain without contrast (CPT® 70551) **OR** MRI Brain without and with contrast (CPT® 70553) is appropriate if a recent CT is inconclusive.
- MRI Brain without and with contrast (CPT® 70553) is appropriate if an abnormality is identified on a noncontrasted MRI performed greater than 2 weeks, otherwise a MRI Brain with contrast (CPT® 70552) is appropriate
- MRA Head or CTA Head are not generally medically necessary in the evaluation of headache in children unless a vascular lesion has been seen or suspected on a prior MRI Brain or CT Head.
 - Concurrent MRI and MRA is generally not indicated.
- MRV Head (CPT® 70544, CPT® 70545, or CPT® 70546) is indicated in pediatric individuals with papilledema and headache. See **Papilledema/Pseudotumor Cerebri (HD-17.1)** in the Head Imaging Guidelines

Pediatric Head and Face Trauma (PEDHD-4)

Guideline

Head Trauma (PEDHD-4.1)

Facial Trauma (PEDHD-4.2)

References (HDP-4)

Head Trauma (PEDHD-4.1)

HDP.PS.0004.1.A

v1.0.2024

- In individuals with recent head trauma, a history focused on the incident and careful examination of the head, neck, and neurological function should be performed since the onset or change in signs and/or symptoms prior to considering advanced imaging.
- Advanced imaging is indicated for children with head trauma with ANY of the following red flags:
 - Loss of consciousness
 - Altered mental status or abnormal behavior
 - Known or suspected skull fracture
 - Glasgow Coma Score <15
 - Age younger than 2 years
 - Vomiting
 - Severe mechanism of injury
 - Severe or worsening headache
 - Amnesia
 - Nonfrontal scalp hematoma
- CT Head without contrast (CPT® 70450) is the primary advanced imaging study in individuals with acute head trauma.
 - CT Maxillofacial without contrast (CPT® 70486), CT Orbits/Temporal Bone without contrast (CPT® 70480), **OR** CT Cervical Spine without contrast (CPT® 72125) is indicated if there has been associated injury to those structures.
- MRI Brain without contrast (CPT® 70551) **OR** MRI Brain without and with contrast (CPT® 70553) is indicated for the following:
 - Children with an abnormal neurological exam that is not explained by the CT findings.
 - Subacute (8 days to one month after initial traumatic event) or chronic blunt head trauma with new or worsening neurological signs or cognitive symptoms
 - Children suspected of being the victims of physical abuse. See **Suspected Physical Child Abuse (PEDMS-7)** in the Pediatric Musculoskeletal Imaging Guidelines.
- Following a head injury, a repeat CT Head without contrast (CPT® 70450) **OR** MRI Brain without contrast (CPT® 70551) is indicated if the child develops fixed or fluctuating diminished mental acuity or alertness, or new abnormalities on neurological examination.
- Follow-up of known or treated parenchymal subdural or epidural hematoma may require frequent imaging during the initial 8 weeks following injury, and these requests should generally appropriate.

Facial Trauma (PEDHD-4.2)

HDP.PS.0004.2.A

v1.0.2024

- CT Maxillofacial without contrast (CPT® 70486) is the preferred imaging study in facial trauma.

Coding of Facial Imaging

- Both CT Orbital/Facial/Temporal Bone without contrast (CPT® 70480) and CT Maxillofacial (CPT® 70486) cover the structures of the orbits, sinuses, and face. Unless there is a grounded suspicion of simultaneous involvement of more posterior lesions, especially of the region involving the middle or inner ear, one of these studies only should be sufficient.
- CT Maxillofacial without contrast (CPT® 70486) is the usual study (except in obvious orbital or temporal bone trauma), but either study is appropriate.

Sinusitis and Allergic Rhinitis (PEDHD-5)

Guideline

Sinus And Facial Imaging General Considerations (PEDHD-5.1)

Imaging Indications in Sinusitis (PEDHD-5.2)

Stereotactic CT Localization (CPT® 77011) (PEDHD-5.3)

Requests for both Head and Sinus Imaging (PEDHD-5.4)

Allergic Rhinitis (PEDHD-5.5)

Other Indications for Sinus Imaging (PEDHD-5.6)

References (HDP-5)

Sinus And Facial Imaging General Considerations (PEDHD-5.1)

HDP.AR.0005.1.A**v1.0.2024**

- Acute sinusitis is a clinical diagnosis, and imaging is not indicated to establish a diagnosis. Acute bacterial sinusitis can be presumptively diagnosed in a child with acute upper respiratory infection (URI) symptoms and any of the following:
 - Persistent symptoms lasting >10 days without improvement.
 - Worsening symptoms after initial period of improvement.
 - Severe symptoms including purulent nasal discharge and fever >102.2°F for at least 3 consecutive days.
 - Presumed bacterial infections should be treated empirically with appropriate antibiotics.
 - Imaging of any kind cannot distinguish bacterial from viral sinusitis.

Imaging Indications in Sinusitis (PEDHD-5.2)

HDP.AR.0005.2.A

v1.0.2024

- Mild mucosal thickening in the paranasal sinuses or mastoids is an extremely common incidental finding noted on head imaging studies done for other indications. If there are no other abnormalities of facial structures noted, this finding is not an indication for advanced imaging of the sinuses or temporal bone.
- CT Maxillofacial without contrast (CPT® 70486) is indicated if ANY of the following is present:
 - No improvement after 10 days of appropriate antibiotic treatment (generally this will be amoxicillin/clavulanate, amoxicillin, cefdinir, cefuroxime, cefpodoxime, or ceftriaxone)
 - Recurrence of a treated infection within 8 weeks of effective treatment
 - Chronic sinusitis (persistent residual URI symptoms, including nasal obstruction, facial pressure/pain or cough¹¹ for >90 days)
 - Known or suspected fungal sinusitis
 - MRI Orbit/Face/Neck without and with contrast (CPT® 70543) is appropriate if requested instead of CT Maxillofacial
 - Preoperative evaluation to assess surgical candidacy
- CT Maxillofacial with contrast (CPT® 70487) can be performed if ANY of the following is present:
 - Orbital or facial cellulitis
 - Proptosis.
 - Abnormal visual examination
 - Ophthalmoplegia
 - Immunocompromised individual
 - Fungal or vascular lesions visualized in nasal cavity
- CT Head with contrast (CPT® 70460) **OR** MRI Brain without and with contrast (CPT® 70553) **OR** MRI Orbit/Face/Neck with and without contrast (CPT® 70543) is indicated if ANY of the following are present:
 - Focal neurologic findings
 - Altered mental status
 - Seizures
 - Concern for orbital complications
 - Concern for invasive fungal sinusitis
 - MRA Head (CPT® 70544, CPT® 70545, or CPT® 70546) **OR** CTA Head (CPT® 70496) is appropriate with these findings as well if there is clinical concern for

associated vascular complications including but not limited to mycotic aneurysm or venous sinus thrombosis.

- Repeat sinus imaging is generally not indicated for individuals who have responded satisfactorily to treatment, but is appropriate with clear documentation of the need for updated CT results to direct acute patient care decisions.

Stereotactic CT Localization (CPT® 77011) (PEDHD-5.3)

HDP.AR.0005.3.A

v1.0.2024

- Stereotactic CT localization is frequently obtained prior to sinus surgery. The dataset is then loaded into the navigational workstation in the operating room for use during the surgical procedure. The information provides exact positioning of surgical instruments with regard to the individual's 3D CT images. In most cases, the preoperative CT is a technical-only service that does not require interpretation by a radiologist.
- For treatment planning for sinus surgery CPT® 77011: A stereotactic CT localization scan is frequently obtained prior to sinus surgery. The dataset is then loaded into the navigational workstation in the operating room for use during the surgical procedure. The imaging facility should report CPT® 77011 when performing a scan not requiring interpretation by a radiologist.
- If a diagnostic scan is performed and interpreted by a radiologist, the appropriate diagnostic CT code (e.g. CPT® 70486) should be used.
- It is not appropriate to report both CPT® 70486 and CPT® 77011 for the same CT stereotactic localization imaging session.
- 3D Rendering (CPT® 76376 or CPT® 76377) should not be reported in conjunction with CPT® 77011 (or CPT® 70486 if used). The procedure inherently generates a 3D dataset.
- Such operative studies are indicated when ordered by the operating surgeon for this purpose.

Requests for both Head and Sinus Imaging (PEDHD-5.4)

HDP.AR.0005.4.A

v1.0.2024

- CT Head does not visualize all of the sinuses.
- MRI Brain provides excellent visualization of the sinuses sufficient to recognize sinusitis, and addition of sinus CT for this purpose is unnecessary.
- In individuals being evaluated for potential sinus surgery, separate CT Sinus is often appropriate even after a MRI Brain in order to visualize obstructions to spontaneous mucus flow. See **Stereotactic CT Localization (CPT® 77011) (PEDHD-5.3)**.
- Separate head imaging is not generally indicated in individuals with a normal neurological examination who have headaches associated with sinus symptoms.
- CT or MRI Sinus is not indicated for the evaluation of headaches or neurological complaints without a more specific indication pointing to a sinus etiology

Allergic Rhinitis (PEDHD-5.5)

HDP.AR.0005.5.A

v1.0.2024

- Advanced imaging is not indicated for diagnosis or management of individuals with uncomplicated allergic rhinitis.

Other Indications for Sinus Imaging (PEDHD-5.6)

HDP.AR.0005.6.A

v1.0.2024

- See **Facial Trauma (PEDHD-4.2)** for imaging guidelines in trauma.
- CT Maxillofacial without contrast (CPT® 70486) - Congenital anomalies of facial structures.
- Cleft lip and palate can be associated with brain malformations and abnormal brain development.
 - MRI Brain (CPT® 70551) is appropriate in cases of cleft lip and/or palate.
 - MRI Orbits/Face/Neck without contrast (CPT® 70540) or MRI Orbits/Face/Neck with and without contrast (CPT® 70543)¹⁹ is appropriate if requested by surgeon or any provider in consultation with the surgeon. See **Facial Anomalies (PEDHD-8.2)**
- 3D CT reconstructed images (CPT® 76377) **OR** CPT® 76376 in conjunction with routine CT should be an integral part of the examination in evaluating craniofacial abnormalities.
- CT Maxillofacial without and with contrast (CPT® 70488) **OR** MRI Orbits/Face/Neck without and with contrast (CPT® 70543) - Tumors or other disorders of facial structures.
- Obstructive sleep apnea See **Pediatric Sleep Disorders (PEDHD-24.1)** for imaging guidelines.
- See **Sinus and Facial Imaging (HD-29)** for conditions not addressed in **Sinus and Facial Imaging (PEDHD-5)**

Epilepsy and Other Seizure Disorders (PEDHD-6)

Guideline

Epilepsy and Other Seizure Disorders (PEDHD-6.0)

Initial Imaging of Non-Febrile Seizures (PEDHD-6.1)

Repeat imaging indications (PEDHD-6.2)

Special Imaging Studies in Evaluation for Epilepsy Surgery (PEDHD-6.3)

Febrile Seizures (PEDHD-6.4)

References (HDP-6)

Epilepsy and Other Seizure Disorders (PEDHD-6.0)

HDP.EP.0006.0.A

v1.0.2024

- A pertinent evaluation including a detailed history, physical examination with a thorough neurologic examination, since the onset or change in signs and/or symptoms, and appropriate laboratory studies should be performed prior to considering the use of an advanced imaging (CT, MRI, Nuclear Medicine) procedure. An exception can be made if the individual is undergoing guideline-supported, scheduled follow-up imaging evaluation or request is from or in consultation with a neurologist or neurosurgeon who has seen the individual since onset of symptoms. This clinical evaluation should also include family history and (whenever possible) the accounts of eyewitnesses to the event(s).

Initial Imaging of Non-Febrile Seizures (PEDHD-6.1)

HDP.EP.0006.1.A

v1.0.2024

- MRI Brain without contrast (CPT® 70551) **OR** MRI Brain without and with contrast (CPT® 70553) is indicated for the following:
 - First-time seizure in child that has no known cause and is not associated with fever
 - Partial seizures
 - New onset primary generalized epilepsy (e.g., absence epilepsy or juvenile myoclonic epilepsy)¹ in those who are neurologically abnormal (e.g. developmental delay)
 - Focal neurologic deficits
 - Inconclusive findings on recent cranial ultrasound or CT Head
 - If individual meets criteria for MRI imaging for initial imaging of non-febrile seizure, MRI is appropriate even with a recent negative CT.
 - MRI Brain with and without contrast (CPT® 70553) is appropriate if there are history or examination findings concerning for a mass lesion or demyelinating disease.
- CT Head without contrast (CPT® 70450) is indicated for the following:
 - First-time seizure in child associated with recent head trauma, barrier to obtaining a neuroimaging study in a timely manner and should not preclude MRI imaging when requested. (Late post traumatic seizures may be better evaluated by MRI Brain without contrast (CPT® 70551) See **Head Trauma (PEDHD-4.1)**)
 - Individual cannot safely undergo MRI (avoidance of sedation is not an indication) or in urgent situations.
 - Identification of blood and calcifications
- Cranial ultrasound (CPT® 76506) for the following:
 - First-time seizure in child <30 days of age that has no known cause and is not associated with fever if the infant has an open fontanelle.
 - Cranial ultrasound is not required before MRI Brain without (CPT® 70551) for hypoxic ischemic encephalopathy (HIE) and congenital malformations.
- The following imaging tests do not generally add valuable information initially and are not indicated for the initial evaluation of seizures in children:
 - CTA Head or Neck
 - MRA Head or Neck
 - MRI Cervical, Thoracic, or Lumbar Spine

Repeat imaging indications (PEDHD-6.2)

HDP.EP.0006.2.A

v1.0.2024

- Repeat MRI Brain without contrast (CPT® 70551) **OR** MRI Brain without and with contrast (CPT® 70553) is indicated for the following:
 - Need to perform MRI using Epilepsy Protocol (typically 3T magnet with thin section angled slices through hippocampus and temporal lobes, either without or without and with contrast)
 - New or worsening focal neurologic deficits
 - Refractory or drug resistant seizures (See **Background and Supporting Information** below)
 - Change in seizure type
 - Repeat imaging for persistent seizures as per specialist request or any provider in consultation with a specialist
 - MRI Brain with contrast (CPT® 70552) **OR** MRI Brain without and with contrast (CPT® 70553) to clarify an abnormality on noncontrast MRI or if considering infection or inflammation

Background and Supporting Information

- Drug Resistant synonyms may include “Refractory”, “Intractable” or “Pharmacoresistant”
- Drug Resistant requires only 2 trials of antiepileptic medications

Special Imaging Studies in Evaluation for Epilepsy Surgery (PEDHD-6.3)

HDP.EP.0006.3.U

v1.0.2024

- Individuals with a previous MRI Brain and documentation of intractable epilepsy for which surgical treatment or another interventional modality is under active consideration, below are examples of, but not all inclusive, include:
 - Focal Resection
 - Temporal Lobe Resection
 - Extratemporal Resection
 - Lesionectomy
 - Multiple Subpial Transections
 - Laser Interstitial Thermal Therapy
 - Anatomical or Functional Hemispherectomy and Hemispherotomy
 - Corpus Callosotomy
 - Stereotactic Radiosurgery
 - Neurostimulation Device Implantations including,
 - Vagus Nerve Stimulation (VNS)
 - Responsive Neurostimulation
 - Deep Brain Stimulation
- The following requests are appropriate for presurgical evaluation:
 - MRI Brain without contrast (CPT® 70551) **OR MRI Brain** with and without contrast 3T/7T (CPT® 70553)
 - Ictal SPECT (CPT® 78803)
 - Functional MRI (f-MRI) (CPT® 70555 or CPT® 70554) See **Functional MRI (fMRI) (HD-24.2)** in the Head Imaging Guidelines
 - Metabolic (FDG) PET Brain (CPT® 78608)
 - Metabolic (FDG) PET Brain/MRI is generally not supported for neurologic conditions due to lack of standardization in imaging technique and interpretation. However, it may be appropriate in certain pediatric individuals when ALL of the following criteria are met:
 - The individual meets guideline criteria for Metabolic (FDG) PET/CT Brain AND
 - Metabolic (FDG) PET/CT Brain is not available at the treating institution AND
 - The provider requests Metabolic (FDG) PET Brain/MRI in lieu of Metabolic (FDG) PET/CT Brain

- Metabolic (FDG) PET Brain (CPT® 78608) **AND**
- MRI Brain without contrast (CPT® 70551 **OR** MRI Brain without and with contrast (CPT® 70553). All other methods of reporting Metabolic (FDG) PET Brain/MRI are inappropriate.
- When clinically appropriate, diagnostic MRI codes may be appropriate at the same time as the Metabolic (FDG) PET Brain/MRI code combination.
- MR Spectroscopy (CPT® 76390).
- See **Primary Central Nervous System Tumors-General Considerations (ONC-2.1)** in the Oncology Imaging Guidelines for additional imaging requests for surgery and/or **Neurosurgical Imaging (HD-28)** in the Head Imaging Guidelines
- When noninvasive EEG monitoring is insufficient, intracranial monitoring with stereo-EEG or grids/strips and electrodes may be required with appropriate additional imaging for neuronavigation with one of each of the following after consulting the health plan direction for unlisted codes:
 - MRI Brain with and without contrast (CPT® 70553) **OR** MRI Brain without contrast (CPT® 70551)
 - CT Head, contrast as requested CPT
 - If previous head imaging is considered inadequate or additional sequences/protocols are required **OR** is greater than 6 months old, diagnostic head imaging may be appropriate.
- Due to variances with techniques currently available for neuronavigation, the following are appropriate:
 - CTA Head (CPT® 70496) **OR** MRA Head (CPT® 70544, CPT® 70545 or CPT® 70546)
 - Post-operative imaging including after intracranial (EEG) monitoring is appropriate per neurosurgeon's request.

Febrile Seizures (PEDHD-6.4)

HDP.EP.0006.4.A

v1.0.2024

- A typical febrile seizure is a generalized seizure occurring in the presence of fever ($T > 100.4^{\circ}\text{F}/38^{\circ}\text{C}$) and no central nervous system infection in a child between the age of 6 months and 5 years.
- Neuroimaging should not be performed in the routine evaluation of children with simple febrile seizures.
- MRI Brain without contrast (CPT® 70551) **OR** MRI Brain without and with contrast (CPT® 70553) is indicated for febrile seizures in the presence of one or more of the following:
 - Seizure lasting >15 minutes
 - Partial seizures
 - Focal neurologic deficits
 - Multiple seizures within 24 hours
 - Macrocephaly (Head circumference that is greater than the 95th percentile for age and sex, established by use of measurements and CDC growth charts. See **Macrocephaly (PEDHD-7.1)**)
 - Signs and symptoms of increased intracranial pressure
 - Developmental delay
 - If CT Head without contrast (CPT® 70450) was performed for an initial evaluation for new onset seizure, MRI (as described above) is indicated for additional evaluation
- CT of head without contrast (CPT® 70450) is indicated for:
 - Evaluation of structural findings in seizure etiologies that contain dystrophic calcifications, such as with oligodendrogliomas and tuberous sclerosis.
 - Acute setting of seizure evaluation.

Macrocephaly, Microcephaly, and Hydrocephalus (PEDHD-7)

Guideline

Macrocephaly (PEDHD-7.1)

Microcephaly (PEDHD-7.2)

Hydrocephalus (PEDHD-7.3)

References (HDP-7)

Macrocephaly (PEDHD-7.1)

HDP.MC.0007.1.A

v1.0.2024

- Macrocephaly is defined as head circumference that is greater than the 95th percentile for age and sex, or head circumference increasing in percentiles over two visits established by use of measurements and CDC growth charts. An online calculator to determine head circumference percentile is available at: <http://www.infantchart.com/cdc0to3headforage.php>.
- Birth to age 6 months:
 - Ultrasound Head (CPT® 76506) is indicated initially in individuals with an open fontanelle.
 - CT Head without contrast (CPT® 70450) is indicated if hydrocephalus or hemorrhage is present on ultrasound.
 - MRI Brain without contrast (CPT® 70551) or without and with contrast (CPT® 70553) is indicated for any abnormality seen on ultrasound.
- Age 7 months and older, or with closed fontanelle:
 - MRI Brain without contrast (CPT® 70551) or without and with contrast (CPT® 70553) is indicated.
 - CT is generally not indicated in this age group since uncomplicated hydrocephalus is less likely after early infancy.

Microcephaly (PEDHD-7.2)

HDP.MC.0007.2.A**v1.0.2024**

- Microcephaly is defined as head circumference that is less than the 5th percentile for age and sex, or head circumference decreasing in percentiles over two visits established by use of measurements and CDC growth charts. An online calculator to determine head circumference percentile is available at: <http://www.infantchart.com/cdc0to3headforage.php>.
- MRI Brain without and with contrast (CPT® 70553) is indicated for all individuals.
 - CT is generally not recommended as that modality lacks the sensitivity to detect the relevant anatomical abnormalities

Hydrocephalus (PEDHD-7.3)

HDP.MC.0007.3.A

v1.0.2024

- This is the most common identifiable cause of macrocephaly. Almost all hydrocephalus is obstructive, except hydrocephalus due to choroid plexus papillomas. See **Choroid Plexus Tumors (PEDONC-4.13)** in the Pediatric Oncology Imaging Guidelines for those lesions.
- Hydrocephalus is traditionally divided into non-communicating (the obstruction lies within the course of the brain's ventricular system) and communicating (the obstruction is distal to the ventricular system).
- Ventriculomegaly refers to enlarged ventricular spaces. It is often initially found on fetal ultrasound. It can be from an obstructive cause or can be relative secondary to small brain volume. It can remain stable and may be monitored with serial ultrasound (CPT® 76506) to assess stability or MRI Brain with and without contrast (CPT® 70553) if over age 6 months. If ventriculomegaly progresses to hydrocephalus, follow imaging timelines listed below for hydrocephalus.
- Benign external hydrocephalus (aka benign extra-axial fluid collection among other names) is defined as a rapid increase in head circumference in an infant with enlarged frontal subarachnoid spaces. It is a common cause of macrocephalus and is commonly secondary to a familial large head size. See **Macrocephaly (PEDHD-7.1)** for initial imaging guidelines. It typically requires no intervention. Once diagnosed and confirmed with MRI Brain with and without contrast (CPT® 70553) no additional imaging is required unless new neurological symptoms appear, worsen or persist beyond age 4 years. If developmental motor delay See **Developmental Motor Delay (PEDHD 19.3)**.
- For CSF flow imaging See **CSF Flow Imaging (HD-24.4)** in the Head Imaging Guidelines

Initial Imaging Indications

- Age 0-6 months:
 - Screening head ultrasound examination (CPT® 76506)
 - MRI Brain without and with contrast (CPT® 70553) is indicated if ultrasound shows hydrocephalus.
 - Serial US (CPT® 76506) can be used to monitor ventricular size to determine need and timing of placement of a ventricular catheter, or performance of an endoscopic third ventriculostomy (ETV).
- Greater than 6 months old:
 - MRI Brain without and with contrast (CPT® 70553) is indicated.

Spine Imaging Indication	Imaging Study
Including, but not limited to: <ul style="list-style-type: none"> Chiari Malformation Malignant infiltration of meninges 	MRI Cervical Spine without and with contrast (CPT® 72156) OR MRI Cervical Spine without contrast (CPT® 72141) AND/OR MRI Thoracic Spine without contrast (CPT® 72146) OR MRI Thoracic Spine without and with contrast (CPT® 72157) AND/OR MRI Lumbar Spine without and with contrast (CPT® 72158) OR MRI Lumbar Spine without contrast (CPT® 72148)
Dandy-Walker malformation	MRI Cervical Spine without and with contrast (CPT® 72156) OR MRI Cervical Spine without contrast (CPT® 72141)

Repeat Imaging Indications including CSF flow shunting and Ventriculostomy

- Rapid MRI Brain without contrast (CPT® 70551) **OR** CT Head without contrast (CPT® 70450) is indicated for any new signs or symptoms suggesting shunt malfunction or ETV malfunction, including (but not limited to) sepsis, decreased level of consciousness, protracted vomiting, visual or neurologic deterioration, decline of mentation after initial improvement, or new or changing pattern of seizures.
- Rapid MRI Brain without contrast (CPT® 70551) **OR** CT Head without contrast (CPT® 70450) is indicated after shunt setting adjustments or as ordered by a neurologist or neurosurgeon or any provider in consultation with a neurologist or neurosurgeon.
- Rapid MRI Brain without contrast (CPT® 70551) **OR** CT Head without contrast (CPT® 70450) is indicated in the postoperative period following shunt placement or ETV, with further follow-up imaging 6-12 months after the procedure and then every 12 months for individuals with stable clinical findings.
 - Rapid MRI provides more anatomical detail and does not involve radiation exposure, but many providers use CT Head as rapid MRI is not universally available.

- For routine follow up imaging with CT a low dose protocol should be used.
- Shunting into the peritoneum (VP shunts) can give rise to abdominal complications, but these are generally symptomatic, so surveillance imaging of the abdomen is not indicated.
 - Abdominal ultrasound (CPT® 76700) is appropriate for suspicion of CSF pseudocyst formation or distal shunt outlet obstruction.
- Familial screening is not indicated for hydrocephalus except in siblings of individuals with aqueductal stenosis, for whom a one-time CT Head without contrast (CPT® 70450) or Rapid MRI Brain without contrast (CPT® 70551) is indicated.

Additional Rarely Used Studies

- Cisternogram (CPT® 78630) is rarely done in children but can be appropriate for the following:
 - Known hydrocephalus with worsening symptoms.
 - Suspected obstructive hydrocephalus.
 - Suspected normal pressure hydrocephalus with gait disturbance and either dementia or urinary incontinence.
- Cerebrospinal Ventriculography (CPT® 78635) is rarely done in children but can be appropriate for the following:
 - Evaluation of internal shunt, porencephalic cyst, or posterior fossa cyst.
- Nuclear Medicine Shunt Evaluation (CPT® 78645) and CSF Flow SPECT (CPT® 78803) are rarely done in children but can be appropriate for the following:
 - Suspected malfunction of ventriculoperitoneal, ventriculopleural, or ventriculovenous shunts.

Background and Supporting Information

- Head ultrasound can be performed while the fontanelles are still open and has excellent spatial and anatomic resolution, particularly within the first 2 months of life. After 6 months, smaller acoustic windows due to closing sutures limit the sensitivity of the examination.
- Rapid MRI Brain without contrast (CPT® 70551) provides more anatomical detail and does not involve radiation exposure, but many providers use CT Head as rapid MRI is not universally available

Craniosynostosis (PEDHD-8)

Guideline

Craniosynostosis Imaging (PEDHD-8.1)

Facial Anomalies (PEDHD-8.2)

References (HDP-8)

Craniosynostosis Imaging (PEDHD-8.1)

HDP.CS.0008.1.A

v1.0.2024

- Craniosynostosis is the premature closure of one or more cranial sutures, usually during infancy. Craniosynostosis may be caused by a genetic condition, such as Apert, Pfeiffer or Crouzon syndrome to name a few.¹⁸ Abnormal head shape **is the common clinical feature**.
- Skull x-rays and/or ultrasound should be obtained prior to considering advanced imaging. In cases of very strong consideration of craniosynostosis with surgical planning in progress, x-rays and/or ultrasound are not required.
- CT Head without contrast (CPT® 70450) is indicated in the diagnosis of craniosynostosis, with reported sensitivity near 100%. CT also detects associated intracranial pathology.
- 3D rendering (CPT® 76376 or CPT® 76377) is indicated with the initial diagnostic CT to evaluate the extent of synostosis and determine surgical candidacy or for preoperative planning.
- CT Maxillofacial without contrast (CPT® 70486) **AND** CT Orbits/Temporal Bone without contrast (CPT® 70480) are generally not necessary to evaluate individuals with craniosynostosis but are indicated if the craniosynostosis is part of a larger congenital defect which also involves the bones of the face or orbit.
- CT Maxillofacial without contrast (CPT® 70486) **AND/OR** CT Orbits/Temporal Bone without contrast (CPT® 70480) is/are supported in certain types of craniosynostosis is/are supported be when ordered by surgical specialties or in consultation with surgical specialties during surgical evaluation and planning.
- Ultrasound Head (CPT® 76506) is supported as an alternative method of assessing sutural patency in neonates and infants when radiographs are indeterminate. If inconclusive or for pre-operative planning, CT with 3D rendering is supported as discussed previously in this section.
- CT Head without contrast (CPT® 70450) is supported postoperatively at the discretion of or in consultation with the surgical specialist coordinating the individual's care.
- Positional plagiocephaly typically does NOT require advanced imaging.^{13,15,16}

Facial Anomalies (PEDHD-8.2)

HDP.CS.0008.2.A

v1.0.2024

- Congenital anomalies of facial structures
 - CT Maxillofacial without contrast (CPT® 70486) **OR** MRI Orbits/Face/Neck without contrast (CPT® 70540) **OR** MRI Orbits/Face/Neck with and without CPT® 70543)¹⁹.
- Facial Anomalies (such as, cleft lip and palate) can be associated with brain malformations and abnormal brain development.
 - MRI Brain without contrast (CPT® 70551) is supported in individuals with cleft lip and/or palate.
 - MRI Orbits/Face/Neck without contrast (CPT® 70540) **OR** MRI Orbits/Face/Neck with and without contrast (CPT® 70543)¹⁹ is supported if requested by surgeon or any provider in consultation with the surgeon.

Chiari and Skull Base Malformations (PEDHD-9)

Guideline

Chiari I Malformations (PEDHD-9.1)

Basilar Impression (PEDHD-9.4)

Platybasia (PEDHD-9.5)

References (HDP-9)

Chiari I Malformations (PEDHD-9.1)

HDP.CH.0009.1.A

v1.0.2024

- Ultrasound can be utilized for initial examination in infants to determine ventricular size and associated anomalies and to provide a baseline for follow up evaluation but is not required prior to MRI.

Indication	Imaging Study
<ul style="list-style-type: none">Initial evaluation for suspected or known Chiari malformations	<p>Any of the following sets of imaging:</p> <p>MRI Brain without contrast (CPT® 70551) OR</p> <p>MRI Brain without contrast (CPT® 70551) OR</p> <p>MRI Brain without and with contrast (CPT® 70553)</p> <p>AND/OR</p> <p>MRI Cervical Spine without contrast (CPT® 72141) OR</p> <p>MRI Cervical Spine without and with contrast (CPT® 72156)</p> <p>AND/OR</p> <p>MRI Thoracic Spine without contrast (CPT® 72146) OR</p> <p>MRI Thoracic Spine without and with contrast (CPT® 72157)</p> <p>AND/OR</p> <p>MRI Lumbar Spine without contrast (CPT® 72148) OR</p> <p>MRI Lumbar Spine without and with contrast (CPT® 72158)</p>

Indication	Imaging Study
<ul style="list-style-type: none"> Repeat imaging for any of the following: <ul style="list-style-type: none"> At the discretion of or in consultation with the neurologist and/or neurosurgeon coordinating the individual's care New or worsening signs or symptoms Surgical procedure is actively being considered 	<p>Any of the following sets of imaging:</p> <p>MRI Cervical Spine without contrast (CPT® 72141) OR</p> <p>MRI Cervical Spine without and with contrast (CPT® 72156)</p> <p>AND/OR</p> <p>MRI Thoracic Spine without contrast (CPT® 72146) OR</p> <p>MRI Thoracic Spine without and with contrast (CPT® 72157)</p> <p>AND/OR</p> <p>MRI Lumbar Spine without contrast (CPT® 72148) OR</p> <p>MRI Lumbar Spine without and with contrast (CPT® 72158)</p>

- Familial screening is not indicated for Chiari I Malformations
- For CSF flow imaging, see **CSF Flow Imaging (HD-24.4)** in the Head Imaging Guidelines

Background and Supporting Information

- Chiari I malformations involve caudal displacement or herniation of the cerebellar tonsils. Chiari I may be associated with syringomyelia, and rarely with hydrocephalus. Most cases are asymptomatic and discovered incidentally on a head scan performed for another indication. When symptoms are present, they are usually nonspecific but can include headache, lower cranial nerve palsies, or sleep apnea.
- Chiari II malformations are more severe than Chiari I malformations. These individuals usually present at birth. Myelomeningocele is always present, and syringomyelia and hydrocephalus are extremely common.
- Chiari III malformations include cerebellar herniation into a high cervical myelomeningocele. Chiari IV malformations refer to complete cerebellar agenesis. Both Chiari III and IV malformations are noted at birth, and are rarely compatible with life.

- Repeat brain and spine imaging in individuals with Chiari I malformations and known syringomyelia or hydromyelia is highly individualized.

Basilar Impression (PEDHD-9.4)

HDP.CH.0009.4.A

v1.0.2024

- Basilar impression involves malformation of the occipital bone in relation to C1-2 (cervical vertebrae 1 and 2). The top of the spinal cord is inside the posterior fossa and the foramen magnum is undersized. Over time, this can lead to brain stem and upper spinal cord compression. Basilar impression can also be associated with the Chiari malformation, producing very complex anatomical abnormalities.
- MRI Brain without contrast (CPT® 70551) **AND** Cervical Spine without contrast (CPT® 72141) are indicated.
- CT Head without contrast (CPT® 70450) **AND** Cervical Spine without contrast (CPT® 72125) are also indicated if surgery is being considered.
- Basilar impression appears to be genetic, and one-time screening of first-degree relatives with MRI Brain without contrast (CPT® 70551) can be appropriate.

Platybasia (PEDHD-9.5)

HDP.CH.0009.5.A

v1.0.2024

- Platybasia is a flattening malformation of the skull base, in which the clivus has a horizontal orientation.
- MRI Brain without contrast (CPT® 70551) **OR** CT Head without contrast (CPT® 70450) is indicated to establish a diagnosis when clinically suspected, individuals are usually asymptomatic

Intracranial Aneurysms and AVM (PEDHD-10)

Guideline

Pediatric Intracranial Aneurysms (PEDHD-10.1)

Pediatric Intracranial Arteriovenous Malformations (AVM) (PEDHD-10.2)

References (HDP-10)

Pediatric Intracranial Aneurysms (PEDHD-10.1)

HDP.IA.0010.1.A

v1.0.2024

- A pertinent evaluation including a detailed history, physical examination with a thorough neurologic examination, and appropriate laboratory studies should be performed prior to considering advanced imaging, unless the individual is undergoing guideline-supported scheduled follow-up imaging evaluation or request is from a neurologist or neurosurgeon who has seen the individual since onset of symptoms
- Initial study for suspected subarachnoid hemorrhage:
 - CT Head without contrast (CPT® 70450) **AND OR**
 - MRI Brain without contrast (CPT® 70551) **OR**
 - MRI Brain without and with contrast (CPT® 70553)
- If subarachnoid hemorrhage is present on CT or MRI, or lumbar puncture findings suggest hemorrhage, then the following is/are supported
 - MRA Head (CPT® 70544, CPT® 70545, **OR** CPT® 70546) **OR**
 - CTA Head (CPT® 70496) **AND/OR**
 - CT Brain Perfusion (CPT® 0042T) or MRI Brain Perfusion (CPT® 70553)
 - See also: **Background and Supporting Information**
- If findings suspicious for intracranial aneurysm on MRI, then the following is supported
 - MRA Head (CPT® 70544, CPT® 70545, **OR** CPT® 70546) **OR**
 - CTA Head (CPT® 70496)
- Initial study for individuals presenting with headache, increased intracranial pressure, seizures, or focal neurologic findings:
 - CT Head without contrast (CPT® 70450) **AND/OR**
 - MRI Brain without contrast (CPT® 70551) **OR**
 - MRI Brain without and with contrast (CPT® 70553)
 - If findings suspicious for intracranial aneurysm on prior imaging, then the following is supported:
 - MRA head (CPT® 70544, CPT® 70545, **OR** CPT® 70546) **OR**
 - CTA Head (CPT® 70496)
- Imaging for individuals with known aneurysm presenting with headache, increased intracranial pressure, seizures, or focal neurologic findings:
 - MRI Brain without contrast (CPT® 70551) **OR**
 - MRI Brain without and with contrast (CPT® 70553) **AND/OR**
 - MRA Head (CPT® 70544, CPT® 70545 **OR** CPT® 70546) **OR**
 - CTA Head (CPT® 70496)

- CTA Head (CPT® 70496) for individuals with treated aneurysms is preferred.
- MRI Brain without contrast (CPT® 70551) **OR** MRI Brain without and with contrast (CPT® 70553) **AND/OR** MRA Head (CPT® 70544, CPT® 70545, **OR** CPT® 70546) is/are indicated for individuals with any of the following conditions (including but not limited to the conditions below) and headache, increased intracranial pressure, seizures, or focal neurologic findings:
 - Polycystic kidney disease
 - Fibromuscular dysplasia
 - Ehlers-Danlos Syndrome
 - Klippel-Trenaunay-Weber Syndrome
 - Tuberous Sclerosis
 - Moyamoya Syndrome
 - Hereditary Hemorrhagic Telangiectasia (Osler-Weber-Rendu Syndrome)
 - Pseudoxanthoma elasticum
 - Neurofibromatosis type 1
 - Kawasaki disease
 - Coarctation of the aorta
 - Patent ductus arteriosus
 - Hyper-IgE syndrome
 - 4 forms of Loeys-Dietz syndrome
 - Klinefelter syndrome
 - Alpha-glucosidase deficiency
 - Noonan syndrome
 - Pheochromocytoma
 - Alpha-1-antitrypsin deficiency
 - Presence of an azygos anterior cerebral artery
 - Marfan Syndrome
 - Bicuspid aortic valve
 - Microcephalic osteodysplastic primordial dwarfism Type II
 - Multisystemic Smooth Muscle Syndrome (MSMS)/Smooth Muscle Dysfunction Syndrome (SMDS)/ACTA2 Mutations^(Regalado,Cuoco) (See PEDHD 12.8)
- MRI Perfusion may be obtained with MRI Brain (CPT® 70551 **OR** CPT® 70552 **OR** CPT® 70553)
 - No additional CPT® codes are necessary or appropriate to perform MRI perfusion.²²
- The timing of follow-up imaging for intracranial aneurysms in children is similar to that in adults. See **Intracranial Aneurysms (HD-12.1)** in the Head Imaging Guidelines.
- Screening MRI Brain or MRA Head for aneurysms is generally not supported in asymptomatic individuals under age 20 since only 0.6 % of ruptured aneurysms

occur in the pediatric age range. However, for Multisystemic Smooth Muscle Syndrome (MSMS)/Smooth Muscle Dysfunction Syndrome (SMDS)/ACTA2 Mutations see PEDHD 12.8)

- Screening MRI Brain or MRA Head for aneurysms is not supported in individuals with coarctation of the aorta repaired before age 3 since there is not an increased risk for intracranial aneurysm in this individual population.

Background and Supporting Information

- Prior CT Head (CPT® 70450) does not exclude indication for MRI Brain without and with contrast (CPT® 70553) **OR** MRI Brain without contrast (CPT® 70551)
- Unlike adults, the majority of pediatric aneurysms are caused by genetic or developmental defects rather than environmental or lifestyle factors.
- Pediatric aneurysms most commonly present with subarachnoid hemorrhage, headache, increased intracranial pressure, seizure activity, or focal neurologic findings.

Pediatric Intracranial Arteriovenous Malformations (AVM) (PEDHD-10.2)

HDP.IA.0010.2.A

v1.0.2024

- A pertinent evaluation including a detailed history, physical examination with a thorough neurologic examination, and appropriate laboratory studies should be performed prior to considering advanced imaging, unless the individual is undergoing guideline-supported scheduled follow-up imaging evaluation or request is from or in consultation with a neurologist or neurosurgeon who has seen the individual since onset of symptoms.
- Vascular malformations include arteriovenous, venous, cavernous, and capillary malformations and vein of Galen Malformations.

Disorders	Indications (any of the following)	Supported Imaging
<ul style="list-style-type: none"> Any aneurysmal and/or AVM Disorder listed in this guideline 	<ul style="list-style-type: none"> When MRI is contraindicated Any emergency setting 	<ul style="list-style-type: none"> CT Head without contrast (CPT® 70450) AND OR CTA Head (CPT® 70496)AND OR CTA Neck (CPT® 70498)

Additional indications

- CT Head without contrast (CPT® 70450) may be indicated for:
 - Mass effect
 - Urgent/emergent settings due to availability and speed of CT
 - Trauma
 - Recent hemorrhage, whether traumatic or spontaneous
 - Prior to lumbar puncture in individuals with cranial complaints
 - Scenarios in which MRI is contraindicated (i.e. pacemakers, ICDs, cochlear implants, aneurysm clips, orbital metallic fragments, etc.)

Background and Supporting Information

- Prior CT Head (CPT® 70450) does not exclude indication for MRI Brain without and with contrast (CPT® 70553) **OR** MRI Brain without contrast (CPT® 70551)
- Most intracranial AVMs are congenital, vary widely in their location and type, and are discovered at birth due to associated clinical findings or incidentally later in life. Certain hereditary conditions are associated with an increased risk for AVM development.
- Vascular malformations include arteriovenous, venous, cavernous, and capillary malformations. The vein of Galen malformation is the most common arteriovenous malformation, presenting in neonates with signs of high output congestive heart failure or later in infancy of childhood with signs of hydrocephalus. Low flow venous, cavernous, and capillary malformations may be asymptomatic and discovered incidentally or they may present in childhood with seizures or neurologic findings secondary to intracranial hemorrhage.
- Hereditary AVMs usually have an autosomal dominant pattern of inheritance.^{5,6,13, 20}

Syncope (PEDHD-11)

Guideline

Syncope (PEDHD-11.1)

References (HDP-11)

Syncope (PEDHD-11.1)

HDP.SY.0011.1.A

v1.0.2024

- Syncope in children is almost always neurocardiogenic (vasovagal) in nature. Intracranial mass lesions do not cause isolated syncope. Syncope and seizure activity can often be challenging to distinguish for unwitnessed syncope.
- Advanced imaging of the brain is not indicated for individuals with isolated syncope without focal neurologic findings. See **Syncope (PEDCD-5)** in the Pediatric Cardiac Imaging Guidelines and **Epilepsy and Other Seizure Disorders (PEDHD-6)** for additional imaging considerations.
- There is no role for advanced neuroimaging for Postural Tachycardia Syndrome (POTS).

Pediatric Stroke General Considerations (PEDHD-12.1)

HDP.PS.0012.1.A

v1.0.2024

- Imaging indications are the same for neonates as for older children.

Pediatric Stroke Initial Imaging (PEDHD-12.2)

HDP.PS.0012.2.A

v1.0.2024

- Children may not present with typical stroke findings. MRI Brain without contrast (CPT® 70551) or MRI Brain without and with contrast (CPT® 70553) is appropriate in the presence of neurological signs and/or symptoms with concern for stroke.⁴
- ANY of the following studies are indicated for evaluation.
 - CT Head without contrast (CPT® 70450) **OR** MRI Brain without contrast (CPT® 70551)
 - MRA Head (CPT® 70544, CPT® 70545, **OR** CPT® 70546) **OR** CTA Head (CPT® 70496)
 - For suspected carotid dissection CTA Neck (CPT® 70498) **OR** MRA Neck (CPT® 70547, CPT® 70548 **OR** CPT® 70549)
 - Note: Both MRA **OR** CTA Head **AND** Neck are needed to visualize the posterior vertebrobasilar circulation for evaluation of the vertebrobasilar stroke/TIA (vertigo associated with diplopia, dysarthria, bifacial numbness or ataxia) or concern for arterial dissection (risks may include premature stroke [under age 50], head or neck trauma, fibromuscular dysplasia, Ehlers-Danlos syndrome, and chiropractic neck manipulation)
- In individuals with COVID-19, See **COVID-19 and Multisystem Inflammatory Syndrome in Children (MIS-C) (PEDHD-12.7)**

Pediatric Stroke Subsequent Imaging (PEDHD-12.3)

HDP.PS.0012.3.A

v1.0.2024

- MRI Brain without contrast (CPT® 70551) **OR** MRI Brain without and with contrast (CPT® 70553) is indicated for any new or worsening neurological findings or seizure activity.
- Repeat imaging for follow up and resolution of stroke or hemorrhage as determined by a neurology specialist or any provider in consultation with a neurology specialist.
 - MRI Brain without contrast (CPT® 70551) **OR** MRI Brain without and with contrast (CPT® 70553)
 - MRA Head/MRV Head (CPT® 70544, CPT® 70545 **OR** CPT® 70546) **OR** CTA Head/CTV Head (CPT® 70496) for follow-up of known cerebral artery stenosis or thrombosis^{4,7}
 - Other surveillance imaging indications after stroke are listed in the disease-specific sections.

Background and Supporting Information

- CT and MR Venography (CTV and MRV) are reported with the same codes as the CTA/MRA counterpart (there is no specific code for CT/MR venography):
 - If arterial and venous CT or MR studies are both performed in the same session, only **one** CPT® code is used to report both procedures
 - If an arterial CTA **OR** MRA study has been performed and subsequently a repeat study is needed to evaluate the venous anatomy, then this study is supported
 - If a venous CTV **OR** MRV study has been performed and subsequently a repeat study is needed to evaluate the arterial anatomy, then this study is supported
 - MRA without and with contrast with venous sinus thrombosis to differentiate total from subtotal occlusion

Moyamoya Syndrome/Disease (PEDHD-12.4)

HDP.PS.0012.4.A

v1.0.2024

Initial imaging

- Below are indicated for initial evaluation of Moyamoya Syndrome Disease:
 - MRI Brain without contrast (CPT® 70551) **OR**
 - MRI Brain without and with contrast (CPT® 70553) **AND/OR**
 - MRA Head (CPT® 70544, CPT® 70545, **OR** CPT® 70546) **AND/OR**
 - MRA Neck (CPT® 70547, CPT® 70548, **OR** CPT® 70549)
 - If MRA is contraindicated or not readily available, then CTA Head (CPT® 70496) **AND/OR** CTA Neck (CPT® 70498) are supported.
- MRI Perfusion may be obtained with MRI Brain (CPT® 70551 **OR** CPT® 70552 **OR** CPT® 70553), No additional CPT® codes are necessary or appropriate to perform MRI perfusion³³

Repeat imaging for Moyamoya Syndrome/Disease

- MRA Head (CPT® 70544, CPT® 70545, **OR** CPT® 70546) every 12 months.
 - CTA Head (CPT® 70496) can be appropriate if MRI/MRA is contraindicated or not readily available
- MRI Brain without contrast (CPT® 70551) **OR** MRI Brain without and with contrast (CPT® 70553) every 12 months
- Radiopharmaceutical Localization Imaging SPECT (CPT® 78803) with vasodilating agent acetazolamide (Diamox) challenge can be appropriate when surgery or other vascular intervention is being considered.
- CT Perfusion (CPT® 0042T) **OR** MRI Perfusion (CPT® 70551 **OR** CPT® 70552 **OR** CPT® 70553)³³ (see **Background and Supporting Information**) is indicated for the following:
 - Prior to change in treatment
 - Post-surgical
 - When requested by any provider coordinating care with a neurologist or neurosurgeon^(Choudri2014, ACR2017)
- CT or MRI Perfusion see **General Guidelines-Other Imaging Situations (PEDHD-1.4)**
- MRI Perfusion may be obtained with MRI Brain (CPT® 70551 **OR** CPT® 70552 **OR** CPT® 70553), No additional CPT® codes are necessary or appropriate to perform MRI perfusion.³³

Screening imaging for Moyamoya Disease^(HAN2014, KIM2016)

- Screening is **NOT** indicated for Moyamoya SYNDROME.
 - See **Background and Supporting Information** for Moyamoya DISEASE versus Moyamoya SYNDROME
- Screening with any of the following for Moyamoya Disease is indicated for first degree relatives (biological parent, full sibling, or biological child) of individuals with Moyamoya Disease:
 - MRA Head (CPT® 70544, CPT® 70545, **OR** CPT® 70546) **OR**
 - Transcranial Doppler (TCD) Ultrasound (CPT® 93886 or CPT® 93888)
 - See **Transcranial Doppler (CPT®93886) (HD-24.8)** in the Head Imaging Guideline
 - If MRA is contraindicated or not readily available, then CTA Head (CPT® 70496) is supported
 - See **General Guidelines-Other Imaging Situations (PEDHD-1.4)**
- MRI Perfusion may be obtained with MRI Brain (CPT® 70551 **OR** CPT® 70552 **OR** CPT® 70553), No additional CPT® codes are necessary or appropriate to perform MRI perfusion.³³

Background and supporting information

- Moyamoya disease (MMD) is a rare cerebrovascular disease characterized by progressive spontaneous bilateral occlusion of the intracranial internal carotid arteries (ICA) and their major branches (middle cerebral artery [MCA], and anterior cerebral artery [ACA]) with compensatory capillary collaterals as an expression of pathologically increased angiogenic activity resembling a "puff of smoke" (Japanese: Moyamoya) on cerebral angiography.²⁶ Moyamoya Disease is most prevalent in individuals with East Asian ancestry. Up to 15% of individuals with Moyamoya Disease may have a family history of Moyamoya Disease.^{23, 24}
- Moyamoya Disease is distinguished from Moyamoya Syndrome (MMS). MMD is a primary disease process. MMS is a secondary process that occurs in response to another underlying pathological process that causes stenosis of intracranial blood vessels.²⁵ There are two peaks of incidence with different clinical presentations, at around 10 years and 30-40 years. The peak appears to occur later in women than men. In children, ischemic symptoms, especially transient ischemic attacks, are predominant. Intellectual decline, seizures, and involuntary movements are also more common in this age group. In contrast, adult patients present with intracranial hemorrhage more often than pediatric patients.²⁴

Sickle Cell Disease (PEDHD-12.5)

HDP.PS.0012.5.A

v1.0.2024

- The following imaging is indicated for all sickle cell individuals with a severe phenotype (Hgb SS or Hgb S β^0)
 - Transcranial Doppler (TCD) Ultrasound (CPT® 93886 or CPT® 93888) annually for all individuals age 2 to 16:
 - A short interval repeat study is indicated for individuals with conditional (170-199 cm/sec) flow results, or with individuals undergoing transfusion therapy.
 - TCD for children aged 17 years old may be appropriate on a case-by-case basis.
 - See **Transcranial Doppler (CPT® 93886) (HD-24.8)** in the Head Imaging Guidelines for other indications for this modality and **Stroke/TIA (HD-21.1)** in the Head Imaging Guidelines
 - After 17 years old, for individuals with a history of abnormal TCDs, TCDs may be repeated every 3 months.
 - TCD is not indicated for individuals with other phenotypes (Hgb SC, Hgb S β^+).
 - See indications below for advanced imaging with MR or CT.
- MRI Brain without contrast (CPT® 70551) **OR** MRI Brain without and with contrast (CPT® 70553) is indicated for any of the following:
 - 2 non-imaging Transcranial Doppler (TCD) measurements of ≥ 200 cm/sec or a single measurement of > 220 cm/sec or 2 assessment TCD measurements ≥ 185 cm/sec or a single measurement > 205 cm/sec.
 - Persistently abnormal TCD velocities
 - For more regarding TCD, see **Background and Supporting Information**
 - Screening to detect silent cerebral infarcts
 - New symptoms or cognitive impairment occurs or a change in academic performance
 - After an infarct-like lesion is identified, repeat every 12-24 months to assess for cerebral infarct progression
 - Prior to any change in therapy²⁰⁻²⁵

Background and Supporting Information

- TCD is used to screen for overt and silent infarctions and monitor response to transfusion therapy
- Individuals with sickle cell disease are at significantly increased risk for stroke and silent infarction, beginning at a very young age. Recent advances allow physicians to identify individuals at high risk for stroke and begin a primary stroke prevention program.

- Identification of silent cerebral infarction is important because treatment with prophylactic red cell transfusions to maintain hemoglobin S levels at <30% of total hemoglobin may reduce recurrent stroke and extent of neurologic damage.

CNS Vasculitis and Stroke (PEDHD-12.6)

HDP.PS.0012.6.A

v1.0.2024

- MRI Brain without and with contrast (CPT® 70553) is the recommended initial study for all individuals with vasculitis and suspected CNS involvement, whether primary or secondary.
 - A normal MRI Brain almost always completely excludes intracranial vasculitis
 - MRA Head (CPT® 70544, CPT® 70545, or CPT® 70546) is indicated for inconclusive MRI findings suggesting medium or large vessel vasculitis.
 - Individuals with aggressive disease being treated with systemic therapy can have imaging for treatment response every 3 months during active treatment.
 - Annual surveillance imaging is appropriate to detect progressive vascular damage that may require intervention.

COVID-19 and Multisystem Inflammatory Syndrome in Children (MIS-C) (PEDHD-12.7)

HDP.PS.0012.7.A

v1.0.2024

- Symptoms of MIS-C may include some or all of the following:
 - Headache, irritability
 - Mucocutaneous changes similar to Kawasaki disease (i.e. strawberry tongue, red cracked lips, rash of hands and/or feet)
 - Polymorphous or vasculitic rash
 - Non-exudative conjunctivitis
 - Tachycardia, hypotension
 - Cough, shortness of breath
 - Abdominal pain, vomiting, diarrhea
 - Lymphadenopathy, joint pain, sore throat
- MRA is the preferred study in children however, CTA Head (CPT® 70496) and/or Neck (CPT® 70498) is appropriate if MRA is contraindicated

Indication	Imaging Study
<ul style="list-style-type: none"> Imaging for neurological signs and/or symptoms, including headache, after known or presumed COVID-19 infection 	<ul style="list-style-type: none"> Any or all of the following sets of imaging: <ul style="list-style-type: none"> MRI Brain without contrast (CPT® 70551) OR MRI Brain without and with contrast (CPT® 70553) MRA Head (CPT® 70544, CPT®70545 OR CPT® 70546) OR CTA Head (CPT® 70496) AND/OR MRA Neck (CPT® 70547 OR CPT® 70548 OR CPT® 70549) OR CTA Neck (CPT® 70498)

- If concern for CNS infection – See **CNS Infection (PEDHD-29.1)**
- See **Multisystem inflammatory syndrome in children (MIS-C) (PEDCD-12)** in the Pediatric Cardiac Imaging Guidelines

Background and Supporting Information

- COVID-19 infections in children are generally mild in comparison to that of adults, however a post viral syndrome in children has become increasingly noted.

Multisystem Inflammatory Syndrome in Children (MIS-C) can cause an inflammatory vasculopathy, prothombotic state and/or post viral myocarditis in children who have had a COVID-19 infection caused by SARS-CoV-2. The child may have had minor symptoms or been asymptomatic at the time of COVID-19 infection but the virus can trigger endothelial injury and activation of the IL-1 pathway similar to that in Kawasaki disease and acute rheumatic fever.

Multisystemic Smooth Muscle Syndrome (MSMS)/Smooth Muscle Dysfunction Syndrome (SMDS)/ACTA2 Mutations (PEDHD-12.8)

HDP.PS.0012.8.A

v1.0.2024

Head/Neck Evaluations for MSMS/SMDS

Initial Evaluations

- Confirmed ACTA2 Mutation
 - MRI Brain without and with contrast (CPT® 70553) with **OR** without Perfusion **AND/OR**
 - MRA Head (CPT® 70544, CPT® 70545, or CPT® 70546) **AND/OR**
 - MRA Neck (CPT® 70547, CPT® 70548, or CPT® 70549)

As requested by neurologist and/or neurosurgeon and/or geneticist and/or provider coordinating care with a neurologist and/or neurosurgeon and/or geneticist

- MRI Brain without and with contrast (CPT® 70553) with **OR** without Perfusion **AND/OR**
- MRA Head (CPT® 70544, CPT® 70545, **OR** CPT® 70546) **AND/OR**
- MRA Neck (CPT® 70547, CPT® 70548, **OR** CPT® 70549)
- MRI Perfusion may be obtained with MRI Brain (CPT® 70551 **OR** CPT® 70552 **OR** CPT® 70553), No additional CPT® codes are necessary or appropriate to perform MRI perfusion.³³
- Because radiation is a known risk factor for moyamoya disease. MRI/MRA Head is recommended instead of Computed Tomography (CT/CTA).²⁹
- Conventional catheter angiogram should be reserved for patients with focal neurologic symptoms or evidence on MRA or transcranial Doppler (TCD) of critical or progressive narrowing of the cerebral arteries.³¹
- See **Screening for Suspected Peripheral Artery Disease/Aneurysmal Disease (PVD-2)**.

Background and Supporting Information

- Smooth muscle dysfunction syndrome (SMDS)/Multisystemic Smooth Muscle Syndrome (MSMS) presents with a recognizable pattern of complications, including congenital mydriasis, patent ductus arteriosus (PDA), pulmonary arterial hypertension, aortic and other arterial aneurysms, moyamoya-like cerebrovascular disease, intestinal hypoperistalsis and malrotation, and hypotonic bladder.²⁹
- SMDS/MSMS is caused by heterozygous mutations of the ACTA2 altering arginine 179, most commonly p.Arg179His. With a single exception, all cases are due to de novo mutations.²⁹

Benign Brain Lesions (PEDHD-13)

Guideline

Arachnoid Cysts (PEDHD-13.1)

Pineal/Colloid Cysts (PEDHD-13.2)

Acoustic Neuromas (PEDHD-13.3)

References (HDP-13)

Arachnoid Cysts (PEDHD-13.1)

HDP.BL.0013.1.A

v1.0.2024

- Arachnoid cysts arise in the middle or posterior fossa, and the majority of lesions are discovered incidentally and do not require surgical intervention.
- MRI Brain without contrast (CPT® 70551) **OR** MRI Brain without and with contrast (CPT® 70553) is indicated for initial evaluation of arachnoid cysts if not already completed.
- Repeat MRI Brain is not indicated for most individuals with arachnoid cysts, but is appropriate for the following:
 - Annual MRI Brain without contrast (CPT® 70551) **OR** MRI Brain without and with contrast (CPT® 70553) until age 4 if diagnosed at a younger age
 - New or worsening headache or focal neurologic deficits suggesting progression of cyst
 - Preoperative planning
 - When requested by a specialist or any provider in consultation with a specialist

Pineal/Colloid Cysts (PEDHD-13.2)

HDP.BL.0013.2.A

v1.0.2024

- Pineal cysts are generally discovered incidentally and do not require surgical intervention.
- MRI Brain without contrast (CPT® 70551) **OR** MRI Brain without and with contrast (CPT® 70553) is indicated for initial evaluation of pineal cysts if not already completed.
- Repeat MRI Brain is not indicated for most individuals with pineal cysts, but MRI Brain without contrast (CPT® 70551) **OR** MRI Brain without and with contrast (CPT® 70553) is appropriate for the following:
 - New or worsening headache or focal neurologic deficits suggesting progression of cyst
 - Preoperative planning
- Repeat MRI Brain without contrast (CPT® 70551) **OR** MRI Brain without and with contrast (CPT® 70553) is appropriate for colloid cysts for the following:
 - In the presence of symptoms including syncope
 - Evaluation of CSF flow (CPT® 70551)
 - When requested by a specialist or any provider in consultation with a specialist

Acoustic Neuromas (PEDHD-13.3)

HDP.BL.0013.3.A

v1.0.2024

- See **Neurofibromatosis 2 (PEDPND-2.2)** in the Pediatric Peripheral Nerve Disorders Imaging Guidelines

Pediatric Demyelinating Diseases (PEDHD-14)

Guideline

Pediatric Demyelinating Disease General Considerations (PEDHD-14.1)

Multiple Sclerosis (MS) (PEDHD-14.2)

Acute Disseminated Encephalomyelitis (ADEM) and Other Pediatric Demyelinating Disorders (PEDHD-14.3)

Transverse Myelitis (PEDHD-14.4)

References (HDP-14)

Pediatric Demyelinating Disease

General Considerations (PEDHD-14.1)

HDP.DD.0014.1.A

v1.0.2024

- MRI Brain without and with contrast (CPT® 70553) is the preferred imaging study for evaluation of pediatric demyelinating disease.
 - MRI Cervical Spine without and with contrast (CPT® 72156 **AND** MRI Thoracic Spine without and with contrast CPT® 72157) is also indicated for evaluation of pediatric demyelinating disease.
 - MRI Lumbar Spine without and with contrast (CPT® 72158) is not indicated unless the individual has a tethered cord or other anatomic abnormality causing caudal displacement of the filum terminalis.
- CT imaging is generally not indicated in the evaluation of demyelinating disease.
- Metabolic (FDG) PET Brain (CPT® 78608) and MR Spectroscopy (CPT® 76390) are considered investigational for evaluation of pediatric demyelinating diseases.
- See **Neurometabolic and Neurogenetic Disorders (PEDHD-19.4)**

Multiple Sclerosis (MS) (PEDHD-14.2)

HDP.DD.0014.2.A

v1.0.2024

- Multiple sclerosis is less common in children. About 4% of MS cases are diagnosed before age 18, and only ~0.7% of all MS cases begin before age 10.
- Ataxia, optic neuritis, diplopia, and transverse myelitis are common presentations. MS can present as an acute encephalitis-like illness, especially in childhood.
- Among children with suspected demyelinating diseases, the principal differential diagnosis is often between MS and acute disseminated encephalomyelitis.
- MRI Brain without and with contrast (CPT® 70553) **AND** Cervical Spine (CPT® 72156 **AND** Thoracic Spine without and with contrast (CPT® 72157) is indicated for initial diagnosis in individuals with clinical signs and/or symptoms suggestive of MS.
 - MRI Brain (CPT® 70551) and Spinal Cord (CPT® 72141 and CPT® 72146) without contrast is appropriate if there is a contraindication to gadolinium administration.
- MRI Brain without contrast (CPT® 70551), which is preferred, OR MRI Brain without and with contrast (CPT® 70553) is indicated every 6 months for disease monitoring whether or not receiving treatment.¹⁹
 - MRI Cervical Spine without and with contrast (CPT® 72156) **AND/OR** MRI Thoracic Spine without and with contrast (CPT® 72157) **OR** Cervical Spine without contrast (CPT® 72141) **AND/OR** CPT® 72146) is (are) indicated every 12 months or for new signs or symptoms.¹⁹
 - MRI Orbits/Face/Neck without and with contrast (CPT® 70543) may be considered if optic neuritis is suspected, in addition to the above scenario
 - Symptoms suggestive of Progressive Multifocal Leukoencephalopathy (PML) during Tysabri therapy (or other medications with similar risk).
 - Screening for individuals on natalizumab (Tysabri) or other drugs with risk of PML (Progressive Multifocal Leukoencephalopathy)
 - MRI Brain without and with contrast (CPT® 70553) **OR** MRI Brain without contrast (CPT® 70551) every 6 months while on treatment
 - MRI Brain without and with contrast (CPT® 70553) **OR** MRI Brain without contrast (CPT® 70551) every 3-6 months for high risk individuals positive for serum JC virus antibody and >18 months natalizumab exposure
- If a non-contrast study shows incidental evidence of possible demyelinating disease, repeat with MRI Brain with contrast (CPT® 70552) is appropriate within 2 weeks of previous non-contrast study as the presence of enhancing lesions may be helpful in confirming the diagnosis. If non-contrast study was performed more than 2 weeks prior to the performance of the repeat imaging, an MRI Brain with and without contrast (CPT® 70553) is appropriate.

Background and Supporting Information

- Medications with similar risks of PML as Tysabri include: Dimethyl fumarate (Tecfidera), Fingolimod (Gilenya), Ocrelizumab (Ocrevus), Mavenclad (cladribine),

Vumerity (diroximel fumarate), Soliris (eculizaumab), Zeposia (ozanimod), Lemtrada (alemtuzumab), Bafiertam (monomethyl fumarate), Rituxan (rituximab).

- 3D imaging in the evaluation of Multiple Sclerosis is not supported as a separate code as most scanners are capable of 3D acquisitions or other imaging sequences may be done.

Acute Disseminated Encephalomyelitis (ADEM) and Other Pediatric Demyelinating Disorders (PEDHD-14.3)

HDP.DD.0014.3.A

v1.0.2024

- ADEM has an acute onset, and is more common among younger children than MS, but the signs and symptoms overlap significantly, and distinguishing between MS and ADEM can be challenging based on clinical examination alone.
- MRI Brain (CPT® 70553) and Spinal Cord (CPT® 72156 and CPT® 72157) without and with contrast is indicated for initial diagnosis in individuals with clinical signs and/or symptoms suggestive of ADEM.
 - MRI Brain (CPT® 70551) and Spinal Cord (CPT® 72141 and CPT® 72146) without contrast is indicated if there is a contraindication to gadolinium.
- MRI Brain without and with contrast (CPT® 70553) **AND** MRI Cervical Spine (CPT® 72156 **AND** MRI Thoracic Spine without contrast (CPT® 72157) is/are indicated every 3 months for 1 year following diagnosis or if ordered out of sequence or beyond one year by a neurologist or any provider in consultation with a neurologist.
 - MRI Brain without contrast (CPT® 70551) **AND** Cervical Spine (CPT® 72141) **AND** MRI Thoracic Spine without contrast (CPT® 72146) is/are indicated if there is a contraindication to gadolinium.
 - Most individuals will have complete clinical recovery by 12 months, while stable MRI abnormalities (gliosis) may persist. These findings do not require additional imaging unless the individual develops new neurologic symptoms. Prolonged symptoms or return of symptoms may represent a different demyelinating disorder.
- There are other pediatric demyelinating disorders that are less common but have clinical overlap with multiple sclerosis and ADEM such as (but not limited to):
 - Neuromyelitis optica (NMO) spectrum disorders (See **Neuromyelitis Optica and NMO Spectrum Disorders (HD 16.2)**)
 - Anti-MOG syndromes (anti-myelin oligodendrocyte glycoprotein) (See **Anti-MOG Syndromes (HD 16.3)**)
 - Demyelination secondary to infectious or inflammatory disorders (e.g. transverse myelitis) (See **General Guidelines – Other Imaging Situations (HD 1.7)**)
- These conditions may require a different treatment regimen than multiple sclerosis and may require repeat imaging to monitor treatment response as the diagnosis becomes more clear. Repeat imaging with MRI Brain and/or MRI Cervical Spine and MRI Thoracic Spine as requested by neurology or infectious disease is supported.

- See **Neurometabolic and Neurogenetic Disorders (PEDHD-19.4)**

Transverse Myelitis (PEDHD-14.4)

HDP.DD.0014.4.A

v1.0.2024

- Transverse myelitis is an inflammatory disorder of the spine and can be:
 - Idiopathic
 - Associated with autoimmune central nervous system inflammatory diseases
 - First event of multiple sclerosis (MS)
 - Neuromyelitis optica (NMO)
 - MOG (Myelin Oligodendrocyte Glycoprotein) antibody disorder
 - Associated with connective tissue autoimmune disease
 - Systemic Lupus Erythematosus (SLE)
 - Systemic Sclerosis
 - Rheumatoid Arthritis (RA)
 - Sjogren's Syndrome (SS)
 - Neuro-Sarcoidosis (NS)
 - Post-infectious or post-vaccine neurological syndrome
- See **Multiple Sclerosis (MS) and Related Conditions (HD-16)**

Pituitary Dysfunction (PEDHD-15)

Guideline

Pituitary Dysfunction General Considerations (PEDHD-15.1)

Panhypopituitarism (PEDHD-15.2)

Isolated Growth Hormone Deficiency (PEDHD-15.3)

Diabetes Insipidus (DI) and Other Disorders of Anti-Diuretic Hormone (PEDHD-15.4)

Precocious Puberty (PEDHD-15.5)

Benign Pituitary Tumors (PEDHD-15.6)

Pituitary Malignancies (PEDHD-15.7)

References (HDP-15)

Pituitary Dysfunction General Considerations (PEDHD-15.1)

HDP.PD.0015.1.A

v1.0.2024

- The initial step in the evaluation of all potential pituitary masses is a detailed history, recent physical examination, and thorough neurological exam, including evaluation of the visual fields.
- Endocrine laboratory studies should be performed prior to considering initial advanced imaging.
- MRI Brain without and with contrast (CPT® 70553) or MRI Brain without contrast (CPT® 70551) when pituitary imaging is indicated.
 - Pituitary Gland: one study (either MRI Brain without and with contrast [CPT® 70553] **OR** MRI Orbits/Face/Neck [CPT® 70543]) is adequate to report the imaging of the pituitary. The reporting of two CPT® codes, to image the pituitary, is not indicated.
- If a previous MRI Brain was reported to show a possible pituitary tumor with supporting evidence of pituitary disease or is inconclusive, a repeat MRI with dedicated pituitary protocol may be performed. If a prior MRI Brain was without contrast a follow up scan either MRI Brain with contrast (CPT® 70552) **OR** MRI Brain with and without contrast (CPT® 70553) is appropriate
- For association between pituitary dysfunction and optic nerve issues see **Eye Disorders and Visual Loss (HD- 32.1)** in the Head Imaging Guidelines
- For repeat imaging, See **Pituitary (HD-19.1)** in the Head Imaging Guidelines

Panhypopituitarism (PEDHD-15.2)

HDP.PD.0015.2.A

v1.0.2024

- Endocrine testing should be performed initially.
- MRI Brain without and with contrast (CPT® 70553) **OR** MRI Brain without contrast (CPT® 70551) with special attention to the pituitary is indicated for newly diagnosed Panhypopituitarism.
- Individuals with a normal pituitary on initial MRI do not need routine follow up imaging.
- Individuals with mass lesions should have follow up imaging according to the guidelines for the specific diagnosis

Isolated Growth Hormone Deficiency (PEDHD-15.3)

HDP.PD.0015.3.A

v1.0.2024

- Clinical features include: height below the normal range (<3rd percentile), subnormal growth velocity or the child's height is below the range expected based on parental height.
- Risk factors include: a history of brain tumor, cranial irradiation or other congenital/organic hypothalamic-pituitary abnormality as well as an incidental finding of a hypothalamic-pituitary abnormality on MRI.
- Endocrine testing should be performed initially.
- MRI Brain without and with contrast (CPT® 70553) **OR** MRI Brain without contrast (CPT® 70551) with special attention to the pituitary is indicated for any of the following:
 - Both IGF1 and IGFBP3 are below the laboratory reference range for age/sex or Tanner stage.
 - 2 measurements of growth hormone stimulation with different stimulation agents (glucagon, clonidine, arginine, insulin, levodopa) performed on the same day or separate days produce maximal GH levels <10ng/mL See **Background and Supporting Information**
- Individuals with a normal pituitary on initial MRI do not need routine follow up imaging.
- Individuals with mass lesions should have follow up imaging according to the guidelines for the specific diagnosis.

Background and Supporting Information

- Growth hormone stimulation testing is limited by poor specificity and requires failure on 2 tests to diagnose growth hormone deficiency.
- Controversy exists as to the cutoff level which differentiates a normal response from a deficient response on provocative testing. Some experts support GH <7 ng/mL however many pediatric endocrinologists consider a peak GH level <10 ng/mL to be indicative of growth hormone deficiency and may identify children with partial GHD.

Diabetes Insipidus (DI) and Other Disorders of Anti-Diuretic Hormone (PEDHD-15.4)

HDP.PD.0015.4.A

v1.0.2024

- Laboratory testing should be performed initially. Diabetes insipidus is characterized by serum osmolality >300mOsm/kg and urine osmolality <300 mOsm/kg.
- Central diabetes insipidus (CDI) is caused by diminished synthesis or secretion of vasopressin in the hypothalamus and nephrogenic diabetes insipidus (NDI) is caused by renal resistance to vasopressin.

Central Diabetes Insipidus (DI)

- MRI Brain without and with contrast (CPT® 70553) **OR** MRI Brain without contrast (CPT® 70551) is indicated for newly diagnosed central DI
- Individuals with a normal pituitary on initial MRI can have repeat MRI Brain without and with contrast (CPT® 70553) every 3-6 months for the first 2 years as germinomas may cause central DI while still too small to detect on imaging.
 - Serial measurement of β -hCG is also indicated for these individuals, and MRI should be repeated if a significant rise in β -hCG is detected on screening.
- Individuals with mass lesions should have follow up imaging according to the guidelines for the specific diagnosis.

Nephrogenic DI

- Once this diagnosis is firmly established, further advanced imaging is usually not indicated.

Syndrome of Inappropriate Antidiuretic Hormone Secretion (SIADH)

- Laboratory studies should be obtained prior to considering advanced imaging—urine osmolality should be high and serum osmolality low.
- MRI Brain without and with contrast (CPT® 70553) **OR** MRI Brain without contrast (CPT® 70551) is indicated for initial evaluation of unexplained central (hypothalamic pituitary) SIADH.
- Individuals with a normal pituitary on initial MRI do not need routine follow up imaging.
- Individuals with mass lesions should have follow up imaging according to the guidelines for the specific diagnosis.

Background and Supporting Information

- See **Small Cell Lung Cancer-Suspected/Diagnosis (ONC-7.1)** and **Paraneoplastic Syndromes (ONC-30.3)** in the Oncology Imaging Guidelines.
- Pulmonary diseases including infection (tuberculosis, viral/bacterial pneumonia), acute respiratory infections, mechanical ventilation and others can cause SIADH although the mechanism is unclear. Individuals with lung disease should have chest imaging according to the guidelines for the specific diagnosis.

Precocious Puberty (PEDHD-15.5)

HDP.PD.0015.5.A

v1.0.2024

- Defined as the appearance of secondary sexual characteristics before age 8 in females and before age 9 in males. The diagnosis is made clinically using Tanner staging and often will include a bone age assessment (hand/wrist radiographs) and/or abdominal and/or pelvic ultrasound (See Peripheral Precocious Puberty below).
- Endocrine laboratory studies (baseline LH, FSH and either estradiol or testosterone) are used to determine if the etiology of precocious puberty is central (gonadotropin dependent) or peripheral (gonadotropin independent). Estradiol and testosterone levels will often be elevated to a pubertal range.

Central Precocious Puberty (CPP)

- An LH >0.3 U/L on a random blood sample is the most reliable screening test for central precocious puberty. If LH <0.3 U/L and CPP is suspected, a stimulation test with a GnRH analog is the gold standard.
- Neuroimaging should always follow hormonal studies that suggest a central origin of precocious puberty.
- MRI Brain without and with contrast (CPT® 70553, preferred study) **OR** MRI Brain without contrast (CPT® 70551) is indicated for evaluation of any child with documented central precocious puberty.
- MRI is appropriate irrespective of age and gender in individuals with precocious puberty and concurrent CNS symptoms of severe headache, visual changes or seizures.
- Individuals with a normal pituitary on initial MRI do not need routine follow up imaging.
- Individuals with mass lesions should have follow up imaging according to the guidelines for the specific diagnosis. (**Benign Pituitary Tumors (PEDHD-15.6)** and **Pituitary Malignancies (PEDHD-15.7)**)

Peripheral Precocious Puberty

- The differential diagnosis of peripheral precocious puberty (LH suppressed or in the pre-pubertal range with elevated estradiol, testosterone and/or adrenal androgens) is broad and may include ovarian, testicular, adrenal and other sources of excessive hormonal production
- Ultrasound Abdomen (CPT® 76700) in both genders and Ultrasound Pelvis (CPT® 76856) in females and Scrotal ultrasound (CPT 76870) in males depending on the suspected source of hormonal excess for initial imaging.
- See **CNS Germinomas and Non-Germinomatous Germ Cell Tumors (PEDONC-4.7)** in the Pediatric Oncology Imaging Guidelines for evaluation of HCG secreting CNS tumors
- See **Hepatoblastoma (PEDONC-11.2)** in the Pediatric Oncology Imaging Guidelines for evaluation of HCG secreting hepatic tumors

- See **Pediatric Germ Cell Tumors (PEDONC-10)** in the Pediatric Oncology Imaging Guidelines and **Testicular, Ovarian and Extragenadal Germ Cell Tumors (ONC-20)** in the Oncology Imaging Guidelines for evaluation of Leydig Cell tumors.
- See **Adrenal Cortical Lesions (AB-16.1)** in the Abdomen Imaging Guidelines for evaluation of adrenal virilizing tumors

Benign Pituitary Tumors (PEDHD-15.6)

HDP.PD.0015.6.A

v1.0.2024

- Benign pituitary tumor indications in pediatric individuals are identical to those for adult individuals. See **Pituitary (HD-19)** in the Head Imaging Guidelines.

Pituitary Malignancies (PEDHD-15.7)

HDP.PD.0015.7.A

v1.0.2024

- See Craniopharyngioma and Other Hypothalamic/Pituitary Region Tumors (PEDONC-4.10) or Histiocytic Disorders (PEDONC-18) in the Pediatric Oncology Imaging Guidelines

Pediatric Ear Disorders (PEDHD-16)

Guideline

Hearing Loss (PEDHD-16.1)

Ear Pain (PEDHD-16.2)

Cholesteatoma (PEDHD-16.3)

Vertigo (PEDHD-16.4)

Tinnitus (PEDHD-16.5)

References (HDP-16)

Hearing Loss (PEDHD-16.1)

HDP.ED.0016.1.A

v1.0.2024

- A pertinent evaluation including a detailed history, physical examination (including otoscopic examination), and age-appropriate audiology testing should be performed on any child with known or suspected hearing loss prior to considering advanced imaging. The selection of imaging testing will depend on the age of the child and type of hearing loss.
- CT Orbits/Temporal Bone without contrast (CPT® 70480) is indicated for the following:
 - Conductive hearing loss of any cause.
 - Preoperative planning for resection of mass lesion or cochlear implant placement.
 - Sensorineural hearing loss in individuals who cannot safely undergo MRI.
 - Mixed conductive and sensorineural hearing loss.
 - Congenital hearing loss.
 - Total deafness.
- MRI Brain without and with contrast (CPT® 70553) with attention to internal auditory canals (included in CPT® 70553 and does not require a separate CPT code) is indicated for the following:
 - Conductive hearing loss secondary to known or suspected mass lesion.
 - Preoperative planning for resection of mass lesion or cochlear implant placement.
 - Sensorineural hearing loss of any cause.
 - Mixed conductive and sensorineural hearing loss.
 - Congenital hearing loss.
 - Total deafness.
 - Hearing loss associated with tinnitus see **Tinnitus (PEDHD-16.5)**
- Both modalities (CT and MRI) are supported simultaneously for evaluation and surgical planning if ordered by or in consultation with an ENT or Neurosurgical specialist
- Limited MRI Brain with attention to internal auditory canals (CPT® 70540, CPT® 70542, or CPT® 70543) is supported when requested by the provider in place of a complete MRI Brain. Note: Limited MRI codes should not be used in addition to MRI Brain codes; IAC views are performed as additional sequences as part of the brain study. (See **General Guidelines – Anatomic Issues (HD-1.1)** in the Head Imaging Guidelines)

Ear Pain (PEDHD-16.2)

HDP.ED.0016.2.A

v1.0.2024

- A pertinent evaluation including a detailed history, physical examination (including otoscopic examination), should be performed on any child with ear pain prior to considering advanced imaging. Common causes of ear pain include external and middle ear infections, dental problems, sinus infection, neck problems, and referred pain from the oral pharynx, tonsillitis, and pharyngitis.
- Advanced imaging is not indicated in the overwhelming majority of pediatric individuals with ear pain.

Indications	Imaging Study
<ul style="list-style-type: none">• Any of the following<ul style="list-style-type: none">• Persistent ear pain without obvious cause• Clinical suspicion for complicated or invasive infection such as mastoiditis• Clinical suspicion of mass lesion causing ear pain• Significant trauma with concern for hematoma formation• Preoperative planning	<ul style="list-style-type: none">• ONE of the following:<ul style="list-style-type: none">• CT Orbits/Temporal Bone without contrast (CPT® 70480) OR• CT Orbits/Temporal Bone without and with contrast (CPT® 70482) OR• MRI Brain without and with contrast with attention to internal auditory canals (CPT® 70553) OR• MRI Orbits/Face/Neck without and with contrast (CPT® 70543)

Cholesteatoma (PEDHD-16.3)

HDP.ED.0016.3.A

v1.0.2024

- One of the following study is indicated for preoperative evaluation in children with cholesteatoma:
 - CT Orbits/Temporal Bone without contrast (CPT® 70480) **OR**
 - CT Orbits/Temporal Bone without and with contrast (CPT® 70482) **OR**
 - MRI Brain without and with contrast with attention to internal auditory canals (CPT® 70553), **OR**
 - MRI Orbits/Face/Neck without and with contrast (CPT® 70543)
- ONE of the following study is indicated one time post-operatively to exclude residual or regrown cholesteatoma to avoid the need for a second-look surgery:
 - CT Orbits/Temporal Bone without contrast (CPT® 70480) **OR**
 - CT Orbits/Temporal without and with contrast (CPT® 70482) **OR**
 - MRI Brain without and with contrast with attention to internal auditory canals (CPT® 70553) **OR**
 - MRI Orbits/Face/Neck without and with contrast (CPT® 70543)

Background and Supporting Information

- Cholesteatomas are expansive cysts of the middle ear filled with cellular debris. They can be congenital or arise from recurrent middle ear infections or trauma to the tympanic membrane. Hearing loss is usually conductive, although if the lesion is large enough combined conductive and sensorineural hearing loss may be present. Otoscopic exam findings and symptoms may include a white mass in the middle ear cleft, painless drainage from the ear or chronic/recurrent ear infections. Advanced imaging for the diagnosis and management of suspected cholestatoma, in particular, should be reserved for the otolaryngologist or provider in consultation with the otolaryngologist.

Vertigo (PEDHD-16.4)

HDP.ED.0016.4.A

v1.0.2024

- Isolated vertigo is an uncommon complaint during childhood. Middle ear/Eustachian tube problems are the most common cause of isolated vertigo in children.
- A pertinent evaluation including a detailed history, physical examination (including otoscopic examination), should be performed on any child with vertigo prior to considering advanced imaging.
- If physical examination is otherwise normal and the vertigo responds to treatment, advanced imaging is not indicated.
- MRI Brain without and with contrast with attention to internal auditory canals (CPT® 70553) is indicated for the following:
 - Vertigo with associated headache or ataxia.
 - Vertigo associated with tinnitus.
 - Vertigo that does not respond to vestibular treatment.

Tinnitus (PEDHD-16.5)

HDP.ED.0016.5.A

v1.0.2024

- Tinnitus without hearing loss is a less common complaint during childhood.
- Children with hearing loss and tinnitus should be imaged according to **Hearing Loss (PEDHD-16.1)**. A pertinent evaluation including a detailed history, physical examination (including otoscopic examination), and age-appropriate audiology testing should be performed on any child with known or suspected tinnitus prior to considering advanced imaging.
- Advanced imaging is not indicated in the overwhelming majority of pediatric individuals with isolated tinnitus and normal hearing.

Indications	Imaging Study
<ul style="list-style-type: none"> ANY of the following <ul style="list-style-type: none"> Clinical suspicion of mass lesion causing tinnitus Persistent tinnitus after recent significant trauma 	<ul style="list-style-type: none"> ONE of the following <ul style="list-style-type: none"> CT Orbits/Temporal Bone without contrast (CPT® 70480) OR CT Orbits/Temporal Bone without and with contrast (CPT® 70482), OR MRI Brain without and with contrast with attention to internal auditory canals (CPT® 70553) OR MRI Brain without contrast with attention to internal auditory canals (CPT® 70553) OR MRI Orbits/Face/Neck without and with contrast (CPT® 70543)
<ul style="list-style-type: none"> ANY of the following: <ul style="list-style-type: none"> Pulsatile tinnitus Suspicion for vascular lesions 	<ul style="list-style-type: none"> MRA Head (CPT® 70544, CPT® 70545 OR CPT® 70546) OR CTA Head (CPT® 70496) <p>AND/OR</p> <ul style="list-style-type: none"> MRA Neck (CPT® 70547, CPT® 70548 OR CPT® 70549) OR CTA Neck (CPT® 70498)

Guideline

Autism Spectrum Disorders (PEDHD-17.1)

References (HDP-17)

Autism Spectrum Disorders (PEDHD-17.1)

HDP.AS.0017.1.A

v1.0.2024

- The group of diagnoses, including Asperger syndrome, are classified as pervasive development disorders (PDD). These diagnoses are established on clinical criteria, and no imaging study can confirm the diagnosis.
- Comprehensive evaluation for autism might include history, physical exam, audiology evaluation, speech, language, and communication assessment, cognitive and behavioral assessments, and academic assessment.
- MRI Brain without and with contrast (CPT® 70553) **OR** MRI Brain without contrast (CPT® 70551) is indicated for new or worsening focal neurologic findings documented on a pertinent physical. Consider advanced imaging if there is loss of developmental milestones and/or regression in two or more areas of development.
- PET imaging is considered investigational in the evaluation of individuals with autism spectrum disorders.

Behavioral and Psychiatric Disorders (PEDHD-18)

Guideline

Behavioral and Psychiatric Disorders (PEDHD-18.1)
Reference (HDP-18)

Behavioral and Psychiatric Disorders (PEDHD-18.1)

HDP.BD.0018.1.A

v1.0.2024

- Behavioral and psychiatric disorders of childhood or adolescence, to include Attention Deficit Hyperactivity Disorder (ADHD), generally require no advanced imaging for diagnosis or management.²
 - MRI Brain without and with contrast (CPT® 70553) **OR** MRI Brain without contrast (CPT® 70551) **OR** CT Head without contrast (CPT® 70450) is indicated for:
 - Acute onset mental status change
 - New or worsening focal neurologic findings
 - Presentation of acute psychiatric symptoms with comorbid serious medical illness
 - Non-auditory hallucinations (e.g., visual, tactile, olfactory) with no known etiology
 - Nonresponse to adequate medication trials
 - Symptoms of an organic brain disorder (e.g., focal deficits, severe headache, or seizures)
 - Prior to Electro-Convulsive Therapy (ECT) to screen for intracranial disease
See **HD 4.2: Mental Health Related Disorders**
- For concerns of PANS (Pediatric acute-onset neuropsychiatric syndrome) and PANDAS (Pediatric autoimmune neuropsychiatric disorder associated with streptococcal infection) see **Movement Disorders including Tourette's Syndrome (PEDHD-26)**

Developmental Disorders (PEDHD-19)

Guideline

Intellectual Disability (PEDHD-19.1)

Cerebral Palsy (PEDHD-19.2)

Developmental Motor Delay (PEDHD-19.3)

Neurometabolic and Neurogenetic Disorders (PEDHD-19.4)

References (HDP-19)

Intellectual Disability (PEDHD-19.1)

HDP.ID.0019.1.A
v1.0.2024

- Intellectual disability may be primary or secondary to a variety of heterogeneous disorders. See **Background and Supporting Information**.
- MRI Brain without and with contrast (CPT® 70553) **OR** MRI Brain without contrast (CPT® 70551) is indicated for new or worsening focal neurologic findings and/or new or worsening cognitive decline.⁹

Background and Supporting Information

- Intellectual disability is a condition characterized by significant limitations in both intellectual functioning and adaptive behavior that originates before the age of 22.¹³ One way to measure intellectual functioning is an IQ test. Generally, an IQ test score of around 70 or as high as 75 indicates a significant limitation in intellectual functioning.¹³

Cerebral Palsy (PEDHD-19.2)

HDP.ID.0019.2.A

v1.0.2024

- MRI Brain without and with contrast (CPT® 70553) **OR** MRI Brain without contrast (CPT® 70551) is indicated for:
 - Initial evaluation of newly diagnosed cerebral palsy.
 - New or worsening focal neurologic findings documented on a physical examination, including the presence of developmental delay.
 - Re-evaluation after 24 months of age due to rapid myelination during the first 2 years of life.
- For spinal imaging requests See **Myelopathy (SP-7.1)** in the Spine Imaging Guidelines

Background and Supporting Information

- Many individuals with intellectual disability also have cerebral palsy, but not all individuals with cerebral palsy have intellectual disability
- Cerebral palsy is a static motor encephalopathy caused by a variety of entities spanning developmental, metabolic, genetic, infectious, ischemic, and other acquired etiologies

Developmental Motor Delay (PEDHD-19.3)

HDP.ID.0019.3.A

v1.0.2024

- There are many causes for developmental motor delay. Individuals with motor delay can have decreased, normal, or increased muscular tone. Individuals with normal tone do not require imaging unless they have focal neurologic findings.
- MRI Brain without contrast (CPT® 70553) **OR** MRI Brain without and with contrast (CPT® 70553) is indicated for:
 - Initial evaluation of newly diagnosed developmental motor delay with abnormal muscle tone.
 - Toe walking, when associated with upper motor neuron signs including hyperreflexia, abnormal tone (spasticity/hypotonia), or positive Babinski sign.
 - New or worsening focal neurologic findings.
 - Re-evaluation after 24 months of age due to rapid myelination during the first 2 years of life.
- For spinal imaging requests See **Myelopathy (SP-7.1)** in the Spine Imaging Guidelines and **Tethered Cord (PEDSP-5)** in the Pediatric Spine Imaging Guidelines.

Neurometabolic and Neurogenetic Disorders (PEDHD-19.4)

Ataxia (PEDHD-20)

Guideline

Ataxia (PEDHD-20.1)

References (HDP-20)

Ataxia (PEDHD-20.1)

HDP.AT.0020.1.A

v1.0.2024

- Ataxia refers to an abnormally ill-coordinated or unsteady gait for age. “Limb ataxia” refers to impaired coordination (for age) of limbs, especially arms. Developmental failure to acquire the ability to walk is a form of developmental delay, not ataxia.
- See also **Developmental Disorders (PEDHD-19)**
- A pertinent evaluation including a detailed history and physical examination with a thorough neurologic examination, should be performed prior to considering advanced imaging, unless the individual is undergoing guideline-supported scheduled follow-up imaging evaluation or request is from or in consultation with a neurologist or neurosurgeon who has seen the individual since onset of symptoms.
- If spinal etiology of ataxia is suspected the following may be indicated
 - MRI Cervical Spine (CPT® 72141 or CPT® 72156) and/or
 - MRI Thoracic Spine (CPT® 72146 or CPT® 72157) and/or
 - MRI Lumbar Spine (CPT® 72148 or CPT® 72158)

Indications	Imaging Studies
<ul style="list-style-type: none"> ANY of the following: <ul style="list-style-type: none"> Ataxia Hereditary Ataxia Slowly progressive ataxia 	<ul style="list-style-type: none"> ONE of the following: <ul style="list-style-type: none"> MRI Brain without and with contrast (CPT® 70553) OR MRI Brain without contrast (CPT® 70551)
<ul style="list-style-type: none"> Suspected Spinal Etiology 	<ul style="list-style-type: none"> MRI Cervical Spine without contrast (CPT® 72141) OR MRI Cervical Spine without and with contrast (CPT® 72156)AND/OR MRI Thoracic Spine without contrast (CPT® 72146) OR MRI Thoracic Spine without and with contrast (CPT® 72157)AND/OR MRI Lumbar Spine without contrast (CPT® 72148) OR MRI Lumbar Spine without and with contrast (CPT® 72158)

Indications	Imaging Studies
<ul style="list-style-type: none"> Acute ataxia following significant head trauma 	<ul style="list-style-type: none"> ONE of the following: <ul style="list-style-type: none"> CT Head without contrast (CPT® 70450) OR CT Head without and with contrast (CPT® 70470) OR MRI Brain without contrast (CPT® 70551) OR MRI Brain without and with contrast (CPT® 70553)
<ul style="list-style-type: none"> Contraindication to MRI 	<ul style="list-style-type: none"> ONE of the following: <ul style="list-style-type: none"> CT Head without and with contrast (CPT® 70470) OR CT Head with contrast (CPT® 70460)
<ul style="list-style-type: none"> BOTH of the following: <ul style="list-style-type: none"> Contraindication to MRI Suspected Spinal Etiology 	<ul style="list-style-type: none"> CT Cervical Spine without contrast (CPT® 72125) OR CT Cervical Spine without and with contrast (CPT® 72127) AND/OR CT Thoracic Spine without contrast (CPT® 72128) OR CT Thoracic Spine without and with contrast (CPT® 72130) AND/OR CT Lumbar Spine without contrast (CPT® 72131) OR CT Cervical Spine without and with contrast (CPT® 72133)

- CT should not be used in place of MRI solely to avoid sedation in young children because MRI is superior for imaging the posterior fossa.
- If there is a contraindication to contrast and a spinal etiology is suspected the following may be indicated:
 - CT Cervical Spine (CPT® 72125 or CPT® 72127) **AND/OR**
 - CT Thoracic Spine (CPT® 72128 or CPT® 72130) **AND/OR**
 - CT Lumbar Spine (CPT® 72131 or CPT® 72133)
- Repeat imaging may be appropriate no more frequently than every 12 months when requested by a neurologist and/or neurosurgeon or any provider in consultation with a neurologist and/or neurosurgeon unless there are new signs or symptoms.

Pediatric Sleep Disorders (PEDHD-24)

Guideline

Pediatric Sleep Disorders (PEDHD-24.1)

References (HDP-24)

Pediatric Sleep Disorders (PEDHD-24.1)

HDP.SD.0024.1.A

v1.0.2024

- See **Pediatric Sleep Guidelines (SL-3)** in the Sleep Apnea and Treatment Clinical Guidelines
- For over 18 years of age OR regarding Oral Appliance OR Hypersomnolence
 - See **Sleep-Related Imaging Guidelines (HD-37)**
- For Obstructive Sleep Apnea:
 - There is NO indication for imaging prior to tonsillectomy (with or without adenoidectomy) for obstructive sleep apnea
 - Initially, endoscopic examination of the upper airway should be performed.
 - CT Maxillofacial without contrast (CPT® 70486) is supported for evaluation of obstructive anatomy if operative intervention, other than a tonsillectomy (with or without adenoidectomy), is being considered.
- For suspected Central Sleep Apnea, the following is supported:
 - MRI Brain without contrast (CPT® 70551) OR
 - MRI Brain without and with contrast (CPT® 70553)
- Advanced imaging is NOT indicated for the following:
 - Confusional arousals
 - Sleep terrors
 - Nightmare disorder
 - Sleep walking (Somnambulism)
 - Bed wetting (Enuresis)
 - Insomnia
 - Narcolepsy (without or with cataplexy)
 - Restless Leg Syndrome/Periodic Limb Movement Disorder
- For suspected sleep-related seizures, see **Epilepsy and Other Seizure Disorders (PEDHD-6)**

Temporomandibular Joint (TMJ)/Dental/Maxillofaci al Imaging in Children (PEDHD-25)

Guideline

Temporomandibular Joint Imaging (PEDHD-25.1)

Dental/Periodontal/Maxillofacial Imaging (PEDHD-25.2)

References (HDP-25)

Temporomandibular Joint Imaging (PEDHD-25.1)

HDP.TJ.0025.1.A

v1.0.2024

- Temporomandibular Joint (TMJ) Imaging in Children indications in pediatric individuals are very similar to those for adult individuals. See **Temporomandibular Joint Disease (TMJ) (HD-30.1)** in the Head Imaging Guidelines.
- Pediatric-specific imaging considerations include the following:
 - There is a paucity of clinical symptoms and poor sensitivity of conventional x-rays in diagnosing TMJ arthritis in pediatric individuals with arthritis
- MRI TMJ (CPT® 70336) is indicated annually for detecting silent TMJ arthritis in children with juvenile idiopathic arthritis (JIA) as requested by a rheumatologist and/or oral/maxillofacial surgeon (OMS) and/or any provider in consultation with a rheumatologist or OMS
- Repeat imaging with MRI TMJ (CPT® 70336) in patients with JIA is indicated for any of the following:
 - Change in signs or symptoms suggesting progression of disease
 - To monitor the effects of treatment⁸
- Bone Scintigraphy/Bone Scan 3 Phase Study (CPT® 78315) in individuals over 12 years of age⁷ is appropriate in anticipation or consideration of surgery⁷
- Unilateral condylar hyperplasia is manifested by slow growth in areas of the mandible causing facial asymmetry. It is usually a self-limiting condition seen predominantly in 12–30 year olds.

Dental/Periodontal/Maxillofacial Imaging (PEDHD-25.2)

Movement Disorders including Tourette's Syndrome (PEDHD-26)

Guideline

Tourette's Syndrome (PEDHD-26.1)

Movement Disorders (PEDHD-26.2)

References (HDP-26)

Tourette's Syndrome (PEDHD-26.1)

HDP.MD.0026.1.A

v1.0.2024

- The diagnosis of Tourette's syndrome is made clinically and advanced neuroimaging is not indicated for either diagnosis or management.

Movement Disorders (PEDHD-26.2)

HDP.MD.0026.2.A

v1.0.2024

- Movement disorders are hyperkinetic and hypokinetic movements that are involuntary. The majority are diagnosed based on a clinical diagnosis and do not require imaging.
- Typically Benign Movement disorders include:
 - Stereotypies, repetitive rhythmic movements
 - Tics that are vocal or motor with typical onset and course
 - Tourette Syndrome
 - Essential Tremor or tremors of anxiety or weakness
 - Restless Leg Syndrome
- MRI Brain without contrast (CPT® 70551), **OR** MRI Brain without and with contrast (CPT® 70553) is considered in the following clinical scenarios:
 - Atypical clinical features for example, movements that persist in sleep, onset outside of typical age at onset (4-6 years for tics), rapid progression, incomplete or uncertain medication responsiveness, or clinical diagnostic uncertainty, limbic encephalitis
 - Dystonia, intermittent involuntary muscle contractions
 - Chorea, continual irregular movements
 - Ballism, involuntary high amplitude movements
 - Athetosis, slow writhing continuous movements
 - Myoclonus, involuntary muscle jerks (not sleep myoclonus)
- MRI Brain without contrast (CPT® 70551) **OR** MRI Brain without and with contrast (CPT® 70553) is supported for concerns of:
 - PANS (Pediatric acute-onset neuropsychiatric syndrome) and/or
 - PANDAS (Pediatric autoimmune neuropsychiatric disorder associated with streptococcal infection)
 - Only after a complete medical workup including labs, acute infection, and other comorbid psychiatric disorders (examples, such as Obsessive Compulsive Disorder (OCD), Attention Deficit Hyperactivity Disorder (ADHD) and Autism Spectrum Disorder (ASD) have been investigated.
 - Routine brain imaging is not routinely recommended for OCD, ADHD or ASD.
- See **Movement Disorders (HD-15.1)** in the Head Imaging Guidelines for the following
 - Suspected Huntington Disease
 - Evaluation for surgical treatment of Essential Tremor or Parkinson's disease, including Deep Brain Stimulator (DBS) placement

- Post-op imaging is supported when ordered by a neurologist or neurosurgeon or any provider in consultation with a neurologist or neurosurgeon for either procedure.

Background and Supporting Information

- There is little evidence to support the use of MRA/CTA and PET in the evaluation of movement disorders.
- Tourette syndrome (TS) is a neurological disorder characterized by repetitive, stereotyped, involuntary movements and vocalizations called tics. The first symptoms of TS are almost always noticed in childhood. Some of the more common tics include eye blinking and other vision irregularities, facial grimacing, shoulder shrugging, and head or shoulder jerking. Perhaps the most dramatic and disabling tics are those that result in self-harm such as punching oneself in the face, or vocal tics including coprolalia (uttering swear words) or echolalia (repeating the words or phrases of others). Many with TS experience additional neurobehavioral problems including inattention, hyperactivity and impulsivity, and obsessive-compulsive symptoms such as intrusive thoughts/worries and repetitive behaviors

CNS Infection (PEDHD-29.1)

References (HDP-29)

CNS Infection (PEDHD-29.1)

HDP.CI.0029.1.A

v1.0.2024

- CNS infection imaging indications in pediatric individuals are similar to those for adult individuals. See **CNS and Head Infection/Neuro-COVID-19 (HD-14)** in the Head Imaging Guidelines.
- CT Head (as per **General Guidelines – CT Head (HD-1.4)** in the Head Imaging Guidelines) may be considered in Pediatric CNS Infection.
- The following studies are supported for suspected intracranial infection if any signs of CNS infection are present:
 - MRI Brain without and with contrast (CPT® 70553) (preferred) **OR** MRI Brain without contrast (CPT® 70551)
 - CT Head (CPT® 70450, CPT® 70460, **OR** CPT® 70470) in cases where MRI is contraindicated or urgently required prior to lumbar puncture to evaluate for meningitis.
- Repeat imaging is supported if requested by infectious disease specialist, neurologist, ophthalmologist, neuro-ophthalmologist or neurosurgeon or any provider coordinating care with an infectious disease specialist, neurologist, ophthalmologist, neuro-ophthalmologist or neurosurgeon.
- Pediatric-specific imaging considerations include suspected congenital brain infection and neonatal meningitis. The common causes of prenatal infections of the central nervous system are cytomegalovirus, *Toxoplasma gondii*, herpes simplex type 2 virus and most recently zika virus. The findings suggesting prenatal brain infection include microcephaly, microphthalmia, chorioretinitis, cataracts, hypotonia, and seizures. The following are performed for congenital brain infections:
 - The following imaging is considered for newborn infants with suspected prenatal brain infection regardless of inciting organism. (For additional information see CDC's Areas with risk of Zika site: <https://wwwnc.cdc.gov/travel/page/zika-information>)
- Ultrasound Head (CPT® 76506) is supported as an initial imaging study
 - MRI Brain without and with contrast (CPT® 70553) is indicated if the ultrasound is abnormal.
 - Newborn infants with microcephaly should be evaluated as discussed in **Macrocephaly, Microcephaly, and Hydrocephalus (PEDHD-7)**
- The following imaging is considered for newborns or older infants with an open fontanelle and suspected meningitis:
 - Ultrasound Head (CPT® 76506) as an initial imaging study, but is not required
 - MRI Brain without and with contrast (CPT® 70553)² is indicated if the ultrasound is abnormal
- A wide spectrum of neurological diseases have been observed in children with COVID-19 infection in children including, but not limited to, Multisystem Inflammatory Syndrome.^{10,11}

- MRI Brain without and with contrast (CPT® 70553) **AND/OR**
- MRA Head (CPT® 70544, CPT® 70545 **OR** CPT® 70546) **OR** CTA Head (CPT® 70496) **AND/OR**
- MRA Neck (CPT® 70547 **OR** CPT® 70548 **OR** CPT® 70549) **OR** CTA Neck (CPT® 70498) **AND/OR**
 - If Acute Necrotizing Myelitis is suspected, the following are indicated:
 - MRI Cervical Spine without and with contrast (CPT® 72156) **AND/OR**
 - MRI Thoracic Spine without and with contrast (CPT® 72157) **AND/OR**
 - MRI Lumbar Spine without and with contrast (CPT® 72158)
- Metabolic (FDG) Brain PET (CPT® 78608) is appropriate to evaluate individuals suspected of having encephalitis, including autoimmune encephalitis, if diagnosis remains unclear after evaluation with MRI Brain, CSF analysis, and lab testing including serology.¹²

Background and Supporting Information

- Neonatal meningitis most often is caused by bacterial pathogens and usually occurs as a complication of sepsis in the first week of life. In older infants and children, meningeal inoculation occurs secondary to hematogenous spread or penetrating trauma.

Scalp and Skull Lesions (PEDHD-30)

Guideline

Scalp and Skull Lesions (PEDHD-30.1)

References (HDP-30)

Scalp and Skull Lesions (PEDHD-30.1)

HDP.SL.0030.1.A

v1.0.2024

- Scalp and skull lesion imaging indications in pediatric individuals are identical to those for adult individuals with the exception of neonates. See **Scalp and Skull Lesions (HD-20.1)** in the Head Imaging Guidelines.
 - In neonates and young infants, scalp masses include:
 - Congenital lesions (cephalocele-discussed above, dermoid cysts, epidermoid cyst)
 - Vascular lesions (hemangioma, sinus pericranii)
 - Extracranial hemorrhage related to birth trauma (caput succedaneum, cephalohematoma, subgaleal hematoma)
 - After the first year of life, malignant tumors, such as Langerhans cell histiocytosis metastases from neuroblastoma and rhabdomyosarcoma are an additional cause of a scalp mass.
 - The following imaging is considered for newborns with palpable scalp and skull lesions.
 - Ultrasound Head (CPT® 76506) is supported as an initial imaging study.
 - MRI Brain without and with contrast (CPT® 70553) (preferred) or CT Head without and with contrast (CPT® 70470) is indicated if the ultrasound is abnormal and associated anomalies are suspected
 - The following imaging is indicated for children and adults with Pott Puffy Tumor:
 - MRI Brain without and with contrast (CPT® 70553) OR CT Head without and with contrast (CPT® 70470)⁸
 - Repeat imaging is supported if requested by neurologist, neurosurgeon, otolaryngologist (ENT) and/or oral maxillofacial surgery (OMS) or any provider coordinating care with a neurologist, neurosurgeon, otolaryngologist (ENT) and/or oral maxillofacial surgery (OMS).

Background and Supporting Information

- Pott Puffy Tumor is an abscess involving the frontal bone with adjacent osteomyelitis as the result of a frontal sinus infection that spreads contiguously through the wall of the sinus or through hematogenous spread via the veins that drain sinus mucosa.⁸

PET Imaging; limited area (this code not used in pediatrics)	78811
PET Imaging; skull base to mid-thigh (this code not used in pediatrics)	78812
PET Imaging; whole body (this code not used in pediatrics)	78813
PET with concurrently acquired CT; limited area (this code rarely used in pediatrics)	78814
PET with concurrently acquired CT; skull base to mid-thigh	78815
PET with concurrently acquired CT; whole body	78816
Bone Marrow Imaging Limited Areas	78102
Bone Marrow Imaging Multiple Areas	78103
Bone Marrow Imaging Whole Body	78104
Nuclear Bone Scan Limited	78300
Nuclear Bone Scan Multiple Areas	78305
Nuclear Bone Scan Whole Body	78306
Bone Scan Three Phase	78315
DEXA Bone Densitometry, axial skeleton	77080
DEXA Bone Densitometry, peripheral skeleton	77081
Radiopharmaceutical localization of tumor, inflammatory process or distribution of radiopharmaceutical agent(s) (includes vascular flow and blood pool imaging, when performed); planar, single area (eg, head, neck, chest, pelvis), single day imaging	78800

Nuclear Medicine	CPT®
Radiopharmaceutical localization of tumor, inflammatory process or distribution of radiopharmaceutical agent(s) (includes vascular flow and blood pool imaging, when performed); planar, 2 or more areas (eg, abdomen and pelvis, head and chest), 1 or more days imaging or single area imaging over 2 or more days	78801
Radiopharmaceutical localization of tumor, inflammatory process or distribution of radiopharmaceutical agent(s) (includes vascular flow and blood pool imaging, when performed); planar, whole body, single day imaging	78802
Radiopharmaceutical localization of tumor, inflammatory process or distribution of radiopharmaceutical agent(s) (includes vascular flow and blood pool imaging, when performed); tomographic (SPECT), single area (eg, head, neck, chest, pelvis), single day imaging	78803
Radiopharmaceutical localization of tumor, inflammatory process or distribution of radiopharmaceutical agent(s) (includes vascular flow and blood pool imaging, when performed); tomographic (SPECT) with concurrently acquired computed tomography (CT) transmission scan for anatomical review, localization and determination/detection of pathology, single area (eg, head, neck, chest, pelvis), single day imaging	78830
Radiopharmaceutical localization of tumor, inflammatory process or distribution of radiopharmaceutical agent(s) (includes vascular flow and blood pool imaging, when performed); tomographic (SPECT), minimum 2 areas (eg, pelvis and knees, abdomen and pelvis), single day imaging, or single area imaging over 2 or more days	78831
Radiopharmaceutical localization of tumor, inflammatory process or distribution of radiopharmaceutical agent(s) (includes vascular flow and blood pool imaging, when performed); tomographic (SPECT) with concurrently acquired computed tomography (CT) transmission scan for anatomical review, localization and determination/detection of pathology, minimum 2 areas (eg, pelvis and knees, abdomen and pelvis), single day imaging, or single area imaging over 2 or more days	78832

Ultrasound	CPT®
Ultrasound, extremity, nonvascular; complete joint	76881
Ultrasound, extremity, nonvascular; limited, anatomic specific for focal abnormality	76882
Ultrasound, infant hips; dynamic (requiring physician manipulation)	76885
Ultrasound, infant hips; limited, static (not requiring physician manipulation)	76886
Ultrasound, axilla	76882
Ultrasound, upper back	76604

Ultrasound	CPT®
Ultrasound, lower back	76705
Ultrasound, other soft tissue areas not otherwise specified	76999
Limited bilateral noninvasive physiologic studies of upper or lower extremity arteries	93922
Complete bilateral noninvasive physiologic studies of upper or lower extremity arteries	93923
Duplex scan of upper extremity arteries or arterial bypass grafts; complete bilateral	93930
Duplex scan of upper extremity arteries or arterial bypass grafts; unilateral or limited	93931
Duplex scan of extremity veins including responses to compression and other maneuvers; complete bilateral study	93970
Duplex scan of extremity veins including responses to compression and other maneuvers; unilateral or limited study	93971
Duplex scan of hemodialysis access (including arterial inflow, body of access and venous outflow)	93990

General Guidelines (PEDMS-1.0)

MSP.GG.0001.0.A

v1.0.2024

- A pertinent clinical evaluation including a detailed history, physical examination, appropriate laboratory studies and basic imaging such as plain radiography or ultrasound should be performed prior to considering advanced imaging (CT, MR, Nuclear Medicine), unless the individual is undergoing guideline-supported scheduled imaging evaluation. A meaningful technological contact (telehealth visit, telephone call, electronic mail or messaging) can serve as a pertinent clinical evaluation.
- Plain x-ray should be done prior to advanced imaging. The results of plain x-rays performed after the current episode of symptoms started or changed need to be available to the requesting provider of the advanced imaging study. X-ray can rule out those situations that do not require advanced imaging, such as acute/healing fracture, osteomyelitis, and tumors of bone amenable to biopsy or radiation therapy (in known metastatic disease), etc.
 - Even in soft tissue masses, plain x-rays are helpful in evaluating for calcium/bony deposits, e.g. myositis ossificans and invasion of bone.
- Unless otherwise stated in a specific guideline section, repeat imaging studies of the same body area are not necessary unless there is evidence for progression of disease, new onset of disease, and/or documentation of how repeat imaging will affect individual management or treatment decisions.
- Provider-directed conservative care may include any or all of the following: R.I.C.E (rest, ice, compression, and elevation), NSAIDs (non-steroidal anti-inflammatory drugs), narcotic and non-narcotic analgesic medications, oral or injectable corticosteroids, viscosupplementation injections, a provider-directed home exercise program, cross-training, physical medicine, or immobilization by splinting/casting/bracing.
- These guidelines are based upon using advanced imaging to answer specific clinical questions that will affect patient management. Imaging is not indicated if the results will not affect individual management decisions. Standard medical practice would dictate continuing conservative therapy prior to advanced imaging in individuals who are improving on current treatment programs.

Age Considerations (PEDMS-1.1)

MSP.GG.0001.1.A

v1.0.2024

- Many conditions affecting the musculoskeletal system in the pediatric population are different diagnoses than those occurring in the adult population. For those diseases which occur in both pediatric and adult populations, differences may exist in management due to individual age, comorbidities, and differences in disease natural history between children and adults.
- Individuals who are ≤ 18 years old should be imaged according to the Pediatric Musculoskeletal Imaging Guidelines if discussed. Any conditions not specifically discussed in the Pediatric Musculoskeletal Imaging Guidelines should be imaged according to the General Musculoskeletal Imaging Guidelines. Individuals who are > 18 years old should be imaged according to the General Musculoskeletal Imaging Guidelines except where directed otherwise by a specific guideline section.

Appropriate Clinical Evaluation and Conservative Treatment (PEDMS-1.2)

MSP.GG.0001.2.A

v1.0.2024

- See: General Guidelines (PEDMS-1.0)

Modality General Considerations (PEDMS-1.3)

MSP.GG.0001.3.A

v1.0.2024

- MRI
 - MRI without contrast is the preferred modality for pediatric musculoskeletal imaging unless otherwise stated in a specific guideline section, as it is superior in imaging the soft tissues and can also define physiological processes in some instances, e.g. edema, loss of circulation (AVN), and increased vascularity (tumors).
 - MRI without and with contrast is frequently recommended for evaluation of tumors, infection, post-operative evaluation, arthrography, and juvenile idiopathic arthritis, as described in the disease-specific guideline sections.
 - Due to the length of time required for MRI acquisition and the need to minimize patient movement, anesthesia is usually required for almost all infants (except neonates) and young children (age <7 years), as well as older children with delays in development or maturity. This anesthesia may be administered via oral or intravenous route. In this individual population, MRI sessions should be planned with a goal of minimizing anesthesia exposure by adhering to the following considerations:
 - MRI procedures can be performed without and/or with contrast as supported by these condition-based guidelines. If intravenous access will already be present for anesthesia administration and there is no contraindication for using contrast, imaging without and with contrast may be appropriate if requested. By doing so, the requesting provider may avoid repetitive anesthesia administration to perform an MRI with contrast if the initial study without contrast is inconclusive.
 - Recent evidence-based literature demonstrates the potential for gadolinium deposition in various organs including the brain, after the use of MRI contrast.
 - The U.S. Food and Drug Administration (FDA) has noted that there is currently no evidence to suggest that gadolinium retention in the brain is harmful and restricting gadolinium-based contrast agents (GBCAs) use is not warranted at this time. It has been recommended that GBCA use should be limited to circumstances in which additional information provided by the contrast agent is necessary and the necessity of repetitive MRIs with GBCAs should be assessed.
 - If multiple body areas are supported by eviCore guidelines for the clinical condition being evaluated, MRI of all necessary body areas should be obtained concurrently in the same imaging session.
 - The presence of surgical hardware or implanted devices may preclude MRI, as magnetic field distortion may limit detail in adjacent structures. CT may be the procedure of choice in these cases.

- The selection of best examination may require coordination between the provider and the imaging service.
- CT
 - CT without contrast is generally superior to MRI for imaging bone and joint anatomy; thus it is useful for studying complex fractures (particularly of the joints, dislocations, and assessing delayed union or non-union of fractures, integration of bone graft material, if plain x-rays are equivocal).
 - CT should not be used to replace MRI in an attempt to avoid sedation unless listed as a recommended study in a specific guideline section.
 - CT beam attenuation can result in streak artifact which can obscure adjacent details. This can occur with radiopaque material such as metal objects or dense bones.
 - The selection of best examination may require coordination between the requesting provider and the rendering imaging facility.
- Ultrasound
 - Ultrasound is frequently used to evaluate infants for hip dysplasia, to detect and/or aspirate joint effusion, and as an initial evaluation of extremity soft tissue masses.
 - CPT® codes vary by body area and the use of Doppler imaging. These CPT® codes are included in the table at the beginning of this guideline.
- Nuclear Medicine
 - Nuclear medicine studies are commonly used in evaluation of the peripheral musculoskeletal system, and other rare indications exist as well:
 - Bone scan (CPT® 78315), Distribution of Radiopharmaceutical Agent SPECT (CPT® 78803, or 78831), or SPECT/CT (CPT® 78830) is indicated for evaluation of suspected loosening of orthopedic prostheses when recent plain x-ray is nondiagnostic.
 - Nuclear medicine bone marrow imaging (CPT® codes: CPT® 78102, CPT® 78103, or CPT® 78104), SPECT (CPT® code: 78803), or SPECT/CT (CPT® 78830) is indicated for detection of ischemic or infarcted regions in sickle cell disease.
 - Triple phase bone scan (CPT® 78315) is indicated for evaluation of complex regional pain syndrome or reflex sympathetic dystrophy.
- 3D Rendering
 - 3D Rendering indications in pediatric musculoskeletal imaging are identical to those in the general imaging guidelines. See: **3D Rendering (MS-3)** for imaging guidelines.
- Bilateral Imaging
 - Coding for bilateral imaging may vary from health care plan to health care plan. Not all coding options may be available for all health care plans.

The guidelines listed in this section for certain specific indications are not intended to be all-inclusive; clinical judgment remains paramount and variance from these guidelines may be appropriate and warranted for specific clinical situations.

Fracture and Dislocation (PEDMS-2)

Guideline

Fracture and Dislocation (PEDMS-2)

Acute Fracture (PEDMS-2.1)

Joint-Adjacent Fracture (PEDMS-2.2)

Growth Plate Injuries (Salter-Harris Fractures) (PEDMS-2.3)

Osteochondral or Chondral Fractures, Including Osteochondritis Dissecans (PEDMS-2.4)

Stress/Occult Fracture (PEDMS-2.5)

Compartment Syndrome (PEDMS-2.6)

Physical Child Abuse (PEDMS-2.7)

References (PEDMS-2)

Fracture and Dislocation (PEDMS-2)

MSP.FX.0002.0.A

v1.0.2024

- A pertinent clinical evaluation including a detailed history, physical examination, and plain radiography should be performed prior to considering advanced imaging.

Acute Fracture (PEDMS-2.1)

MSP.FX.0002.1.A

v1.0.2024

- Plain x-rays should be performed initially in any obvious or suspected acute fracture or dislocation.
 - If plain x-rays are positive, no further imaging is generally indicated except in complex (comminuted or displaced) joint fractures where MRI or CT without contrast can be approved for preoperative planning.
 - 3D Rendering may sometimes be indicated for complex fracture repairs. See: **3D Rendering (MS-3)** in the Musculoskeletal Imaging Guidelines.
- Ultrasound (CPT® 76881 or CPT® 76882) may be approved for evaluation of fracture, but is not required to allow for other advanced imaging¹², especially in infants¹³.
- CT or MRI without contrast is indicated if plain x-rays are negative or equivocal for fracture, and fracture or bone marrow edema is still clinically suspected, and if the results will determine immediate treatment decisions as documented by the treating physician.¹²
- Bone scan may be approved for evaluation of suspected fracture when two x-rays are negative at least 10 days apart, using any of the following CPT® code combinations:
 - CPT® 78300, CPT® 78305, or CPT® 78306 as a single study
 - See: **Stress/Occult Fracture (PEDMS-2.5)** for bone scan indications

Joint-Adjacent Fracture (PEDMS-2.2)

MSP.FX.0002.2.A

v1.0.2024

- CT without contrast can be approved in complex (comminuted or displaced) fractures seen on plain x-ray involving a joint for preoperative planning.
- CT without contrast can be approved when there is clinical concern for delayed union or non-union of fracture or joint fusions on follow-up plain x-ray.

Growth Plate Injuries (Salter-Harris Fractures) (PEDMS-2.3)

MSP.FX.0002.3.A**v1.0.2024**

- These fractures can generally be diagnosed and managed adequately with plain x-ray.
- In case of severe injury with displacement of bone fractures seen on plain x-ray, CT without contrast may be indicated prior to surgical intervention.
- If there is concern for delayed union or non-union of the bone seen on plain x-ray, CT without contrast is indicated.
- MRI without contrast is indicated for the evaluation of a suspected physeal bar in a healing fracture or other complication of a fracture involving the growth plate seen on plain x-ray, which may result in abnormal growth.
- Compressive injuries of the growth plate (Salter-Harris V) injuries may be difficult to identify on plain films, and MRI without contrast is indicated for confirmation.

Osteochondral or Chondral Fractures, Including Osteochondritis Dissecans (PEDMS-2.4)

MSP.FX.0002.4.A

v1.0.2024

An osteochondral fracture is a tear of the cartilage which covers the end of a bone, within a joint. It is also known as Osteochondritis Dissecans. In both disorders, loose bone fragments may form in a joint.

- If x-rays are negative and an osteochondral fracture is still suspected, or if x-ray or clinical exam suggests an unstable osteochondral injury, either MRI without contrast, MR arthrogram, or CT arthrogram of the involved joint is indicated.
- If plain x-rays show a non-displaced osteochondral fragment, follow up imaging should be with plain x-rays. Advanced imaging is not necessary.
- MRI without contrast or CT without contrast is indicated when healing cannot be adequately assessed on follow up plain x-rays.¹¹

Stress/Occult Fracture (PEDMS-2.5)

MSP.FX.0002.5.A**v1.0.2024**

- These fractures can usually be adequately evaluated by history, physical exam, and x-ray. Advanced imaging may be appropriate as discussed below if the initial evaluation of history, physical exam, and plain x-ray fails to establish a definitive diagnosis.
- Plain x-rays should be performed before advanced imaging. Plain x-rays are often negative initially, but may become positive after 14 days.
- If stress or occult fracture is suspected involving the pelvis, sacrum, hip, femur, tibia, tarsal navicular, proximal 5th metatarsal, or scaphoid, and initial plain x-ray fails to establish a definitive diagnosis:
 - MRI or CT without contrast is indicated, without conservative care or follow-up plain x-rays OR
 - Bone scan (CPT® 78315, 78306, or 78300), SPECT/CT (CPT® 78830), or Distribution Of Radiopharmaceutical Agent SPECT (CPT® 78803) may be approved in place of MRI or CT if provider requests
- For all other suspected stress or occult fractures, if follow-up plain x-rays are negative after 10 days of conservative care, or initial non-diagnostic x-ray is obtained a minimum of 14 days after the onset of symptoms:
 - MRI or CT without contrast is indicated OR
 - Bone scan (CPT® 78315, 78306, or 78300), SPECT/CT (CPT® 78830), or Distribution Of Radiopharmaceutical Agent SPECT (CPT® 78803) may be approved in place of MRI or CT if provider requests
- Periodic follow-up plain x-rays will usually show progressive healing.
 - CT without contrast is indicated when there is clinical concern for non-union.

Compartment Syndrome (PEDMS-2.6)

MSP.FX.0002.6.A

v1.0.2024

- Acute compartment syndrome is a clinical diagnosis made by direct measurement of compartment pressure and is a surgical emergency. Advanced imaging is not indicated.
- See: **Chronic Exertional Compartment Syndrome (MS-11.3)** for imaging guidelines.

Physical Child Abuse (PEDMS-2.7)

MSP.FX.0002.7.A

v1.0.2024

- See: **Suspected Physical Child Abuse (PEDMS-7)** for imaging guidelines

Soft Tissue and Bone Masses (PEDMS-3)

Guideline

Soft Tissue and Bone Masses – General Considerations (PEDMS-3.1)

Soft Tissue Mass with Negative X-ray and Abnormal Ultrasound (PEDMS-3.2)

Soft Tissue Mass with Calcification/Ossification on X-ray (PEDMS-3.3)

Mass Involving Bone (Including Suspected Lytic and Blastic Metastatic Disease) (PEDMS-3.4)

References (PEDMS-3)

Soft Tissue and Bone Masses – General Considerations (PEDMS-3.1)

MSP.ST.0003.1.A

v1.0.2024

- A pertinent clinical evaluation including a detailed history, physical examination, with detailed information on the mass (including location, size, duration, solid vs. cystic, fixed vs. not fixed to bone) should be performed prior to considering advanced imaging.
- Evaluation by a surgical specialist or oncologist is strongly recommended to help determine the most helpful advanced imaging studies for an individual.
- Plain x-rays should be performed as initial imaging. This is true even for soft tissue masses that are clearly not directly associated with osseous structures. Details such as soft tissue calcification, presence or absence of phleboliths, radiographic density, and any effect on adjacent bone are all potentially significant plain film findings that may help better identify the etiology of the mass and determine the optimal modality and contrast level when advanced imaging is indicated.
- Ultrasound (CPT® 76881 or CPT® 76882) if initial plain x-ray is negative to evaluate:
 - Ill-defined masses or areas of swelling
 - Hematomas
 - Subcutaneous lipomas with inconclusive clinical examination
 - Lipomas in other locations
 - Masses that have been present and stable for ≥ 1 year
 - Vascular malformations (see: **Vascular Anomalies (PEDPVD-2)** in the Pediatric Peripheral Vascular Disease Imaging Guidelines)
- Advanced imaging is not indicated for the following entities:
 - Ganglion cysts
 - Sebaceous cysts
 - Hematomas
 - Subcutaneous lipomas
 - MRI without or without and with contrast can be performed if surgery is planned.
- MRI without and with contrast, or ultrasound (CPT® 76881 or CPT® 76882) is indicated for lipomas in other locations (not subcutaneous).

Soft Tissue Mass with Negative X-ray and Abnormal Ultrasound (PEDMS-3.2)

MSP.ST.0003.2.A

v1.0.2024

- MRI without and with contrast is indicated when plain x-ray is negative and ultrasound is abnormal.
 - CT without or with contrast is indicated if MRI is contraindicated.

Soft Tissue Mass with Calcification/Ossification on X-ray (PEDMS-3.3)

MSP.ST.0003.3.A

v1.0.2024

- MRI without and with contrast is indicated when calcification/ossification is noted on plain x-ray.
 - CT without or with contrast is indicated if MRI is contraindicated.

Mass Involving Bone (Including Suspected Lytic and Blastic Metastatic Disease) (PEDMS-3.4)

MSP.ST.0003.4.A

v1.0.2024

- Complete radiograph of the entire bone containing the lesion of bone is required prior to consideration of advanced imaging. Many benign bone tumors have a characteristic appearance on plain x-ray and advanced imaging is not necessary unless one of the following applies:
 - MRI without and with contrast and/or CT without may be indicated for preoperative planning.
 - MRI without and with contrast when the diagnosis is uncertain based on plain x-ray appearance.
 - CT without or with contrast can be approved if MRI is contraindicated.
- Surveillance of benign bony lesions is with plain x-ray¹¹
 - MRI without and with contrast may be approved for new findings on x-ray, or new or worsening clinical symptoms not explained by recent x-ray.
- Osteochondroma, osteoid osteoma, osteogenic sarcoma, and Ewing sarcoma family of tumors should be imaged according to **Bone Tumors (PEDONC-9)** in the Pediatric Oncology Imaging Guidelines.
- If there is concern for metastatic disease in an individual with a known malignancy, refer to the appropriate Pediatric Oncology Imaging Guideline.

Limping Child (PEDMS-4)

Guideline

General Evaluation of the Limping Child (PEDMS-4.1)

Limping Child with Suspected Trauma (PEDMS-4.2)

Limping Child with Suspected Infection (PEDMS-4.3)

Limping Child with No Evidence of Trauma or Infection (PEDMS-4.4)

References (PEDMS-4)

General Evaluation of the Limping Child (PEDMS-4.1)

MSP.LC.0004.1.A**v1.0.2024**

- This guideline primarily applies to children under the age of 6 years. It may also be applied to older children with pre-existing conditions who may not be able to communicate, such as a child with severe intellectual disability. Many of these cases will be urgent, because of the risk of adverse outcomes in delay of diagnosis.
- A pertinent clinical evaluation, including a detailed history and physical examination, should be performed, which will help determine any indication for advanced imaging. Based on this clinical evaluation, the most likely etiology should be determined, usually trauma, infection, or neither trauma nor infection.
- X-ray should be obtained if there are no localized findings on physical examination.⁵

Limping Child with Suspected Trauma (PEDMS-4.2)

MSP.LC.0004.2.A**v1.0.2024**

- Plain radiographs are indicated for detection of fractures, destructive lesions, and avascular necrosis. For children under age 4 this may require x-rays of the entire leg from hip to foot. If clinical suspicion is high for “toddler fracture” imaging may start with tibia/fibula radiographs, and if a fracture is demonstrated, additional imaging may not be required.
- If initial radiographs are negative, but limping symptoms or avoidance of weight-bearing persist, follow-up radiographs in 7 to 10 days are indicated.
 - If plain films are negative and suspicion remains high for stress fractures or soft tissue injury:
 - MRI without contrast of the affected body area OR
 - Radionuclide bone scan (CPT® 78300, CPT® 78305, CPT® 78306, or CPT® 78315), SPECT/CT (CPT® 78830), or SPECT (CPT® 78803) may be approved if implanted hardware or devices precluding MRI are present.
- CT use is limited in the evaluation of the limping child with suspected trauma.

Limping Child with Suspected Infection (PEDMS-4.3)

MSP.LC.0004.3.A

v1.0.2024

- Pain localized to hip:
 - It is essential to exclude septic arthritis. Ultrasound of the hip (CPT® 76881 or 76882) is used to exclude hip joint effusion.
 - Hip joint fluid aspiration to distinguish infection from non-infectious etiologies if hip joint effusion is demonstrated.
 - Plain radiographs should be obtained if no hip joint effusion is demonstrated.
 - MRI without contrast (CPT® 73721) or without and with contrast (CPT® 73723) is indicated if plain films are not diagnostic.
- Pain localized distal to hip:
 - MRI without contrast or without and with contrast of the affected body part if plain radiographs are not diagnostic.
- Nonlocalized pain:
 - Plain radiographs of the spine, pelvis, and lower extremities may be necessary to localize the abnormality.
 - If plain radiography is not diagnostic and suspicion for infection remains high:
 - Whole-body bone scan (CPT® 78306) OR
 - SPECT (CPT® 78803) OR
 - SPECT/CT (CPT® 78830) OR
 - MRI without contrast or without and with contrast of the affected body area

Limping Child with No Evidence of Trauma or Infection (PEDMS-4.4)

MSP.LC.0004.4.A

v1.0.2024

- This differential diagnosis is quite broad.
 - Transient (or toxic) synovitis of the hip:
 - Ultrasound of the hip (CPT® 76881 or CPT® 76882) is the preferred initial exam.
 - Plain radiographs if no hip effusion is demonstrated.
 - Hip joint fluid aspiration is indicated if a hip joint effusion is demonstrated. This is usually performed with US guidance, though fluoroscopic guidance or blind aspiration may be required.
 - Avascular Necrosis, see: **Avascular Necrosis (AVN)/ Legg-Calvé-Perthes Disease (PEDMS-6)**
 - Juvenile Idiopathic Arthritis, see: **Juvenile Idiopathic Arthritis (PEDMS-10.1)**
 - Histiocytic Disorders, see: **Histiocytic Disorders (PEDONC-18)** in the Pediatric Oncology Imaging Guidelines
 - Neoplasm, see: **General Guidelines (PEDONC-1)**, **Pediatric Leukemias (PEDONC-3)**, **Neuroblastoma (PEDONC-6)**, **Pediatric Soft Tissue Sarcomas (PEDONC-8)**, or **Bone Tumors (PEDONC-9)** in the Pediatric Oncology Imaging Guidelines
 - Child abuse, see: **Suspected Physical Child Abuse (PEDMS-7)**

Developmental Dysplasia of the Hip (PEDMS-5)

Guideline

Developmental Dysplasia of the Hip (PEDMS-5)

References (PEDMS-5)

Developmental Dysplasia of the Hip (PEDMS-5)

MSP.DZ.0005.A

v1.0.2024

Developmental dysplasia of the hip (DDH) was formerly known as congenital dislocation of the hip. DDH includes a spectrum of abnormalities including abnormal acetabular shape (dysplasia) and malposition of the femoral head ranging from mild subluxation, dislocatable hip to fixed dislocation. 60 to 80% of abnormalities are identified by physical exam, and more than 90% are identified by ultrasound. Treatment may involve placement in a Pavlik harness, casting, or surgery in extreme or refractory cases.

Screening studies

- The routine use of ultrasound in screening neonates and infants without risk factors for DDH is not recommended by the American Academy of Pediatrics and the American Academy of Orthopedic Surgeons.
- There are two sonographic methods of evaluating the hip: the dynamic stress (Harcke) technique and the static (Graf) technique
- Screening ultrasound (CPT® 76885 or CPT® 76886) is recommended for infants between 4 weeks⁸ of age and 4 months of age with one or more of the following risk factors:
 - Breech presentation
 - Family history of DDH
 - Abnormal hip exam (e.g. positive Ortolani or Barlow maneuvers, asymmetric thigh folds, shortening of the thigh observed on the dislocated side, limitation of hip abduction).
- For children between 4 and 6 months of age plain x-ray is the preferred imaging modality as femoral head ossification is often seen on x-ray in normal patients
 - If x-ray is inconclusive, ultrasound (CPT® 76885 or CPT® 76886) may be indicated
- Indications for follow-up hip ultrasound (CPT® 76885 or CPT® 76886):
 - Type IIA hip was diagnosed on a previous hip ultrasound using the Graf method and follow-up hip ultrasound is requested to confirm normal development.
 - Graf type IIA hip has an alpha angle (bony angle) between 50 to 59 degrees in a child less than 3 months of age.
 - The overwhelming majority of these hips mature spontaneously, but follow-up may be required to ensure that maturation has occurred.
 - Full description of the Graf classification can be found at: <http://radiopaedia.org/articles/ultrasound-classification-of-developmental-dysplasia-of-the-hip-1>.
 - Subluxation or dislocation was diagnosed on previous hip ultrasound using the dynamic Harcke imaging method.

- Prior ultrasound demonstrates abnormal hip and treatment has been applied, such as a Pavlik harness or other device. Follow-up ultrasound is indicated to document effectiveness of treatment, to ensure the femoral head remains located in the acetabulum or to identify treatment failure. The usual interval for follow-up sonography is monthly, but earlier imaging is indicated for clinical suspicion of treatment failure, subluxation or dislocation of the hip.
- MRI without contrast (CPT® 73721) or CT without contrast (CPT® 73700) is indicated to evaluate alignment following reduction. Children in casts or following surgery may require repeated advanced imaging to ensure the reduction remains satisfactory, or to assess incorporation of bone graft material.
- Hip ultrasound is NOT indicated for the following:
 - Infants less than 2 weeks of age, since hip laxity is normal after birth and usually resolves spontaneously.
 - Infants older than 6 months of age as plain x-ray of the hips become more reliable due to femoral head ossification and should be used in infants over 6 months of age.
 - Type I, IIB, IIC, IID, and III hips diagnosed on a previous hip ultrasound using the Graf method. Type I hip is normal, and Type IIB, IIC, IID, and III require referral for treatment rather than follow-up imaging.
 - Plain x-ray of the hips should be performed rather than ultrasound if there is a clinical suspicion for teratogenic dysplasia.

Avascular Necrosis (AVN) / Legg-Calvé- Perthes Disease / Idiopathic Osteonecrosis (PEDMS-6)

Guideline

Avascular Necrosis and Legg-Calvé-Perthes Disease (PEDMS-6.1)
Osteonecrosis (PEDMS-6.2)
References (PEDMS-6)

Avascular Necrosis and Legg-Calvé-Perthes Disease (PEDMS-6.1)

MSP.AN.0006.1.A

v1.0.2024

- Plain x-ray is the initial imaging study and may be all that is necessary for follow-up¹¹.
- MRI Hip either without contrast (CPT® 73721) or without and with contrast (CPT® 73723) is indicated if the diagnosis is uncertain on plain x-ray¹⁰.
 - If MRI is contraindicated or unavailable, any one of the following studies may be approved in lieu of MRI:
 - CT scan without contrast, OR
 - Nuclear bone scan (CPT® codes: 78300, 78305, 78306, or 78803) OR
 - SPECT/CT (CPT® 78830)

Osteonecrosis (PEDMS-6.2)

MSP.AN.0006.2.A

v1.0.2024

- Osteonecrosis can occur in a number of conditions, including during treatment for developmental dysplasia of the hip.
- Individuals with acute lymphoblastic leukemia, lymphoblastic lymphoma, or other conditions with recurrent exposure to high dose corticosteroids and known or suspected osteonecrosis should be imaged according to guidelines in: **Acute Lymphoblastic Leukemia (ALL) (PEDONC-3.2)** in the Pediatric Oncology Imaging Guidelines.
- Known or suspected osteonecrosis in long-term cancer survivors should be imaged according to guidelines in: **Osteonecrosis in Long Term Cancer Survivors (PEDONC-19.4)** in the Pediatric Oncology Imaging Guidelines.
- X-ray is indicated as initial imaging study¹⁰
- MRI either without contrast or without and with contrast in other individuals with concern for osteonecrosis and inconclusive recent x-ray, if imaging results will change current individual management.
 - CT scan without contrast may be appropriate for surgical planning⁸

Suspected Physical Child Abuse (PEDMS-7)

Guideline

Suspected Physical Child Abuse (PEDMS-7)

References (PEDMS-7)

Suspected Physical Child Abuse (PEDMS-7)

MSP.AB.0007.A

v1.0.2024

The suspicion of physical abuse of a child often requires imaging, both for clinical management and for forensic purposes. Every effort should be made to support reasonable requests for imaging in these children.

Child abuse injuries may affect any organ or system. Fractures are common, but injuries may also involve solid and hollow visceral organs, and/or superficial and deep soft tissue injuries. Some fracture patterns are highly correlated with non-accidental mechanisms, such as the “classic metaphyseal lesion,” also known as a corner fracture or bucket handle fracture, but fractures may occur in any bone. Unsuspected fractures, multiple fractures at various stages of healing, or fractures of a configuration or distribution inconsistent with the history provided, may raise the suspicion for physical abuse.

Skeletal Injury

- The radiographic skeletal survey is the primary imaging procedure for detecting fractures, especially in children age 24 months or younger. In older children, skeletal survey may be indicated, but more tailored radiographic evaluation based on history and physical examination may be preferable to skeletal survey.
- When skeletal survey is negative, but clinical suspicion remains high:
 - Bone scan (CPT® codes: CPT® 78300, 78305, 78306, 78315, or 78830) OR
 - Distribution of Radiopharmaceutical Agent SPECT (CPT® 78803)
- Suspected injury to the spine should usually first be evaluated with plain radiographs. CT without contrast and/or MRI without contrast or without and with contrast may be required for complete evaluation of osseous and soft tissue spine injuries. If requested for suspected or known physical abuse, both CT without contrast and/or MRI without contrast or without and with contrast of suspected sites should be approved.
- CT Chest without contrast (CPT® 71250) is indicated in patients with a negative skeletal survey and a high clinical suspicion for rib fracture associated with child abuse.⁸
- A repeat skeletal survey performed approximately 2 weeks after the initial examination can provide additional information on the presence and age of child abuse fractures and should be performed when abnormal or equivocal findings are found on the initial study and when abuse is suspected on clinical grounds

Head Injury

- CT Head without contrast (CPT® 70450) is indicated when there is clinical evidence of head injury or when skull fracture of any age is detected on survey skull x-ray.⁷

- CT Head without contrast (CPT® 70450) is also indicated when known or suspected cervical trauma is present in a pediatric individual.
- CT Head without contrast (CPT® 70450) is indicated in individuals less than 1 year of age, even if no neurologic symptoms are detected due to the great potential morbidity of abuse head trauma. MRI Brain without contrast (CPT® 70551) may also be approved.¹
- MRI Spine without contrast (CPT® 72141, 72146, 72148) or without and with contrast (CPT® 72156, 72157, 72158) may be approved when there is clinical evidence of head injury or when skull fracture of any age is detected on survey skull x-ray. CT Spine (CPT® 72125, CPT® 72128, CPT® 72131) may be approved if MRI is not readily available.⁹
- MRI Brain without contrast (CPT® 70551) or without and with contrast (CPT® 70553) is indicated to further evaluate brain parenchymal injury, or in a child where the clinical signs of brain injury are not sufficiently explained by CT findings.

Other Body Area Injuries

- CT should be performed with contrast unless an absolute contraindication exists.
- ANY of the following imaging studies are indicated for suspected injury to the abdomen or pelvis^{6,7}:
 - Abdominal ultrasound (CPT® 76700)
 - Pelvic ultrasound (CPT® 76856)
 - CT Abdomen with contrast (CPT® 74160)
 - CT Pelvis with contrast (CPT® 72193)
 - CT Abdomen and Pelvis with contrast (CPT® 74177)
- ANY of the following imaging studies are indicated for suspected injury to the chest:
 - CT Chest without contrast (CPT® 71250)
 - CT Chest with contrast (CPT® 71260)

Screening of other children

- Contacts are defined as the asymptomatic siblings, cohabiting children, or children under the same care as an index child with suspected child physical abuse. All contact children should undergo a thorough physical examination and a history elicited prior to imaging. Contact children younger than 12 months should have neuroimaging, and skeletal survey. CT Head without contrast (CPT® 70450) or MRI Brain without contrast (CPT® 70551) may be approved. Contact children aged 12 to 24 months should undergo skeletal survey. No routine imaging is indicated in asymptomatic children older than 24 months.¹⁰

Infection/Osteomyelitis (PEDMS-8)

Guideline

Infection/Osteomyelitis (PEDMS-8)

References (PEDMS-8)

Infection/Osteomyelitis (PEDMS-8)

MSP.OI.0008.A

v1.0.2024

- Infection and osteomyelitis imaging indications in pediatric individuals are similar to those for adult individuals other than the limping child.
 - See: **Infection/Osteomyelitis (MS-9)** in the Musculoskeletal Imaging Guidelines other than in the limping child.
 - See: **Limping Child with Suspected Infection (PEDMS-4.3)** for imaging guidelines when limping is present.
 - See: **Inflammatory Musculoskeletal Disease (PEDMS-10)** for imaging guidelines for chronic recurrent multifocal osteomyelitis (CRMO, which is an autoimmune disease).
- Ultrasound of the involved extremity (CPT® 76881 or CPT® 76882) is indicated to evaluate for effusion or soft tissue fluid collection⁶
 - Ultrasound is not a prerequisite for other advanced imaging studies
- Bone scan (CPT® 78300, 78305, 78306, or 78315), SPECT/CT (CPT® 78830, or 78832), or SPECT (CPT® 78803, or 78831) is indicated for evaluation of suspected bone infection if MRI cannot be done and when infection is multifocal, or when the infection is associated with orthopedic hardware or chronic bone alterations from trauma or surgery. Combining bone scintigraphy with a labeled leukocyte scan enhances sensitivity. A labeled leukocyte scan (radiopharmaceutical localization of tumor, inflammatory process, or distribution of radiopharmaceutical agent(s) imaging) - one of the following CPT® codes: CPT® 78800, CPT® 78801, 78802, or CPT® 78803 in concert with Tc-99m sulfur colloid marrow imaging (one of CPT® codes: CPT® 78102, CPT® 78103, or CPT® 78104) or SPECT/CT (CPT® 78830) is particularly useful in cases with altered bone marrow distribution, such as joint prosthesis.

Foreign Body (PEDMS-9)

Guideline

Foreign Body (PEDMS-9)

Reference (PEDMS-9)

Foreign Body (PEDMS-9)

MSP.FB.0009.A

v1.0.2024

- Foreign body imaging indications in pediatric individuals are similar to those for adult individuals. See: **Foreign Body – General (MS-6.1)** for imaging guidelines.
- The common soft tissue foreign bodies in children are wood, glass, and metal slivers. The latter two elements are radiopaque and visible to some degree on plain radiographs, whereas wood is usually radiolucent and nearly always imperceptible on radiographs. When a radiolucent foreign body is suspected, ultrasound (CPT® 76881 or 76882) can be used to identify the foreign body.

Reference (PEDMS-9)

Inflammatory Musculoskeletal Disease (PEDMS-10)

Guideline

Inflammatory Musculoskeletal Disease (PEDMS-10.0)

Juvenile Idiopathic Arthritis (PEDMS-10.1)

Chronic Recurrent Multifocal Osteomyelitis (PEDMS-10.2)

Inflammatory Muscle Diseases (PEDMS-10.3)

References (PEDMS-10)

Inflammatory Musculoskeletal Disease (PEDMS-10.0)

MSP.MD.0010.0.A

v1.0.2024

- A pertinent clinical evaluation including a detailed history, physical examination, and plain radiography should be performed prior to considering advanced imaging.
- Inflammatory arthritis imaging indications in pediatric patients are very similar to those for adult individuals. See: **Rheumatoid Arthritis (RA) and Inflammatory Arthritis (MS-15)** in the Musculoskeletal Imaging Guidelines. Specific pediatric considerations are included below.

Juvenile Idiopathic Arthritis (PEDMS-10.1)

MSP.MD.0010.1.A

v1.0.2024

- Ultrasound (CPT® 76881 or 76882) is indicated for assessment of: size and characteristics of joint effusions, extent of synovial hypertrophy, which is the hallmark of juvenile idiopathic arthritis, and involvement of tendinous structures.
 - Repeat imaging for monitoring treatment or with planned treatment change may be approved
 - MRI of the most symptomatic joint without contrast or without and with contrast may be considered if ultrasound is inconclusive and MRI findings would alter individual management
- Distribution of Radiopharmaceutical Agent SPECT (CPT® 78802, or 78803), or SPECT/CT (CPT® 78830), is indicated for evaluation of facet arthropathy in patients with ankylosing spondylitis, osteoarthritis, or rheumatoid arthritis.
- MRI TMJ (CPT® 70336) is indicated annually for detecting silent TMJ arthritis in children with juvenile idiopathic arthritis (JIA).
- MRI without or without and with of the most involved joint may be approved to evaluate involved or symptomatic joints in the following situations:¹⁵
 - When diagnosis is uncertain prior to initiation of drug therapy
 - To study the effects of treatment with disease modifying anti-rheumatic drug (DMARD) therapy
 - To determine a change in treatment
- MRI (with the exception of the annual screening MRI of the TMJ discussed above) should NOT be considered for routine follow-up of treatment.

Chronic Recurrent Multifocal Osteomyelitis (PEDMS-10.2)

MSP.MD.0010.2.A

v1.0.2024

Chronic recurrent multifocal osteomyelitis (CRMO) is a rare autoimmune disease affecting multiple bones, arising most commonly during the second decade of life. Treatment consists of anti-inflammatory and immunomodulatory therapies, and is directed predominantly by status of clinical symptoms (most commonly pain).

- Individuals with CRMO can have the following imaging approved for evaluation of new or worsening pain, or response to treatment in patients without complete clinical resolution of pain symptoms, when plain x-rays are non-diagnostic:
 - Bone scan (CPT® codes: 78300, 78305, 78306, 78315) OR
 - SPECT (CPT® codes: 78803, or 78831), OR
 - Nuclear Bone Marrow imaging (CPT® codes: 78102, 78103, or 78104), OR
 - Radiopharmaceutical localization of tumor, inflammatory process, or distribution of radiopharmaceutical agent imaging (CPT® codes: 78800, 78801, 78802, or 78803), OR
 - SPECT/CT (CPT® codes: 78830, or 78832)
 - MRI without contrast of specific painful body areas when plain x-ray and bone scan are insufficient to direct acute individual care decisions.
- Literature¹⁴ suggests MRI may have greater sensitivity for clinically occult lesions than bone scan. Whole-body MRI (CPT® 76498) can be approved for CRMO in the following situations.
 - WBMRI may be approved in an individual suspected of having CRMO if characteristic MR findings of CRMO would preclude the need for a biopsy.
 - Characteristic finding include multiple lesions most commonly involving the juxtaphyseal/peri-physeal portions of the tibia and femur, the clavicle and thoracolumbar spine.
 - WBMRI may be approved every 6-12 months in individuals with an established diagnosis of CRMO to monitor treatment or to evaluate for clinically occult, but radiographically active lesions.
 - See: **Whole Body MR Imaging (Preface-5.2)** for additional details.

Inflammatory Muscle Diseases (PEDMS-10.3)

MSP.MD.0010.3.A

v1.0.2024

- A pertinent clinical face-to-face evaluation including a detailed history, physical examination, and plain radiography should be performed prior to considering advanced imaging.

Inflammatory Muscle Diseases:

These include but are not limited to dermatomyositis, polymyositis, and sporadic inclusion body myositis. MRI without contrast of a single site is indicated in these disorders for the following purposes:

- Selection of biopsy site
- Clinical concern for progression
- Treatment monitoring
- Detection of occult malignancy

Juvenile Dermatomyositis:

- MRI without contrast can frequently confirm the diagnosis and thus avoid a biopsy.
- CT without contrast (CPT® 73700) is indicated to follow progressive calcification in muscles, but MRI (CPT® 73718) is often used instead since it permits assessment of the primary muscle disease as well.
 - Both CT and MRI are rarely indicated concurrently.
- Contrary to adult dermatomyositis, juvenile dermatomyositis is very rarely paraneoplastic in nature, and routine screening for occult neoplasm is not indicated.
 - CT Chest (CPT® 71260) and Abdomen and Pelvis (CPT® 74177) with contrast are indicated for individuals with palpable lymphadenopathy or hepatosplenomegaly.

Muscle/Tendon Unit Injuries (PEDMS-11)

Guideline

Muscle/Tendon Unit Injuries (PEDMS-11)

Muscle/Tendon Unit Injuries (PEDMS-11)

MSP.MI.0011.A

v1.0.2024

- Muscle and tendon unit injury imaging indications in pediatric individuals are identical to those in the general imaging guidelines. See: **Muscle/Tendon Unit Injuries/Diseases (MS-11)** in the Musculoskeletal Imaging Guidelines.

Osgood-Schlatter Disease (PEDMS-12)

Guideline

Osgood-Schlatter Disease (PEDMS-12)

References (PEDMS-12)

Osgood-Schlatter Disease (PEDMS-12)

MSP.OD.0012.A

v1.0.2024

- Osgood-Schlatter Disease is defined as traction apophysitis of the tibial tubercle in skeletally immature individuals. Diagnosis is by clinical examination and x-ray, and treatment is conservative.
- Advanced imaging is not indicated in this disorder.

References (PEDMS-12)

Popliteal (Baker) Cyst (PEDMS-13)

Guideline

Popliteal (Baker) Cyst (PEDMS-13)

References (PEDMS-13)

Popliteal (Baker) Cyst (PEDMS-13)

MSP.PC.0013.A**v1.0.2024**

Popliteal or Baker cyst in children is a different clinical entity than in adults and is almost never due to intra-articular pathology. These lesions are usually treated conservatively and rarely require surgery.

- Ultrasound (CPT® 76881 or 76882) is the appropriate initial imaging study.
- MRI without contrast (CPT® 73721) is indicated for preoperative planning or if ultrasound is non-diagnostic.

Slipped Capital Femoral Epiphysis (SCFE) (PEDMS-14)

Guideline

Slipped Capital Femoral Epiphysis (SCFE) (PEDMS-14)
References (PEDMS-14)

Slipped Capital Femoral Epiphysis (SCFE) (PEDMS-14)

MSP.FE.0014.A

v1.0.2024

Slipped capital femoral epiphysis (SCFE) should be considered in young adolescents or preadolescents with groin, anterior thigh, or atraumatic knee pain. Symptoms often include a history of intermittent limp and pain for several weeks or months that are often poorly localized to the thigh, groin, or knee. Any obese adolescent or preadolescent presenting with a history of a limp and thigh, knee, or groin pain for several weeks to one month should be presumed to have a slipped capital femoral epiphysis (SCFE).

Imaging studies:

- Anteroposterior and lateral x-rays (frog leg or cross table lateral) of both hips will confirm or exclude the diagnosis.⁸
 - If clinical suspicion remains after negative plain films, MRI without contrast (CPT® 73721) or without and with contrast (CPT® 73723) is indicated to detect widening of the physis before the femoral head is displaced (pre-slip).
- Because a significant percentage of SCFE is bilateral at presentation, it is reasonable to evaluate the contralateral hip if requested, as some surgeons advocate surgical treatment of pre-slip.
- If MRI was not completed for diagnosis, MRI without contrast (CPT® 73721) is indicated for preoperative planning.

Limb Length Discrepancy (PEDMS-15)

Guideline

Limb Length Discrepancy (PEDMS-15)

Limb Length Discrepancy (PEDMS-15)

MSP.LL.0015.A

v1.0.2024

- Limb length discrepancy imaging indications in pediatric individuals are identical to those in the general imaging guidelines. See: **Limb Length Discrepancy (MS-17.1)** in the Musculoskeletal Imaging Guidelines.

Congenital Anomalies of the Foot and Lower Extremity (PEDMS-16)

Guideline

Tarsal Coalition (Calcaneonavicular Bar/Rigid Flat Foot) (PEDMS-16.1)

Club Foot (PEDMS-16.2)

Vertical Talus (PEDMS-16.3)

Femoral Anteversion and Tibial Torsion (PEDMS-16.4)

References (PEDMS-16)

Tarsal Coalition (Calcaneonavicular Bar/Rigid Flat Foot) (PEDMS-16.1)

MPS.CD.0016.1.A

v1.0.2024

- Plain x-rays should be performed initially since the calcaneonavicular bar is readily visible in older children and adults.
 - Talocalcaneal coalition is more difficult to evaluate on plain x-rays.
- CT without contrast (CPT® 73700) or MRI without contrast (CPT® 73718) is indicated if tarsal coalition is suspected (because of restricted hindfoot motion on physical exam), and plain x-rays are inconclusive.

Club Foot (PEDMS-16.2)

MSP.CD.0016.2.A**v1.0.2024**

Club Foot is a congenital foot contracture with foot in equinus (plantar flexion) and heel and forefoot in varus/adduction (turned in). Immediate diagnosis and specialty evaluation in the first week of life provide the best chance for successful correction.

- Plain x-rays should be performed initially since the anomaly is readily visible in older children and adults.
- Ultrasound (CPT® 76881 or 76882) can be used to characterize the cartilaginous tarsal bones and demonstrate tarsal bone alignment in infants with non-ossified tarsal bones.
- MRI is not currently used to image clubfoot, and limited experiences are published in the literature. MRI (CPT® 73718) or CT (CPT® 73700) can be approved to determine residual deficits following repair.
 - Ultrasound is not required prior to MRI or CT if those studies are appropriate.

Vertical Talus (PEDMS-16.3)

MSP.CD.0016.3.A**v1.0.2024**

- Congenital vertical talus (also known as congenital rocker-bottom foot) is a fixed foot deformity characterized by irreducible talonavicular dislocation. The talus is plantar flexed and does not articulate with the navicular bone.
- Plain x-rays should be performed initially since the anomaly is readily visible in older children and adults.
- MRI (CPT® 73718) or CT (CPT® 73700) to determine residual deficits following repair.

Femoral Anteversion and Tibial Torsion (PEDMS-16.4)

MSP.CD.0016.4.A

v1.0.2024

- Femoral anteversion is a rotational deformity of the femur which may lead to an in-toeing gait.
- Tibial torsion is a rotational deformity of the tibia that may lead to in-toeing or out-toeing gait, and can be associated with the foot deformities already discussed in **Tarsal Coalition (Calcaneonavicular Bar/Rigid Flat Foot) (PEDMS-16.1)**, **Club Foot (PEDMS-16.2)**, and **Vertical Talus (PEDMS-16.3)**.
- Both deformities are typically diagnosed on clinical examination, but CT Lower Extremity without contrast (CPT® 73700) can be approved for preoperative evaluation⁹.

Procedure Codes Associated with Neck Imaging

NKP.GG.ProcedureCodes.A
v1.0.2024

MRI	CPT®
MRI Orbit, Face, Neck without contrast	70540
MRI Orbit, Face, Neck with contrast (rarely used)	70542
MRI Orbit, Face, Neck without and with contrast	70543
MRI Temporomandibular Joint (TMJ)	70336
Unlisted MRI procedure (for radiation planning or surgical software)	76498

MRA	CPT®
MRA Neck without contrast	70547
MRA Neck with contrast	70548
MRA Neck without and with contrast	70549

CT	CPT®
CT Maxillofacial without contrast (includes sinuses, jaw, and mandible)	70486
CT Maxillofacial with contrast (includes sinuses, jaw, and mandible)	70487
CT Maxillofacial without and with contrast (includes sinuses, jaw, and mandible)	70488
CT Neck without contrast (includes jaw, and mandible)	70490
CT Neck with contrast (includes jaw, and mandible)	70491
CT Neck without and with contrast (includes jaw, and mandible)	70492
CT Guidance for Placement of Radiation Therapy Fields	77014
Unlisted CT procedure (for radiation planning or surgical software)	76497

CTA	CPT®
CTA Neck	70498

Nuclear Medicine	CPT®
PET Imaging; limited area (this code not used in pediatrics)	78811
PET Imaging; skull base to mid-thigh (this code not used in pediatrics)	78812
PET Imaging; whole body (this code not used in pediatrics)	78813

Nuclear Medicine	CPT®
PET with concurrently acquired CT; limited area (this code rarely used in pediatrics)	78814
PET with concurrently acquired CT; skull base to mid-thigh	78815
PET with concurrently acquired CT; whole body	78816
Thyroid Uptake, Single or Multiple Quantitative Measurement(s) (Including Stimulation, Suppression, or Discharge, When Performed)	78012
Thyroid Imaging (Including Vascular Flow, When Performed)	78013
Thyroid Imaging (Including Vascular Flow, When Performed); with Single or Multiple Uptake(s) Quantitative Measurement(s) (Including Stimulation, Suppression, or Discharge, When Performed)	78014
Thyroid Carcinoma Metastases Imaging Limited Area	78015
Thyroid Carcinoma Metastases Imaging with Additional Studies	78016
Thyroid Carcinoma Metastases Imaging Whole Body	78018
Thyroid Carcinoma Metastases Uptake (Add-on Code)	78020
Parathyroid Planar Imaging (Including Subtraction, When Performed)	78070
Parathyroid Planar Imaging (Including Subtraction, When Performed); with Tomographic (SPECT)	78071
Parathyroid Planar Imaging (Including Subtraction, When Performed); with Tomographic (SPECT), and Concurrently Acquired Computed Tomography (CT) for Anatomical Localization	78072
Salivary Gland Nuclear Imaging	78230
Salivary Gland Nuclear Imaging with Serial Imaging	78231
Salivary Gland Function Study	78232
Esophageal Motility Study	78258
Radiopharmaceutical Localization Imaging Limited area	78800
Radiopharmaceutical Localization Imaging Whole Body	78802
Radiopharmaceutical Localization Imaging SPECT	78803

Ultrasound	CPT®
Soft tissues of head and neck Ultrasound (thyroid, parathyroid, parotid, etc.)	76536
Duplex scan of extracranial arteries; complete bilateral study	93880
Duplex scan of extracranial arteries; unilateral or limited study	93882
Non-invasive physiologic studies of extracranial arteries, complete bilateral study	93875

Ultrasound	CPT [®]
Ultrasound guidance for needle placement	76942

General Guidelines (PEDNECK-1.0)

NKP.GG.0001.0.A

v1.0.2024

- A pertinent clinical evaluation including a detailed history, physical examination, since the onset or change in symptoms, and appropriate laboratory studies should be performed prior to considering advanced imaging (CT, MRI, Nuclear Medicine), unless the individual is undergoing guideline-supported scheduled follow-up imaging evaluation. A meaningful technological contact (telehealth visit, telephone call, electronic mail or messaging) since the onset or change in symptoms can serve as a pertinent clinical evaluation.
- Unless otherwise stated in a specific guideline section, the use of advanced imaging to screen asymptomatic individuals for disorders involving the neck is not supported. Advanced imaging of the neck is only supported in individuals who have documented active clinical signs or symptoms of disease involving the neck.
- Unless otherwise stated in a specific guideline section, repeat imaging studies of the neck are not necessary unless there is evidence for progression of disease, new onset of disease, and/or documentation of how repeat imaging will affect individual management or treatment decisions.

Age Considerations (PEDNECK-1.1)

NKP.GG.0001.1.A

v1.0.2024

- Many conditions affecting the neck in the pediatric population are different diagnoses than those occurring in the adult population. For those diseases which occur in both pediatric and adult populations, minor differences may exist in management due to individual age, comorbidities, and differences in disease natural history between children and adults.
- Individuals who are 18 years old or younger¹¹ should be imaged according to the Pediatric Neck Imaging Guidelines. Any conditions not specifically discussed in the Pediatric Neck Imaging Guidelines should be imaged according to the General Neck Imaging Guidelines. Individuals who are >18 years old should be imaged according to the General Neck Imaging Guidelines, except where directed otherwise by a specific guideline section.

Modality General Considerations (PEDNECK-1.3)

NKP.GG.0001.3.A

v1.0.2024

- MRI
 - MRI Orbit/Face/Neck is generally performed without and with contrast (CPT® 70543) unless the individual has a documented contraindication to gadolinium or otherwise stated in a specific guideline section.
 - Due to the length of time required for MRI acquisition and the need to minimize individual movement, sedation is usually required for almost all infants (except neonates) and young children (age <7 years) as well as older children with developmental delays. Sedation may be administered by oral, intravenous, and/or inhalational routes. In order to limit sedation time in this subdivision of pediatric individuals, the following should be considered:
 - MRI procedures can be performed without and/or with contrast use as supported by these condition-based guidelines. If intravenous access is indicated for sedation and there is no contraindication for using contrast, imaging without and with contrast may avoid repeating a study with sedation to perform an MRI with contrast if the initial study without contrast is inconclusive.
 - Recent evidence-based literature demonstrates the potential for gadolinium deposition in various organs including the brain, after the use of MRI contrast.
 - The U.S. Food and Drug Administration (FDA) has noted that there is currently no evidence to suggest that gadolinium retention in the brain is harmful and restricting gadolinium-based contrast agents (GBCAs) use is not warranted at this time. It has been recommended that GBCA use should be limited to circumstances in which additional information provided by the contrast agent is necessary and the necessity of repetitive MRIs with GBCAs should be assessed.
 - If studies of multiple body areas are supported by eviCore guidelines for the clinical condition being evaluated, MRI studies of all necessary body areas should be obtained concurrently in the same sedation session.
 - The presence of surgical hardware or implanted devices may preclude the use of MRI.
 - Coordination between provider and the imaging service can result in providing the best choice of radiologic studies for the pediatric individual.
- CT
 - CT Neck typically extends from the base of the skull to the upper thorax.
 - A separate CPT® code for head imaging in order to visualize the skull base is not necessary.

- In some cases, especially in follow-up of a known finding, it may be appropriate to limit the exam to the region of concern to reduce radiation exposure.
- CT Neck is generally performed with contrast (CPT® 70491) unless the individual has a documented contraindication to CT contrast or otherwise stated in a specific guideline section.
- CT Neck may be indicated for further evaluation of abnormalities suggested on prior US or MRI Procedures.
- In general, CT Neck is appropriate when evaluating trauma, malignancy, and for preoperative planning.
- CTA Neck (CPT® 70498) is indicated for evaluation of the vessels of the neck, especially with concern for dissection.
- CT should not be used to replace MRI in an attempt to avoid sedation unless listed as a recommended study in a specific guideline section.
- Coordination between the provider and the imaging service can result in the best choice of radiologic studies for the pediatric individual.
- Ultrasound
 - Ultrasound soft tissues of the neck (CPT® 76536) is indicated as an initial study for evaluating thyroid, parathyroid, parotid and other salivary gland lesions. Ultrasound is also used to further characterize adenopathy, palpable superficial masses, or swelling.
 - For those individuals who do require additional advanced imaging after ultrasound; ultrasound can be very beneficial in selecting the proper modality, body area, image sequences, and contrast level that will provide the most definitive information for the pediatric individual.
- Nuclear Medicine
 - Nuclear medicine studies of the neck in pediatric individuals are most commonly used to evaluate neck masses, or thyroid and parathyroid disease following initial studies with anatomic imaging, such as ultrasound, CT, or MRI. See **Neck Masses (Pediatric) (PEDNECK-2.1)** and **Thyroid and Parathyroid (PEDNECK-6)** for imaging guidelines.
 - Evaluation of salivary gland function in individuals with dry mouth (xerostomia) and **ONE** of the following:
 - Sjögren syndrome **OR**
 - Sialadenitis **OR**
 - History of head or neck radiation therapy, one of the following is supported:
 - Salivary Gland Nuclear Imaging (CPT® 78230) **OR**
 - Salivary Gland Nuclear Imaging with Serial Imaging (CPT® 78231) **OR**
 - Salivary Gland Function Study (CPT® 78232)
- 3D Rendering
 - 3D Rendering indications in pediatric neck imaging are identical to those in the general imaging guidelines. See **3D Rendering (Preface-4.1)** in the Preface Imaging Guidelines.

The guidelines listed in this section for certain specific indications are not intended to be all-inclusive; clinical judgment remains paramount and variance from these guidelines may be appropriate and warranted for specific clinical situations.

Neck Masses (Pediatric) (PEDNECK-2)

Guideline

Neck Masses (Pediatric) (PEDNECK-2.1)

References (PEDNECK-2)

Neck Masses (Pediatric) (PEDNECK-2.1)

NKP.NM.0002.1.A

v1.0.2024

- Evaluation of neck masses in pediatric individuals involves careful consideration of clinical history and accurate physical examination. The individual's age and knowledge of the anatomy and common lesions of the neck are very important in narrowing the differential diagnosis.
- Initial imaging of choice:
 - Ultrasound Neck (CPT® 76536)
 - Color Doppler ultrasound bilateral study of carotid arteries (CPT® 93880) **OR** Duplex unilateral study (CPT® 93882) is supported to evaluate the vasculature.
- For inconclusive ultrasound or to further delineate abnormalities on ultrasound:
 - MRI Orbit/Face/Neck without contrast (CPT® 70540) **OR**
 - MRI Orbit/Face/Neck without and with contrast (CPT® 70543) **OR**
 - CT Neck with contrast (CPT® 70491)
- Lymphadenopathy persisting for more than 4-weeks of treatment **OR** suspicion of complications such as abscess formation:
 - Ultrasound Neck (CPT® 76536) is indicated. See **Cervical Lymphadenopathy (PEDNECK-3.1)**.
- Congenital cervical cysts:
 - Ultrasound Neck (CPT® 76536) is supported for suspected cystic neck mass.
- Congenital cervical sinus, fistula, or cyst for preoperative planning:
 - MRI Orbit/Face/Neck without and with contrast (CPT® 70543) **OR**
 - CT Neck with contrast (CPT® 70491)
 - For fourth branchial cleft cyst/sinus/fistula- barium swallow is supported in addition to the above conventional imaging.
- Salivary gland nuclear imaging: **ONE** of the following is indicated for evaluation of parotid masses to allow preoperative diagnosis of Warthin's tumor:
 - Salivary Gland Nuclear Imaging (CPT® 78230) **OR**
 - Salivary Gland Nuclear Imaging with Serial Imaging (CPT® 78231) **OR**
 - Salivary Gland Function Study (CPT® 78232)
- Ranula (a cystic structure on the floor of the mouth):
 - CT Neck with contrast (CPT® 70491) **OR**
 - MRI Orbit/Face/Neck without and with contrast (CPT® 70543) is supported, especially when there is concern for a "plunging" ranula (lesion extending into the submandibular space).¹¹

Background and Supporting Information

Cervical lymphadenitis is common in children and follows most viral or bacterial infections of the ears, nose, and throat. No advanced imaging is necessary with uncomplicated lymph node enlargement.

Congenital cervical cysts frequently present in children and include thyroglossal duct cyst (55% of cases), cystic hygroma (25%), branchial cleft cysts (16%), bronchogenic cyst (0.91%), and thymic cyst (0.3%).

The most common malignant ENT tumors in children are lymphoma and rhabdomyosarcoma.

Differential Diagnosis of Neck Lesions by Anatomic Region:

- Subcutaneous tissues:
 - Teratoma (includes dermoid cysts)
 - Cervical teratomas are typically large bulky masses discovered at birth or in the first year of life.
 - Large lesions may cause stridor, dyspnea, or dysphagia.
 - Most teratomas arise in the anterior suprahyoid neck and may be midline or off midline in location and adjacent to or within a thyroid lobe.
 - Vascular malformations
 - Lipoma
 - Cellulitis
 - Plexiform neurofibromas
 - Keloid
 - Scar
 - Pilomatrixoma
 - Subcutaneous fat fibrosis (in neonates)
- Retropharyngeal space:
 - Abscess, cellulitis, adenitis
 - Usually involves children under age 6.
 - Individuals have history of upper respiratory tract infection followed by high fever, dysphagia, and neck pain.
 - Lymphadenopathy
 - Extension of goiter
 - Extension of pharyngeal tumor
- Retrovisceral space (posterior to the cervical esophagus):
 - Gastrointestinal duplication cysts (usually are diagnosed in first year of life).
- Pretracheal space (contains trachea, larynx, cervical esophagus, recurrent laryngeal nerves, and thyroid and parathyroid glands):
 - Thyroglossal duct cyst

- Thyroglossal duct cyst most commonly presents before the age of 20; 75% present as a midline mass and 43% of individuals present with an infected mass.
- Usually presents as an enlarging, painless midline mass.
- Thyroid carcinoma occurs in 1% of thyroglossal duct cysts.
- Goiter
- Laryngocele
- Lymphadenopathy
- Teratoma
- Abscess
- Ectopic thymus or cervical extension of normal thymus
- Danger space (closed space lying between the skull base and the posterior mediastinum and between the alar and prevertebral fasciae in a sagittal plane):
 - Cellulitis
 - Abscess
- Prevertebral space:
 - Neurenteric cyst
 - Cellulitis
 - Abscess
 - Spondylodiskitis
 - Lymphadenopathy
 - Paraganglioma
- Carotid sheath space:
 - Jugular vein thrombosis or phlebitis
 - Lymphadenopathy
 - Cellulitis
 - Abscess
 - Paraganglioma
- Parotid gland space:
 - Parotid lymphadenopathy
 - Retromandibular vein thrombosis
 - Parotiditis
 - Sialodochitis (inflammation of the salivary gland duct)
 - Salivary duct stone
 - Abscess
- Submandibular and sublingual spaces:
 - Cellulitis
 - Abscess
 - Sialadenitis

- Thyroglossal duct cyst
- Branchial cleft cyst
 - 90% of branchial abnormalities arise from the second branchial apparatus.
 - Second branchial cleft cysts are the most common branchial cleft cyst and usually present in individuals between 10 and 40 years as painless fluctuant masses.
 - They typically present as slowly growing, non-tender masses in the upper neck
 - Most second branchial cleft cysts are located in the submandibular space, at the anteromedial border of the sternocleidomastoid muscle, lateral to the carotid space, or posterior to the submandibular gland.
 - Ranula – typically cystic masses in the floor of the mouth.
- Masticator space (includes masseter and pterygoid muscles):
 - Venous or lymphatic malformation
 - Cellulitis
 - Abscess
 - Rhabdomyosarcoma
- Parapharyngeal space:
 - Cellulitis
 - Abscess
 - Neurogenic tumors (CN V, IX, XI and XII)
 - Paragangliomas
 - Neurofibromas
 - Lymphoma
 - Rhabdomyosarcoma
- Paravertebral space:
 - Cervical dermal sinus (epithelium lined dural tubes that connect the skin with the central nervous system or its covering)
 - Meningocele
 - Rhabdomyosarcoma
 - Lymphoma
 - Neuroblastoma
 - Neurofibroma
- Posterior cervical space:
 - Lymphadenopathy
 - Lymphatic malformation

Congenital Neck Masses:^{2,13}

- Anterior neck masses
 - Branchial anomalies

- Sinus: with either an internal (to the pharynx) or external (to the skin) opening
- Fistula: with both an internal and external opening
- Cyst: closed sac with no openings
- First branchial anomalies
 - Typically sinus or cyst
 - Located anywhere from the external auditory canal to the region of the parotid gland, down to the level of the hyoid; may communicate with the preauricular soft tissue/parotid, parapharyngeal space or anterior triangle of the neck
 - Type I tract parallels the external auditory meatus
 - Type II tract courses over the angle of mandible through the parotid ending near/within the external auditory canal bony cartilaginous junction
- Second branchial anomalies
 - The most common
 - Located from anterior neck in the region of the middle to lower two thirds of the sternocleidomastoid and the great vessels to the pharyngeal mucosa (tonsil)- a tract and/or cyst may occur anywhere along this path
- Third branchial anomalies
 - Typically located from the low anterior neck to the base of the pyriform sinus
- Fourth branchial anomalies
 - Potential tract from the low anterior neck to the thyroid gland or mediastinum
- Cervical thymus
 - Ectopic thymic remnants can be found in the anterior neck (left more commonly than right) and extend deep (near the carotid sheath)- can connect to mediastinum or have cystic components
- Midline
 - Ectopic Thyroid/Thyroglossal Duct Cysts
 - Anywhere from the tongue base to the mediastinum (a result of the normal embryologic pathway of the thyroid that fails to obliterate or reach its normal location in the lower neck)
- Just off the midline
 - Laryngocele
 - An an abnormal dilation of the saccule of the larynx
 - Internal: within the thyroid cartilage
 - External: beyond the thyrohyoid membrane into the neck
- Anywhere within the neck
 - Teratomas
 - Tissue form all three germ cell layers (ectodermal, mesodermal and endodermal components) typically present as a firm mass, can have calcifications seen on imaging

- Dermoid cysts
 - Cysts with ectodermal and mesodermal structures (Commonly lined by epidermis and containing epidermal appendages) typically in the midline/submental region, but can be anywhere in the head and neck including orbit
- Epidermoid cysts
 - Cysts with only ectodermal components (with squamous material)
- Pilomatixoma
 - Lesion derived from hair matrix/follicles
- Vascular anomalies
 - Hemangiomas (most common)
 - Congenital: present at birth typically involute
 - Infantile: noted to have a rapid/proliferative phase followed by involution
 - High flow
 - Arteriovenous malformations (AVM) and arteriovenous fistulas (AVF) tangle of vessels
 - Low flow
 - Venous lymphatic and capillary malformations
- Lymphatic malformations (lymphangiomas)
 - Result from a failure of lymph spaces to connect to the rest of the lymphatic system
 - Macrocytic: comprised of large cysts
 - Microcystic: comprised of smaller cysts typically more infiltrative, lending to difficult excision

Cervical Lymphadenopathy (PEDNECK-3)

Guideline

Imaging (PEDNECK-3.1)

References (PEDNECK-3)

Imaging (PEDNECK-3.1)

NKP.CL.0003.1.A

v1.0.2024

- Painful acute lymphadenopathy and other painful neck masses (including neck “swelling”) should be treated with a trial of conservative therapy for at least 4-weeks, including antibiotics if appropriate.
 - If there is improvement with conservative treatment, advanced imaging is not indicated.
 - Ultrasound (CPT® 76536) is indicated for any of the following:
 - Initial evaluation of persistent lymphadenopathy following 4-weeks of treatment/observation **OR**
 - Unexplained fever (temperature $\geq 100.4^{\circ}\text{F}$) and there is clinical concern for suppurative lymphadenopathy/neck abscess
- For inconclusive ultrasound/to further characterize abnormalities found on ultrasound:
 - MRI Orbit/Face/Neck without contrast (CPT® 70540) **OR**
 - MRI Orbit/Face/Neck without and with contrast (CPT® 70543) **OR**
 - CT Neck with contrast (CPT® 70491)
- If systemic symptoms or other clinical findings suggest malignancy, see **Pediatric Lymphomas (PEDONC-5)** in the Pediatric Oncology Imaging Guidelines.

Background and Supporting Information

Both MRI and CT are superior to ultrasound for defining the relationship of an abscess to adjacent structures, particularly the airway; and detecting posterior cervical, mediastinal and intracranial extension.

Inflammatory lymph nodes from acute lymphadenitis are usually painful, tender and mobile, frequently associated with upper respiratory infection, pharyngitis or dental infection.

Occasionally, sarcoidosis or toxoplasmosis and Human immunodeficiency virus (HIV) can cause inflammatory lymphadenopathy as well.

Dystonia/Torticollis (PEDNECK-4)

Guideline

Dystonia/Torticollis (PEDNECK-4.1)

References (PEDNECK-4)

Dystonia/Torticollis (PEDNECK-4.1)

NKP.TO.0004.1.A

v1.0.2024

Infants under 12 Months of Age (Congenital Muscular Torticollis/Fibromatosis Colli)

- Ultrasound Neck (CPT® 76536) is indicated as the initial study.
 - If Ultrasound is Positive→ No further imaging is needed since diagnosis is defined.
 - If Ultrasound is Negative or to further evaluate for other structural causes:
 - CT Neck with contrast (CPT® 70491) **OR**
 - MRI Orbit/Face/Neck without contrast (CPT® 70540) **OR**
 - MRI Orbit/Face/Neck without and with contrast (CPT® 70543)

Background and Supporting Information

- Individuals usually present by 2-weeks of life with an anterior neck mass, which is commonly right sided (75% of cases). A history of a traumatic breech or forceps delivery is common.

Children and Adults (Acquired Torticollis)

- Initial evaluation with recent trauma, and low suspicion of injury:
 - Plain radiographs of the cervical spine
 - To identify fracture or malalignment if plain radiographs are inconclusive or in individuals with a high-risk mechanism of cervical spine injury within the last 3 months (see below**):
 - CT Neck with contrast (CPT® 70491) **AND/OR**
 - CT Cervical Spine without contrast (CPT® 72125) is supported
- In the clinical setting of cervical spine trauma with an associated neurologic deficit:
 - MRI Cervical Spine without contrast (CPT® 72141) is supported
- In the absence of trauma, to identify underlying abscess, bony, muscular, vascular, or neurologic causes, ONE of the following is supported:
 - CT Neck with contrast (CPT® 70491), **OR**
 - CT Cervical Spine without contrast (CPT® 72125), **OR**
 - MRI Cervical Spine without contrast (CPT® 72141), **OR**
 - MRI Orbit/Face/Neck without and with contrast (CPT® 70543), **OR**
 - MRA Neck without and with contrast (CPT® 70549)
 - Positive→ Further advanced imaging is not required if a local cause has been identified
 - Negative→ MRI Brain without and with contrast (CPT® 70553) is supported to exclude CNS cause

****High-risk mechanisms of cervical spine injury may include:**

- Head trauma and/or maxillofacial trauma
- Pedestrian in a motor vehicle accident
- Fall from above standing height
- Diving accident
- Head-on motor vehicle collision without/with airbag deployment
- Rollover motor vehicle collision
- Ejection from the vehicle in a motor vehicle collision
- High speed of the vehicle at the time of collision
- Not wearing a seatbelt/shoulder harness in a motor vehicle collision
- Individuals with ankylosing spondylitis are at high-risk of cervical spine fractures even with minor direct/indirect trauma to the cervical spine which can result in quadriparesis/quadriplegia

Background and Supporting Information

- Injury or inflammation involving the sternocleidomastoid or trapezius muscles is the most common cause of acquired torticollis in children.
- Torticollis or cervical dystonia is an abnormal twisting of the neck in which the head is rotated or twisted. Acute causes are most common. Children with deep space neck infections present with torticollis approximately 50% of the time.⁵ Other causes are variable and may be congenital, acquired (caused by trauma, juvenile idiopathic arthritis, or neoplasm), or idiopathic.

Dysphagia (PEDNECK-5)

Guideline

Dysphagia (PEDNECK-5.1)

References (PEDNECK-5)

Dysphagia (PEDNECK-5.1)

NKP.DY.0005.1.A

v1.0.2024

- Dysphagia imaging indications in pediatric individuals are very similar to those for adult individuals. See **Dysphagia and Esophageal Disorders (Neck-3.1)** in the Neck Imaging Guidelines.
- Concern for foreign body ingestion as the etiology of dysphagia initial imaging:
 - X-rays of the neck and chest are supported⁶
- Dysphagia associated with chest pain and difficulty swallowing both solids and liquids or Gastroesophageal reflux:
 - Esophageal motility study (CPT[®] 78258) is indicated
- For a suspected anatomical variant such as a vascular ring, right sided aortic arch, or double arch noted on chest radiography (which can be associated with dysphagia):
 - CTA Chest (CPT[®] 71275) **OR**
 - MRA Chest (CPT[®] 71555) is supported

Parathyroid Imaging (PEDNECK-6.4)

References (PEDNECK-6)

Thyroid Masses or Nodules (PEDNECK-6.1)

NKP.PT.0006.1.A

v1.0.2024

- Initial study for evaluation of thyroid masses, diffuse thyroid enlargement, or nodules in pediatric individuals:
 - Ultrasound Neck (CPT® 76536) is indicated
- **For a normal or elevated TSH** with any solitary or suspicious thyroid nodule noted on imaging or physical exam:
 - Fine needle aspiration (FNA) under ultrasound guidance (CPT® 76942) is indicated
- **For a low TSH:**
 - Nuclear thyroid scintigraphy (either CPT® 78013 or CPT® 78014) is indicated
 - Hyperfunctioning nodules should be treated surgically but may also undergo FNA under ultrasound guidance (CPT® 76942) if suspicious in appearance and not being treated surgically.
 - Hypofunctioning nodules should undergo FNA under ultrasound guidance (CPT® 76942).
- For lymph node assessment if cervical lymph node imaging was not performed at the time of the initial diagnostic thyroid ultrasound:
 - Repeat imaging with Ultrasound Neck (CPT® 76536) is supported.
- For preoperative planning in individuals with large or fixed masses, vocal cord paralysis, or bulky cervical or supraclavicular adenopathy:
 - CT Neck without contrast (CPT® 70490) **OR**
 - CT Neck with contrast (CPT® 70491) **OR**
 - MRI Orbit/Face/Neck without contrast (CPT® 70540) **OR**
 - MRI Orbit/Face/Neck without and with contrast (CPT® 70543) is supported
 - In addition, individuals with substernal extension of the thyroid, pulmonary symptoms or abnormalities on recent chest x-ray:²¹
 - CT Chest without contrast (CPT® 71250) **OR**
 - CT Chest with contrast (CPT® 71260) is supported
- If any biopsy reveals thyroid carcinoma, See **Thyroid Cancer (ONC-6)** in the Oncology Imaging Guidelines.
- Repeat ultrasound (CPT® 76536) and/or FNA under ultrasound guidance (CPT® 76942) is indicated 3-6 months following initial biopsy if the initial biopsy shows inadequate, or non-diagnostic findings.
 - Repeat ultrasound (CPT® 76536) is indicated in 6-12 months if the nodule is stable and/or FNA is benign.
 - The nodule should be treated surgically if growing or the FNA is not benign.

- Repeat ultrasound (CPT® 76536) is indicated 6-12 months following initial biopsy if the initial biopsy shows benign findings.
 - Repeat ultrasound (CPT® 76536) is indicated every 1-2 years if the nodule is stable.
 - Repeat FNA under ultrasound guidance (CPT® 76942) or be treated surgically if the nodule is growing or concerning new findings are present.
 - Benign nodules that have been surgically resected do not require routine imaging follow up in the absence of clinical or laboratory changes suggesting recurrence.
- If the initial biopsy shows indeterminate or suspicious findings, surgery is recommended.

Hyperthyroidism (PEDNECK-6.2)

NKP.PT.0006.2.A

v1.0.2024

- Initial study for evaluation of hyperthyroidism:
 - Ultrasound Neck (CPT® 76536) is supported
 - If a nodule or mass is discovered on ultrasound, the individual should be imaged according to **Thyroid Masses or Nodules (PEDNECK-6.1)**
- For all other individuals with documented hyperthyroidism:
 - Thyroid uptake nuclear imaging (either CPT® 78012 or CPT® 78014) is supported

Background and Supporting Information

- Common causes are Graves' disease and autoimmune disorders (lupus, rheumatoid arthritis, and Sjögren syndrome).

Hypothyroidism (PEDNECK-6.3)

NKP.PT.0006.3.A

v1.0.2024

- Initial study for evaluation of hypothyroidism:
 - Ultrasound Neck (CPT® 76536) is supported
 - If a nodule or mass is discovered on ultrasound, the individual should be imaged according to **Thyroid Masses or Nodules (PEDNECK-6.1)**
- For individuals with documented congenital hypothyroidism, thyroid uptake nuclear imaging (either CPT® 78012 or CPT® 78014) is indicated.

Background and Supporting Information

- Causes of pediatric hypothyroidism include thyroid congenital dysgenesis, dyshormonogenesis autoimmune thyroiditis, Hashimoto thyroiditis, subacute thyroiditis, and abnormality in the pituitary gland or hypothalamus. Congenital hypothyroidism is usually diagnosed in the neonate on a routine perinatal screening examination.

Parathyroid Imaging (PEDNECK-6.4)

NKP.PT.0006.4.A

v1.0.2024

- Parathyroid imaging indications in pediatric individuals are the same as those for adult individuals. See **Parathyroid Imaging (Neck-8.3)** in the Neck Imaging Guidelines

Esophagus (PEDNECK-7)

Guideline

Esophagus (PEDNECK-7.1)

References (PEDNECK-7)

Esophagus (PEDNECK-7.1)

NKP.ES.0007.1.A

v1.0.2024

- Esophagus imaging indications in pediatric individuals are very similar to those for adult individuals. See **Dysphagia and Esophageal Disorders (Neck-3.1)** in the Neck Imaging Guidelines.
- Pediatric-specific imaging considerations include the following:
 - Suspected foreign body ingestion or impaction:
 - Plain x-rays initial imaging⁵
 - Ultrasound Neck (CPT® 76536) can be approved for evaluation of upper esophageal foreign bodies.
 - See **Dysphagia and Esophageal Disorders (Neck-3.1)**
 - For evaluating congenital atresia with associated tracheoesophageal fistula:
 - Esophagram is supported
 - For evaluation of suspected congenital malformations with inconclusive x-rays or esophagram:
 - CT Neck with contrast (CPT® 70491) **AND/OR**
 - CT Chest with contrast (CPT® 71260)
 - 3D rendering (CPT® 76376 or CPT® 76377) is supported for preoperative planning in complex cases.
 - Plain radiographs alone usually suffice for the diagnosis of other types of esophageal atresia and a contrast examination of the esophagus is not warranted but may be indicated for post-operative evaluation.

Trachea (PEDNECK-8)

Guideline

Trachea (PEDNECK-8.1)

References (PEDNECK-8)

Trachea (PEDNECK-8.1)

NKP.TR.0008.1.A

v1.0.2024

- Trachea imaging indications in pediatric individuals are similar to those for adult individuals. See **Trachea and Bronchus (Neck-9.1)** in the Neck Imaging Guidelines.
- Pediatric-specific imaging considerations include the following:
 - For evaluation of suspected congenital malformations if x-rays are inconclusive:
 - CT Neck with contrast (CPT® 70491) **AND/OR**
 - CT Chest with contrast (CPT® 71260) are supported
 - 3D rendering (CPT® 76376 or CPT® 76377) is supported for preoperative planning in complex cases.
 - CT is not routinely performed to evaluate foreign body aspiration, but it may be considered in complicated cases.

CPT®	Current procedural terminology; trademark of the American Medical Association
CSF	Cerebrospinal fluid
CT	Computed tomography
CXR	Chest x-ray
DAWT	Diffuse anaplasia Wilms tumor
ESFT	Ewing sarcoma family of tumors
FAWT	Focal anaplasia Wilms tumor
FHWT	Favorable histology Wilms tumor
HL	Hodgkin lymphoma
HSCT	Hematopoietic stem cell transplant (bone marrow or peripheral blood)
HVA	Homovanillic acid
LL	Lymphoblastic lymphoma

Abbreviations for Pediatric and Special Populations Oncology Imaging Guidelines

MIBG	Metaiodobenzylguanidine (nuclear scan using ¹²³ I or ¹³¹ I)
MPNST	Malignant peripheral nerve sheath tumor
MRI	Magnetic resonance imaging
NBL	Neuroblastoma
NED	No evidence of disease
NHL	Non-hodgkin lymphoma
NPC	Nasopharyngeal carcinoma
NRSTS	Nonrhabdomyosarcomatous soft tissue sarcomas
OS	Osteosarcoma
PET	Positron emission tomography
PMBCL	Primary mediastinal b-cell lymphoma
PNET	Primitive neuroectodermal tumor
RCC	Renal cell carcinoma
RMS	Rhabdomyosarcoma
US	Ultrasound
VMA	Vannilylmandelic acid
WBC	White blood cell count
XRT	Radiation therapy

General Guidelines (PEDONC-1.0)

ONCP.GG.0001.0.A

v2.0.2024

- A recent clinical evaluation (within 60 days) or meaningful contact (telephone call, electronic mail or messaging) should be performed prior to considering advanced imaging, unless the individual is undergoing guideline-supported scheduled off therapy surveillance evaluation or cancer screening. The clinical evaluation may include a relevant history and physical examination, including biopsy, appropriate laboratory studies, and results of non-advanced or advanced imaging modalities.
 - Because of the relatively small number of childhood cancer treatment centers, it is common to combine off-therapy visits with imaging and other subspecialist visits to accommodate families traveling long distances for their child's care.
- Unless otherwise stated in the disease-specific guideline, a histological confirmation of malignancy (or recurrence) and the stage of disease is required to perform a medical necessity review of the requested imaging.
- Unless otherwise stated in the disease-specific guideline, advanced imaging of asymptomatic individuals is not routinely supported without signs or symptoms of systemic involvement of cancer.
- Conventional imaging performed prior to diagnosis should not be repeated unless there is a delay of at least 6 weeks since previous imaging and treatment initiation or there are new or significantly worsening clinical signs or symptoms
- Generally, the studies listed in the disease-specific sections reflect the studies supported by current literature and research for that condition. If a study is not listed, then it is not supported.
- Routine imaging of brain, spine, neck, chest, abdomen, pelvis, bones, or other body areas is not indicated except where explicitly stated in a diagnosis-specific guideline section, or if one of the following applies:
 - Known prior disease involving the requested body area
 - New or worsening symptoms or physical exam findings involving the requested body area (including non-specific findings such as ascites or pleural effusion)
 - New finding on basic imaging study such as plain x-ray or ultrasound
 - New finding on adjacent body area CT/MRI study (i.e., pleural effusion observed on CT abdomen)
 - Unless otherwise stated in the disease-specific guideline, advanced imaging of asymptomatic individuals is not routinely supported without signs or symptoms of systemic involvement of cancer.
 - Repeat imaging studies are not generally necessary unless there is evidence of disease progression, recurrence of disease, and/or the repeat imaging will affect an individual's clinical management.
- Unless otherwise stated in the diagnosis-specific guidelines, imaging for treatment response can be approved after every 2 cycles, which is usually ~6 weeks of therapy for solid tumors and usually ~8 to 12 weeks for CNS tumors

- Unless otherwise specified for a specific cancer type, once PET has been documented to be negative for a given individual's cancer or all PET-avid disease has been surgically resected, PET should not be used for continued disease monitoring or surveillance unless one of the following applies:
 - Conventional imaging (CT, MRI, US, plain film) reveals findings that are inconclusive or suspicious for recurrence
 - Residual mass that has not changed in size since the last conventional imaging does not justify PET imaging
 - PET avidity in a residual mass at the end of planned therapy is not an indication for PET imaging during surveillance

Clarification of phases of therapy

Phases of Oncology Imaging	Definition
Screening	<ul style="list-style-type: none">• Imaging requested for individuals at increased risk for a particular cancer in the absence of known clinical signs or symptoms• Screening using advancing imaging is only supported for conditions listed in <u>Screening Imaging in Cancer Predisposition Syndromes (PEDONC-2)</u>
Suspected/Initial Staging	<ul style="list-style-type: none">• All imaging studies requested from the time cancer is first clinically suspected until the initiation of specific treatment<ul style="list-style-type: none">• CT Chest prior to anesthesia for biopsy or resection of solid tumors and CTs of other involved body areas are generally indicated and should be performed concurrently• Metastatic CNS imaging and nuclear medicine imaging are generally deferred until after a histologic diagnosis is made, unless otherwise indicated by diagnosis-specific guideline
Treatment Response	<ul style="list-style-type: none">• Imaging performed during any type of active treatment (chemotherapy or other medications, radiation therapy, or surgery), including evaluation at the end of planned active treatment<ul style="list-style-type: none">• Unless otherwise stated in the diagnosis-specific guidelines, imaging for treatment response can be approved after every 2 cycles, which is usually ~6 weeks of therapy for solid tumors and usually ~8 to 12 weeks for CNS tumors

Phases of Oncology Imaging	Definition
Surveillance	<ul style="list-style-type: none"> Imaging performed in individuals who are asymptomatic or have chronic stable symptoms and not receiving any active treatment, even if residual imaging abnormalities are present PET imaging is not supported for surveillance imaging unless specifically stated in elsewhere in the diagnosis-specific guideline sections
Recurrence	<ul style="list-style-type: none"> All imaging studies completed at the time a recurrence or progression of a known cancer is strongly suspected or documented based on clinical signs or symptoms, laboratory findings, or results of basic imaging studies such as plain radiography or ultrasound Following documented recurrence of childhood cancer, any studies recommended for initial staging of that cancer type in the diagnosis-specific imaging guideline section should be approved <ul style="list-style-type: none"> During active treatment for recurrent pediatric cancer, conventional imaging evaluation (CT or MRI, should use the same modality for ongoing monitoring as much as possible) of previously involved areas should be approved according to the treatment response imaging in the diagnosis-specific guideline section Always refer to the diagnosis specific guideline for PET indications in recurrence.

- Brain imaging is performed for signs or symptoms of brain disease
 - MRI Brain without and with contrast (CPT® 70553) is the recommended study for evaluation of suspected or known brain metastases. If a non-contrast CT head shows suspicious lesion, MRI Brain may be obtained to further characterize the lesion
 - CT without and with contrast (CPT® 70470) can be approved when MRI is contraindicated or not available, or if there is skull bone involvement
 - Certain malignancies including, but not limited to melanoma, lung cancer and renal cell cancer have indications for brain imaging for asymptomatic individuals
 - If stage IV disease is demonstrated elsewhere or if systemic disease progression is noted, refer to disease specific guidelines
 - Initiation of angiogenesis therapy is not an indication for advanced imaging of the brain in asymptomatic individuals (Avastin/Bevacizumab; <3% risk of bleeding and <1% risk of serious bleeding)

- Bone Scan:
 - Primarily used for evaluation of bone metastases in individuals with solid malignancies.
 - Indications for bone scan in individuals with history of malignancy include – bone pain, rising tumor markers, elevated alkaline phosphatase or in individuals with primary bone tumor.
 - For evaluation of suspected or known bony metastases, CPT® 78306 (Nuclear bone scan whole-body), may be approved.
 - Radiopharmaceutical Localization scan SPECT (CPT® 78803 or CPT® 78831) or SPECT/CT (CPT® 78830 or CPT® 78832) may be approved as an add-on test for further evaluation of a specific area of interest.
 - CPT® codes 78300 (Nuclear bone scan limited), 78305 (Nuclear bone scan multiple areas) or 78315 do not have any indications in oncology nuclear medicine imaging.
- Bone scan supplemented by plain x-rays are the initial imaging modalities for suspected malignant bone pain. For specific imaging indications, see also:
 - **Nuclear Medicine (NM) Imaging in Oncology (ONC-1.3)**
 - **Bone (including Vertebral) Metastases (ONC-31.5)**
 - **Spinal Cord Compression (ONC-31.6)**
 - **Carcinoma of Unknown Primary Site (ONC-31.7)**
- Delay PET/CT for at least 12 weeks after completion of radiation treatment, unless required sooner for imminent surgical resection.
- PET/CT may be considered prior to biopsy in order to determine a more favorable site for biopsy when a prior biopsy was nondiagnostic or a relatively inaccessible site is contemplated which would require invasive surgical intervention for biopsy attempt.
- PET/CT may be indicated if:
 - Conventional imaging (CT, MRI or bone scan) reveals findings that are inconclusive or negative, with continued suspicion for recurrence
- **Unless specified in diagnosis-specific guideline section PET/CT Imaging is NOT indicated for:**
 - Infection, inflammation, trauma, post-operative healing, granulomatous disease, rheumatological conditions
 - Concomitantly with separate diagnostic CT studies
 - Conclusive evidence of distant or diffuse metastatic disease on recent conventional imaging studies
 - Metastatic disease in the central nervous system (CNS)
 - Lesions less than 8 mm in size
 - Follow up after localized therapy (i.e. radiofrequency ablation, embolization, stereotactic radiation, etc.)

- Rare malignancies, due to lack of available evidence regarding the diagnostic accuracy of PET in rare cancers
- Surveillance
 - Serial monitoring of individuals who are not currently receiving anti-tumor treatment or are receiving maintenance treatment
 - Serial monitoring of FDG avidity until resolution.
 - PET/CT avidity in a residual mass at the end of planned therapy is not an indication for PET/CT imaging during surveillance.
 - Residual mass that has not changed in size since the last conventional imaging does not justify PET imaging
- Please refer to general guidelines section **PET Imaging in Oncology (ONC-1.4)** and **PET Imaging in Pediatric Oncology (PEDONC-1.4)** for further guidance regarding PET. Those guidelines should be applied with regard to radiotracer coverage.
- Please refer to general guidelines in **Unlisted Procedure Codes in Oncology (ONC-1.5)** for unlisted procedures in pediatric oncology.

Clinical Trials

- Similar to investigational and experimental studies, clinical trial imaging requests will be considered to determine whether they meet Health Plan coverage and eviCore's evidence-based guidelines.
- Imaging studies which are inconsistent with established clinical standards, or are requested for data collection and not used in direct clinical management are not supported.

Age Considerations (PEDONC-1.1)

ONCP.GG.0001.1.A
v2.0.2024

- The majority of malignancies occurring in the pediatric population are different diagnoses than those occurring in the adult population.
- For those diseases which occur in both pediatric and adult populations, minor differences may exist in management between pediatric and adult medical oncologists due to the following:
 - Age of the individual
 - Comorbidities
 - Differences in disease natural history between children and adults

AGE APPROPRIATE GUIDELINES	
Age of Individual	Appropriate Imaging Guidelines
≥18 years old at initial diagnosis	<ul style="list-style-type: none">• General Oncology Imaging Guidelines, except where directed otherwise by a specific guideline section
<18 years old at initial diagnosis	<ul style="list-style-type: none">• Pediatric Oncology Imaging Guidelines, except where directed otherwise by a specific guideline section
15 to 39 years old at initial diagnosis (defined as Adolescent and Young Adult (AYA) oncology individuals)	<ul style="list-style-type: none">• When unique guidelines for a specific cancer type exist only in either Oncology or Pediatric Oncology, AYA individuals should be imaged according to the guideline section for their specific cancer type, regardless of the individual's age• When unique guidelines for a specific cancer type exist in both Oncology and Pediatric Oncology, AYA individuals should be imaged according to the age rule in the previous bullet

Appropriate Clinical Evaluations (PEDONC-1.2)

ONCP.GG.0001.2.A

v2.0.2024

- The majority of pediatric oncology imaging indications are listed in the diagnosis-specific guideline sections
 - Rare malignancies and other circumstances not specifically addressed elsewhere in the Pediatric Oncology guidelines, the following general principles apply:
 - Routine imaging of brain, spine, neck, chest, abdomen, pelvis, bones, or other body areas is not indicated in the absence of:
 - Localizing symptoms or
 - Abnormalities on plain radiography or ultrasound
- The overwhelming majority of pediatric oncology individuals treated in the United States will be enrolled on or treated according to recent Children's Oncology Group (COG) protocols
 - COG is a National Cancer Institute (NCI) supported clinical trials group
 - These imaging guidelines are generally consistent with evaluations recommended by COG protocols commonly used for direct individual care (whether formally enrolled on study or not)
 - Requests for exception to guidelines based on COG protocol should be accompanied by the COG road map or COG details in the medical record for case-by-case consideration.
 - For individuals enrolled on a COG study, imaging recommended by COG protocols should generally be approved unless the imaging is being performed solely to address a study objective and would not be indicated in usual clinical care.
 - Requests for exception to guidelines based on COG protocol should be accompanied by the COG road map or COG details in the medical record for case-by-case consideration.

Phases of Pediatric Oncology Imaging:

- Pediatric malignancies, in general, behave more aggressively than adult cancers, and the time from initial suspicion of cancer to specific therapy initiation can be measured in hours to days for most pediatric cancers
- It is recommended that children with pediatric solid tumors undergo CT evaluation of the chest prior to general anesthesia for biopsy or resection due to the risk of post-operative atelectasis mimicking pulmonary metastasis resulting in inaccurate staging and/or delay in therapy initiation
- Unlike adult cancers, in most pediatric cancers surveillance does not begin until all planned multimodal therapy is completed

- Pediatric cancers where surgical resection is considered curative are listed in the diagnosis-specific guideline sections
- Certain tumor types do not require surveillance with advanced imaging as individual outcomes following relapse are not improved by surveillance imaging. See diagnosis-specific guideline sections for details
- Imaging may be indicated more frequently than recommended by guidelines with clinical documentation that the imaging results are likely to result in a treatment change for the individual, including a change from active treatment to surveillance

Phases of Oncology Imaging	Definition
Screening	<ul style="list-style-type: none"> • Imaging requested for individuals at increased risk for a particular cancer in the absence of known clinical signs or symptoms • Screening using advancing imaging is only supported for conditions listed in <u>Screening Imaging in Cancer Predisposition Syndromes (PEDONC-2)</u>
Suspected/Initial Staging	<ul style="list-style-type: none"> • All imaging studies requested from the time cancer is first clinically suspected until the initiation of specific treatment <ul style="list-style-type: none"> • CT Chest prior to anesthesia for biopsy or resection of solid tumors and CTs of other involved body areas are generally indicated and should be performed concurrently • Metastatic CNS imaging and nuclear medicine imaging are generally deferred until after a histologic diagnosis is made, unless otherwise indicated by diagnosis-specific guideline
Treatment Response	<ul style="list-style-type: none"> • Imaging performed during any type of active treatment (chemotherapy or other medications, radiation therapy, or surgery), including evaluation at the end of planned active treatment <ul style="list-style-type: none"> • Unless otherwise stated in the diagnosis-specific guidelines, imaging for treatment response can be approved after every 2 cycles, which is usually ~6 weeks of therapy for solid tumors and usually ~8 to 12 weeks for CNS tumors
Surveillance	<ul style="list-style-type: none"> • Imaging performed in individuals who are asymptomatic or have chronic stable symptoms and not receiving any active treatment, even if residual imaging abnormalities are present <ul style="list-style-type: none"> • PET imaging is not supported for surveillance imaging unless specifically stated in elsewhere in the diagnosis-specific guideline sections

Phases of Oncology Imaging	Definition
Recurrence	<ul style="list-style-type: none"> All imaging studies completed at the time a recurrence or progression of a known cancer is strongly suspected or documented based on clinical signs or symptoms, laboratory findings, or results of basic imaging studies such as plain radiography or ultrasound Following documented recurrence of childhood cancer, any studies recommended for initial staging of that cancer type in the diagnosis-specific imaging guideline section should be approved During active treatment for recurrent pediatric cancer, conventional imaging evaluation (CT or MRI, should use the same modality for ongoing monitoring as much as possible) of previously involved areas should be approved according to the treatment response imaging in the diagnosis-specific guideline section <ul style="list-style-type: none"> Always refer to the diagnosis specific guideline for PET indications in recurrence.

Radiation Treatment Planning In Pediatric Oncology

- Imaging performed in support of radiation therapy treatment planning should follow guidelines outlined in **Unlisted Procedure Codes in Oncology (ONC-1.5)**.

Cardiac Function Assessment in Pediatric Oncology During Active Treatment:

Indication	Imaging Study
<ul style="list-style-type: none"> Evaluation of cardiac function prior to cardiotoxic chemotherapy, and for monitoring while on active therapy or at end of therapy at the discretion of the treating pediatric oncologist based on: <ul style="list-style-type: none"> Cumulative cardiotoxic therapy received to date Individual's age and gender Most recent echocardiogram results New or worsening cardiac symptoms 	<ul style="list-style-type: none"> Echocardiography (CPT® 93306, CPT® 93307, or CPT® 93308)

Indication	Imaging Study
<ul style="list-style-type: none"> For either of the following: <ul style="list-style-type: none"> Echocardiography yielded a borderline shortening fraction (<30%) and additional left ventricular function data are necessary to make a chemotherapy decision OR Echocardiography windowing is suboptimal due to body habitus or tumor location 	<ul style="list-style-type: none"> Multi-gated acquisition (MUGA, CPT® 78472) blood pool nuclear medicine scanning

Background and Supporting Information

Immunosuppression During Pediatric Cancer Therapy and Imaging Ramifications:

- Individuals may be severely immunocompromised during active chemotherapy treatment and any conventional imaging request to evaluate for infectious complications during this time frame should be approved immediately
 - Imaging requests for infectious disease concerns for all individuals with absolute neutrophil count (ANC) <500 **or**
 - Inconclusive findings on chest x-ray or US at any ANC during active treatment should be approved as requested
 - Individuals may have therapy-induced hypogammaglobulinemia which requires supplemental intravenous immune globulin (IVIG) during maintenance therapy. These individuals receiving supplemental IVIG should be treated similarly to individuals with ANC <500 with regards to imaging for infectious disease
- Some individuals are treated with very intensive chemotherapy regimens (including autologous stem cell transplantation) and spend the majority of their chemotherapy treatment phase in the hospital. See: **Hematopoietic Stem Cell Transplantation (ONC-29)**.
- Due to the high risk of invasive infections, frequent CT may be indicated to evaluate known sites of invasive fungal infection, and in general these should be approved as requested
 - Surveillance imaging of asymptomatic individuals to detect invasive fungal infection has not been shown to impact individual outcomes
 - Imaging requests are indicated when acute clinical decisions will be made based on the imaging

Hematopoietic Stem Cell Transplant (HSCT) in Pediatric Oncology:

- Transplantation of hematopoietic stem cells from bone marrow, peripheral blood, or cord blood is commonly used in the following clinical situations:

- High-risk or recurrent leukemia (allogeneic)
- Recurrent lymphoma (allogeneic or autologous)
- Hemophagocytic lymphohistiocytosis (allogeneic)
- High-risk sickle cell disease (allogeneic)
- High-risk neuroblastoma (autologous)
- High-risk CNS tumors (autologous)
- Recurrent Ewing sarcoma family of tumors (autologous, rarely allogeneic)
- Imaging considerations for HSCT should follow guidelines in: **Hematopoietic Stem Cell Transplantation (ONC-29)**.

Modality General Considerations (PEDONC-1.3)

ONCP.GG.0001.3.A
v2.0.2024

- Plain radiography
 - Chest x-ray (CXR) can provide a prompt means to evaluate primary intrathoracic tumors and continues to be the initial imaging study recommended to detect complications, such as suspected infection, in symptomatic individuals undergoing treatment.
 - CXR continues to be the initial imaging study recommended for pulmonary surveillance for some pediatric cancers. See diagnosis-specific guideline sections for details.
 - Plain radiography continues to be the initial imaging study recommended for evaluation of lesions involving the appendicular skeleton, both during and after completion of treatment. See diagnosis-specific guideline sections for details.
 - Plain abdominal radiographs have largely been replaced by ultrasound, CT, or MRI.
- Ultrasound
 - Ultrasound is not widely used in pediatric oncology for staging but is frequently used for surveillance in individuals who have successfully treated (primarily abdominal or pelvic) tumors with little or no residual disease.
 - See diagnosis-specific guideline sections for details.
- CT
 - CT with contrast is the imaging study of choice in pediatric individuals with lymphomas or solid tumors of the neck, thorax, abdomen, and/or pelvis
 - If CT contrast use is contraindicated due to allergy or impaired renal function, either CT without contrast or MRI without and with contrast may be substituted at the discretion of the ordering physician
- MRI
 - MRI without and with contrast is the study of choice for CNS tumors and musculoskeletal tumors
 - If MRI contrast use is contraindicated due to allergy or impaired renal function, MRI without contrast may be substituted at the discretion of the ordering physician
 - Due to the length of time for image acquisition and the need for stillness, anesthesia is required for almost all infants and young children (age <7 years), as well as older children with delays in development or maturity. In this population, MRI imaging sessions should be planned with a goal of avoiding a short-interval repeat anesthesia exposure due to insufficient information using the following considerations:

- MRI should generally be performed without and with contrast unless there is a specific contraindication to gadolinium use since the individual already has intravenous access for anesthesia
 - Recent evidence-based literature demonstrates the potential for gadolinium deposition in various organs including the brain, after the use of MRI contrast
 - The U.S. Food and Drug Administration (FDA) has noted that there is currently no evidence to suggest that gadolinium retention in the brain is harmful and restricting gadolinium-based contrast agents (GBCAS) use is not warranted at this time
 - It has been recommended that GBCA use should be limited to circumstances in which additional information provided by the contrast agent is necessary and the necessity of repetitive MRIs with GBCAS should be assessed
 - If requesting clinicians indicate that a non-contrast study is being requested due to concerns regarding the use of gadolinium, the exam can be approved
- In some instances, to reduce time under anesthesia for MRI in pediatric individuals, surveillance or restaging studies may be requested with contrast only when it is determined that repeat non-contrast imaging does not add to an individual clinical case. These may be approved on a case-by-case basis.
 - If multiple body areas are supported by eviCore guidelines for the clinical condition being evaluated, MRI of all necessary body areas should be obtained concurrently in the same anesthesia session
- Nuclear medicine
 - General PET imaging consideration can be found in **PET Imaging in Pediatric Oncology (PEDONC-1.4)**.
 - Bone scan is frequently used for evaluation of bone metastases in pediatric oncology during initial treatment, treatment response, and surveillance
 - CPT® 78315 has no specific indications for evaluation of malignant disease
 - ¹²³I-metaiodobenzylguanidine (MIBG) scintigraphy is the preferred metabolic imaging for neuroblastoma and is positive in 90% to 95% of neuroblastomas. MIBG is also used for evaluation of pheochromocytomas, paragangliomas, ganglioneuromas, and ganglioneuroblastomas, PET/CT indications are provided in the relevant sections.

Study Type	Coding
Bone Scan	<ul style="list-style-type: none"> ANY of the following codes can be approved: <ul style="list-style-type: none"> CPT® 78300 CPT® 78305 CPT® 78306 CPT® 78803, 78830, or 78832 <ul style="list-style-type: none"> May be approved alone or in combination with: <ul style="list-style-type: none"> CPT® 78305 CPT® 78306
¹²³ I- metaiodobenzylguanidine (MIBG) scintigraphy	<ul style="list-style-type: none"> ANY one of the following codes can be approved: <ul style="list-style-type: none"> CPT® 78801 CPT® 78802 CPT® 78804 ANY one of the following codes may also be approved, individual or in combination with CPT® 78801, 78802 or 78804: <ul style="list-style-type: none"> CPT® 78803 CPT® 78830 CPT® 78831 CPT® 78832 CPT® 78800 may be approved for KNOWN neuroblastoma when only a single site follow up is desired but is not sufficient for the initial workup of suspected disease
Octreotide scan	Same coding as MIBG
Gallium scan	Same coding as MIBG

PET Imaging in Pediatric Oncology (PEDONC-1.4)

ONCP.GG.0001.4.A

v2.0.2024

Throughout these guidelines, the term “PET” refers specifically to ^{18}F -FDG-PET imaging and also applies to PET/CT fusion studies.

- PET imaging in pediatric oncology should use PET/CT fusion imaging (CPT® 78815 or CPT® 78816)
- The decision whether to use skull base to mid-femur (“eyes to thighs”) procedure code for PET (CPT® 78815) or whole-body PET (CPT® 78816) is addressed in the diagnosis-specific guideline sections.
- PET imaging in oncology should use PET/CT fusion imaging (CPT® 78815 or CPT® 78816)
- PET/MRI is generally not supported by eviCore for a vast majority of oncologic conditions due to lack of standardization in imaging technique and interpretation. **However, it may be approved in certain oncologic conditions when all of the following criteria are met:**
 - PET/MRI is supported in the condition-specific guideline criteria **OR**
 - The individual meets guideline criteria for PET/CT **AND**
 - The individual is a pediatric patient or the patient is an adult whose condition is reviewed under pediatric eviCore Radiology Guidelines (examples include histiocytic disorders, osteosarcoma, Ewing sarcoma, and some lymphomas) **AND**
 - PET/CT is **not** available at the treating institution **AND**
 - The provider requests PET/MRI in lieu of PET/CT
 - When the above criteria are met, PET/MRI may be approved using the code combination of PET Whole-Body (CPT® 78813) and MRI Unlisted (CPT® 76498). All other methods of reporting PET/MRI are inappropriate.
 - When clinically appropriate, diagnostic MRI codes may be approved at the same time as the PET/MRI code combination.
- Unbundling PET/CT imaging into separate PET (such as CPT® 78812 or CPT® 78813) and diagnostic CT codes is otherwise not supported.
- PET imaging is not reliable for the detection of anatomic lesions smaller than 8 mm in size.
- Delay PET/CT for at least 12 weeks after completion of radiation treatment, unless required sooner for imminent surgical resection.
- PET imaging using isotopes other than ^{18}F -FDG, ^{68}Ga -DOTATATE, or ^{68}Ga -DOTATOC is considered investigational at this time.
- PET has not been shown to be diagnostically useful in all forms of childhood cancer. PET is supported for pediatric malignancies with significant published

evidence regarding its diagnostic accuracy and importance in accurately directing individual care decisions. See diagnosis-specific guideline sections for details.

- PET imaging is not specific to cancer, and has a high rate of false positivity. Inflammation, infection (especially granulomatous), trauma, and post-operative healing may show high levels of FDG uptake and be false-positive for malignant lesions.
- PET for rare malignancies not specifically addressed by eviCore guidelines is generally not indicated, due to lack of available evidence regarding diagnostic accuracy of PET in the majority of rare cancers. Conventional imaging studies should be used for initial staging and treatment response for these diagnoses.
- PET can be approved if **all** of the following apply:
 - Conventional imaging (CT, MRI, US, plain film) reveals findings that are equivocal or suspicious
 - No other specific metabolic imaging (MIBG, octreotide, technetium, etc.) is appropriate for the cancer type
 - The submitted clinical information describes a specific decision regarding the individual's care that will be made based on the PET results
- PET imaging for surveillance imaging **only** when specifically stated elsewhere in the diagnosis-specific guideline sections
- Unless otherwise specified for a specific cancer type, once PET has been documented to be negative for a given individual's cancer or all PET-avid disease has been surgically resected, PET should not be used for continued disease monitoring or surveillance unless **one** of the following applies:
 - Conventional imaging (CT, MRI, US, plain film) reveals findings that are inconclusive or suspicious for recurrence
 - Residual mass that has not changed in size since the last conventional imaging does **not** justify PET imaging
 - PET avidity in a residual mass at the end of planned therapy is **not** an indication for PET imaging during surveillance.
 - Very rare circumstances where tumor markers or obvious clinical symptoms show strong evidence suggesting recurrence and PET would replace conventional imaging modalities
 - The individual is undergoing salvage treatment for a recurrent solid tumor with residual measurable disease on conventional imaging and confirmed repeat negative PET imaging will allow the individual to transition from active treatment to surveillance

Diagnostic Radiation Exposure in Pediatric Oncology (PEDONC-1.5)

ONCP.GG.0001.5.A

v2.0.2024

- Young children are presumed to be at increased risk for malignancy from diagnostic radiation exposure, most commonly from CT and nuclear medicine imaging. They are more sensitive to radiation than adults and generally live longer after receiving radiation doses from medical procedures, resulting in a larger number of years during which to manifest a cancer.
- Because of this presumed increased risk in young children, requests to substitute MRI without and with contrast for CT with contrast to avoid radiation exposure can be approved if ALL of the following criteria apply:
 - The individual is presently a young child and the ordering physician has documented the reason for MRI, rather than CT, is to avoid radiation exposure.
 - The disease-specific guidelines do not list CT as superior to MRI for the current disease and time point, meaning the MRI will provide equivalent or superior information relative to CT.
 - The request is for a body area other than Chest as MRI is substantially inferior to CT for detection of small pulmonary metastases.
- The guidelines listed in this section for certain specific indications are not intended to be all-inclusive; clinical judgment remains paramount and variance from these guidelines may be appropriate and warranted for specific clinical situations.

Screening Imaging in Cancer Predisposition Syndromes – General Considerations (PEDONC-2.1)

ONCP.SC.0002.1.A
v2.0.2024

- This section is intended to give guidance for screening imaging prior to diagnosis with a specific malignancy. Once an individual with a cancer predisposition syndrome has been diagnosed with a malignant disease, future imaging decisions should be guided by the appropriate disease-specific guidelines except as explicitly stated elsewhere in this section.
- This section's guidelines are limited to cancer predisposition syndromes with screening imaging considerations. Syndromes requiring only clinical or laboratory screening are not discussed here.
- In general, a recent (within 60 days) detailed history and physical examination and appropriate laboratory studies should be performed prior to considering advanced imaging, unless the individual is undergoing guideline-supported scheduled screening evaluation identified in this section.
- Where MRI is indicated in these guidelines, CT may be approved only if MRI is contraindicated, given the risk of radiation exposure in these syndromes.
- Many of these cancer predisposition syndromes also affect adults as survival continues to improve for these individuals.
 - Adults with syndromes covered in this section may follow these imaging guidelines except where contradicted by specific statements in the general imaging guidelines.
- Documentation of genetic or molecular confirmation of the appropriate syndrome with increased cancer risk is preferred for any individual to qualify for screening imaging. There are a number of complex ethical, social, and financial issues involved in the decision to complete genetic testing in a pediatric individual.
 - From the 2013 AAP Policy Statement, "Predictive genetic testing for adult-onset conditions generally should be deferred unless an intervention initiated in childhood may reduce morbidity or mortality." **Imaging surveillance is one such intervention and should not be performed without justifiable cause.**
 - Genetic testing should be performed in conjunction with genetic counseling for appropriate communication of risks identified by testing.
 - When genetic testing is not possible or not supported by health plan coverage policies, formal diagnosis after evaluation by a physician with significant training and/or experience in cancer predisposition syndromes (most commonly a geneticist or oncologist) is generally sufficient to confirm eligibility for screening imaging.
- Due to the length of time for image acquisition and the need for stillness, anesthesia is required for almost all infants and young children (age < 7 years), as

well as older children with delays in development or maturity. In this individual population, MRI imaging sessions should be planned with a goal of avoiding a short-interval repeat anesthesia exposure due to insufficient information using the following considerations:

- MRI should always be performed without and with contrast unless there is a specific contraindication to gadolinium use, since the individual already has intravenous access for anesthesia.
 - Recent evidence-based literature demonstrates the potential for gadolinium deposition in various organs including the brain, after the use of MRI contrast.
 - The U.S. food and drug administration (FDA) has noted that there is currently no evidence to suggest that gadolinium retention in the brain is harmful and restricting gadolinium-based contrast agents (GBCAS) use is not warranted at this time. It has been recommended that GBCA use should be limited to circumstances in which additional information provided by the contrast agent is necessary and the necessity of repetitive MRIs with GBCAS should be assessed.
 - If requesting clinicians indicate that a non-contrast study is being requested due to concerns regarding the use of gadolinium, the exam can be approved.
 - In some instances, to reduce time under anesthesia for MRI in pediatric individuals, surveillance or restaging studies may be requested with contrast only when it is determined that repeat non-contrast imaging does not add to an individual clinical case. These may be approved on a case-by-case basis.
- If multiple body areas are supported by eviCore guidelines for the clinical condition being evaluated, MRI of all necessary body areas should be obtained concurrently in the same anesthesia session

Li-Fraumeni Syndrome (LFS) (PEDONC-2.2)

ONCP.SC.0002.2.A

v2.0.2024

The following imaging studies should be considered appropriate in individuals with LFS:

Indication	Imaging Study
All individuals	<ul style="list-style-type: none"> BOTH of the following, annually: <ul style="list-style-type: none"> MRI Brain without and with contrast (CPT® 70553) Whole-body MRI (WBMRI, CPT® 76498) <ul style="list-style-type: none"> CPT® 76498 is the only approvable code for whole-body MRI at this time. Every 3 months from birth to age 18: <ul style="list-style-type: none"> Abdominal (CPT® 76700) and pelvic (CPT® 76856) ultrasound Beginning at age 20: <ul style="list-style-type: none"> Annual Breast MRI (CPT® 77049), alternating every 6 months with breast ultrasound, in addition to the previously noted annual MRI studies.
Documented signs or symptoms suggestive of possible malignancy	<ul style="list-style-type: none"> Targeted MRI without and with contrast of the involved body area(s)

Background and Supporting Information

- LFS - syndrome inherited in an autosomal dominant manner (50% risk to offspring) associated with germline mutations in *TP53* resulted in an increased susceptibility to a variety of cancers.
 - Eighty percent of individuals will have germline *TP53* mutation:
 - Tumor-specific *TP53* mutations are much more common than germline *TP53* mutations and are not associated with an increased risk for subsequent cancers
 - If *TP53*-negative, formal diagnosis of LFS should be assigned by a physician with significant training and/or experience in LFS (most commonly a geneticist or oncologist) based on specified clinical criteria prior to beginning a screening imaging program

- *TP53* mutations may be present in 50% to 80% of pediatric adrenocortical carcinoma, 10% of pediatric rhabdomyosarcoma, and 10% of pediatric osteosarcoma
- Individuals with LFS have an increased sensitivity to ionizing radiation, so screening strategies resulting in significant radiation exposure are not appropriate (CT and nuclear medicine).
- When a specific malignancy is suspected, the individual should be imaged according to the eviCore imaging guideline specific to the suspected cancer type
- Annual complete detailed physical examinations, complete blood counts, and urinalyses form the backbone of LFS cancer screening.

Neurofibromatosis 1 and 2 (NF1 and NF2) (PEDONC-2.3)

ONCP.SC.0002.3.A

v2.0.2024

The following imaging studies should be considered appropriate in individuals with NF1:

Indication	Imaging Study
<ul style="list-style-type: none"> Clarification of the diagnosis of NF1 if evaluation by a physician with significant training and/or experience in neurofibromatosis is inconclusive <ul style="list-style-type: none"> Most commonly a neurologist, geneticist, ophthalmologist, or oncologist 	<ul style="list-style-type: none"> One-time MRI Brain (CPT® 70553) and Orbits (CPT® 70543) without and with contrast

Plain x-ray or ultrasound is not required prior to advanced imaging in these individuals.
<ul style="list-style-type: none"> New bone mass(es) 	<ul style="list-style-type: none"> See: <u>Bone Tumors - General Considerations (PEDONC-9.1)</u>
<ul style="list-style-type: none"> Documented optic pathway gliomas 	<ul style="list-style-type: none"> See: <u>Intracranial Low Grade Gliomas (PEDONC-4.2)</u>
<ul style="list-style-type: none"> Known plexiform neurofibromas 	<ul style="list-style-type: none"> MRI without and with contrast of a known body area containing a neurofibroma is indicated for any of the following: <ul style="list-style-type: none"> Every 3 months for treatment response in individuals receiving active treatment New or worsening clinical symptoms suggesting progression Preoperative planning
<ul style="list-style-type: none"> Biopsy-proven MPNST in individuals with known NF-1 or NF-2 	<ul style="list-style-type: none"> See: <u>Non-Rhabdomyosarcoma Soft Tissue Sarcomas (NRSTS)</u> <u>(PEDONC-8.3)</u>

Background and Supporting Information

NF1:

- Common syndrome inherited in an autosomal dominant manner (50% risk to offspring) affecting 1 in 2500 people. The diagnosis is commonly made based on established clinical criteria including café-au-lait spots, lisch nodules of the iris, axillary freckling, family history, and the presence of NF-associated tumors.
- Genetic testing is encouraged for children with possible NF1 and no family history prior to assigning a diagnosis, but will not identify a mutation for all individuals with NF1.
- The majority of tumors are benign in nature, but malignant degeneration can occur.

- NF1-affected persons have increased sensitivity to ionizing radiation, so CT and nuclear medicine imaging are not appropriate screening or surveillance studies for these individuals.
- CT and/or nuclear medicine studies may be indicated for acute clinical situations and should be judged on a case-by-case basis.
- Annual ophthalmology evaluation is strongly recommended beginning at the time of diagnosis of NF1 to evaluate for optic pathway abnormalities:
 - Screening MRIs Brain (CPT® 70553) and Orbits (CPT® 70543) for asymptomatic individuals are **not** generally recommended due to the ~60% rate of unidentified bright objects (UBOs, T2-weighted signal abnormalities) which mostly disappear by age 30
 - Routine follow up imaging of UBOs is not warranted in the absence of acute symptoms suggesting new or worsening intracranial disease
- Individuals with NF1 are at increased risk for plexiform neurofibromas (PN) and malignant peripheral nerve sheath tumors (MPNST— a high grade sarcoma)
 - Screening imaging of asymptomatic individuals for these tumors is not supported by evidence. PET imaging is not supported for PN surveillance in asymptomatic individuals at this time as the positive predictive value is only 60% to 65% even in symptomatic individuals.
- Although PET imaging has a positive predictive value of only 61% to 63% in NF1 with suspected transformation to MPNST, the negative predictive value is high (96% to 99%)
 - Considerations for PET/CT coding and indications/coding for PET/MRI are found in **PET Imaging in Pediatric Oncology (PEDONC-1.4)**
 - Inconclusive PET findings should lead to biopsy of the concerning lesion
 - Repeat PET studies are not indicated due to the poor positive predictive value in this setting
- 2017 AACR recommendations support a single baseline Whole-Body MRI to assess tumor burden in late adolescence or young adulthood. Further imaging should be based on focused MRI for symptomatic changes or pre-operative planning, and further surveillance WBMRI are not supported.

The following imaging studies should be considered appropriate in individuals with NF2:

Indication	Imaging Study
<ul style="list-style-type: none"> • All individuals, beginning at age 10 years 	<ul style="list-style-type: none"> • Annual MRI Brain without and with contrast (CPT® 70553)
<ul style="list-style-type: none"> • All individuals without a history of spinal tumors, beginning at age 10 years 	<ul style="list-style-type: none"> • MRI Spine without and with contrast (Cervical-CPT® 72156, Thoracic-CPT® 72157, Lumbar-CPT® 72158) every 3 years

Indication	Imaging Study
<ul style="list-style-type: none"> All individuals with a history of spinal tumors 	<ul style="list-style-type: none"> Annual MRI Spine without and with contrast (Cervical-CPT® 72156, Thoracic-CPT® 72157, Lumbar-CPT® 72158)
<ul style="list-style-type: none"> Clinical symptoms of intracranial mass or vestibular disease 	<ul style="list-style-type: none"> MRI Brain without and with contrast (CPT® 70553)
<ul style="list-style-type: none"> <u>Any of the following:</u> <ul style="list-style-type: none"> Clinical symptoms suggestive of new or progressive spinal or paraspinal tumors, including uncomplicated back pain or radiculopathy Recent diagnosis with a meningioma or vestibular schwannoma 	<ul style="list-style-type: none"> MRI Spine without and with contrast (Cervical-CPT® 72156, Thoracic-CPT® 72157, Lumbar-CPT® 72158)
<ul style="list-style-type: none"> Surveillance for progression of unresected tumors in individuals with known vestibular schwannoma 	<ul style="list-style-type: none"> Annual MRI Brain without and with contrast (CPT® 70553)
<ul style="list-style-type: none"> <u>Known vestibular schwannomas and any of the following:</u> <ul style="list-style-type: none"> New or worsening clinical symptoms including hearing loss Preoperative planning 	<ul style="list-style-type: none"> MRI Brain without and with contrast (CPT® 70553)
<ul style="list-style-type: none"> Known meningioma 	<ul style="list-style-type: none"> See: Meningiomas (ONC-2.8) in the Oncology Imaging Guidelines
<ul style="list-style-type: none"> Known ependymoma 	<ul style="list-style-type: none"> See: Ependymoma (PEDONC-4.8)

Background and Supporting Information

NF2:

- NF2 is substantially less common than NF1. It is inherited in an autosomal dominant manner (50% risk to offspring) affecting ~1 in 25000 people. NF2 is associated with increased risk for meningiomas (50% of affected individuals), vestibular schwannomas, and spinal tumors (75% of affected individuals).

Beckwith-Wiedemann Syndrome (BWS) (PEDONC-2.4)

ONCP.SC.0002.4.A

v2.0.2024

The following imaging studies should be considered appropriate in individuals with BWS:

Indication	Imaging Study
<ul style="list-style-type: none"> All individuals, from birth to the 8th birthday 	<ul style="list-style-type: none"> Abdominal ultrasound (CPT® 76700) every 3 months
<ul style="list-style-type: none"> Purely cystic adrenal mass found on screening ultrasound 	<ul style="list-style-type: none"> Continue screening ultrasound (CPT® 76700 or 76705) every 3 months without additional imaging (i.e. advanced imaging is not supported for a purely cystic adrenal mass)
<ul style="list-style-type: none"> <u>Solid or mixed adrenal mass found on screening ultrasound AND:</u> <ul style="list-style-type: none"> Individual age 0 to 5 months, and Mass 0 to 3 cm in diameter 	<ul style="list-style-type: none"> MIBG imaging (See: PEDONC-1.3 for coding) and either CT or MRI Abdomen (contrast as requested)
<ul style="list-style-type: none"> <u>Solid or mixed adrenal mass found on screening ultrasound AND:</u> <ul style="list-style-type: none"> Individual age 0 to 5 months, and Mass > 3 cm in diameter 	<ul style="list-style-type: none"> MIBG imaging (See: PEDONC-1.3 for coding) and MRI Abdomen (contrast as requested)
<ul style="list-style-type: none"> <u>Solid or mixed adrenal masses on screening ultrasound AND:</u> <ul style="list-style-type: none"> Individual age 6 months or greater 	<ul style="list-style-type: none"> MIBG imaging (See: PEDONC-1.3 for coding) prior to biopsy or resection <ul style="list-style-type: none"> If no evidence of malignancy on biopsy or resection, resume screening abdominal ultrasound every 3 months
<ul style="list-style-type: none"> <u>Solid or mixed adrenal masses on screening ultrasound AND:</u> <ul style="list-style-type: none"> No evidence of malignancy based on MIBG, CT or MRI, Urine HVA/VMA, and serum ACTH 	<ul style="list-style-type: none"> Repeat abdominal ultrasound (CPT® 76700 or 76705) every 6 weeks for 2 years
<ul style="list-style-type: none"> Known renal tumors 	<ul style="list-style-type: none"> See: <u>Pediatric Renal Tumors (PEDONC-7)</u>

Indication	Imaging Study
• Known hepatoblastoma	• See: <u>Hepatoblastoma (PEDONC-11.2)</u>
• Known neuroblastoma	• See: <u>Neuroblastoma (PEDONC-6)</u>
• Known adrenocortical carcinoma	• See: <u>Pediatric Adrenocortical Carcinoma (PEDONC-14)</u>
• Known pheochromocytoma	• See: <u>Neuroendocrine Cancers and Adrenal Tumors (ONC-15)</u> in the Oncology Imaging Guidelines

Background and Supporting Information

- Inherited syndrome characterized by macroglossia, hemihypertrophy, macrosomia, organomegaly, and neonatal hypoglycemia. Individuals with isolated hemihypertrophy are also imaged according to this guideline.
- Caused by mutation at chromosome 11p15, affected children are predisposed to Wilms tumor, hepatoblastoma, rhabdomyosarcoma, and adrenal tumors.

Denys-Drash Syndrome (DDS) (PEDONC-2.5)

ONCP.SC.0002.5.A

v2.0.2024

The following imaging studies should be considered appropriate in individuals with DDS:

Indication	Imaging Study
<ul style="list-style-type: none">All individuals, from birth to the 8th birthday	<ul style="list-style-type: none">Abdominal ultrasound (CPT® 76700) every 3 months
<ul style="list-style-type: none">Known renal tumors	<ul style="list-style-type: none">See: <u>Pediatric Renal Tumors (PEDONC-7)</u>

Background and Supporting Information

- Characterized by pseudohermaphroditism, early renal failure, and >90% risk of Wilms tumor development in each kidney. Associated with mutations at 11p13, risk of renal failure after detection of symptomatic Wilms tumor is 62%, so early detection may allow for renal-sparing surgical approaches.

Wilms Tumor-Aniridia-Growth Retardation (WAGR) (PEDONC-2.6)

ONCP.SC.0002.6.A

v2.0.2024

The following imaging studies should be considered appropriate in individuals with WAGR:

Indication	Imaging Study
<ul style="list-style-type: none">All individuals, from birth to the 8th birthday	<ul style="list-style-type: none">Abdominal ultrasound (CPT® 76700) every 3 months
<ul style="list-style-type: none">Known renal tumors	<ul style="list-style-type: none">See: <u>Pediatric Renal Tumors (PEDONC-7)</u>

Background and Supporting Information

- Named for the components of the disorder, it is associated with mutations at 11p13. As the name suggests, individuals are predisposed to Wilms tumor, with 57% of individuals in one cohort developing Wilms tumor. Risk of renal failure after detection of symptomatic Wilms tumor is 38%, so early detection may allow for renal-sparing surgical approaches

Familial Adenomatous Polyposis (FAP) and Related Conditions (PEDONC-2.7)

ONCP.SC.0002.7.A

v2.0.2024

- Individuals with Lynch, Gardner, and Turcot syndromes should also be imaged according to these guidelines.

The following imaging studies should be considered appropriate in individuals with FAP and related conditions:

- For colonoscopy and endoscopy guidance for those with FAP and related conditions, See: **EGD-1.16**, **CAPEND-5**, or **COLON-17: Genetic Syndromes** for the endoscopic management of polyposis syndromes.

Indication	Imaging Study
<ul style="list-style-type: none"> All individuals, from birth to the 6th birthday 	<ul style="list-style-type: none"> Abdominal ultrasound (CPT® 76700) every 3 months
<ul style="list-style-type: none"> All individuals, beginning at age 12 years 	<ul style="list-style-type: none"> Annual thyroid ultrasound (CPT® 76536)
<ul style="list-style-type: none"> All individuals, beginning at age 30 years 	<ul style="list-style-type: none"> Annual pelvic ultrasound (CPT® 76856)
<ul style="list-style-type: none"> Family history of desmoid tumors 	<ul style="list-style-type: none"> Abdominal ultrasound (CPT® 76700) annually for life after age 6
<ul style="list-style-type: none"> Individuals with Spigelman Stage III or IV or if duodenectomy is being planned See: <u>Genetic Syndromes (EGD-1.16)</u> for additional information regarding Spigelman staging. 	<ul style="list-style-type: none"> MR Enterography (MRI Abdomen without and with contrast, CPT® 74183 and MRI Pelvis without and with contrast, CPT® 72197)
<ul style="list-style-type: none"> Known colorectal tumors 	<ul style="list-style-type: none"> See: <u>Colorectal Cancer (ONC-16)</u> in the Oncology Imaging Guidelines
<ul style="list-style-type: none"> Known desmoid tumors 	<ul style="list-style-type: none"> See: <u>Non-Rhabdomyosarcoma Soft Tissue Sarcomas (NRSTS) (PEDONC-8.3)</u>

Background and Supporting Information

- Inherited in an autosomal dominant manner (50% risk to offspring), it is also known as Adenomatous Polyposis Coli (APC). It is associated with the development of thousands of colonic polyps by age 20 and >90% risk of colorectal carcinoma. Prophylactic total colectomy is recommended by age 20 for most individuals. FAP is also associated with hepatoblastoma, tumors of the pancreas and small bowel, medulloblastoma, and thyroid cancer.

Multiple Endocrine Neoplasias (MEN) (PEDONC-2.8)

ONCP.SC.0002.8.A

v2.0.2024

The following imaging studies should be considered appropriate in individuals with MEN1:

Indication	Imaging Study
All individuals, beginning at age 5 years	<ul style="list-style-type: none"> Annual MRI Brain without and with contrast (CPT® 70553) Annual MRI Abdomen without and with contrast (CPT® 74183), CT Abdomen with contrast (CPT® 74160), or ultrasound (CPT® 76700) Annual Octreotide study (see: PEDONC-1.3 for coding)
All individuals, beginning at age 15 years	<ul style="list-style-type: none"> Annual MRI Chest without and with contrast (CPT® 71552) or CT Chest with contrast (CPT® 71260)
Known thyroid cancer	<ul style="list-style-type: none"> See: Thyroid Cancer (ONC-6) in the Oncology Imaging Guidelines
Known pheochromocytoma	<ul style="list-style-type: none"> See: Neuroendocrine Cancers and Adrenal Tumors (ONC-15) in the Oncology Imaging Guidelines

The following imaging studies should be considered appropriate in individuals with MEN2a and MEN2b:

Indication	Imaging Study
All individuals, beginning at age 5 years	<ul style="list-style-type: none"> MRI Abdomen without and with contrast (CPT® 74183) can be approved every 3 years
<ul style="list-style-type: none"> One of the following: <ul style="list-style-type: none"> Elevated catecholamines Inconclusive adrenal mass on MRI 	<ul style="list-style-type: none"> ONE of the following: <ul style="list-style-type: none"> Octreotide study (see: PEDONC-1.3 for coding) Adrenal Nuclear Imaging (CPT® 78075)
<ul style="list-style-type: none"> Known pheochromocytoma 	<ul style="list-style-type: none"> See: Neuroendocrine Cancers and Adrenal Tumors (ONC-15)

Background and Supporting Information

- Inherited in an autosomal dominant manner (50% risk to offspring)
- MEN1 is characterized by parathyroid, pancreatic islet cell, and pituitary gland tumors (3 P's), as well as carcinoid tumors in the chest and abdomen, and 28% of individuals will develop at least one tumor by age 15.
- MEN2a is characterized by medullary thyroid carcinoma, parathyroid adenomas, and pheochromocytomas.
- MEN2b is characterized by ganglioneuromas of the GI tract and skeletal abnormalities presenting in infancy.
- Recommended cancer screening includes:
 - Individuals with MEN2a and MEN2b receive annual measurement of catecholamines for pheochromocytoma screening

Tuberous Sclerosis Complex (TSC) (PEDONC-2.9)

ONCP.SC.0002.9.A

v2.0.2024

- Abdominal MRI (CPT® 74183) may be approved for women of childbearing age planning pregnancy.

The following imaging studies should be considered appropriate in individuals with TSC:

Indication	Imaging Study
<ul style="list-style-type: none"> All individuals, at the time of suspected diagnosis until age 25 years 	<ul style="list-style-type: none"> Annual Brain MRI without and with contrast (CPT® 70553)
<ul style="list-style-type: none"> All individuals at diagnosis 	<ul style="list-style-type: none"> Single baseline MRI Abdomen without and with contrast (CPT® 74183)
<ul style="list-style-type: none"> If no renal lesions seen on baseline MRI Abdomen 	<ul style="list-style-type: none"> From diagnosis through age 11: <ul style="list-style-type: none"> Annual Renal US (CPT® 76770) Age 12 (or 10 years earlier than the youngest family member with renal cell carcinoma, whichever comes earlier): <ul style="list-style-type: none"> MRI Abdomen without and with contrast (CPT® 74183) every 3 years in lieu of ultrasound
<ul style="list-style-type: none"> For documented renal lesions on baseline MRI Abdomen or any ultrasound 	<ul style="list-style-type: none"> MRI Abdomen without and with contrast (CPT® 74183) annually
<ul style="list-style-type: none"> All individuals, beginning at age 18 years 	<ul style="list-style-type: none"> CT Chest without contrast (CPT® 71250) every 5 years
<ul style="list-style-type: none"> All individuals, for cardiac screening or follow up of known cardiac disease 	<ul style="list-style-type: none"> See: <u>Initial Transthoracic Echocardiography (TTE) Indications (PEDCD-8.2)</u> and <u>Repeat Transthoracic Echocardiography Indications (PEDCD-8.3)</u> in the Pediatric Cardiology Imaging Guidelines
<ul style="list-style-type: none"> Individuals with documented abnormalities on baseline CT Chest 	<ul style="list-style-type: none"> Additional CT Chest without contrast or with contrast (CPT® 71250 or 71260) may be approved every 1 year

Indication	Imaging Study
<ul style="list-style-type: none"> Any of the following: <ul style="list-style-type: none"> New pulmonary symptoms Worsening pulmonary function testing 	<ul style="list-style-type: none"> CT Chest without contrast (CPT® 71250)
<ul style="list-style-type: none"> Known SEGA tumors 	<ul style="list-style-type: none"> See: <u>Intracranial Low Grade Gliomas (LGG) (PEDONC-4.2)</u>
<ul style="list-style-type: none"> Known renal cell carcinoma 	<ul style="list-style-type: none"> See: <u>Pediatric Renal Cell Carcinoma (RCC) (PEDONC-7.4)</u>

Background and Supporting Information

- Inherited in an autosomal dominant manner (50% risk to offspring), affecting ~1 in 6000 individuals, it is associated with benign tumors, hypopigmented skin macules (ash leaf spots), developmental delay, and epilepsy.
- Malignancies associated with this syndrome include:
 - Subependymal giant cell astrocytomas (SEGA tumors)
 - Historically, early surgery was important to reduce morbidity related to these tumors
 - More recently, everolimus has been successfully used to treat these tumors without surgery, and early detection remains an important feature for success
 - Renal cell carcinoma
 - Cardiac rhabdomyosarcoma
 - Pulmonary lymphangioleiomyomatosis
- Recommended cancer screening includes:
 - Ophthalmologic and dermatologic evaluation annually

Von Hippel-Lindau Syndrome (VHL) (PEDONC-2.10)

ONCP.SC.0002.10.A

v2.0.2024

The following imaging studies should be considered appropriate in individuals with VHL:

Indication	Imaging Study
<ul style="list-style-type: none"> All individuals, beginning at age 11 years 	<ul style="list-style-type: none"> MRI Brain without and with contrast (CPT® 70553) and MRI Spine without and with contrast (Cervical-CPT® 72156), Thoracic-CPT® 72157, and Lumbar-CPT® 72158) every 2 years
<ul style="list-style-type: none"> Individuals with frequent ear infections, prior to age 8 	<ul style="list-style-type: none"> One-time MRI Brain without and with contrast (CPT® 70553)
<ul style="list-style-type: none"> All individuals, beginning at age 5 years 	<ul style="list-style-type: none"> Annual Abdominal US (CPT® 76700)
<ul style="list-style-type: none"> All individuals, beginning at age 15 years 	<ul style="list-style-type: none"> MRI Abdomen without and with contrast (CPT® 74183) every 2 years
<ul style="list-style-type: none"> <u>ONE of the following:</u> <ul style="list-style-type: none"> Elevated catecholamines Inconclusive adrenal mass on MRI 	<ul style="list-style-type: none"> Octreotide study (CPT® 78800, CPT® 78801, CPT® 78802, CPT® 78803, or CPT® 78804) or Adrenal Nuclear imaging (CPT® 78075)
<ul style="list-style-type: none"> Individuals with known hemangioblastoma anywhere in the body (based on imaging) that has not been resected 	<ul style="list-style-type: none"> <u>Both of the following, every 1 year:</u> <ul style="list-style-type: none"> MRI Brain without and with contrast (CPT® 70553) MRI Spine without and with contrast (Cervical-CPT® 72156), Thoracic-CPT® 72157, and Lumbar-CPT® 72158)
<ul style="list-style-type: none"> Known hemangioblastoma that has not been resected and new or worsening symptoms 	<ul style="list-style-type: none"> MRI Brain without and with contrast (CPT® 70553) MRI Spine without and with contrast (Cervical-CPT® 72156), Thoracic-CPT® 72157, and Lumbar-CPT® 72158)
<ul style="list-style-type: none"> Known (based on imaging) CNS hemangioblastoma 	<ul style="list-style-type: none"> See: <u>Intracranial Low Grade Gliomas (LGG) (PEDONC-4.2)</u>
<ul style="list-style-type: none"> Known renal cell carcinoma 	<ul style="list-style-type: none"> See: <u>Pediatric Renal Cell Carcinoma (RCC) (PEDONC-7.4)</u>

Indication	Imaging Study
<ul style="list-style-type: none">Known pheochromocytoma or other neuroendocrine tumor	<ul style="list-style-type: none">See: <u>Neuroendocrine Cancers And Adrenal Tumors (ONC-15)</u> in the Oncology Imaging Guidelines

Background and Supporting Information

- Inherited in an autosomal dominant manner (50% risk to offspring), it is associated with CNS hemangioblastomas, retinal angiomas, endolymphatic sac tumors (ELST), gastrointestinal stromal tumor (GIST), renal cell carcinoma (RCC), and pheochromocytomas and other neuroendocrine tumors (NETs). Pediatric individuals are at risk of developing hemangioblastomas and pheochromocytomas that can remain clinically occult until symptoms become severe. Historically, substantial mortality was attributable to RCC, pancreatic NET, and CNS hemangioblastoma.
- Recommended cancer screening includes:
 - Annual ophthalmologic evaluation beginning at birth
 - Annual measurement of catecholamines beginning at age 2
 - Audiology assessment every 2 years beginning at age 5

Rhabdoid Tumor Predisposition Syndrome (PEDONC-2.11)

ONCP.SC.0002.11.A

v2.0.2024

The following imaging studies should be considered appropriate in individuals with Rhabdoid Tumor Predisposition Syndrome:

Indication	Imaging Study
<ul style="list-style-type: none"> All individuals, at diagnosis, as early as birth if requested 	<ul style="list-style-type: none"> Whole-body MRI (WBMRI) (CPT® 76498)
<ul style="list-style-type: none"> All individuals, from birth to 6 months of age 	<ul style="list-style-type: none"> <u>ALL of the following, monthly:</u> <ul style="list-style-type: none"> US Head (CPT® 76506) US Abdomen (CPT® 76700) US Pelvis (CPT® 76856) US Neck (CPT® 76536) MRI with and without contrast of areas of concern found on baseline WBMRI
<ul style="list-style-type: none"> All individuals, from age 7 months to 5 years 	<ul style="list-style-type: none"> <u>ALL of the following, every 3 months:</u> <ul style="list-style-type: none"> US Abdomen (CPT® 76700) US Pelvis (CPT® 76856) US Neck (CPT® 76536) MRI Brain (CPT® 70553) MRI Spine (CPT® 72156, CPT® 72157, and CPT® 72158) without and with contrast MRI with and without contrast of areas of concern found on baseline WBMRI
<ul style="list-style-type: none"> All individuals, after age 5 years 	<ul style="list-style-type: none"> Annual WBMRI (CPT® 76498)
<ul style="list-style-type: none"> Clinical symptoms or WBMRI findings suggesting malignancy 	<ul style="list-style-type: none"> Targeted advanced imaging of the suspected disease site (CT with or without contrast, or MRI without and with contrast)
<ul style="list-style-type: none"> Inconclusive findings on ultrasound 	<ul style="list-style-type: none"> MRI with and without contrast of the inconclusive US site <ul style="list-style-type: none"> MRI should be used in place of ultrasound for remainder of planned screening

Background and Supporting Information

- Inherited in an autosomal dominant manner (50% risk to offspring), it is associated with malignant rhabdoid tumors of the kidney and extrarenal locations, and atypical teratoid/rhabdoid tumors (ATRT) of the CNS. It is caused by a germline mutation in *INI1* or *SMARCB1*, and is associated with a more variable prognosis than de novo rhabdoid tumors.

Familial Retinoblastoma Syndrome (PEDONC-2.12)

ONCP.SC.0002.12.A

v2.0.2024

- Regular physical and ophthalmologic evaluations under anesthesia (EUA) are the hallmark of surveillance strategies for these individuals, and asymptomatic screening imaging does not have a defined role at this time.

The following imaging studies should be considered appropriate in individuals with Familial Retinoblastoma Syndrome:

Indication	Imaging Study
<ul style="list-style-type: none"> Individuals with retinomas (premalignant retinal lesions) 	<ul style="list-style-type: none"> Annual MRI Orbits (CPT® 70543)
<ul style="list-style-type: none"> Either of the following: <ul style="list-style-type: none"> Inconclusive EUA findings New symptoms 	<ul style="list-style-type: none"> US Orbits (CPT® 76512, 76510, or 76511) or MRI Orbits (CPT® 70543) <ul style="list-style-type: none"> These studies should be used if at all possible in lieu of CT or nuclear imaging to avoid radiation exposure

Background and Supporting Information

- This syndrome is inherited in an autosomal dominant manner (50% risk to offspring). As the name suggests, it is associated with retinoblastoma, as well as osteosarcoma, pediatric melanoma, and a significantly increased risk for radiation-related malignancies.

Hereditary Paraganglioma-Pheochromocytoma (HPP) Syndromes (PEDONC-2.13)

ONCP.SC.0002.13.A
v2.0.2024

The following imaging studies should be considered appropriate in individuals with HPP Syndromes:

Indication	Imaging Study
<ul style="list-style-type: none"> All individuals with SDHx, MAX, TMEM127 mutations, beginning at age 6 	<ul style="list-style-type: none"> Every 2 years, ONE of the following sets of imaging: <ul style="list-style-type: none"> Whole-body MRI (CPT® 76498) <ul style="list-style-type: none"> CPT® 76498 is the only approvable code for whole-body MRI at this time OR MRI Neck without and with contrast (CPT® 70543), MRI Chest without and with contrast (CPT® 71552), MRI Abdomen without and with contrast (CPT® 74183), and MRI Pelvis without and with contrast (CPT® 72197) <ul style="list-style-type: none"> If MRI cannot be performed: CT Neck with contrast (CPT® 70491), CT Chest with contrast (CPT® 71260), and CT Abdomen and Pelvis with contrast (CPT® 74177) MRI Neck imaging should include skull base, thus separate MRI Brain (CPT® 70553) is not routinely supported, but may be approved if there are CNS specific symptoms.
<ul style="list-style-type: none"> Initial screening for individuals diagnosed at age 18 or older 	<ul style="list-style-type: none"> One-time PET/CT (CPT® 78815 or 78816)
<ul style="list-style-type: none"> Known pheochromocytoma or other neuroendocrine tumors 	<ul style="list-style-type: none"> See: <u>Neuroendocrine Cancers and Adrenal Tumors (ONC-15)</u> in the Oncology Imaging Guidelines

Background and Supporting Information

- Caused by mutations in *SDHx* and related genes, this syndrome is inherited in an autosomal dominant manner (50% risk to offspring), and is associated with pheochromocytomas and paragangliomas.

- Individuals with multiple endocrine neoplasias should not use this guideline and should be imaged according to **Multiple Endocrine Neoplasias (MEN) (PEDONC-2.8)**.
- MRI is preferred to CT to minimize radiation exposure given these individuals' lifelong need for screening
- All individuals with HPP receive annual measurement of catecholamines

Costello Syndrome (PEDONC-2.14)

ONCP.SC.0002.14.A
v2.0.2024

The following imaging studies should be considered appropriate in individuals with Costello Syndrome:

Indication	Imaging Study
<ul style="list-style-type: none"> Following confirmation of gene mutation 	<ul style="list-style-type: none"> <u>ANY or ALL of the following:</u> <ul style="list-style-type: none"> Echocardiogram <ul style="list-style-type: none"> CPT® 93306 or CPT® 93308 with 93321 and 93325 MRI Brain (CPT® 70553) without and with contrast MRI Cervical (CPT® 72156) and Thoracic Spine (CPT® 72157) without and with contrast
<ul style="list-style-type: none"> All individuals, from birth to 10th birthday 	<ul style="list-style-type: none"> <u>Every 3 months:</u> <ul style="list-style-type: none"> US Abdomen (CPT® 76700) and Pelvis (CPT® 76856)
<ul style="list-style-type: none"> Known cardiac disease 	<ul style="list-style-type: none"> See: <u>Initial Transthoracic Echocardiography (TTE) Indications (PEDCD-8.2)</u> and <u>Repeat Transthoracic Echocardiography Indications (PEDCD-8.3)</u> in the Pediatric Cardiology Guidelines
<ul style="list-style-type: none"> Known rhabdomyosarcoma 	<ul style="list-style-type: none"> See: <u>Rhabdomyosarcoma (RMS) (PEDONC-8.2)</u>
<ul style="list-style-type: none"> Known neuroblastoma 	<ul style="list-style-type: none"> See: <u>Neuroblastoma (PEDONC-6)</u>

Background and Supporting Information

- Caused by mutations in *HRAS* genes, this syndrome is inherited in an autosomal dominant manner (50% risk to offspring), and is associated with rhabdomyosarcoma and neuroblastoma in early childhood, and transitional cell cancer of the bladder in older children and adults.

Constitutional Mismatch Repair Deficiency (CMMRD or Turcot Syndrome) (PEDONC-2.15)

ONCP.SC.0002.15.A
v2.0.2024

The following imaging studies should be considered appropriate in individuals with CMMRD/Turcot Syndrome:

Indication	Imaging Study
<ul style="list-style-type: none">All individuals, after CMMRD diagnosis is confirmed by genetic mutation	<ul style="list-style-type: none">MRI Brain without and with contrast (CPT® 70553) every 6 months
<ul style="list-style-type: none">All individuals, beginning at age 4 years	<ul style="list-style-type: none">Annual esophagogastroduodenoscopy and colonoscopy
<ul style="list-style-type: none">All individuals, beginning at age 6 years	<ul style="list-style-type: none">Annual whole-body MRI (CPT® 76498)<ul style="list-style-type: none">76498 is the only approvable code for whole-body MRI at this time

Background and Supporting Information

- A highly penetrant and aggressive cancer predisposing syndrome resulting from autosomal recessive inheritance of biallelic mutations in mismatch repair genes, CMMRD syndrome leads to substantial risk for several commonly fatal childhood malignancies - high-grade CNS tumors (glioma, PNET, medulloblastoma) and hematologic malignancies (non-Hodgkin lymphoma, acute lymphoblastic leukemia). Individuals with CMMRD are also at increased risk for gastrointestinal tumors.

Hereditary Leiomyomatosis and Renal Cell Cancer (HLRCC) (PEDONC-2.16)

ONCP.SC.0002.16.A

v2.0.2024

The following imaging studies should be considered appropriate in individuals with HLRCC:

Indication	Imaging Study
<ul style="list-style-type: none">Beginning at age 8 years, individuals with at least ONE of the following:<ul style="list-style-type: none">Documented fumarate hydratase (FH) gene mutation/variant consistent with HLRCCHistologically confirmed multiple cutaneous piloleiomyomasAt least TWO of the following manifestations:<ul style="list-style-type: none">Surgical treatment for symptomatic uterine leiomyomas before age 40Type 2 papillary renal cell carcinoma or collecting duct renal carcinoma before age 40A first-degree family member with either of the two above criteria	<ul style="list-style-type: none">MRI Abdomen with and without contrast (CPT® 74183), annually

Background and Supporting Information

- Hereditary leiomyomatosis and renal cell cancer (HLRCC) is a disorder in which affected individuals tend to develop benign tumors containing smooth muscle tissue (leiomyomas) in the skin and, in females, the uterus. Approximately 20 percent of people with HLRCC develop renal cell cancer. People with HLRCC are commonly diagnosed with kidney cancer in their forties but cases have been reported in individuals as young as 11.
- In 2019, Forde et. al. published the first large, prospective study of screening for HLRCC and showed that most symptomatic individuals present with stage 3 or 4 RCC with a high risk of death and one life is saved for every 5 individuals on an MRI screening protocol.

Other Renal Cell Cancer Predisposition Syndromes (PEDONC-2.17)

ONCP.SC.0002.17.A
v2.0.2024

Birt-Hogg-Dube Syndrome (BHDS)

The following imaging studies should be considered appropriate in individuals with BHDS:

Indication	Imaging Study
<ul style="list-style-type: none"> All individuals, beginning at age 20 years 	<ul style="list-style-type: none"> Abdominal MRI with and without contrast (CPT® 74183) every 3 years

Background and Supporting Information

- Birt-Hogg-Dube Syndrome (BHDS) is an autosomal dominant disorder with a heterozygous pathogenic variant in FLCN gene.
- These individuals have, or may have:
 - Cutaneous manifestations (fibrofolliculomas, acrochordons, angiofibromas, oral papules, cutaneous collagenomas, and epidermal cysts)
 - Pulmonary cysts/history of pneumothorax
 - A seven-fold increase in renal tumors
 - The most common renal tumors are oncocytoma, chromophobe, and a hybrid of these two.
 - Renal tumors may be multifocal and bilateral.
 - Median age of renal tumor diagnosis is 48 years.
- Recommended cancer screening includes:
 - Screening colonoscopy starting at age 40
 - Earlier colonoscopy may be considered for those with a family history of colorectal cancer earlier than age 40.

BAP1 Tumor Predisposition Syndrome

The following imaging studies should be considered appropriate in individuals with BAP1:

Indication	Imaging Study
<ul style="list-style-type: none"> All individuals, beginning at age 30 years 	<ul style="list-style-type: none"> Abdominal MRI with and without contrast (CPT® 74183) every 2 years

Background and Supporting Information

BAP1 tumor predisposition syndrome (TPDS) is an autosomal dominant condition with a predisposition to melanoma (ocular and cutaneous), mesothelioma, clear cell renal cancer, and chromophobe renal cancer.

Hereditary Papillary Renal Carcinoma (HPRC)

The following imaging studies should be considered appropriate in individuals with HPRC:

Indication	Imaging Study
<ul style="list-style-type: none"> All individuals, beginning at age 30 years 	<ul style="list-style-type: none"> Abdominal MRI with and without contrast (CPT® 74183) every 2 years

Background and Supporting Information

- Hereditary papillary renal carcinoma (HPRC) is an autosomal dominant condition involving the MET gene and predisposes individuals to multifocal, bilateral renal tumors.

DICER1

The following imaging studies should be considered appropriate in individuals with DICER1:

Indication	Imaging Study
<ul style="list-style-type: none"> DICER1 mutation asymptomatic lung surveillance 	<ul style="list-style-type: none"> Once at age 3-6 months of age and again at 2.5-3 years of age: <ul style="list-style-type: none"> CT Chest (contrast as requested) In addition, chest x-ray at birth and every 6 months until 8 years of age and annually until age 12
<ul style="list-style-type: none"> DICER1 mutation asymptomatic abdominal and pelvic surveillance 	<ul style="list-style-type: none"> Every 3 months, from birth to the 8th birthday, then every 12 months until 12 years of age: <ul style="list-style-type: none"> Abdominal US (CPT® 76700) After age 12, females with DICER1 mutation may continue abdominal and pelvic ultrasounds (CPT® 76700 and CPT® 76856 or CPT® 76857) annually until age 40
<ul style="list-style-type: none"> DICER1 mutation thyroid surveillance 	<ul style="list-style-type: none"> Baseline thyroid US (CPT® 76536) by 8 years of age then every 3 years

Indication	Imaging Study
<ul style="list-style-type: none"> Individuals with DICER1 mutation and new CNS symptoms 	<ul style="list-style-type: none"> MRI Brain without and with contrast (CPT® 70553)

Other Renal Predisposition Syndromes

The following imaging studies should be considered appropriate in individuals with other renal predisposition syndromes:

Indication	Imaging Study
<ul style="list-style-type: none"> Individuals with <u>any of the following genetic variants or syndromes</u>: <ul style="list-style-type: none"> REST, TRIM28, FBXW7, NYNRIN, KDM3B, XPO5, CHECK2, PALB2, CTNNB1, DROSHA, WT1 and 2, WTX, DGCR8, SIC1 and 2, BCORL1, MLLT1, MYCN Bloom Syndrome/BLM mutations Frasier Syndrome Trisomy 18 Perlman Syndrome Bohring-Opitz Syndrome (ASXL1) MULIBREY and Nanism Syndrome Congenital anomalies associated with Wilms Tumor <ul style="list-style-type: none"> Horseshoe kidney Renal ectopia, hypoplasia or renal/ureteral duplication Congenital mesoblastic nephroma 	<ul style="list-style-type: none"> Every 3 months, from birth to the 8th birthday: <ul style="list-style-type: none"> Abdominal US (CPT® 76700)

Background and Supporting Information

- The list of syndromes and congenital anomalies associated with Wilms Tumor specifically is ever growing. The following genetic variants and syndromes, not otherwise listed in **PEDONC-2** for more specific imaging, may have imaging as shown above.

Infantile Myofibromatosis (PEDONC-2.18)

ONCP.SC.0002.18.A

v2.0.2024

The following imaging studies should be considered appropriate in individuals with Infantile Myofibromatosis:

Indication	Imaging Study
<ul style="list-style-type: none"> Assess for the presence of multifocal disease in children under two years of age 	<ul style="list-style-type: none"> WBMRI (CPT® 76498) once within 6 months of diagnosis
<ul style="list-style-type: none"> Pre-operative planning or Signs or symptoms suggesting progression that may require treatment with surgery or chemotherapy 	<ul style="list-style-type: none"> Imaging of cutaneous/muscular sites with MRI with and without contrast of symptomatic sites or sites requiring treatment.
<ul style="list-style-type: none"> Unresected, known visceral sites of disease 	<ul style="list-style-type: none"> MRI with and without contrast of unresected visceral involved sites, every 6 months until the age of two years
<ul style="list-style-type: none"> <u>Post-operative evaluation and both of the following:</u> <ul style="list-style-type: none"> Adequacy of resection is unclear and Re-excision is being considered 	<ul style="list-style-type: none"> One-time MRI with and without contrast
<ul style="list-style-type: none"> Surveillance for emergence of visceral disease 	<ul style="list-style-type: none"> <u>Every 6 months, until the age of two years:</u> <ul style="list-style-type: none"> CT Chest with contrast (CPT® 71260) or without contrast (CPT® 71250) CT Abdomen and Pelvis (CPT® 74177) CT should not duplicate simultaneous MRI imaging of involved sites
<ul style="list-style-type: none"> Individuals requiring chemotherapy 	<ul style="list-style-type: none"> See: <u>PEDONC-8.3</u>

Background and Supporting Information

- Infantile myofibromatosis is a benign condition characterized by soft tissue tumors, 90% of which present in the first 2 years of life. 75% of cases present as solitary lesions affecting the skin and/or muscles of the head, neck and trunk. Other patterns of inheritance include congenital multicentric disease limited to skin and muscle, congenital multicentric with a single visceral site, and congenital with multiple visceral site involvement.
- The condition is most commonly sporadic, though familial cases associated with *PDGFRB* and *NOTCH3* have been described
- The majority of cases with skin or muscle only involvement regress spontaneously.
- Visceral cases are lethal in the absence of therapy in 75% of cases due to organ compression, particularly with cardiopulmonary involvement.
- If vital structures are involved or significant symptoms occur, treatment is generally radical resection. Chemotherapy is sometimes utilized for progressive or multifocal life threatening lesions.
- Infants may present with a single lesion and develop further lesions in the first two years of life. This scenario, along with the inability of infants to readily express symptoms, impacts the imaging studies that may be approved.
- Routine surveillance of cutaneous/muscular sites is not supported as spontaneous regression is common.
- Surveillance beyond the age of two years is not supported.

Bloom Syndrome (PEDONC-2.19)

ONCP.SC.0002.19.A
v2.0.2024

The following imaging studies should be considered appropriate in individuals with Bloom Syndrome:

Indication	Imaging Study
Malignancy screening particularly lymphomas	<ul style="list-style-type: none">Every 2 years, starting at age 13:<ul style="list-style-type: none">Whole-Body MRI (CPT® 76498)
Wilms tumor screening	<ul style="list-style-type: none">See: <u>Other Renal Cell Cancer Predisposition Syndromes (PEDONC-2.17)</u>
Gastrointestinal tumor screening	<ul style="list-style-type: none">There is no strong data to support endoscopic screening
Breast cancer screening	<ul style="list-style-type: none">There is no strong data to support Breast MRI. See: <u>Breast MRI Indications (BR-5.1)</u> for any updates to supported imaging

Pediatric Leukemias (PEDONC-3)

Guideline

Pediatric Leukemia General Considerations (PEDONC-3.1)

Acute Lymphoblastic Leukemia (ALL) (PEDONC-3.2)

Acute Myeloid Leukemia (AML) (PEDONC-3.3)

References (PEDONC-3)

Pediatric Leukemia General Considerations (PEDONC-3.1)

ONCP.LE.0003.1.A

v2.0.2024

- MRI Brain without and with contrast (CPT® 70553) in individuals exhibiting CNS symptoms
 - Imaging due to CSF tumor burden has not been shown to improve the detection of CNS involvement compared with CSF alone
- See: **Hematopoietic Stem Cell Transplantation (ONC-29)** for imaging guidelines related to transplant

Background and Supporting Information

- The overwhelming majority of leukemias occurring in children are acute. Chronic myelogenous leukemia (CML) is rare in children, and the occurrence of chronic lymphocytic leukemia (CLL) appears to have only been reported once in pediatric individuals to date
- Routine advanced imaging is not indicated in the evaluation and management of chronic myeloid leukemia in the absence of specific localizing clinical symptoms or clearance for hematopoietic stem cell transplantation

Acute Lymphoblastic Leukemia (ALL) (PEDONC-3.2)

ONCP.LE.0003.2.A

v2.0.2024

- Individuals with B-precursor or T-cell lymphoblastic lymphoma without bone marrow involvement are treated similarly to leukemia individuals of the same cell type and should be imaged according to this guideline section
- This section does not apply to individuals with mature B-cell histology (primarily Burkitt's in children). Please refer to **Pediatric Aggressive Mature B-Cell Non-Hodgkin Lymphomas (NHL) (PEDONC-5.3)** for guidelines for these individuals
- Scrotal Ultrasound CPT® 76870 and/or doppler ultrasound of the scrotum CPT® 93975 or 93976 may be approved for suspected testicular involvement.
- Chest x-ray should be performed to evaluate for mediastinal mass in suspected cases or upon initial diagnosis.
 - CT Chest with contrast (CPT® 71260) immediately to evaluate for airway compression and anesthesia safety prior to attempting histologic diagnosis if mediastinal widening is seen on chest x-ray
 - Individuals with known or strongly suspected T-cell histology or other suspected lymphoblastic lymphoma involvement EITHER of the following for initial staging purposes:
 - CT Neck (CPT® 70491), CT Chest (CPT® 71260) and CT Abdomen and Pelvis (CPT® 74177) with contrast OR
 - PET/CT (CPT® 78816)
 - Indications and coding for rare circumstances where PET/MRI may be approved are found in **PET Imaging in Pediatric Oncology (PEDONC-1.4)**
- MRI Brain without and with contrast (CPT® 70553) for individuals exhibiting CNS symptoms.
 - Imaging due to CSF tumor burden has not been shown to improve the detection of CNS involvement compared with CSF alone.

Additional imaging in lymphoblastic lymphoma/lymphomatous extramedullary disease:

- CT to assess response to therapy **only** for individuals with known bulky nodal disease (usually with T-cell histology) at the end of induction (4 to 6 weeks). Individuals with residual masses can be evaluated with every new therapy phase (Consolidation, Interim maintenance, etc., generally every 8 to 12 weeks) until disease resolution is seen
- PET/CT (CPT® 78815) when residual mass ≥ 8 mm in diameter is present on recent CT imaging **and** immediate radiation or chemotherapy plan will be based on results.
 - Residual mass of any size with no PET-avidity is considered a complete response at the extranodal/lymphomatous site.

- Chest x-ray or Abdominal ultrasound (CPT® 76700) **only**, as indicated by site(s) of bulky disease present at diagnosis, for further surveillance, once CT imaging shows no evidence of disease.
- CT of all involved bulky nodal areas individuals with persistent residual masses performed as part of an end of therapy evaluation

Immunosuppression during ALL therapy:

- CT or MRI requests for infectious disease concerns for individuals with ALL with:
 - Absolute neutrophil count (ANC) <500 or
 - Inconclusive findings on chest x-ray **or** ultrasound at any ANC during active treatment
- Individuals with ALL are severely immunocompromised during the first 4 to 6 weeks of treatment (induction) and any conventional imaging request to evaluate for infectious complications during this time frame should be approved immediately
- MRA/MRV of the head (CPT® 70544, 70545, or 70546)
 - To rule out bleeding associated with sinus venous thrombosis in individuals treated with asparaginase

Imaging during therapy for relapsed ALL:

- Frequent CT or MRI imaging may be indicated to evaluate known or suspected new sites of invasive fungal or other aggressive infections
- Surveillance imaging of asymptomatic individuals to detect invasive fungal infection **only** when acute clinical decisions will be made based on the imaging

Imaging of known or suspected osteonecrosis in ALL:

- MRI without contrast or without and with contrast of the affected joint(s) with symptoms suggesting osteonecrosis
 - CT without contrast can be approved when MRI is contraindicated or unavailable, or for diagnosis of suspected subchondral fracture
- MRI Bilateral Hips (CPT® 73721 or CPT® 73723 with modifier -50) once at 6 to 9 months after diagnosis for individuals age ≥11 years
- Repeat MRI without contrast of the affected joint(s) every 2 cycles of maintenance (every 6 months) if reintroduction of corticosteroids is being considered in individuals whose symptoms have resolved and are still receiving active treatment
- MRI without contrast of the affected joint(s) for preoperative planning for individuals undergoing core decompression
- See: **Osteonecrosis In Long Term Cancer Survivors (PEDONC-19.4)** for information on osteonecrosis in ALL individuals who have completed therapy

Background and Supporting Information

- The majority of individuals with ALL have B-precursor ALL and routine advanced imaging is not necessary.
- Individuals with ALL who relapse are treated with very intensive chemotherapy regimens and most spend the majority of their chemotherapy treatment phase in the hospital
- Individuals may have therapy-induced hypogammaglobulinemia which requires supplemental intravenous immune globulin (IVIG) during maintenance therapy. Those receiving supplemental IVIG should be treated similarly to individuals with ANC <500 with regards to imaging for infectious disease
- Osteonecrosis (ON) in individuals with ALL is a relatively common complication of ALL and its treatment, primary corticosteroids. Approximately 3% of younger children and 12 to 15% of adolescents are affected by ON at some point during therapy. The peak incidence occurs approximately one year from the time of diagnosis
- Screening MRI of asymptomatic individuals age ≤10 years to detect osteonecrosis has not been shown to impact individual outcomes, and it is not standard to alter treatment based on imaging findings alone without symptoms
- If osteonecrosis is detected on initial MRI, corticosteroids are often withheld during maintenance chemotherapy (but continued in earlier phases of therapy).

Acute Myeloid Leukemia (AML) (PEDONC-3.3)

ONCP.LE.0003.3.A

v2.0.2024

- Frequent CT or MRI imaging may be indicated to evaluate known sites of invasive fungal infection
- Surveillance imaging of asymptomatic individuals to detect invasive fungal infection **only** when acute clinical decisions will be made based on the imaging
- Advanced imaging may be approved on a case-by-case basis for rare individuals with bulky tumor masses (commonly referred to as chloromas, leukemic sarcomas, or myeloid sarcomas) noted on physical examination or other imaging such as plain film or ultrasound

Background and Supporting Information

- The majority of AML individuals do not have any bulky disease and routine advanced imaging is not necessary
- AML individuals are treated with very intensive chemotherapy regimens and spend the majority of their chemotherapy treatment phase in the hospital

CNS Tumors (PEDONC-4)

Guideline

CNS Tumors General Considerations (PEDONC-4.1)
CNS Low Grade Gliomas (LGG) (PEDONC-4.2)
CNS High Grade Gliomas (HGG) (PEDONC-4.3)
Medulloblastoma (MDB), Other CNS Embryonal Tumors, and
Pineoblastoma (PEDONC-4.4)
Atypical Teratoid/Rhabdoid Tumors (ATRT) (PEDONC-4.5)
Pineocytomas and Pineal Parenchymal Tumors (PEDONC-4.6)
CNS Germinomas and Non-Germinomatous Germ Cell Tumors
(NGGCT) (PEDONC-4.7)
Ependymal Tumors (Ependymoma) (PEDONC-4.8)
Malignant Tumors of the Spinal Cord (PEDONC-4.9)
Craniopharyngioma and Other Tumors of the Sellar Region
(PEDONC-4.10)
Primary CNS Lymphoma (PEDONC-4.11)
Meningiomas (PEDONC-4.12)
Choroid Plexus Tumors (PEDONC-4.13)
References (PEDONC-4)

CNS Tumors General Considerations (PEDONC-4.1)

ONCP.CT.0004.1.A

v2.0.2024

- The classification of pediatric central nervous tumors has recently been revised to incorporate molecular biomarkers in addition to histology, immunohistochemical results and ultrastructure characteristics. The changes in nomenclature are incorporated in these guidelines⁵⁰.
- Central nervous system tumors are the second most common form of childhood cancer, accounting for ~20% of all pediatric malignancies

Red Flag Symptoms Raising Suspicion for CNS Tumors Include:

Any headache complaint from a child age ≤5 years

Headaches awakening from sleep

Focal findings on neurologic exam

Clumsiness (common description of gait or coordination problems in young children)

Headaches associated with morning nausea/vomiting

New onset of seizure activity with focal features

Papilledema on physical exam

Loss of developmental milestones (infants and young children)

MRI Considerations

- MRI is the preferred imaging modality for all pediatric CNS tumors
 - MRI Brain without and with contrast (CPT® 70553) is the primary imaging study for pediatric brain tumors
 - MRI Brain without contrast (CPT® 70551) if requested for initial evaluation of suspected CNS tumor for children able to undergo MRI without sedation
 - Initial MRI should be performed without and with contrast in order to avoid a second anesthesia exposure in younger children requiring sedation for MRI
- MRI Spine with contrast only (Cervical-CPT® 72142, Thoracic-CPT® 72147, Lumbar-CPT® 72149) can be substituted where MRI Spine without and with contrast is indicated, if being performed immediately following a contrast-enhanced MRI Brain
- Functional MRI (CPT® 70555 or CPT® 70554) is indicated to depict spatial relationships between eloquent cortex and neoplasms for preoperative planning and to promote safe resections (following baseline MRI Brain).
- MRI Orbits without and with contrast (CPT® 70543) is indicated in individuals who present with papilledema, altered vision, strabismus, nystagmus, anisocoria, proptosis, ocular cranial nerve palsies, coloboma, or leukocoria.

CT Considerations

- CT for evaluation of ventriculomegaly or other operative considerations, or for children who cannot undergo MRI safely
 - CT for evaluation of headaches related to head trauma or evaluation of skull or facial bone abnormalities
 - Post-contrast CT is generally not indicated
- CT is not a recommended study for evaluation of pediatric headache when brain tumor is clinically suspected because of its limited diagnostic accuracy in this area. MRI should be used as first line imaging in these cases
- CT should not be used in place of MRI to avoid sedation in young children when red flag symptoms for CNS tumors are present

MRA/CTA and Perfusion Studies

- MRA or CTA **only** for preoperative planning or to clarify inconclusive findings on MRI or CT
- CT and MRI Perfusion
 - See: **CT or MRI Perfusion (HD-24.5)** in the Head Imaging guidelines

MR Spectroscopy (MRS, CPT® 76390)

- MRS is **only** supported for use in brain tumors of specified histologies where diagnostic accuracy has been established in peer-reviewed literature
 - See diagnosis-specific guidelines for MRS indications
- MRS is considered investigational/experimental for all other histologies and indications not listed in a diagnosis-specific guideline section
- MR spectroscopy is not indicated for routine surveillance

PET Brain Imaging (CPT® 78608 and CPT® 78609)

- PET Brain Metabolic imaging (CPT® 78608) is **only** supported for use in brain tumors of specified histologies where diagnostic accuracy has been established in peer-reviewed literature
 - See diagnosis-specific guidelines for PET indications
- PET Brain Metabolic is not indicated for routine surveillance
- PET Brain Metabolic imaging is considered investigational/experimental for all other histologies and indications not listed in a diagnosis-specific guideline section
- PET Brain Perfusion imaging (CPT® 78609) is not indicated in the evaluation or management of primary CNS tumors
- Fusion PET/CT studies (CPT® 78814, CPT® 78815, or CPT® 78816) are not indicated in the evaluation or management of primary CNS tumors

Timing and Frequency of Imaging

- Definitive imaging should be completed prior to considering biopsy given the high degree of morbidity associated with operating on the CNS
 - Occasionally biopsy is not necessary because the imaging findings provide a definitive diagnosis
 - Examples include diffuse intrinsic pontine glioma and optic pathway gliomas in an individual with known neurofibromatosis
- Perioperative imaging frequency
 - Children may undergo very frequent imaging in the immediate perioperative period around resection or debulking of a CNS tumor due to the small anatomic spaces involved
 - Requests for imaging during this time period to specifically evaluate postoperative course or ventriculoperitoneal shunt functioning should, in general, be approved as requested
 - MRI Brain without and with contrast (CPT® 70553) one time in the immediate preoperative period (even if another study has already been completed) to gain additional information which can be important in optimizing individual outcomes, such as:
 - Completion of additional specialized MRI sequences such as diffusion-tensor imaging
 - Perfusion imaging
 - Tractography
 - Other sequences not reported under a separate CPT® code but not part of a routine MRI Brain series
 - Repeat MRI Brain that is being requested solely for loading into operative navigation software should not be requested as a diagnostic code but can be approved under a treatment planning code (CPT® 76498).
 - Clinical note: for all pediatric CNS tumors, cerebrospinal fluid pathology positive for malignancy is considered leptomeningeal/spinal disease.

CNS Low Grade Gliomas (LGG) (PEDONC-4.2)

ONCP.CT.0004.2.A

v2.0.2024

- MR Spectroscopy and PET Brain Metabolic are not indicated for routine surveillance
- MRI is generally superior to CT for staging and restaging CNS malignancies, but CT may be approved in accordance with these guidelines where MRI is contraindicated.

Indication	Imaging Study
Initial staging of all LGG	<ul style="list-style-type: none"> MRI Brain without and with contrast (CPT® 70553) MRI Spine without and with contrast (Cervical-CPT® 72156, Thoracic-CPT® 72157, Lumbar-CPT® 72158) MRI Orbits without and with contrast (CPT® 70543) is indicated in addition to the above studies for individuals presenting with visual signs or symptoms as listed in PEDONC-4.1
<ul style="list-style-type: none"> <u>At any time, for ANY of the following:</u> <ul style="list-style-type: none"> For rapid assessment in the acute setting Evaluation of acute intracranial hemorrhage Evaluation of ventriculomegaly Evaluation of shunt-related issues 	<ul style="list-style-type: none"> CT Head without contrast (CPT® 70450)
<ul style="list-style-type: none"> <u>ANY of the following:</u> <ul style="list-style-type: none"> Determining the need for biopsy when transformation to high grade glioma is suspected based on clinical symptoms or recent MRI findings Evaluation of a brain lesion of indeterminate nature when the PET findings will be used to determine whether biopsy/resection can be safely postponed 	<ul style="list-style-type: none"> PET Brain Metabolic imaging (CPT® 78608)

Indication	Imaging Study
<ul style="list-style-type: none"> • <u>ANY of the following:</u> <ul style="list-style-type: none"> • Distinguish low grade from high grade gliomas • Evaluate a brain lesion of indeterminate nature when the MRS findings will be used to determine whether biopsy/resection can be safely postponed • Distinguish radiation-induced tumor necrosis from progressive disease within 18 months of completing radiotherapy 	<ul style="list-style-type: none"> • MR Spectroscopy (MRS, CPT® 76390)
Baseline imaging after resection, to assess degree of resection	<ul style="list-style-type: none"> • MRI Brain without and with contrast (CPT® 70553) • MRI with and without contrast at level of resected spinal site • If orbital resection, MRI Orbits without and with contrast (CPT® 70543)
Treatment response at the completion of radiotherapy	<ul style="list-style-type: none"> • MRI Brain without and with contrast (CPT® 70553) • MRI with and without contrast at level of irradiated spinal site • If prior orbital involvement, MRI Orbits without and with contrast (CPT® 70543)
Treatment response on chemotherapy	<ul style="list-style-type: none"> • MRI Brain without and with contrast (CPT® 70553) approved every 2 cycles during active treatment and at the end of planned chemotherapy • If prior orbital involvement, MRI Orbits without and with contrast (CPT® 70543)
Additional treatment response imaging during induction chemotherapy for individuals with measurable spinal cord disease on MRI	<ul style="list-style-type: none"> • MRI Spine without and with contrast (Cervical-CPT® 72156, Thoracic-CPT® 72157, Lumbar-CPT® 72158) every 2 cycles

Indication	Imaging Study
Surveillance	<ul style="list-style-type: none"> For individuals with intracranial primary: <ul style="list-style-type: none"> MRI Brain without and with contrast (CPT® 70553) every 3 months for 2 years, then every 6 months for 3 years, then annually thereafter. If prior orbital involvement, MRI Orbits without and with contrast (CPT® 70543) MRI Spine is not indicated during surveillance in individuals without prior history of spinal involvement except to evaluate symptoms suspicious for spinal cord recurrence For individuals with a history of spine primary tumor or metastatic spinal involvement: <ul style="list-style-type: none"> MRI Spine without and with contrast (Cervical-CPT® 72156, Thoracic-CPT® 72157, Lumbar-CPT® 72158) every 3 months for 2 years, then every 6 months for 3 years, then annually thereafter
Surveillance imaging for individuals with optic pathway glioma and a history of NF1	<ul style="list-style-type: none"> Every 3 months for 2 years, then every 6 months for 3 years, then annually thereafter: <ul style="list-style-type: none"> MRI Brain without and with contrast (CPT® 70553) and MRI Orbits without and with contrast (CPT® 70543)
Suspected intracranial or intraspinal recurrence	<ul style="list-style-type: none"> All imaging supported in initial staging criteria may be repeated

Background and Supporting Information**Includes the following tumors:**

- Pediatric-type diffuse low-grade gliomas
 - Diffuse astrocytoma, MYB- or MYBL1-altered
 - Angiocentric glioma
 - Polymorphous low-grade neuroepithelial tumor of the young
 - Diffuse low-grade glioma, MAPK pathway-altered
- Circumscribed astrocytic gliomas
 - Pilocytic astrocytoma
 - High-grade astrocytoma with piloid features
 - Pleomorphic xanthoastrocytoma
 - Subependymal giant cell astrocytoma (SEGA)
 - Choroid glioma
 - Astroblastoma, MN
- Glioneuronal and neuronal tumors
 - Ganglioglioma
 - Desmoplastic infantile ganglioglioma/desmoplastic infantile astrocytoma
 - Dysembryoplastic neuroepithelial tumor
 - Diffuse glioneuronal tumor with oligodendroglioma-like features and nuclear clusters
 - Papillary glioneuronal tumor
 - Rosette-forming glioneuronal tumor
 - Myxoid glioneuronal tumor
 - Diffuse leptomeningeal glioneuronal tumor
 - Gangliocytoma
 - Multinodular and vacuolating neuronal tumor
 - Dysplastic cerebellar gangliocytoma (Lhermitte-Duclos disease)
 - Central neurocytoma
 - Extraventricular neurocytoma
 - Cerebellar liponeurocytoma
- Any other glial tumor with a WHO grade I or II classification

General Considerations:

- Account for 40 to 60% of pediatric CNS tumors.
- These tumors are defined as having a WHO grade of I or II (out of IV), can occur anywhere in the CNS

Treatment Considerations:

- Children with neurofibromatosis and small optic pathway tumors may not undergo biopsy or resection and will proceed directly to treatment or surveillance

- Children on observation without specific treatment should be imaged according to surveillance guidelines for LGG
- Individuals who undergo complete resection should be imaged according to surveillance guidelines after post-resection imaging
- Individuals age >10 years with incompletely resected tumors usually receive adjuvant radiation therapy
- Individuals age ≤10 years with incompletely resected tumors are commonly treated with chemotherapy

CNS High Grade Gliomas (HGG) (PEDONC-4.3)

ONCP.CT.0004.3.A

v2.0.2024

Indication	Imaging Study
Initial staging of all HGG	<ul style="list-style-type: none"> MRI Brain without and with contrast (CPT® 70553) MRI Spine without and with contrast (Cervical-CPT® 72156, Thoracic-CPT® 72157, Lumbar-CPT® 72158) 3D rendering may be approved as requested for initial staging
<ul style="list-style-type: none"> <u>At any time, for ANY of the following:</u> <ul style="list-style-type: none"> For rapid assessment in the acute setting Evaluation of acute intracranial hemorrhage Evaluation of ventriculomegaly Evaluation of shunt-related issues 	<ul style="list-style-type: none"> CT Head without contrast (CPT® 70450)
<ul style="list-style-type: none"> <u>ANY of the following:</u> <ul style="list-style-type: none"> Distinguishing radiation-induced tumor necrosis from progressive disease within 18 months of completing radiotherapy Evaluating inconclusive MRI findings when the PET findings will be used to determine need for biopsy or change in therapy, including a change from active therapy to surveillance Evaluation of a brain lesion of indeterminate nature when the PET findings will be used to determine whether biopsy/resection can be safely postponed 	<ul style="list-style-type: none"> PET Brain Metabolic Imaging (CPT® 78608)

Indication	Imaging Study
<ul style="list-style-type: none"> • <u>ANY of the following:</u> <ul style="list-style-type: none"> • To distinguish low grade from high grade gliomas • To evaluate a brain lesion of indeterminate nature when the MRS findings will be used to determine whether biopsy/resection can be safely postponed • To distinguish radiation-induced tumor necrosis from progressive disease within 18 months of completing radiotherapy 	<ul style="list-style-type: none"> • MR Spectroscopy (MRS, CPT® 76390)
Baseline imaging following resection, to assess degree of resection	<ul style="list-style-type: none"> • MRI Brain without and with contrast (CPT® 70553) • MRI with and without contrast at level of resected spinal site
Treatment response at the completion of radiotherapy	<ul style="list-style-type: none"> • MRI Brain without and with contrast (CPT® 70553) • MRI with and without contrast at level of irradiated spinal site
Treatment response on chemotherapy	<ul style="list-style-type: none"> • MRI Brain without and with contrast (CPT® 70553) every 2 cycles during active treatment and at the end of planned chemotherapy
Additional treatment response imaging during induction chemotherapy for individuals with measurable spinal cord disease on MRI	<ul style="list-style-type: none"> • MRI Spine without and with contrast (Cervical-CPT® 72156, Thoracic-CPT® 72157, Lumbar-CPT® 72158) every 2 cycles
Signs or symptoms of recurrence or progression	<ul style="list-style-type: none"> • MRI Brain without and with contrast (CPT® 70553) • MRI Spine without and with contrast (Cervical-CPT® 72156, Thoracic-CPT® 72157, Lumbar-CPT® 72158)

Indication	Imaging Study
Surveillance	<ul style="list-style-type: none"> For individuals with intracranial primary: <ul style="list-style-type: none"> MRI Brain without and with contrast (CPT® 70553) every 3 months for 3 years, then every 6 months thereafter MRI Spine is not indicated during surveillance in individuals without prior history of spinal involvement except to evaluate symptoms suspicious for spinal cord recurrence For individuals with a history of spine primary tumor or metastatic spinal involvement: <ul style="list-style-type: none"> MRI Spine without and with contrast (Cervical-CPT® 72156, Thoracic-CPT® 72157, Lumbar-CPT® 72158) every 3 months for 3 years, then every 6 months thereafter
Suspected intracranial or intraspinal recurrence	<ul style="list-style-type: none"> All imaging supported for initial staging may be repeated
Suspected spinal cord recurrence	<ul style="list-style-type: none"> MRI Spine without and with contrast (Cervical-CPT® 72156, Thoracic-CPT® 72157, Lumbar-CPT® 72158)

Background and Supporting Information

Includes the following tumors:

- Diffuse midline glioma, H3 K27-altered
- Diffuse hemispheric glioma, H3 G34-mutant
- Diffuse pediatric-type high-grade glioma, H3-wildtype and IDH-wildtype
- Infant-type hemispheric glioma
- Any other glial tumor with a WHO grade of III or IV classification

General Considerations:

- Rare in children compared with the adult population, but represent 10% to 20% of pediatric CNS tumors
- Prognosis is very poor, and survival significantly beyond 3 years from diagnosis is rare, even with complete surgical resection at initial diagnosis
- These tumors are defined as having a WHO histologic grade of III or IV (out of IV) can occur anywhere in the CNS (though the majority occur in the brain)

Treatment Considerations:

- Individuals who undergo complete resection should be imaged according to surveillance guidelines after post-resection imaging
- Individuals with incompletely resected tumors are commonly treated with chemotherapy

Medulloblastoma (MDB), Other CNS Embryonal Tumors, and Pineoblastoma (PEDONC-4.4)

ONCP.CT.0004.4.A
v2.0.2024

- MR Spectroscopy and PET Brain Metabolic are not indicated for routine surveillance

Indication	Imaging Study
Initial staging for all individuals, preoperatively	<ul style="list-style-type: none"> MRI Brain without and with contrast (CPT® 70553) MRI spine without and with contrast (Cervical-CPT® 72156, Thoracic-CPT® 72157, Lumbar-CPT® 72158)
<ul style="list-style-type: none"> <u>At any time, for ANY of the following:</u> <ul style="list-style-type: none"> For rapid assessment in the acute setting Evaluation of acute intracranial hemorrhage Evaluation of ventriculomegaly Evaluation of shunt-related issues 	<ul style="list-style-type: none"> CT Head without contrast (CPT® 70450)
<ul style="list-style-type: none"> <u>ANY of the following:</u> <ul style="list-style-type: none"> To distinguish radiation-induced tumor necrosis from progressive disease within 18 months of completing radiotherapy To evaluate inconclusive MRI findings when the PET findings will be used to determine need for biopsy or change in therapy, including a change from active therapy to surveillance To evaluate a brain lesion of indeterminate nature when the PET findings will be used to determine whether biopsy/resection can be safely postponed 	<ul style="list-style-type: none"> PET Brain Metabolic Imaging (CPT® 78608)

Indication	Imaging Study
<ul style="list-style-type: none"> <u>ANY of the following:</u> <ul style="list-style-type: none"> To evaluate a brain lesion of indeterminate nature when the MRS findings will be used to determine whether biopsy/resection can be safely postponed 	<ul style="list-style-type: none"> MR Spectroscopy (CPT® 76390)
Postoperative (preferably within 48 hours of surgery) to quantify residual tumor volume	<ul style="list-style-type: none"> MRI Brain without and with contrast (CPT® 70553)
Within 28 days post-op, if spinal imaging was not performed preoperatively	<ul style="list-style-type: none"> MRI Spine without and with contrast (Cervical-CPT® 72156, Thoracic-CPT® 72157, Lumbar-CPT® 72158)
Treatment response	<ul style="list-style-type: none"> At the start of adjuvant chemotherapy and every 2 cycles until therapy is completed: <ul style="list-style-type: none"> MRI Brain without and with contrast (CPT® 70553) MRI Spine without and with contrast (Cervical-CPT® 72156, Thoracic CPT® 72157, Lumbar-CPT® 72158)
Children age <3 years treated with multiple cycles of high dose chemotherapy with autologous stem cell rescue in lieu of radiotherapy	<ul style="list-style-type: none"> Disease evaluations (imaging per treatment response guidelines) may occur prior to each cycle (every 4 to 6 weeks) if needed for response determination.
End of treatment evaluation	<ul style="list-style-type: none"> MRI Brain without and with contrast (CPT® 70553) MRI Spine with contrast (Cervical-CPT® 72142, Thoracic-CPT® 72147, Lumbar-CPT® 72149) or MRI Spine without and with contrast (Cervical-CPT® 72156, Thoracic-CPT® 72157, Lumbar-CPT® 72158)
Signs or symptoms of recurrence or progression	<ul style="list-style-type: none"> MRI Brain without and with contrast (CPT® 70553) MRI Spine without and with contrast (Cervical-CPT® 72156, Thoracic-CPT® 72157, Lumbar-CPT® 72158)

Indication	Imaging Study
Surveillance	<ul style="list-style-type: none"> • Every 3 months for 3 years, then every 6 months for 2 years, then annually for 10 years: <ul style="list-style-type: none"> • MRI Brain without and with contrast (CPT® 70553) • MRI Spine without and with contrast (Cervical-CPT® 72156, Thoracic-CPT® 72157, Lumbar-CPT® 72158) • For additional imaging guidelines for individuals in long term follow up after CNS tumor treatment that included radiation therapy, see: <u>Second Malignant Neoplasms (SMN) (PEDONC-19.3)</u>

Background and Supporting Information

Includes the Following Tumors:

- Medulloblastoma
 - Molecularly-defined Medulloblastoma
 - WNT-activated Medulloblastoma
 - SHH-activated and TP53-wildtype Medulloblastoma
 - SHH-activated and TP53-mutant Medulloblastoma
 - Non-WNT/Non-SHH
 - Medulloblastoma, histologically defined
- Other CNS Embryonal Tumors (previously supratentorial primitive neuroectodermal tumors)
 - CNS embryonal tumor
 - Cribriform neuroepithelial tumor
 - Embryonal tumor with multilayered rosettes
 - CNS neuroblastoma
 - FOXR2-activated CNS tumor with BCOR internal tandem duplication
- Pineoblastoma

Risk Assessment is Important in Determining Optimal Treatment**High-Risk Features Include the Following:**

- Spinal metastasis (including cytology positive only)
- Multifocal intracranial tumors
- Anaplastic histology
- All other CNS embryonal tumors and pineoblastomas
- > 1.5 cm² residual tumor area on postoperative MRI and age <3 years

Individuals without any high-risk features are considered “Average Risk”**General Considerations:**

- Account for 15% to 25% of pediatric CNS tumors
- Prognosis is generally favorable
- Leptomeningeal spread is common and can occur after initial diagnosis

Treatment Considerations:

- Individuals generally proceed to chemoradiotherapy within 31 days of surgical resection
 - All individuals receive adjuvant chemotherapy lasting 6 to 12 months that begins ~6 weeks after completion of chemoradiotherapy

Atypical Teratoid/Rhabdoid Tumors (ATRT) (PEDONC-4.5)

ONCP.CT.0004.5.A

v2.0.2024

- PET Brain Metabolic does not have a defined role in the evaluation of ATRT at this time
- MR Spectroscopy is not indicated for routine surveillance

Indication	Imaging Study
Initial staging for all individuals, preoperatively	<ul style="list-style-type: none"> MRI Brain without and with contrast (CPT® 70553) MRI Spine without and with contrast (Cervical-CPT® 72156, Thoracic-CPT® 72157, Lumbar-CPT® 72158) Renal US (CPT® 76770) <ul style="list-style-type: none"> If renal US is abnormal, refer to: <u>Malignant Rhabdoid Tumor of the Kidney (MRT) and Other Extracranial Sites (PEDONC-7.6)</u>
<ul style="list-style-type: none"> <u>At any time, for ANY of the following:</u> <ul style="list-style-type: none"> For rapid assessment in the acute setting Evaluation of acute intracranial hemorrhage Evaluation of ventriculomegaly Evaluation of shunt-related issues 	<ul style="list-style-type: none"> CT Head without contrast (CPT® 70450)
Evaluation of a brain lesion of indeterminate nature when the MRS findings will be used to determine whether biopsy/resection can be safely postponed	<ul style="list-style-type: none"> MR Spectroscopy (CPT® 76390)
Postoperative (preferably within 48 hours of surgery) to quantify residual tumor volume	<ul style="list-style-type: none"> MRI Brain without and with contrast (CPT® 70553)
Within 28 days post-op, if spinal imaging was not performed preoperatively	<ul style="list-style-type: none"> MRI Spine without and with contrast (Cervical-CPT® 72156, Thoracic-CPT® 72157, Lumbar-CPT® 72158)

Indication	Imaging Study
Treatment response to induction chemotherapy	<ul style="list-style-type: none"> • <u>After every 2 cycles:</u> <ul style="list-style-type: none"> • MRI Brain without and with contrast (CPT® 70553) • MRI Spine without and with contrast (Cervical-CPT® 72156, Thoracic-CPT® 72157, Lumbar-CPT® 72158)
Individuals treated with consolidation chemotherapy and autologous stem cell rescue	<ul style="list-style-type: none"> • Disease evaluation is indicated following the end of the planned stem cell rescues but may occur prior to each cycle (every 4 to 6 weeks) if needed for response determination
End of treatment evaluation	<ul style="list-style-type: none"> • MRI Brain without and with contrast (CPT® 70553) • MRI Spine without and with contrast (Cervical-CPT® 72156, Thoracic-CPT® 72157, Lumbar-CPT® 72158)
Signs or symptoms of recurrence or progression	<ul style="list-style-type: none"> • MRI Brain without and with contrast (CPT® 70553) • MRI Spine without and with contrast (Cervical-CPT® 72156, Thoracic-CPT® 72157, Lumbar-CPT® 72158)
Surveillance	<ul style="list-style-type: none"> • <u>Every 3 months for 2 years, then every 6 months for 3 years, then annually for 10 years:</u> <ul style="list-style-type: none"> • MRI Brain without and with contrast (CPT® 70553) • MRI Spine without and with contrast (Cervical-CPT® 72156, Thoracic-CPT® 72157, Lumbar-CPT® 72158) • For additional imaging guidelines for individuals in long term follow up after CNS tumor treatment that included radiation therapy, see: <u>Second Malignant Neoplasms (SMN) (PEDONC-19.3)</u>

Background and Supporting Information**General Considerations:**

- Highly aggressive tumor occurring primarily in very young children that has a clinical presentation very similar to medulloblastoma with a much higher rate of leptomeningeal spread.
- Metastases can occur outside the CNS, and associated tumors can also arise in the kidneys (Malignant Rhabdoid Tumor of the Kidney, MRT).
 - Rhabdoid malignancies occurring outside the CNS should be imaged according to **Malignant Rhabdoid Tumor of the Kidney (MRT) and Other Extracranial Sites (PEDONC-7.6)**.
- Overall prognosis is poor, with <20% of individuals surviving beyond 2 years from diagnosis.
- Individuals generally proceed to induction chemotherapy shortly following surgical resection or biopsy.
- Following completion of chemotherapy some individuals will proceed to radiotherapy.
 - MRI performed at the end of consolidation therapy should serve as the diagnostic MRI prior to radiotherapy.

Pineocytomas and Pineal Parenchymal Tumors (PEDONC-4.6)

ONCP.CT.0004.6.A

v2.0.2024

- PET Brain Metabolic imaging and MR Spectroscopy do not have a defined role in the evaluation of pineocytoma

Indication	Imaging Study
Initial staging for all individuals	<ul style="list-style-type: none"> MRI Brain without and with contrast (CPT® 70553)
<ul style="list-style-type: none"> Additional initial staging imaging for individuals with: <ul style="list-style-type: none"> Multicentric tumors Atypical histology including pineoblastoma-like elements (grade 2 or 3 pineal parenchymal tumor which have not been considered a pineoblastoma) Clinical signs or symptoms suggesting spinal cord involvement 	<ul style="list-style-type: none"> MRI Spine without and with contrast (Cervical-CPT® 72156, Thoracic-CPT® 72157, Lumbar-CPT® 72158)
Baseline imaging following resection	<ul style="list-style-type: none"> MRI Brain without and with contrast (CPT® 70553)
End of radiotherapy	<ul style="list-style-type: none"> MRI Brain without and with contrast (CPT® 70553)
Additional imaging at end of radiotherapy for individuals with measurable spinal cord disease on MRI	<ul style="list-style-type: none"> MRI Spine without and with contrast (Cervical-CPT® 72156, Thoracic-CPT® 72157, Lumbar-CPT® 72158)
Surveillance	<ul style="list-style-type: none"> MRI Brain without and with contrast (CPT® 70553) every 3 months for 1 year, then every 4 months for 1 year, then every 6 months for 1 year, then annually thereafter
Additional surveillance imaging for individuals with cord involvement at diagnosis	<ul style="list-style-type: none"> MRI Spine without and with contrast (Cervical-CPT® 72156, Thoracic-CPT® 72157, Lumbar-CPT® 72158) after completion of therapy every 3 months for 1 year, then every 4 months for 1 year, then every 6 months for 1 year, then annually thereafter

Indication	Imaging Study
Signs or symptoms of recurrence or progression	<ul style="list-style-type: none">MRI Brain without and with contrast (CPT® 70553)
Suspected spinal cord recurrence or progression	<ul style="list-style-type: none">MRI Spine without and with contrast (Cervical-CPT® 72156, Thoracic-CPT® 72157, Lumbar-CPT® 72158)

Background and Supporting Information

General Considerations:

- Low grade malignancy that is similar in presentation to low grade glioma (LGG)
- Surgical resection is curative for most individuals
 - Individuals with a complete resection should then be imaged according to surveillance guidelines
- Individuals with incompletely resected tumors may receive adjuvant radiation therapy
 - After end of radiotherapy imaging, these individuals should be imaged according to surveillance guidelines

CNS Germinomas and Non-Germinomatous Germ Cell Tumors (NGGCT) (PEDONC-4.7)

ONCP.CT.0004.7.A

v2.0.2024

- PET Metabolic Brain imaging does not have a defined role in the evaluation of CNS GCT

Indication	Imaging Study
Initial staging for all individuals	<ul style="list-style-type: none"> MRI Brain without and with contrast (CPT® 70553) MRI Spine without and with contrast (Cervical-CPT® 72156, Thoracic-CPT® 72157, Lumbar-CPT® 72158)

Prior to second-look surgery	<ul style="list-style-type: none"> MRI of all known sites of measurable disease

Indication	Imaging Study
Prior to radiotherapy	<ul style="list-style-type: none"> MRI of all known sites of measurable disease
At the end of all planned therapy	<ul style="list-style-type: none"> MRI Brain without and with contrast (CPT® 70553) MRI Spine (with or without and with contrast)
Signs or symptoms of recurrence or progression	<ul style="list-style-type: none"> MRI Brain without and with contrast (CPT® 70553) MRI Spine without and with contrast (Cervical-CPT® 72156, Thoracic-CPT® 72157, Lumbar-CPT® 72158)
Surveillance	<ul style="list-style-type: none"> <u>Every 3 months for 1 year, then every 4 months for 1 year, then every 6 months for 1 year, then annually until 5 years after completion of therapy:</u> <ul style="list-style-type: none"> MRI Brain without and with contrast (CPT® 70553) MRI Spine without and with contrast (Cervical-CPT® 72156, Thoracic-CPT® 72157, Lumbar-CPT® 72158) For additional imaging guidelines for individuals in long term follow up after CNS tumor treatment that included radiation therapy, see: <u>Second Malignant Neoplasms (SMN) (PEDONC-19.3)</u>
Suspected recurrence - new or worsening neurologic symptoms (including worsening of diabetes insipidus)	<ul style="list-style-type: none"> MRI Brain without and with contrast (CPT® 70553) MRI Spine without and with contrast (Cervical-CPT® 72156, Thoracic-CPT® 72157, Lumbar-CPT® 72158)

Background and Supporting Information**Includes the following tumors:**

- CNS Germinoma
- Non-Germinomatous Germ Cell Tumors (NGGCT)
 - Embryonal carcinoma
 - Yolk sac tumor
 - Choriocarcinoma
 - Immature Teratoma
 - Mature Teratoma
 - Mixed germ cell tumor

General Considerations:

- More common in older school age children and younger adolescents, but can occur throughout the pediatric age range
- Although leptomeningeal spread is common, prognosis is excellent due to high sensitivity to chemotherapy and radiotherapy
- Individuals generally proceed to chemotherapy shortly following surgical resection or biopsy and will usually receive 2 to 4 cycles
- Following completion of chemotherapy, individuals with residual disease will proceed to second-look surgery and/or radiotherapy

Ependymal Tumors (Ependymoma) (PEDONC-4.8)

ONCP.CT.0004.8.A

v2.0.2024

- PET Brain Metabolic imaging does not have a defined role in the evaluation of ependymal tumors
- MR Spectroscopy is not indicated for routine surveillance

Indication	Imaging Study
Initial staging for all individuals	<ul style="list-style-type: none"> MRI Brain without and with contrast (CPT® 70553) MRI Spine without and with contrast (Cervical-CPT® 72156, Thoracic-CPT® 72157, Lumbar-CPT® 72158)
Evaluation of a brain lesion of indeterminate nature when the MRS findings will be used to determine whether biopsy/resection can be safely postponed	<ul style="list-style-type: none"> MR Spectroscopy (CPT® 76390)
Baseline imaging following resection	<ul style="list-style-type: none"> MRI Brain without and with contrast (CPT® 70553) or MRI without and with contrast of involved spinal level(s)
Completion of radiotherapy	<ul style="list-style-type: none"> MRI Brain without and with contrast (CPT® 70553) or MRI without and with contrast of involved spinal level(s)
Prior to radiotherapy	<ul style="list-style-type: none"> MRI of all known sites of measurable disease
Treatment response to induction chemotherapy	<ul style="list-style-type: none"> MRI Brain without and with contrast (CPT® 70553) or MRI without and with contrast of involved spinal level(s) every 2 cycles
End of induction chemotherapy and again at end of all therapy	<ul style="list-style-type: none"> MRI Brain without and with contrast (CPT® 70553) MRI Spine without and with contrast (Cervical-CPT® 72156, Thoracic-CPT® 72157, Lumbar-CPT® 72158)
Prior to second-look surgery	<ul style="list-style-type: none"> MRI of all known sites of measurable disease

Indication	Imaging Study
Signs or symptoms of recurrence or progression	<ul style="list-style-type: none"> MRI Brain without and with contrast (CPT® 70553) MRI Spine without and with contrast (Cervical-CPT® 72156, Thoracic-CPT® 72157, Lumbar-CPT® 72158)
Surveillance, primary intracranial ependymal tumor and NO history of spinal cord involvement	<ul style="list-style-type: none"> MRI Brain without and with contrast (CPT® 70553) every 3 months for 2 years, then every 4 months for 1 year, then every 6 months in years 4 and 5, then annually to 10 years post treatment <ul style="list-style-type: none"> For additional imaging guidelines for individuals in long term follow up after CNS tumor treatment that included radiation therapy, see: <u>Second Malignant Neoplasms (SMN) (PEDONC-19.3)</u> MRI Spine without and with contrast (Cervical-CPT® 72156, Thoracic-CPT® 72157, Lumbar-CPT® 72158) can be approved annually for 2 years
Surveillance, primary intracranial ependymal tumor AND metastatic cord involvement at diagnosis	<ul style="list-style-type: none"> MRI Brain without and with contrast (CPT® 70553) every 3 months for 2 years, then every 4 months for 1 year, then every 6 months in years 4 and 5, then annually to 10 years post treatment <ul style="list-style-type: none"> For additional imaging guidelines for individuals in long term follow up after CNS tumor treatment that included radiation therapy, see: <u>Second Malignant Neoplasms (SMN) (PEDONC-19.3)</u> MRI Spine without and with contrast (Cervical-CPT® 72156, Thoracic-CPT® 72157, Lumbar-CPT® 72158) every 3 months for 2 years, then every 4 months for 1 year, then every 6 months in years 4 and 5, then annually to 10 years post treatment

Indication	Imaging Study
Surveillance, primary intraspinal ependymal tumor and NO history of intracranial involvement	<ul style="list-style-type: none"> MRI without and with contrast of the involved spinal level(s) every 3 months for 2 years, then every 4 months for 1 year, then every 6 months in years 4 and 5, then annually to 10 years post treatment
Surveillance, primary intraspinal ependymal tumor AND metastatic intracranial involvement at diagnosis	<ul style="list-style-type: none"> MRI of the involved spinal level(s) without and with contrast every 3 months for 2 years, then every 4 months for 1 year, then every 6 months in years 4 and 5, then annually to 10 years post treatment MRI Brain without and with contrast (CPT® 70553) every 3 months for 2 years, then every 4 months for 1 year, then every 6 months in years 4 and 5, then annually to 10 years post treatment

Background and Supporting Information

Includes the following tumors:

- Ependymal tumors
 - Supratentorial ependymoma
 - ZFTA fusion-positive Supratentorial ependymoma
 - YAP1 fusion-positive Posterior fossa ependymoma
 - Posterior fossa ependymoma, group
 - PFA Posterior fossa ependymoma, group PFB

General Considerations:

- Occur primarily intracranially, roughly 2/3 in the posterior fossa
- Overall prognosis is very good, with supratentorial tumors faring better
- Primary spinal tumors can also occur, and are more common in adult individuals than pediatric individuals.
- Surgery is the primary treatment modality
- Individuals with a complete resection should then be imaged according to surveillance guidelines
- Radiotherapy +/- chemotherapy is used for:
 - Incompletely resected tumors
 - Anaplastic histology

- Infratentorial location
 - Individuals with incomplete resection or high-risk histology that receive adjuvant radiation therapy should then be imaged according to surveillance guidelines after end of radiotherapy imaging.
- Individuals with gain of chromosome 1q have worse progression-free survival and overall survival outcomes
- RELA-fusion supratentorial ependymoma did not portend worse overall survival outcomes in recent Clinical Oncology Group studies, and is generally not considered an indication for more frequent surveillance imaging

Malignant Tumors of the Spinal Cord (PEDONC-4.9)

ONCP.CT.0004.9.A

v2.0.2024

- If a disease-specific guideline exists, image according to the guidance found in that disease-specific guideline section.
- Common histologies of primary spinal cord tumor in children include:
 - Low Grade Glioma, see: **CNS Low Grade Glioma (LGG) (PEDONC-4.2)** for guidelines
 - High Grade Glioma, see: **CNS High-Grade Glioma (HGG) (PEDONC-4.3)** for guidelines
 - Ependymoma, see: **Ependymal Tumors (Ependymoma) (PEDONC-4.8)** for guidelines
 - NF 1 or 2, see **Neurofibromatosis 1 and 2 (NF1 and NF2) (PEDONC-2.3)** for guidelines
 - Any type of malignant spinal cord tumor can occur, but other histologies are rare.

For rare histologies that do not have a disease-specific guideline section, follow the imaging outlined in the table below

Indication	Imaging Study
Initial staging for all individuals	<ul style="list-style-type: none"> • MRI Brain without and with contrast (CPT® 70553) • MRI Spine without and with contrast (Cervical-CPT® 72156, Thoracic-CPT® 72157, Lumbar-CPT® 72158)
Treatment response, every 2 cycles	<ul style="list-style-type: none"> • MRI Spine without and with contrast (Cervical-CPT® 72156, Thoracic-CPT® 72157, Lumbar-CPT® 72158) • Additionally, MRI Brain without and with contrast (CPT® 70553) for known intracranial disease
Signs or symptoms of recurrence or progression	<ul style="list-style-type: none"> • MRI Spine without and with contrast (Cervical-CPT® 72156, Thoracic-CPT® 72157, Lumbar-CPT® 72158) • Additionally, MRI Brain without and with contrast (CPT® 70553) for known intracranial disease

Indication	Imaging Study
<p>Surveillance of rare histologies is highly individualized.</p> <p>Surveillance imaging after recent evaluation by a physician with significant training and/or experience in pediatric spinal cord tumors (most commonly a pediatric neurosurgeon or pediatric oncologist) may be indicated in these rare individuals.</p>	<ul style="list-style-type: none">• MRI Brain and/or MRI Spine may be considered

Background and Supporting Information

- Treatment principles are the same as tumors of the brain, and should follow imaging guidelines according to the specific histologic type
- Multiple spinal cord tumors should raise suspicion for neurofibromatosis
- Asymptomatic surveillance imaging should generally end at the time point appropriate for the specific tumor type

Craniopharyngioma and Other Tumors of the Sellar Region (PEDONC-4.10)

ONCP.CT.0004.10.A

v2.0.2024

- Individuals of all ages should be imaged according to these guidelines.
- PET Brain Metabolic Imaging and MR Spectroscopy do not have a defined role in the evaluation of craniopharyngioma

Indication	Imaging Study
Initial staging for all individuals	<ul style="list-style-type: none"> • MRI Brain without and with contrast (CPT® 70553) • Concurrent CT Head without contrast (CPT® 70450) can be approved in addition to MRI if craniopharyngioma is suspected
<ul style="list-style-type: none"> • <u>Additional initial staging for individuals with:</u> <ul style="list-style-type: none"> • Multicentric tumors • Clinical signs or symptoms suggesting spinal cord involvement 	<ul style="list-style-type: none"> • MRI Spine without and with contrast (Cervical-CPT® 72156, Thoracic-CPT® 72157, Lumbar-CPT® 72158)
Operative planning or image guidance	<ul style="list-style-type: none"> • MRA Head (CPT® 70544, 70545, or 70546) OR • CTA Head (CPT® 70496)
Baseline imaging following resection	<ul style="list-style-type: none"> • MRI Brain without and with contrast (CPT® 70553)
Completion of radiotherapy	<ul style="list-style-type: none"> • MRI Brain without and with contrast (CPT® 70553)
Treatment response to chemotherapy	<ul style="list-style-type: none"> • MRI Brain without and with contrast (CPT® 70553) approved every 2 cycles during active treatment and at the end of planned chemotherapy
Additional treatment response imaging during induction chemotherapy for individuals with measurable spinal cord disease on MRI	<ul style="list-style-type: none"> • MRI Spine without and with contrast (Cervical-CPT® 72156, Thoracic-CPT® 72157, Lumbar-CPT® 72158) every 2 cycle

Indication	Imaging Study
Signs or symptoms of recurrence or progression	<ul style="list-style-type: none"> MRI Brain without and with contrast (CPT® 70553) <ul style="list-style-type: none"> Concurrent CT Head without contrast (CPT® 70450) can be approved in addition to MRI if craniopharyngioma MRI Spine without and with contrast (Cervical-CPT® 72156, Thoracic-CPT® 72157, Lumbar-CPT® 72158) for signs or symptoms suggesting spinal cord involvement
Surveillance	<ul style="list-style-type: none"> MRI Brain without and with contrast (CPT® 70553) can be approved every 3 months for 1 year, then every 4 months for 1 year, then every 6 months for 1 year, then annually until 10 years after completion of therapy as late progressions can occur <ul style="list-style-type: none"> For additional imaging guidelines for individuals in long term follow up after CNS tumor treatment that included radiation therapy, see: <u>Second Malignant Neoplasms (SMN) (PEDONC-19.3)</u>
Suspected spinal cord recurrence	<ul style="list-style-type: none"> MRI Spine without and with contrast (Cervical-CPT® 72156, Thoracic-CPT® 72157, Lumbar-CPT® 72158)

Background and Supporting Information

Includes the following tumors:

- Adamantinomatous craniopharyngioma
- Papillary craniopharyngioma
- Pituicytoma, granular cell tumor of the sellar region, and spindle cell oncocytoma
- Pituitary adenoma/PitNET
- Pituitary blastoma

General Considerations:

- Imaging guidelines and treatment approaches for pediatric pituitary tumors other than craniopharyngioma are consistent with those used for adults with pituitary tumors

- For these tumors follow guidelines in **Pituitary (HD-19)** in the Head Imaging Guidelines
- Craniopharyngiomas are less common, accounting for 6% to 8% of pediatric CNS tumors.
- Most commonly affects children in the preadolescent ages
- Several key imaging findings can be used to differentiate the tumors in this region including the presence of calcifications, cysts, and T1/T2 enhancement patterns in craniopharyngiomas
 - These are best evaluated using a COMBINATION of both MRI and CT modalities. Preoperative prediction is much more successful when BOTH modalities are obtained prior to biopsy.
- Other less common tumors in the optic chiasm, sella, and suprasella region may include Germ Cell Tumors (GCT, see: **PEDONC-4.7**) and Langerhans Cell Histiocytosis (LCH, see: **PEDONC-18**)

Treatment Considerations:

- Surgical resection is curative for many individuals
 - Those with a complete resection should then be imaged according to surveillance guidelines after post-resection imaging is completed
- Individuals with incomplete resection and receiving adjuvant radiation therapy can have a single MRI Brain (CPT® 70553) approved at completion of radiotherapy and should then be imaged according to surveillance guidelines

Primary CNS Lymphoma (PEDONC-4.11)

ONCP.CT.0004.11.A

v2.0.2024

- Primary CNS lymphoma imaging indications in pediatric individuals are identical to those in the general imaging guidelines. See: **CNS Lymphoma (ONC-2.7)** in the Oncology Imaging Guidelines
- CNS lymphomas also involving bone marrow and/or lymph nodes should be imaged according to: **Pediatric Aggressive Mature B-Cell Non-Hodgkin Lymphomas (NHL) (PEDONC-5.3)**

Background and Supporting Information

- Primary CNS lymphoma is a solitary or multifocal mass occurring in the brain without evidence of systemic (bone marrow or lymph node) involvement
- Usually associated with immunodeficiency, this is a very rare entity in pediatrics accounting for <0.1% of pediatric malignancies, so age-specific guidelines have not been established

Meningiomas (PEDONC-4.12)

ONCP.CT.0004.12.A

v2.0.2024

- Meningioma imaging indications in pediatric individuals are identical to those in the general imaging guidelines
 - See: **Meningiomas (Intracranial and Intraspinal) (ONC-2.8)** in the Oncology Imaging Guidelines

Background and Supporting Information

- Account for 1% to 3% of pediatric CNS tumors
- Usually associated with neurofibromatosis type 2 (NF-2) or prior therapeutic radiation exposure to the brain
 - Lifetime risk may be as high as 20% for young children receiving whole brain radiotherapy, most commonly occurring 15 to 20 years after radiation exposure

Choroid Plexus Tumors (PEDONC-4.13)

ONCP.CT.0004.13.A

v2.0.2024

- PET Metabolic Brain imaging does not have a defined role in the evaluation of choroid plexus tumors

Choroid Plexus Papilloma:

Indication	Imaging Study
Suspected/Diagnosis	<ul style="list-style-type: none">MRI Brain without and with contrast (CPT® 70553)
Evaluation of a brain lesion of indeterminate nature when the MRS findings will be used to determine whether biopsy/resection can be safely postponed	<ul style="list-style-type: none">MR Spectroscopy (CPT® 76390)
Suspected return of hydrocephalus, or return of hydrocephalus seen on CT imaging	<ul style="list-style-type: none">MRI Brain without and with contrast (CPT® 70553)

Choroid Plexus Adenoma or Atypical Choroid Plexus Papilloma:

Indication	Imaging Study
Suspected/Diagnosis	<ul style="list-style-type: none">MRI Brain without and with contrast (CPT® 70553)MRI Spine without and with contrast (Cervical-CPT® 72156, Thoracic-CPT® 72157, Lumbar-CPT® 72158)
Evaluation of a brain lesion of indeterminate nature when the MRS findings will be used to determine whether biopsy/resection can be safely postponed	<ul style="list-style-type: none">MR Spectroscopy (CPT® 76390)
Suspected return of hydrocephalus, or return of hydrocephalus seen on CT imaging	<ul style="list-style-type: none">MRI Brain without and with contrast (CPT® 70553)

Choroid Plexus Carcinoma:

Indication	Imaging Study
Initial staging of all individuals	<ul style="list-style-type: none"> MRI Brain without and with contrast (CPT® 70553) MRI Spine without and with contrast (Cervical-CPT® 72156, Thoracic-CPT® 72157, Lumbar-CPT® 72158)
Evaluation of a brain lesion of indeterminate nature when the MRS findings will be used to determine whether biopsy/resection can be safely postponed	<ul style="list-style-type: none"> MR Spectroscopy (CPT® 76390)
Baseline imaging following resection	<ul style="list-style-type: none"> MRI Brain without and with contrast (CPT® 70553)
Prior to radiotherapy	<ul style="list-style-type: none"> MRI Brain without and with contrast (CPT® 70553) and MRI with and without contrast of all known sites with measurable disease prior to radiotherapy.
Completion of radiotherapy	<ul style="list-style-type: none"> MRI Brain without and with contrast (CPT® 70553)
Treatment response to chemotherapy	<ul style="list-style-type: none"> MRI Brain without and with contrast (CPT® 70553) every 2 cycles during active treatment
Additional treatment response to chemotherapy for individuals with measurable spinal cord disease on MRI	<ul style="list-style-type: none"> MRI Spine without and with contrast (Cervical-CPT® 72156, Thoracic-CPT® 72157, Lumbar-CPT® 72158) every 2 cycles during active treatment
Prior to second-look surgery	<ul style="list-style-type: none"> MRI of all known sites of measurable disease
End of all planned therapy	<ul style="list-style-type: none"> MRI Brain without and with contrast (CPT® 70553) MRI Spine without and with contrast (Cervical-CPT® 72156, Thoracic-CPT® 72157, Lumbar-CPT® 72158)
Signs or symptoms of recurrence or progression	<ul style="list-style-type: none"> MRI Brain without and with contrast (CPT® 70553) MRI Spine without and with contrast (Cervical-CPT® 72156, Thoracic-CPT® 72157, Lumbar-CPT® 72158)

Indication	Imaging Study
Surveillance, no history of spinal cord involvement	<ul style="list-style-type: none"> MRI Brain without and with contrast (CPT® 70553) every 4 months for 3 years, then every 6 months for 2 years after completion of therapy, then annually to 10 years after treatment <ul style="list-style-type: none"> For additional imaging guidelines for individuals in long term follow up after CNS tumor treatment that included radiation therapy, see: <u>Second Malignant Neoplasms (SMN) (PEDONC-19.3)</u> MRI Spine without and with contrast (Cervical-CPT® 72156, Thoracic-CPT® 72157, Lumbar-CPT® 72158) at 12 and 24 months after completion of therapy
Surveillance, individuals with cord involvement at diagnosis	<ul style="list-style-type: none"> MRI Brain without and with contrast (CPT® 70553) every 4 months for 3 years, then every 6 months for 2 years after completion of therapy, then annually to 10 years after treatment <ul style="list-style-type: none"> For additional imaging guidelines for individuals in long term follow up after CNS tumor treatment that included radiation therapy, see: <u>Second Malignant Neoplasms (SMN) (PEDONC-19.3)</u> MRI Spine without and with contrast (Cervical-CPT® 72156, Thoracic-CPT® 72157, Lumbar-CPT® 72158) every 4 months for 3 years, then every 6 months for 2 years after completion of therapy, then annually to 10 years after treatment

Background and Supporting Information

- As a group these account for 1% to 4% of pediatric CNS tumors, and 70% of choroid plexus tumors present within the first 2 years of life
- Includes the following tumors:
 - Choroid plexus papilloma
 - Choroid plexus adenoma, or atypical choroid plexus papilloma
 - Choroid plexus carcinoma
- Choroid plexus papillomas

- Choroid plexus papillomas outnumber other choroid plexus tumors by 4 to 5 times.
- These ventricular tumors commonly present with hydrocephalus caused by increased CSF production, resulting in signs of increased intracranial pressure.
- Appearance on MRI is typical, and they are usually treated by excision.
- Regrowth is rare
- Choroid Plexus Adenoma or Atypical Choroid Plexus Papilloma
 - These are extremely rare tumors with features midway in the malignant spectrum between papillomas and carcinomas
 - They are more prone to local invasion but rarely to metastasis
 - Presenting symptoms are similar to papillomas
 - Appearance on MRI is typical, and they are usually treated by excision
 - Spinal imaging may be approved if requested at initial diagnosis
 - Regrowth is rare
- Choroid Plexus Carcinoma
 - This is a very aggressive malignancy, with high rates of metastasis to other parts of the CNS
 - Overall incidence of metastases in choroid plexus carcinoma is 12%–50%, which is associated with a worse outcome
 - Prognosis is significantly less favorable than for papillomas with overall survival rates of 35% to 40%
 - *TP53* mutations and alternative lengthening telomeres (ALT) are common in individuals with choroid plexus carcinoma
 - Surgical gross total resection is curative for many individuals
 - Individuals with confirmed gross total resection should then be imaged according to surveillance guidelines
 - Individuals with incomplete resection who receive adjuvant radiation therapy should be imaged according to surveillance guidelines after end of radiotherapy imaging
 - MR Spectroscopy is not indicated for routine surveillance

Pediatric Lymphomas (PEDONC-5)

Guideline

Pediatric Lymphoma – General Considerations (PEDONC-5.1)

Pediatric Hodgkin Lymphoma (HL) (PEDONC-5.2)

Pediatric Aggressive Mature B-Cell Non-Hodgkin Lymphomas (NHL)
(PEDONC-5.3)

Anaplastic Large Cell Lymphoma (ALCL) (PEDONC-5.4)

References (PEDONC-5)

Pediatric Lymphoma – General Considerations (PEDONC-5.1)

ONCP.HL.0005.1.A

v2.0.2024

- Lymphoma mostly commonly involves the lymph nodes (LNs). However, lymphoma can also arise from primary lymphoid tissues (bone marrow or thymus) or various secondary lymphoid tissues (spleen, mucosa-associated lymphoid tissue) or non-lymphoid organs (skin, bone, brain, lungs, liver, salivary glands, etc.).
- Pediatric lymphomas are generally Hodgkin Lymphomas, Aggressive B-Cell Non-Hodgkin Lymphomas, Lymphoblastic Lymphomas, or Anaplastic Large Cell Lymphomas
- Individuals with Lymphoblastic Lymphoma (even those with bulky nodal disease) are treated using the leukemia treatment plan appropriate to the cell type (B or T cell).
 - These individuals should be imaged using guidelines in **Acute Lymphoblastic Leukemia (ALL) (PEDONC-3.2)**
- Other histologies are rare in pediatric individuals, and should be imaged according to the following guidelines:
 - Follicular lymphoma: **Follicular Lymphoma (ONC-27.3)** in the Oncology Imaging Guidelines
 - Marginal zone or MALT lymphomas: **Marginal Zone Lymphomas (ONC-27.4)** in the Oncology Imaging Guidelines
 - Mantle cell lymphomas: **Mantle Cell Lymphoma (ONC-27.5)** in the Oncology Imaging Guidelines
 - Cutaneous lymphomas: **Cutaneous Lymphomas and T Cell Lymphomas (ONC-27.8)** in the Oncology Imaging Guidelines
 - **Exception:** Cutaneous B-Lymphoblastic Lymphoma should be imaged using guidelines in **Acute Lymphoblastic Leukemia (ALL) (PEDONC-3.2)**
 - Castleman's Disease: **Castleman's Disease (Unicentric and Multicentric) (ONC-31.11)** in the Oncology Imaging Guidelines
- All CT imaging recommended in this section refers to CT with contrast only.
 - Noncontrast CT imaging has not been shown to be beneficial in the management of pediatric lymphomas
 - Given the limited utility of noncontrast CT imaging in pediatric lymphomas, MRI without or without and with contrast is recommended in place of CT for individuals who cannot tolerate CT contrast due to allergy or impaired renal function
- MRI without and with contrast of symptomatic or previously involved bony areas can be approved in known lymphoma individuals without prior plain x-ray or bone scan evaluation

- Bone scan is inferior to MRI for evaluation of known or suspected bone metastases in lymphoma
- MRI Brain without and with contrast (CPT® 70553) is the preferred study for evaluation of suspected brain metastases in pediatric lymphoma
 - CT Head with (CPT® 70460) or without and with contrast (CPT® 70470) can be approved when MRI is contraindicated

Pediatric Hodgkin Lymphoma (HL) (PEDONC-5.2)

ONCP.HL.0005.2.A

v2.0.2024

Indication	Imaging Study
Initial staging	<p><u>ANY or ALL of the following may be approved:</u></p> <ul style="list-style-type: none"> CT Neck with contrast (CPT® 70491) <ul style="list-style-type: none"> MRI Neck without and with contrast (CPT® 70543) may be substituted for CT to limit radiation exposure if requested CT Chest with contrast (CPT® 71260) <ul style="list-style-type: none"> MRI is not an acceptable substitution for CT Chest CT Abdomen and Pelvis with contrast (CPT® 74177) <ul style="list-style-type: none"> MRI Abdomen with and without contrast (CPT® 74183) and MRI Pelvis (CPT® 72197) may be substituted for CT to limit radiation exposure if requested MRI Brain with and without contrast (CPT® 70553) for known CNS involvement or new signs or symptoms suggesting intracranial disease PET/CT (CPT® 78815 or CPT® 78816) or PET/MRI (only using combination of CPT® 78813 and CPT® 76498) <ul style="list-style-type: none"> Can be performed prior to biopsy if necessary for individual scheduling CT or MRI of other body areas may be indicated for rare individuals based on physical findings or PET/CT results

Indication	Imaging Study
Restaging	<ul style="list-style-type: none"> ALL of the following, as often as every 2 cycles of chemotherapy: <ul style="list-style-type: none"> CT of previously involved visceral areas <ul style="list-style-type: none"> In individuals on treatment for recurrent or refractory Hodgkin Lymphoma, the following are indicated: <ul style="list-style-type: none"> CT Neck with contrast (CPT® 70491) CT Chest with contrast (CPT® 71260) CT Abdomen and Pelvis with contrast (CPT® 74177) MRI Brain with and without contrast (CPT® 70553) for known CNS involvement <p>AND</p> <ul style="list-style-type: none"> After cycles 2 and 4 of chemotherapy* and at end of therapy: <ul style="list-style-type: none"> PET/CT (CPT® 78815 or CPT® 78816) or PET/MRI (only using combination of CPT® 78813 and 76498) <ul style="list-style-type: none"> This restaging PET/CT may instead be performed after cycles 1 and 3 for individuals with low risk stage IA or IIA mixed cellularity Hodgkin lymphoma Diagnostic CT or MRI of previously involved areas may be combined with PET at end of therapy. In addition to the above studies: <ul style="list-style-type: none"> A single follow-up PET/CT (CPT® 78815 or CPT® 78816) or PET/MRI is indicated >12 weeks after radiation therapy, if end of therapy PET/CT report documents Deauville 3, 4, or 5 FDG avidity, to confirm complete response
Surveillance for individuals with no history of recurrent HL	<ul style="list-style-type: none"> Imaging studies are only recommended when relapse is clinically suspected, because most individuals will clinically declare themselves and there is no survival advantage in pre-emptive imaging. Routine surveillance imaging is not supported in individuals without a prior history of recurrent disease
Surveillance, individuals with recurrent HL and no evidence of disease following successful treatment	<ul style="list-style-type: none"> ALL of the following, every 3 months for 1 year after completing therapy for recurrence: <ul style="list-style-type: none"> CT Neck with contrast (CPT® 70491) CT Chest with contrast (CPT® 71260) CT Abdomen and Pelvis with contrast (CPT® 74177)

Indication	Imaging Study
Clarify inconclusive findings on conventional imaging suspicious for recurrence AND considering biopsy to establish recurrence	<ul style="list-style-type: none"> PET/CT (CPT® 78815 or CPT® 78816) or PET/MRI (only using combination of CPT® 78813 and CPT® 76498)
Clinical symptoms suggesting recurrence	<ul style="list-style-type: none"> MRI Brain with and without contrast (CPT® 70553) for known CNS involvement or new signs or symptoms suggesting intracranial disease <p><u>AND either of the following sets of imaging:</u></p> <ul style="list-style-type: none"> Conventional imaging: <ul style="list-style-type: none"> CT Neck with contrast (CPT® 70491) OR MRI Neck with and without (CPT® 70491) AND CT Chest with contrast (CPT® 71260) AND CT Abdomen and Pelvis with contrast (CPT® 74177) OR MRI Abdomen and Pelvis with and without contrast (CPT® 74183 and CPT® 72197) AND CT of other previously involved visceral areas or currently symptomatic areas <p>OR</p> <ul style="list-style-type: none"> PET/CT (CPT® 78815 or 78816) or PET/MRI (only using combination of CPT® 78813 and CPT® 76498)

Background and Supporting Information

- Most individuals experiencing recurrence are detected based on physical findings, and frequent CT surveillance imaging of Hodgkin Lymphoma after completion of therapy does not improve post-recurrence overall survival. The primary determinant of survival at recurrence is time to relapse, regardless of whether relapse is detected clinically or via imaging. NCCN pediatric HL guidelines recommend no pre-emptive surveillance imaging.
- Pediatric individuals have a high rate of neck involvement with Hodgkin Lymphoma
- Early treatment response evaluations involve both PET and CT as decisions about chemotherapy drug selection and radiation treatment are frequently made based on both anatomic (CT-based) and metabolic (PET/CT-based) responses.
- Indications and coding for rare circumstances where PET/MRI may be approved are found in **PET imaging in Pediatric Oncology (PEDONC-1.4)**

Pediatric Aggressive Mature B-Cell Non-Hodgkin Lymphomas (NHL) (PEDONC-5.3)

ONCP.HL.0005.3.A

v2.0.2024

Indication	Imaging Study
Initial staging	<p>ANY or ALL of the following may be approved:</p> <ul style="list-style-type: none"> CT Neck with contrast (CPT® 70491) <ul style="list-style-type: none"> May substitute MRI Neck with and without contrast (CPT® 70543) if requested CT Chest with contrast (CPT® 71260) CT Abdomen and Pelvis with contrast (CPT® 74177) <ul style="list-style-type: none"> May substitute MRI Abdomen without and with contrast (CPT® 74183) and MRI Pelvis without and with contrast (CPT® 72197) in place of CT Abdomen and Pelvis, if requested. Abdominal ultrasound (CPT® 76700 or 76705) may be approved at initial presentation if CT/MRI not available. CT with contrast or MRI without and with contrast any other symptomatic body area PET/CT (CPT® 78815 or CPT® 78816) or PET/MRI (only using combination of CPT® 78813 and CPT® 76498 [may be approved in addition to diagnostic CTs])
Additional initial staging if symptoms or extent of disease suggest intracranial extension or metastasis	<ul style="list-style-type: none"> MRI Brain without and with contrast (CPT® 70553)
Additional initial staging if symptoms or extent of disease suggest intraspinal extension or metastasis (back pain)	<ul style="list-style-type: none"> MRI of suspected spinal level involvement without and with contrast

Indication	Imaging Study
Restaging for treatment response (following initial response evaluation)	<ul style="list-style-type: none"> ANY OR ALL of the following, as often as every cycle of chemotherapy (~every 3 weeks): <ul style="list-style-type: none"> CT with contrast or MRI without and with contrast (should be same modality as initial diagnosis if possible) of previously involved areas PET/CT (CPT® 78815 or CPT® 78816) or PET/MRI (only using combination of CPT® 78813 and CPT® 76498) until a negative PET is obtained <ul style="list-style-type: none"> Whole-body PET/CT (CPT® 78816) may be approved if there is clinical suspicion of, or known, skull or distal lower extremity involvement. PET/CT may be approved in conjunction with diagnostic CTs/MRIs, PET/CT should not replace imaging with contrast-enhanced diagnostic-quality CT or MRI.
Restaging for all subsequent treatment response, including end of therapy evaluation, after negative PET/CT (either Deauville or Lugano 1, 2 or 3 as reported in formal radiology interpretation)	<ul style="list-style-type: none"> CT with contrast or MRI without and with contrast (should be same modality as initial diagnosis if possible) of previously involved areas, as often as every 2 cycles of chemotherapy, and at the end of therapy
Assessment of disease activity in inconclusive residual masses seen on conventional imaging	<ul style="list-style-type: none"> PET/CT (CPT® 78815 or CPT® 78816) or PET/MRI (only using combination of CPT® 78813 and CPT® 76498)
Individuals being treated with Rituximab who present with abdominal pain, due to risk of bowel perforation and obstruction	<ul style="list-style-type: none"> CT Abdomen and Pelvis with contrast (CPT® 74177) <ul style="list-style-type: none"> US, x-ray, or other red flags are not required prior to CT
Surveillance of asymptomatic individuals with residual masses in the chest or abdomen and pelvis	<ul style="list-style-type: none"> Chest x-ray and Abdominal (CPT® 76700) and Pelvic (CPT® 76856) ultrasound 3 months after completion of therapy. If stable, no further imaging is indicated.

Indication	Imaging Study
Clinical symptoms or laboratory findings suggesting recurrence	<ul style="list-style-type: none"> MRI Brain with and without contrast (CPT® 70553) for history of CNS involvement or new signs or symptoms suggesting intracranial disease <p><u>And:</u></p> <ul style="list-style-type: none"> CT Neck with contrast (CPT® 70491) and CT Chest with contrast (CPT® 71260) and CT Abdomen and Pelvis with contrast (CPT® 74177) and CT with contrast of other previously involved visceral areas or currently symptomatic areas (MRI with and without contrast may be substituted for CT for all areas other than the chest if requested) PET/CT (CPT® 78815 or CPT® 78816) or PET/MRI (only using combination of CPT® 78813 and CPT® 76498) may be approved if relapse is suspected based on CT scan findings
Suspected PTLD recurrence with documentation of new palpable nodes, rising LDH, or rising quantitative EBV PCR	<ul style="list-style-type: none"> PET/CT (CPT® 78815 or CPT® 78816) or PET/MRI (only using combination of CPT® 78813 and CPT® 76498)
Clarify inconclusive findings on conventional imaging to evaluate the need for biopsy to establish recurrence	<ul style="list-style-type: none"> PET/CT (CPT® 78815 or CPT® 78816) or PET/MRI (only using combination of CPT® 78813 and CPT® 76498)

Background and Supporting Information

- Aggressive mature B-Cell NHL includes all of the following diagnoses, all of which should be imaged according to this section:
 - Burkitt's lymphoma/leukemia (BL)
 - Diffuse Large B-Cell Lymphoma (DLBCL)
 - Primary Mediastinal Large B-Cell Lymphoma (PMBCL)
 - Post-transplant Lymphoproliferative Disorder (PTLD)
 - Most commonly occurs following solid organ or stem cell transplantation
 - Viral-associated lymphoproliferative disorders
 - Most commonly occurs following hematopoietic stem cell transplantation or in individuals with primary immunodeficiency
- Initial treatment is usually 7 days of low intensity therapy, with early response evaluation determining next steps in therapy using CT with contrast or MRI without and with contrast of previously involved areas performed around day 6

- Individuals are customarily still inpatient for this evaluation so outpatient requests should be rare for this time point
- Routine asymptomatic surveillance with advanced imaging has not been found to impact individual outcomes as the majority of these individuals present clinically at relapse due to the highly aggressive nature of these lymphomas
- Indications and coding for rare circumstances where PET/MRI may be approved are found in **PET Imaging in Pediatric Oncology (PEDONC-1.4)**

Anaplastic Large Cell Lymphoma (ALCL) (PEDONC-5.4)

ONCP.HL.0005.4.A

v2.0.2024

Indication	Imaging Study
Initial staging	<ul style="list-style-type: none">• ANY OR ALL of the following may be approved:<ul style="list-style-type: none">• CT Neck with contrast (CPT® 70491), CT Chest with contrast (CPT® 71260), and CT Abdomen and Pelvis (CPT® 74177)• MRI without and with contrast of affected area<ul style="list-style-type: none">• May be substituted for CT in cases of paraspinal or soft tissue extremity primary tumors• CT with contrast or MRI without and with contrast any other symptomatic body area• PET/CT (CPT® 78815 or CPT® 78816) or PET/MRI (only using combination of CPT® 78813 and 76498)
Additional initial staging for individuals with bony primary tumors or metastatic disease	<ul style="list-style-type: none">• Bone scan (See: <u>Modality General Considerations (PEDONC-1.3)</u>)
Restaging at the end of induction chemotherapy (commonly 4 to 6 weeks)	<ul style="list-style-type: none">• CT with contrast or MRI without and with contrast of previously involved areas (should be same modality as initial diagnosis if possible)

Indication	Imaging Study
Treatment response in individuals treated with cytotoxic chemotherapy	<ul style="list-style-type: none"> <u>Every 2 cycles:</u> <ul style="list-style-type: none"> CT of previously involved areas <ul style="list-style-type: none"> If CT is performed for primary treatment response, PET/CT (CPT® 78815 or CPT® 78816) can be approved to clarify inconclusive findings detected on conventional imaging OR <ul style="list-style-type: none"> PET/CT or PET/MRI (only using combination of CPT® 78813 and CPT® 76498) until a negative PET is obtained <ul style="list-style-type: none"> If PET/CT (CPT® 78815 or CPT® 78816) is performed for primary treatment response, CT or MRI can be approved to clarify inconclusive findings detected on PET imaging
Restaging after negative PET/CT (either Deauville or Lugano 1, 2 or 3 as reported in formal radiology interpretation)	<ul style="list-style-type: none"> CT with contrast of previously involved areas
Surveillance	<ul style="list-style-type: none"> CT with contrast or MRI without and with contrast of all previously involved areas is indicated every 6 months for 2 years after completion of therapy.
Additional surveillance for individuals with bony primary tumors or metastatic disease	<ul style="list-style-type: none"> Bone scan (See: Modality General Considerations (PEDONC-1.3) for coding) is indicated at 3, 6, 12, and 18 months after therapy is completed
Clinical symptoms suggesting recurrence	<ul style="list-style-type: none"> CT Neck (CPT® 70491), CT Chest (CPT® 71260), Abdomen and Pelvis (CPT® 74177), and other previously involved or currently symptomatic areas
Clarify inconclusive findings on conventional imaging to evaluate the need for biopsy to establish recurrence	<ul style="list-style-type: none"> PET/CT (CPT® 78815 or CPT® 78816) or PET/MRI (only using combination of CPT® 78813 and CPT® 76498)

Background and Supporting Information

- Similar in presentation to Hodgkin Lymphoma, and may be indistinguishable until immunocytology and molecular studies are complete.
- Indications and coding for rare circumstances where PET/MRI may be approved are found in **PET Imaging in Pediatric Oncology (PEDONC-1.4)**

Neuroblastoma (PEDONC-6)

Guideline

- Neuroblastoma – General Considerations (PEDONC-6.1)
- Staging and Risk Grouping – Neuroblastoma (PEDONC-6.2)
- Neuroblastoma – Initial Staging (PEDONC-6.3)
- Neuroblastoma – Treatment Response Imaging (Risk Group Dependent) (PEDONC-6.4)
- Neuroblastoma – Surveillance Imaging (Risk Group Dependent) (PEDONC-6.5)
- References (PEDONC-6)

Neuroblastoma – General Considerations (PEDONC-6.1)

ONCP.NP.0006.1.U

v2.0.2024

- **PEDONC-6** should be used to review neuroblastoma in individuals of all ages, with the exception of esthesioneuroblastoma in individuals of all ages, which should be reviewed using **ONC-3**.
- Neuroblastoma is divided into very low, low, intermediate, and high-risk disease based on International Neuroblastoma Risk Group (INRG) Staging System (see: **Staging and Risk Grouping – Neuroblastoma (PEDONC-6.2)**). The treatment approaches for each risk group vary widely and have distinct imaging strategies. The risk group for a given individual should be provided by the ordering provider in the clinical information provided for review.
- For metabolic imaging in individuals who are MIBG positive at diagnosis and then become MIBG negative in response to treatment:
 - Continue to use MIBG (see: table below and **PEDONC-1.3** for coding)

Study Type	Coding
Bone scan	<ul style="list-style-type: none"> • Any of the following codes can be approved: <ul style="list-style-type: none"> • CPT® 78300 • CPT® 78305 • CPT® 78306 • CPT® 78803, 78830, or 78832 <ul style="list-style-type: none"> • May be approved alone or in combination with: <ul style="list-style-type: none"> • CPT® 78305 • CPT® 78306

Study Type	Coding
¹²³ I-metaiodobenzylguanidine (MIBG) scintigraphy	<ul style="list-style-type: none"> Any one of the following codes can be approved: <ul style="list-style-type: none"> CPT® 78801 CPT® 78802 CPT® 78804 Any one of the following codes may also be approved, individual or in combination with CPT® 78801, 78802 or 78804 <ul style="list-style-type: none"> CPT® 78803 CPT® 78830 CPT® 78831 CPT® 78832 CPT® 78800 may be approved for KNOWN neuroblastoma when only a single site follow up is desired, but is not sufficient for the initial workup of suspected disease.
Octreotide scan	<ul style="list-style-type: none"> Same coding as MIBG
Gallium scan	<ul style="list-style-type: none"> Same coding as MIBG

- MIBG remains the standard of care metabolic imaging in neuroblastoma, 18F-FDG-PET-CT is not supported unless one of the exceptions below is present. All other radiotracers are considered investigational at this time:

Indication	Imaging Study
<ul style="list-style-type: none"> Any of the following: <ul style="list-style-type: none"> Individuals with MIBG-negativity documented at initial diagnosis At major decision points (such as hematopoietic stem cell transplant or surgery), if MIBG and CT/MRI findings are inconclusive 	<ul style="list-style-type: none"> Whole body 18F-FDGPET/CT (CPT® 78816) In scenarios where PET/CT is supported, it does not preclude the other diagnostic imaging studies supported throughout PEDONC 6 . PET/CT is viewed as replacing MIBG in these scenarios.Indications and coding for rare circumstances where PET/MRI may be approved are found in <u>PET Imaging in Pediatric Oncology (PEDONC-1.4)</u>

Indication	Imaging Study
<ul style="list-style-type: none"> Individuals currently receiving medications that may interfere with MIBG uptake that cannot be safely discontinued prior to imaging, including: <ul style="list-style-type: none"> Tricyclic antidepressants (amitriptyline, imipramine, etc.) Selective serotonin reuptake inhibitors (SSRI's, sertraline, paroxetine, escitalopram, etc.) Neuroleptics (risperidone, haloperidol, etc.) Antihypertensive drugs (alpha or beta blockers, calcium channel blockers) Decongestants (phenylephrine, ephedrine, pseudoephedrine) Stimulants (methylphenidate, dextroamphetamine, etc.) 	<ul style="list-style-type: none"> PET/CT (CPT® 78816) should only be approved for this indication when specific documentation of the medication interaction is included with the current PET imaging request. Indications and coding for rare circumstances where PET/MRI may be approved are found in <u>PET Imaging in Pediatric Oncology (PEDONC-1.4)</u>

Background and Supporting Information

- Neuroblastoma is the most common extracranial solid tumor of childhood, and generally arises from the adrenal gland or along the sympathetic chain. Neuroblastoma staging has recently changed to better incorporate the prognostic impact of biological and genetic characteristics, particularly segmental chromosome aberrations (SCA) as an additional genomic marker. SCAs of 1p or 11g are poor prognostic indicators.
- 90% to 95% of neuroblastomas secrete homovanillic acid (HVA) and vanillylmandelic acid (VMA) in the urine, and urine HVA/VMA should be performed at every disease evaluation for individuals with positive HVA or VMA at diagnosis
- 99mTc-MDP bone scan does not identify foci of disease that affect staging or clinical management and provides no advantage over MIBG scintigraphy and is not used for evaluation of most individuals with neuroblastoma

Staging and Risk Grouping – Neuroblastoma (PEDONC-6.2)

ONCP.NP.0006.2.A

v2.0.2024

- Most recent treatment protocols are using the updated International Neuroblastoma Risk Group (INRG) staging system
 - L1: Localized tumor not involving vital structures as defined by the list of image-defined risk factors and confined to one body compartment
 - Image-defined risk factors include a list of specific imaging findings defining individuals less likely to be candidates for complete surgical resection
 - These risk factors involve the encasement of major blood vessels, airway, skull base, costovertebral junction, brachial plexus, spinal canal, or major organs or structures
 - L2: Locoregional tumor with presence of one or more image-defined risk factors
 - M: Distant metastatic disease (except stage MS)
 - MS: Metastatic disease in children younger than 18 months with metastases confined to skin, liver, and/or bone marrow with <10% involvement (MIBG must be negative in bone and bone marrow)
- The tables for risk grouping are provided below for reference. The risk group for any given individual should be provided or documented by the requesting provider.

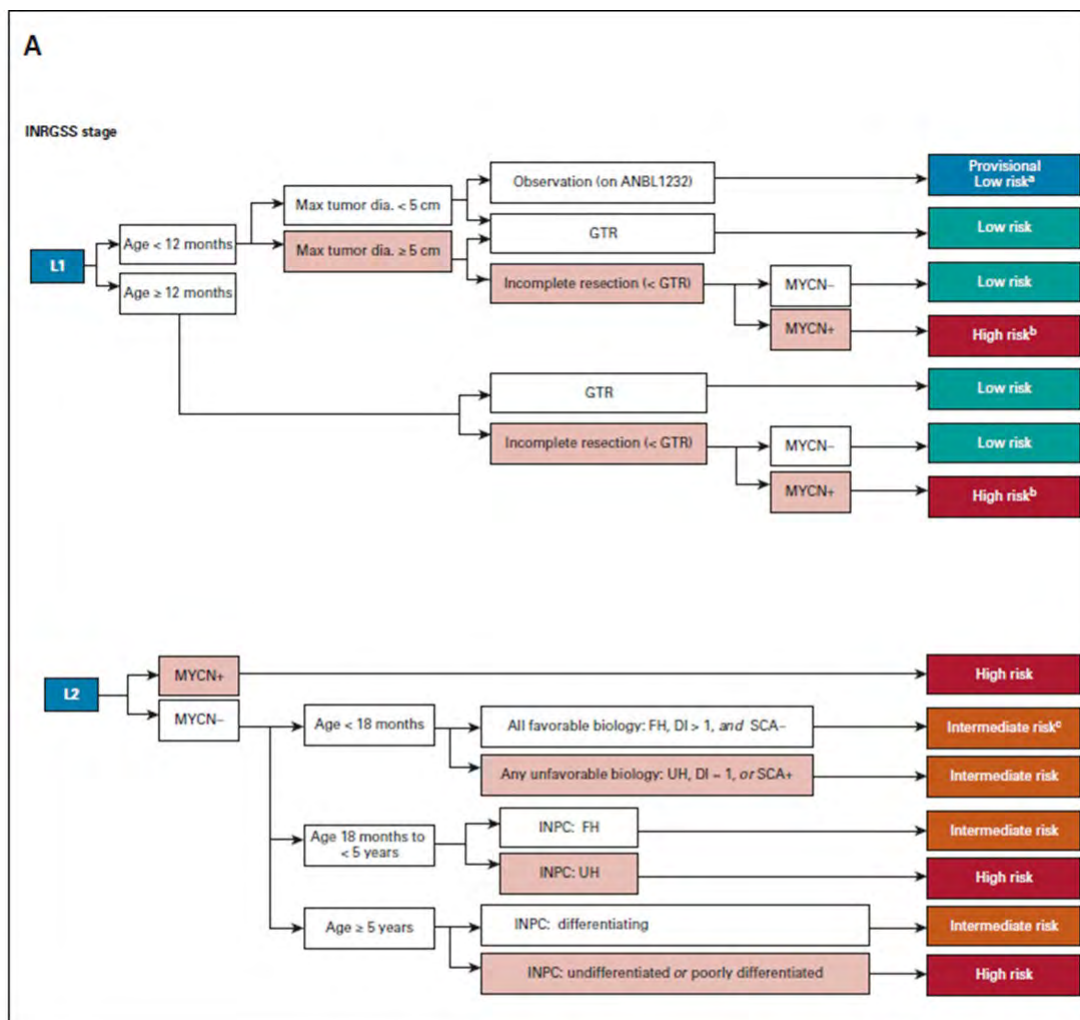

FIG 1. Risk classifier v2 algorithm for patients with (A) locoregional and (B) metastatic tumors. (A) Patients with locoregional tumors with neuroblastoma and ganglioneuroblastoma (nodular) are classified based on INRG stage (L1 and L2), age, resection, biomarkers (*MYCN*, ploidy, and SCAs), and INPC. Select patients with all favorable features are eligible for surveillance on the current non-high-risk COG ANBL1232 protocol. L1 or L2 tumors with histopathology diagnostic category of ganglioneuroma or ganglioneuroblastoma-intermixed will be classified as low-risk regardless of biomarkers (and thus are not included in the figure). Ages are broken down by < 18 months, 18 months to < 5 years, and ≥ 5 years based on age categories used by INPC. ^aIf tumor progresses during observation, biopsy or resect and reclassify with biomarkers (as in COG ANBL1232). ^bConsider complete resection if feasible. ^cIf no tumor burden symptoms, consider observation (as in COG ANBL1232). (B) Patients with metastatic tumors are classified by stage (M and MS), age, INPC, and biomarkers. For MS patients, presence or absence of symptoms may influence therapy independent of biomarker status. In previous risk classifiers, missing data were considered as unfavorable. In COG v2, missing data for SCA will not be considered as unfavorable based on the low incidence of SCA in otherwise favorable subsets. (continued on following page).

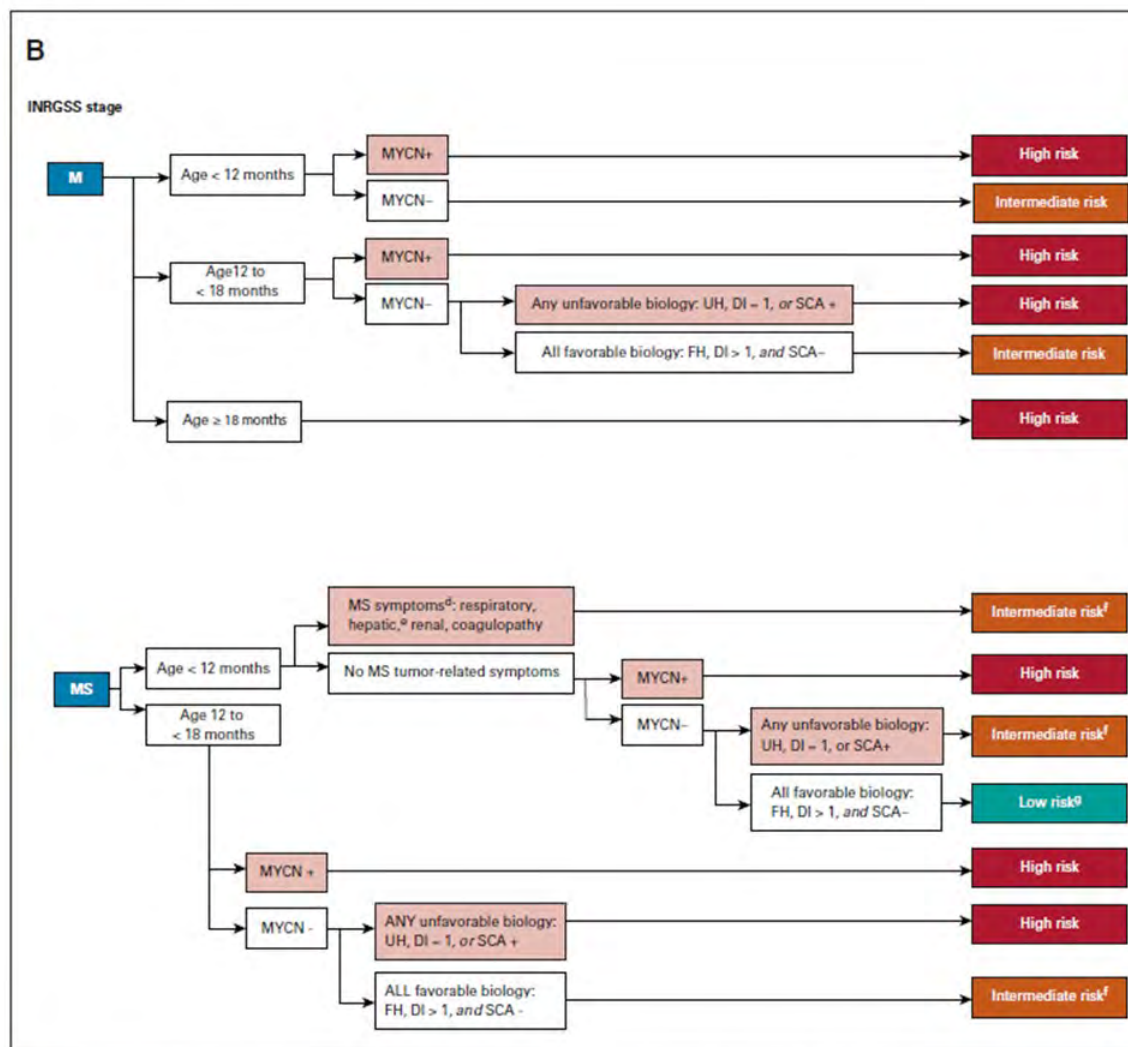

FIG 1. (Continued). *Biopsy contraindicated, defer biopsy until stable (note: biomarker results may modify Risk Class). †Hepatomegaly alone is an MS symptom in patients age < 3 months of age (see COG ANBL1232). ‡Response-based therapy (as in COG ANBL1232). §MS score-based therapy (as in COG ANBL1232). COG, Children's Oncology Group; DI, DNA index; dia., diameter; FH, favorable histology; GTR, gross-total resection; INPC, International Neuroblastoma Pathology Classifier; INRG, International Neuroblastoma Risk Group; MYCN+, *MYCN* amplified; MYCN-, *MYCN* not amplified; SCA, segmental chromosomal aberration; UH, unfavorable histology; v1, version 1; v2, version 2.

Neuroblastoma – Initial Staging (PEDONC-6.3)

ONCP.NP.0006.3.A

v2.0.2024

The following imaging studies should be considered appropriate in the initial staging of individuals with Neuroblastoma:

Indication	Imaging Study
Initial staging for all individuals	<ul style="list-style-type: none"> ¹²³I-metaiodobenzylguanidine (see table in Neuroblastoma – General Considerations (PEDONC-6.1) for MIBG coding details) scintigraphy <p>AND</p> <ul style="list-style-type: none"> <u>ONE</u> of the following sets of imaging: <ul style="list-style-type: none"> CT Neck with contrast (CPT® 70491), CT Chest with contrast (CPT® 71260), and CT Abdomen and Pelvis with contrast (CPT® 74177) <p>OR</p> <ul style="list-style-type: none"> MRI Neck without and with contrast (CPT® 70543), MRI Chest without and with contrast (CPT® 71552), and MRI Abdomen and Pelvis without and with contrast (CPT® 74183 and CPT® 72197)
Evaluation of paraspinal tumors where cord compression is a possibility	<ul style="list-style-type: none"> MRI without and with contrast of the appropriate spinal level
Evaluation of suspected adrenal neuroblastoma, ganglioneuroblastoma, or ganglioneuroma when CT or MRI is inconclusive for an adrenal lesion.	<ul style="list-style-type: none"> Adrenal nuclear imaging (CPT® 78075)
Clinical signs/symptoms suggest brain involvement	<ul style="list-style-type: none"> MRI Brain without and with contrast (CPT® 70553)

- PET should not be used unless one of the exceptions stated in section **Neuroblastoma – General Considerations (PEDONC-6.1)** is present

Background and Supporting Information

- MIBG provides superior sensitivity and sensitivity for detecting viable osseous disease compared with bone scintigraphy so technetium bone scan is not necessary when MIBG is utilized. MIBG is positive in 90% to 95% of neuroblastomas.
 - Most MIBG imaging studies are SPECT/CT studies using CT for localization only. Separate diagnostic CT codes should not be approved for this purpose
 - Occasionally MIBG cannot be performed prior to initiation of therapy. In this circumstance, MIBG should be completed within 3 weeks of therapy initiation as the reduction in MIBG avidity in response to chemotherapy is not immediate. Inability to complete MIBG before starting therapy is not an indication to approve PET imaging
- MRI Brain of asymptomatic individuals with no history of brain metastases is not indicated for neuroblastoma but may be approved for signs and symptoms of brain involvement.

Neuroblastoma – Treatment Response Imaging (Risk Group Dependent) (PEDONC-6.4)

ONCP.NP.0006.4.A
v2.0.2024

- Risk Grouping will not be known at the time of initial staging, but is critical for all imaging decisions after initial staging is complete. **The treating oncologist should always know the individual's risk grouping.** It is not possible to establish the appropriate imaging plan for a neuroblastoma individual without knowing his/her risk group.

All Very Low Risk and Low Risk Neuroblastoma Not Receiving Chemotherapy:

Indication	Imaging Study
All individuals, 6 to 8 weeks after diagnosis to determine if additional treatment is necessary	<ul style="list-style-type: none">CT with contrast or MRI without and with contrast of the primary tumor site. If primary tumor site is abdomen or pelvis, imaging of both sites is indicated.Ultrasound may be used in place of CT or MRI to avoid radiation and/or anesthesia exposure in low risk individuals

Background and Supporting Information

- Many individuals will be treated with surgical resection only without adjuvant therapy, and these individuals enter immediately into surveillance.

All Intermediate Risk Neuroblastoma and Very Low Risk or Low Risk Neuroblastoma Receiving Chemotherapy:

Indication	Imaging Study
Prior to surgical resection	<ul style="list-style-type: none"> Restaging imaging (MIBG and CT or MRI, as performed at initial diagnosis)
Treatment response, as often as every 2 cycles of chemotherapy (~every 6 weeks and at the end of planned treatment)	<ul style="list-style-type: none"> CT Chest with contrast (CPT® 71260) and CT Abdomen and Pelvis with contrast (CPT® 74177) <p>OR</p> <ul style="list-style-type: none"> MRI Neck (CPT® 70543) without and with contrast, MRI Chest without and with contrast (CPT® 71552), and MRI Abdomen and Pelvis without and with contrast (CPT® 74183 and CPT® 72197) <p>AND</p> <ul style="list-style-type: none"> CT or MRI of other sites with prior measurable disease
In addition to treatment response listed above, every 4 cycles, and at the end of planned chemotherapy treatment	<ul style="list-style-type: none"> MIBG scan (see table in <u>Neuroblastoma - General Considerations (PEDONC-6.1)</u> for MIBG coding details)

Background and Supporting Information

- Individuals generally receive 2 to 12 cycles of moderate-intensity chemotherapy depending on response to treatment.
- Surgical resection may occur prior to or following chemotherapy depending on disease stage. Restaging prior to surgery is appropriate.

High-Risk Neuroblastoma:

Indication	Imaging Study
<ul style="list-style-type: none"> ANY of the following: <ul style="list-style-type: none"> Treatment response <ul style="list-style-type: none"> As often as every 2 cycles of chemotherapy, mAb, or biologic therapy (~every 6 weeks) Change in modality <ul style="list-style-type: none"> Prior to surgery, HSCT, XRT, or mAb therapy End of therapy 	<ul style="list-style-type: none"> CT Chest with contrast (CPT® 71260) and CT Abdomen and Pelvis with contrast (CPT® 74177) OR MRI Neck (CPT® 70543) without and with contrast, MRI Chest without and with contrast (CPT® 71552), and MRI Abdomen and Pelvis without and with contrast (CPT® 74183 and CPT® 72197) AND CT or MRI of other sites with prior measurable disease MIBG scan (see table in Neuroblastoma - General consideration (PEDONC-6.1) for MIBG coding details)
At completion of ¹³¹ I-MIBG therapy	<ul style="list-style-type: none"> ¹²³I-MIBG scan <ul style="list-style-type: none"> FDG-PET cannot be used after ¹³¹I-MIBG therapy
Preoperative planning	<ul style="list-style-type: none"> More frequent imaging with any of the above modalities can be approved around the time of surgery if needed

Background and Supporting Information

- This group of individuals receives highly aggressive therapy using sequential chemotherapy, surgery, high dose chemotherapy with stem cell rescue, radiotherapy, monoclonal antibody (mAb) immunotherapy, and biologic therapy.

Neuroblastoma – Surveillance Imaging (Risk Group Dependent) (PEDONC-6.5)

ONCP.NP.0006.5.A
v2.0.2024

Very Low Risk and Low Risk Neuroblastoma:

Indication	Imaging Study
All individuals	<ul style="list-style-type: none">• Every 2 months for 1 year and annually for 3 years to complete 4 years surveillance:<ul style="list-style-type: none">• Ultrasound of involved areas <p>OR</p> <ul style="list-style-type: none">• 3, 6, 9, 12, 24, and 36 months after surgery or to clarify unclear findings on ultrasound:<ul style="list-style-type: none">• CT with contrast or MRI without and with contrast of the primary tumor site• Ultrasound may be approved at 48 months after surgery to complete 4 years surveillance
Clarification of findings on CT or MRI suspicious for disease recurrence	<ul style="list-style-type: none">• MIBG (see table in Neuroblastoma - General Considerations (PEDONC-6.1) for MIBG coding details)

Intermediate Risk Neuroblastoma:

Indication	Imaging Study
Favorable biology	<ul style="list-style-type: none"> Every 3 months for 1 year, then every 4 months for 1 year, and then annually to complete 5 years surveillance <ul style="list-style-type: none"> Ultrasound of involved areas <p>OR</p> <ul style="list-style-type: none"> Every 3 months for 1 year, then every 6 months for 1 year, and then at 36 months after surgery or to clarify unclear findings on ultrasound: <ul style="list-style-type: none"> CT with contrast or MRI without and with contrast of the primary tumor Ultrasound may be approved at 48 and 60 months after surgery to complete 5 years surveillance If primary site is abdomen or pelvis, both body sites may be approved (CPT® 74177 or the combination of CPT® 71297 and CPT® 74183) If negative at 36 months, no further advanced imaging is necessary.
Unfavorable biology or risk for epidural extension	<ul style="list-style-type: none"> Every 3 months for 1 year, every 6 months for 1 year, and then annually for 3 years to complete 5 years surveillance: <ul style="list-style-type: none"> CT with contrast or MRI without and with contrast of the primary tumor site AND MIBG scan (see table in Neuroblastoma – General Considerations (PEDONC-6.1) for coding details) If primary site is abdomen or pelvis, both body sites may be approved (CPT® 74177 or the combination of CPT® 71297 and CPT® 74183)
<ul style="list-style-type: none"> <u>BOTH of the following:</u> <ul style="list-style-type: none"> Individuals with stage 4, or M disease, or 4S, or MS disease AND Positive MIBG at completion of therapy 	<ul style="list-style-type: none"> At 3, 6, 9, 12, 24, and 36 months after completion of therapy: <ul style="list-style-type: none"> MIBG scan (see table in Neuroblastoma – General Considerations (PEDONC-6.1) for MIBG coding details) If negative at 36 months, no further MIBG imaging is necessary. MIBG (or PET, if MIBG-negative at initial diagnosis) not indicated for all other intermediate risk individuals

High Risk Neuroblastoma:

Indication	Imaging Study
All individuals	<ul style="list-style-type: none"> Every 3 months for 2 years, then every 4 months for 1 year, and then annually to complete 6 years surveillance: <ul style="list-style-type: none"> CT with contrast or MRI without and with contrast of the primary tumor site AND MIBG scan (see table in Neuroblastoma – General Considerations (PEDONC-6.1) for MIBG coding details) If primary site is abdomen or pelvis, both body sites may be approved (CPT® 74177 or the combination of CPT® 71297 and CPT® 74183) If negative at 6 years, no further advanced imaging is necessary.
Suspected recurrence	<ul style="list-style-type: none"> CT Chest/Abdomen/Pelvis with contrast (CPT® 71260, and CPT® 74177) or MRI without and with contrast, (CPT® 71552, CPT® 74183, and CPT® 72197) and other sites of prior measurable disease or current symptoms MRI Brain with and without contrast (CPT® 70553) may be approved if signs or symptoms of brain involvement MIBG scan (see table in Neuroblastoma - General Considerations (PEDONC-6.1) for MIBG coding details)

Background and Supporting Information

- Very Low Risk and Low Risk Neuroblastoma:
 - Urine HVA/VMA (if positive at diagnosis) at 1, 2, 3, 6, 9, 12, 18, 24, 36, 48, and 60 months after surgery
 - CT Chest is not indicated in asymptomatic surveillance imaging of any stages of neuroblastoma individuals with no prior history of thoracic disease
- Intermediate Risk Neuroblastoma:
 - Urine HVA/VMA (if positive at diagnosis) every month until 12 months after completion of therapy, then at 14, 16, 18, 21, 24, 30, and 36 months after completion of therapy, then annually until 10 years after completion of therapy
- High-Risk Neuroblastoma:
 - Early detection of recurrence with ¹²³I-MIBG has been shown to improve post-relapse outcomes in high-risk neuroblastoma
 - Urine HVA/VMA (if positive at diagnosis) at 3, 6, 9, 12, 18, 24, 30, 36, 42, 48, 54, and 60 months after completion of therapy, then annually until 10 years after completion of therapy, and for suspected recurrence.

Pediatric Renal Tumors (PEDONC-7)

Guideline

Pediatric Renal Tumors – General Considerations (PEDONC-7.1)
Unilateral Wilms Tumor (UWT) (PEDONC-7.2)
Bilateral Wilms Tumor (BWT) (PEDONC-7.3)
Pediatric Renal Cell Carcinoma (RCC) (PEDONC-7.4)
Clear Cell Sarcoma of the Kidney (CCSK) (PEDONC-7.5)
Malignant Rhabdoid Tumor of the Kidney (MRT) and Other Extracranial Sites (PEDONC-7.6)
Congenital Mesoblastic Nephroma (CMN) (PEDONC-7.7)
References (PEDONC-7)

Pediatric Renal Tumors – General Considerations (PEDONC-7.1)

ONCP.RC.0007.1.U

v2.0.2024

- Ultrasound is considered first-line imaging for suspected pediatric renal mass, given the lack of radiation exposure and need for sedation. Advanced imaging for suspected Wilms Tumor should be done after initial assessment with ultrasound, which has often been completed prior to diagnosis.
- A variety of tumors can occur in the pediatric kidney, and include the following:
 - Wilms Tumor
 - Favorable Histology (FHWT)
 - Focal Anaplasia (FAWT)
 - Diffuse Anaplasia (DAWT)
 - Bilateral Wilms Tumor (BWT)
 - Renal Cell Carcinoma (RCC)
 - Clear Cell Sarcoma of the Kidney (CCSK)
 - Malignant Rhabdoid Tumor of the Kidney (MRT)
 - Congenital Mesoblastic Nephroma (CMN)
 - Other cancers occurring in the kidney:
 - Neuroblastoma
 - Primitive Neuroectodermal Tumor
 - Rhabdomyosarcoma
 - Non-Rhabdomyosarcoma Soft Tissue Sarcomas
 - These and other rare tumors have been reported occurring primarily in the kidney and should be imaged according to the guidelines for the specific histologic diagnosis.
- For suspected renal tumor, cell type unknown, image according to **Pediatric Renal Cell Carcinoma (RCC) (PEDONC-7.4)**
- PET is not **routinely** supported for initial staging, treatment response or surveillance of any pediatric renal tumor-rare circumstances where an exception to routine may be considered are listed in the relevant guideline sections

Unilateral Wilms Tumor (UWT) (PEDONC-7.2)

ONCP.RC.0007.2.A

v2.0.2024

Indication	Imaging Study
Initial Staging	<ul style="list-style-type: none"> CT Abdomen with contrast (CPT® 74160) <ul style="list-style-type: none"> CT Abdomen and Pelvis with contrast (CPT® 74177) may be approved in lieu of CPT® 74160 included if mass is presumed to extend into the pelvis. <ul style="list-style-type: none"> Doppler ultrasound to evaluate for tumor thrombus is not necessary unless CT findings are inconclusive CT Chest with (CPT® 71260) or without contrast (CPT® 71250) <ul style="list-style-type: none"> Should be completed prior to anesthesia exposure if possible PET is not routinely indicated in the initial staging of any pediatric renal tumor
Bilateral renal lesions noted on ultrasound or CT	<ul style="list-style-type: none"> MRI Abdomen (CPT® 74183) and Pelvis (CPT® 72197) without and with contrast
Additional initial staging imaging for any individual with neurologic signs or symptoms raising suspicion of CNS metastases	<ul style="list-style-type: none"> MRI Brain without and with contrast (CPT® 70553)
Additional initial staging imaging for any individual with signs or symptoms raising suspicion of bony metastases	<ul style="list-style-type: none"> Bone scan (see: PEDONC-1.3 for coding)
Treatment response ~every 2 cycles during treatment and at the end of planned therapy	<ul style="list-style-type: none"> CT Chest with (CPT® 71260) or without contrast (CPT® 71250) CT Abdomen with contrast (CPT® 74160) or CT Abdomen and Pelvis with contrast (CPT® 74177) or MRI Abdomen (CPT® 74183) and Pelvis (CPT® 72197) without and with contrast

Indication	Imaging Study
Rare circumstances to establish the presence of active disease only when a major therapeutic decision depends on PET avidity	<ul style="list-style-type: none">PET/CT (CPT® 78815)
Surveillance	<ul style="list-style-type: none">CT Chest with contrast (CPT® 71260) or CT Chest without contrast (CPT® 71250), or chest x-ray AND CT with contrast (CPT® 74160) or Abdominal US (CPT® 76700)<ul style="list-style-type: none">Every 3 months for 2 years, then every 6 months for 2 additional years, to complete 4 years surveillancePelvic imaging (CT or ultrasound) may be added for individuals treated with nephrectomy only or individuals with a history of tumor rupture, known pelvic involvement, or a history of disease recurrence
<ul style="list-style-type: none">There are no data to support the use of PET imaging for routine surveillance in any individual with Wilms tumor.	

Background and Supporting Information

- Many individuals will present with an asymptomatic abdominal mass, and will undergo ultrasound as a primary evaluation.
- Only ~0.5% of individuals with Wilms tumor will ever develop brain metastases
- A very low risk subset of stage I FHWT will be observed after nephrectomy, and enter directly into surveillance.
- The majority of individuals will receive chemotherapy with or without XRT, beginning within 14 days of initial surgery.

Bilateral Wilms Tumor (BWT) (PEDONC-7.3)

ONCP.RC.0007.3.A

v2.0.2024

Indication	Imaging Study
Initial Staging	<ul style="list-style-type: none"> MRI Abdomen and Pelvis without and with contrast (CPT® 74183 and CPT® 72197) <ul style="list-style-type: none"> CT Abdomen and Pelvis with contrast (CPT® 74177) may be approved in lieu of MRI per provider request. CT Abdomen and Pelvis with contrast (CPT® 74177) is often performed prior to discovery of bilateral lesions and should not prevent MRI from being approved if requested <ul style="list-style-type: none"> Doppler ultrasound to evaluate for tumor thrombus is not necessary unless CT findings are inconclusive CT Chest with (CPT® 71260) or without contrast (CPT® 71250) <ul style="list-style-type: none"> Should be completed prior to anesthesia exposure if possible PET is not indicated in the initial staging of any pediatric renal tumor
Additional initial staging imaging for any individual with neurologic signs or symptoms raising suspicion of CNS metastases	<ul style="list-style-type: none"> MRI Brain without and with contrast (CPT® 70553)
Additional initial staging imaging for any individual with signs or symptoms raising suspicion of bony metastases	<ul style="list-style-type: none"> Bone scan (see: PEDONC-1.3 for coding)
Treatment response ~every 2 cycles during treatment and at the end of planned therapy	<ul style="list-style-type: none"> MRI Abdomen and Pelvis without and with contrast (CPT® 74183 and CPT® 72197) <ul style="list-style-type: none"> CT Abdomen and Pelvis with contrast (CPT® 74177) may be used for individuals with a contraindication to MRI CT Chest with (CPT® 71260) or without contrast (CPT® 71250)

Indication	Imaging Study
Rare circumstances to establish the presence of active disease only when a major therapeutic decision depends on PET avidity	<ul style="list-style-type: none">PET/CT (CPT® 78815)
Surveillance	<ul style="list-style-type: none">Every 3 months for 2 years, then every 6 months for 2 additional years, to complete 4 years surveillance:<ul style="list-style-type: none">CT Chest with contrast (CPT® 71260) or CT Chest without contrast (CPT® 71250) or chest x-ray ANDCT Abdomen with contrast (CPT® 74160) or Abdominal US (CPT® 76700)Pelvic imaging (CT or ultrasound) may be added for individuals treated with nephrectomy only or individuals with a history of tumor rupture, known pelvic involvement, or a history of disease recurrence
<ul style="list-style-type: none">PET is not routinely utilized to assess treatment response or for surveillance in Wilms tumor.	

Background and Supporting Information

- Many individuals will present with an asymptomatic abdominal mass, and will undergo ultrasound as a primary evaluation.
- Individuals with bilateral Wilms Tumor may begin therapy without a histologic diagnosis to preserve a localized disease stage and attempt to shrink the tumors to allow for renal-sparing surgical approaches.
- Only ~0.5% of Wilms tumor individuals will ever develop brain metastases
- If treating with chemotherapy without a biopsy, disease evaluation is indicated at week 6. If either tumor has not shrunk 50%, then open biopsy is indicated to confirm favorable histology.
- If partial nephrectomy still not feasible at week 6, the next disease evaluation is at week 12. Surgical resection should occur no later than week 12.

Pediatric Renal Cell Carcinoma (RCC) (PEDONC-7.4)

ONCP.RC.0007.4.A

v2.0.2024

Indication	Imaging Study
Initial Staging	<ul style="list-style-type: none"> CT Abdomen and Pelvis with contrast (CPT® 74177) <ul style="list-style-type: none"> If bilateral renal lesions are noted on ultrasound or CT, MRI Abdomen and Pelvis without and with contrast (CPT® 74183 and CPT® 72197) should be strongly considered CT Chest with (CPT® 71260) <i>or</i> without contrast (CPT® 71250) <ul style="list-style-type: none"> Should be completed prior to anesthesia exposure if possible PET scan is not indicated in the initial staging of any pediatric renal tumor
Additional initial staging for any individual with neurologic signs or symptoms raising suspicion of CNS metastases	<ul style="list-style-type: none"> MRI Brain without and with contrast (CPT® 70553)
Additional initial staging for any individual with signs or symptoms raising suspicion of bony metastases	<ul style="list-style-type: none"> Bone scan (See: <u>PEDONC-1.3</u> for coding)
Treatment response in individuals with residual measurable disease after initial surgery and receiving adjuvant medical therapy	<ul style="list-style-type: none"> Every 2 cycles during active treatment: <ul style="list-style-type: none"> CT Chest with (CPT® 71260) <i>or</i> without contrast (CPT® 71250) and CT Abdomen with contrast (CPT® 74160) <ul style="list-style-type: none"> Pelvic imaging is not indicated unless prior pelvic involvement has been documented
Rare circumstances to establish the presence of active disease only when a major therapeutic decision depends on PET avidity	<ul style="list-style-type: none"> PET/CT (CPT® 78815) Indications and coding for rare circumstances where PET/MRI may be approved are found in <u>PET Imaging in Pediatric Oncology (PEDONC-1.4)</u>

Indication	Imaging Study
Surveillance in individuals with documented CNS metastases	<ul style="list-style-type: none"> Every 6 months for 2 years after completion of all therapy: <ul style="list-style-type: none"> MRI Brain without and with contrast (CPT® 70553)
Surveillance in individuals with TFE3 or TFEB subtype	<ul style="list-style-type: none"> Every 3 months for 2 years, then every 6 months for 2 years after completion of all therapy: <ul style="list-style-type: none"> CT Chest with (CPT® 71260) or without contrast (CPT® 71250) CT Abdomen with contrast (CPT® 74160) or MRI Abdomen without and with contrast (CPT® 74183) <ul style="list-style-type: none"> Pelvic imaging is not indicated for surveillance unless prior pelvic involvement has been documented
Surveillance in all other histologies	<ul style="list-style-type: none"> See: <u>Renal Cell Cancer (RCC) – Surveillance (ONC-17.4)</u>
New signs/symptoms suggestive of CNS recurrence	<ul style="list-style-type: none"> MRI Brain without and with contrast (CPT® 70553)
<ul style="list-style-type: none"> PET is not routinely utilized to assess treatment response in pediatric RCC. 	

Background and Supporting Information

- A majority of pediatric cases have a novel subtype involving TFE3 or TFEB translocations, which have a different natural history than “adult type” RCC
- Individuals of any age with TFE3 or TFEB translocated RCC should be imaged according to this guideline section.
- 40% to 45% of pediatric RCC cases have similar histologies to adult RCC (clear cell, papillary, chromophobe, etc.) and imaging decisions will be similar to general oncology guidelines.
- Individuals with all other subtypes of RCC should be imaged according to **Renal Cell Cancer (RCC) (ONC-17)** in the Oncology Imaging Guidelines
- Many individuals will present with an asymptomatic abdominal mass, and will undergo ultrasound as a primary evaluation. Doppler ultrasound to evaluate for tumor thrombus is no longer necessary unless CT findings are inconclusive, and should not be performed if CT is already completed.
- Other staging imaging than what is stated in the above table should be deferred until a histologic diagnosis is made, by complete nephrectomy for most unilateral renal tumors and biopsy for bilateral renal tumors or inoperable unilateral tumors
- Most individuals will have surgical resection of all disease at the time of diagnosis and will enter directly into surveillance

Clear Cell Sarcoma of the Kidney (CCSK) (PEDONC-7.5)

ONCP.RC.0007.5.A

v2.0.2024

Be careful not to confuse the diagnosis with clear cell RCC. See: Renal Cell Cancer (RCC) (ONC-17) for imaging guidelines.

Indication	Imaging Study
Initial Staging	<ul style="list-style-type: none"> CT Abdomen and Pelvis with contrast (CPT® 74177) <ul style="list-style-type: none"> Doppler ultrasound to evaluate for tumor thrombus is not necessary unless CT findings are inconclusive CT Chest with (CPT® 71260) or without contrast (CPT® 71250) <ul style="list-style-type: none"> Should be completed prior to anesthesia exposure if possible Bone scan (see: PEDONC-1.3 for coding) MRI Brain without and with contrast (CPT® 70553) PET is not indicated in the initial staging of any pediatric renal tumor
Bilateral renal lesions are noted on ultrasound or CT in initial staging	<ul style="list-style-type: none"> MRI Abdomen and Pelvis without and with contrast (CPT® 74183 and CPT® 72197)
Treatment response ~every 2 cycles during treatment and at the end of planned therapy	<ul style="list-style-type: none"> CT Chest with (CPT® 71260) or without contrast (CPT® 71250) CT Abdomen and Pelvis with contrast (CPT® 74177) or MRI Abdomen and Pelvis without and with contrast (CPT® 74183 and CPT® 72197) Additionally, for individuals with CNS metastases at initial staging: <ul style="list-style-type: none"> MRI Brain without and with contrast (CPT® 70553) Bone scan (see: Modality General Considerations (PEDONC-1.3) for coding) at the end of planned therapy
Rare circumstances to establish the presence of active disease only when a major therapeutic decision depends on PET avidity	<ul style="list-style-type: none"> PET/CT (CPT® 78815) Indications and coding for rare circumstances where PET/MRI may be approved are found in <u>PET Imaging in Pediatric Oncology (PEDONC-1.4)</u>

Indication	Imaging Study
Surveillance	<ul style="list-style-type: none"> Every 3 months for 2 years after completion of all therapy: <ul style="list-style-type: none"> CT Chest with (CPT® 71260) <i>or</i> without contrast (CPT® 71250) CT Abdomen and Pelvis with contrast (CPT® 74177) or MRI Abdomen and Pelvis without and with contrast (CPT® 74183 and CPT® 72197) Every 6 months for 3 years after completion of all therapy: <ul style="list-style-type: none"> MRI Brain without and with contrast (CPT® 70553) Every 3 months for 1 year, then every 6 months for 2 years after completion of all therapy: <ul style="list-style-type: none"> Bone scan (see: Modality General Considerations (PEDONC-1.3) for coding) If negative at 36 months, no further advanced imaging is necessary. Other surveillance imaging should be by Abdominal US (CPT® 76700) and chest x-ray

Background and Supporting Information

- Many individuals will present with an asymptomatic abdominal mass, and will undergo ultrasound as a primary evaluation.
- Other staging imaging should be deferred until a histologic diagnosis is made, by complete nephrectomy for most unilateral renal tumors and biopsy for bilateral renal tumors or inoperable unilateral tumors

Malignant Rhabdoid Tumor of the Kidney (MRT) and Other Extracranial Sites (PEDONC-7.6)

ONCP.RC.0007.6.A
v2.0.2024

Be careful not to confuse the diagnosis with rhabdomyosarcoma. See: Rhabdomyosarcoma (RMS) (PEDONC-8.2) for Imaging Guidelines

Indication	Imaging Study
Initial Staging	<ul style="list-style-type: none"> CT Abdomen and Pelvis with contrast (CPT® 74177) <ul style="list-style-type: none"> Doppler ultrasound to evaluate for tumor thrombus is not necessary unless CT findings are inconclusive CT Chest with (CPT® 71260) or without contrast (CPT® 71250) <ul style="list-style-type: none"> Should be completed prior to anesthesia exposure if possible Bone scan (see: PEDONC-1.3 for coding) MRI Brain without and with contrast (CPT® 70553) PET is not indicated in the initial staging of any pediatric renal tumor
Bilateral renal lesions are noted on ultrasound or CT in initial staging	<ul style="list-style-type: none"> MRI Abdomen and Pelvis without and with contrast
Treatment response ~every 2 cycles during treatment and at the end of planned therapy	<ul style="list-style-type: none"> CT Chest with (CPT® 71260) or without contrast (CPT® 71250) CT Abdomen and Pelvis with contrast (CPT® 74177) or MRI Abdomen and Pelvis without and with contrast (CPT® 74183 and CPT® 72197) <ul style="list-style-type: none"> If primary site other than kidney, perform CT with contrast or MRI without and with contrast of primary site in place of abdominal and pelvic imaging MRI Brain without and with contrast (CPT® 70553) can be performed: <ul style="list-style-type: none"> Every 2 cycles during treatment for individuals with CNS metastases at initial staging At the end of planned therapy for all individuals Bone scan (see: PEDONC-1.3 for coding) at the end of planned therapy only if positive at initial diagnosis

Indication	Imaging Study
Rare circumstances to establish the presence of active disease only when a major therapeutic decision depends on PET avidity	<ul style="list-style-type: none"> PET/CT (CPT® 78815) Indications and coding for rare circumstances where PET/MRI may be approved are found in <u>PET Imaging in Pediatric Oncology (PEDONC-1.4)</u>
Surveillance	<ul style="list-style-type: none"> Every 3 months for 2 years after completion of all therapy: <ul style="list-style-type: none"> CT Chest with (CPT® 71260) or without contrast (CPT® 71250) Every 3 months for 3 years after completion of all therapy: <ul style="list-style-type: none"> CT Abdomen and Pelvis with contrast (CPT® 74177) or MRI Abdomen and Pelvis without and with contrast (CPT® 74183 and CPT® 72197) <ul style="list-style-type: none"> If primary site other than kidney, perform CT with contrast or MRI without and with contrast of primary site in place of abdominal imaging Every 3 months for 1 year, then every 6 months for 1 year after completion of all therapy: <ul style="list-style-type: none"> MRI Brain without and with contrast (CPT® 70553) If bone scan positive at initial diagnosis: <ul style="list-style-type: none"> Every 3 months for 1 year, then every 6 months for 2 years: <ul style="list-style-type: none"> Bone scan (see: <u>PEDONC-1.3</u> for coding) If negative at 36 months, no further advanced imaging is necessary The role of surveillance imaging beyond these timeframes is unclear. Abdominal US (CPT® 76700) and chest x-ray may be considered
Continued Surveillance of individuals with Rhabdoid Tumor predisposition Syndrome	<ul style="list-style-type: none"> See: <u>Rhabdoid Tumor Predisposition Syndrome (PEDONC-2.11)</u>

Background and Supporting Information

- MRT is a highly aggressive histologic variant that can also occur in other locations and all non-CNS sites should follow these guidelines.
- Primary CNS rhabdoid malignancies should be imaged according to **Atypical Teratoid/Rhabdoid Tumors (ATRT) PEDONC-4.5**
- Many individuals will present with an asymptomatic abdominal mass, and will undergo ultrasound as a primary evaluation.
- Other staging imaging should be deferred until a histologic diagnosis is made, by complete nephrectomy for most unilateral renal tumors and biopsy for bilateral renal tumors or inoperable unilateral tumors

Congenital Mesoblastic Nephroma (CMN) (PEDONC-7.7)

ONCP.RC.0007.7.A
v2.0.2024

Congenital Mesoblastic Nephroma Initial Staging

- CT Abdomen and Pelvis with contrast (CPT® 74177) is indicated in all individuals
- CT Chest with (CPT® 71260) can be approved to evaluate inconclusive findings on chest x-ray

Congenital Mesoblastic Nephroma Treatment Response

- CT Abdomen and Pelvis with contrast (CPT® 74177) once following resection to establish baseline imaging, and those with a complete resection should then be imaged according to surveillance guidelines
- CT Abdomen and Pelvis with contrast (CPT® 74177) for individuals receiving preoperative chemotherapy every 2 cycles of therapy until surgery and then should be imaged according to surveillance guidelines after their postoperative baseline imaging study

Congenital Mesoblastic Nephroma Surveillance Imaging

- Ultrasound is the preferred surveillance imaging modality to avoid radiation and anesthesia exposures
- CT Abdomen and Pelvis with contrast (CPT® 74177) **or** MRI Abdomen and Pelvis without and with contrast (CPT® 74183 and CPT® 72197) for residual abnormalities present on post-operative imaging or inconclusive findings on ultrasound every 3 months for 1 year after completion of all therapy

Background and Supporting Information

- This is the most common primary renal tumor occurring in young infants, and the overall prognosis is very good
- Complete surgical removal is curative in most cases, and histologically confirmed metastatic disease or bilateral disease has never been reported
- Many individuals will present with an asymptomatic abdominal mass at the time of birth or abnormal prenatal ultrasound, and will undergo ultrasound as a primary evaluation.
- PET is not indicated in the initial staging of any pediatric renal tumor
- Recurrences are rare but most occur within 12 months of diagnosis

Pediatric Soft Tissue Sarcomas (PEDONC-8)

Guideline

Pediatric Soft Tissue Sarcomas – General Considerations
(PEDONC-8.1)

Rhabdomyosarcoma (RMS) (PEDONC-8.2)

Non-Rhabdomyosarcoma Soft Tissue Sarcomas (NRSTS)
(PEDONC-8.3)

References (PEDONC-8)

Pediatric Soft Tissue Sarcomas – General Considerations (PEDONC-8.1)

ONCP.SS.0008.1.U

v2.0.2024

- Unless specified below, individuals age <18 years old should be imaged according to this guideline section. Exceptions include:
 - Rhabdomyosarcoma in individuals (except uterine rhabdomyosarcoma) of all ages should be imaged according to guidelines in **Rhabdomyosarcoma (RMS) (PEDONC-8.2)**
 - Uterine rhabdomyosarcoma individuals of all ages should be imaged according to guidelines in Uterine Cancer (ONC-22). See: **Uterine Cancer – General Considerations (ONC-22.0)** in the Oncology Imaging Guidelines
 - Kaposi's sarcoma in individuals of all ages should be imaged according to guidelines in **Kaposi's Sarcoma (ONC-31.10)** in the Oncology Imaging Guidelines
- Evaluation of soft tissue masses of uncertain nature prior to biopsy should follow general imaging guidelines:
 - Individuals age 0 to 17 years, see: **Soft Tissue and Bone Masses (PEDMS-3)** in the Pediatric Musculoskeletal Imaging Guidelines
 - Individuals age ≥18 years, see: **Soft Tissue Mass or Lesion of Bone (MS-10)** in the Musculoskeletal Imaging Guidelines
- Where there are indications for PET/CT in these guidelines, note that indications and coding for rare circumstances where PET/MRI may be approved are found in **PET Imaging in Pediatric Oncology (PEDONC-1.4)**

Rhabdomyosarcoma (RMS) (PEDONC-8.2)

ONCP.SS.0008.2.A

v2.0.2024

- Individuals of all ages are imaged according to this guideline, with exception of uterine rhabdomyosarcoma, which is imaged according to Uterine Cancer (ONC-22). See: **Uterine Cancer – General Considerations (ONC-22.0)** in the Oncology Imaging Guidelines.

Indication	Imaging Study
Initial staging for all individuals	<p><u>ALL of the following:</u></p> <ul style="list-style-type: none"> MRI without and with contrast of primary site <ul style="list-style-type: none"> CT with contrast is supported if MRI is contraindicated CT Chest with contrast or CT Chest without contrast <ul style="list-style-type: none"> Should be completed prior to anesthesia exposure if possible Whole-Body PET/CT (CPT® 78816) <ul style="list-style-type: none"> Bone scan may be substituted for PET, if PET not available
<p><u>Additional initial staging for ANY of the following:</u></p> <ul style="list-style-type: none"> Evaluation of inconclusive PET findings in the abdomen or pelvis Primary site of abdomen or pelvis Lower extremity primary site 	<ul style="list-style-type: none"> CT Abdomen and Pelvis with contrast (CPT 74177)
<p><u>Additional initial staging for ANY of the following:</u></p> <ul style="list-style-type: none"> Primary site involving the paraspinal or paravertebral region PET or bone scan-avid lesions in skull, neck, vertebrae Neurologic signs or symptoms raising suspicion of CNS metastases 	<p><u>ALL of the following:</u></p> <ul style="list-style-type: none"> MRI Brain (CPT® 70553) MRI Spine without and with contrast (Cervical-CPT® 72156, Thoracic-CPT® 72157, Lumbar-CPT® 72158)

Indication	Imaging Study
Treatment response, every 2 cycles during treatment, prior to local control surgery, and at the end of planned therapy	<p><u>ALL of the following:</u></p> <ul style="list-style-type: none"> CT Chest with (CPT® 71260) contrast or CT Chest without contrast (CPT® 71250) MRI without and with contrast of primary site <ul style="list-style-type: none"> CT may be used if used at initial imaging for MRI contraindication CT with contrast or MRI without and with contrast of all known metastatic sites using the same conventional imaging modality as per initial staging
<p><u>ANY of the following:</u></p> <ul style="list-style-type: none"> Response assessment prior to local control surgery or radiation therapy Evaluation of residual mass visible on conventional imaging as part of end of therapy evaluation Response assessment of disease visible on PET but not conventional imaging PET results are likely to result in a treatment change for the individual, including a change from active treatment to surveillance. 	<ul style="list-style-type: none"> Whole-body PET/CT (CPT® 78816) <ul style="list-style-type: none"> Once PET has been documented to be negative for a given individual's cancer or all PET-avid disease has been surgically resected, PET should not be used for continued disease monitoring or surveillance unless one of the exceptions in section General Guidelines (PEDONC-1.0) applies.
Restaging following local control surgery	<p><u>ALL of the following:</u></p> <ul style="list-style-type: none"> MRI without and with contrast of primary site <ul style="list-style-type: none"> CT may be used if used at initial imaging for MRI contraindication CT with contrast or MRI without and with contrast of all known metastatic sites using the same conventional imaging modality as per initial staging

Indication	Imaging Study
Surveillance, localized RMS	<p><u>ALL of the following, every 3 months for 1 year, then every 4 months for 2 years, then every 6 months for 1 year after completion of all therapy:</u></p> <ul style="list-style-type: none"> • MRI without or without and with contrast of primary tumor site <ul style="list-style-type: none"> • CT may be substituted if MRI contraindicated • Chest x-ray <ul style="list-style-type: none"> • CT Chest with (CPT® 71260) or CT Chest without contrast (CPT® 71250) is indicated for new or worsening clinical symptoms of chest disease or new findings on chest x-ray
Surveillance, metastatic RMS	<p><u>ALL of the following, every 3 months for 1 year, then every 4 months for 2 years, then every 6 months for 1 year after completion of all therapy:</u></p> <ul style="list-style-type: none"> • MRI without or without and with contrast of primary tumor site • CT may be substituted if contraindication to MRI • CT Chest with (CPT® 71260) <i>or</i> without contrast (CPT® 71250) • CT with or without contrast of all known metastatic sites • Nuclear bone scan (see: PEDONC-1.3 for coding) for surveillance of known bony metastases
Suspected recurrence	<ul style="list-style-type: none"> • Repeat conventional imaging as per initial staging for all individuals

Indication	Imaging Study
ONE of the following: <ul style="list-style-type: none">• Biopsy-proven recurrence• Conventional imaging (CT, MRI, US, plain film) reveals findings that are inconclusive or suspicious for recurrence, and PET avidity will determine whether biopsy or continued observation is appropriate• Rare circumstances where obvious clinical symptoms show strong evidence suggesting recurrence, and PET would replace conventional imaging modalities.	<ul style="list-style-type: none">• Whole-body PET/CT (CPT® 78816)

Background and Supporting Information

- Soft tissue sarcomas occur in both adult and pediatric individuals, but some are more common in one age group than the other.
- Pediatric soft tissue sarcomas are divided into **two** groups:
 - Rhabdomyosarcoma (RMS) accounts for ~60% of soft tissue sarcomas in young individuals, but only ~25% of soft tissue sarcomas in adolescents
 - Nonrhabdomyosarcoma soft tissue sarcomas (NRSTS) which encompasses all other histologic subtypes
- Because RMS can arise from any muscle tissue, the presenting symptoms and primary tumor sites vary widely and strongly influence the appropriate imaging decisions
- CT with contrast is the preferred primary site imaging modality for RMS arising in the thoracic cavity (not the chest wall)
- MRI without and with contrast is the preferred primary site imaging modality for RMS occurring in all other anatomic locations, including the chest wall.
- PET/CT is superior to conventional imaging for detection of nodal and bony metastases in pediatric RMS and is indicated in the initial staging of all individuals after histologic diagnosis is established
- CT Abdomen and Pelvis with contrast (CPT® 74177) is not routinely indicated in the initial metastatic staging of pediatric RMS
- PET is not routinely utilized to assess treatment response in RMS
- PET is generally not indicated during active treatment for recurrent pediatric cancer

- Residual mass that has not changed in size since the last conventional imaging does not justify PET imaging during surveillance
- PET avidity in a residual mass at the end of planned therapy is not an indication for PET imaging during surveillance

Non-Rhabdomyosarcoma Soft Tissue Sarcomas (NRSTS) (PEDONC-8.3)

ONcp.ss.0008.3.A

v2.0.2024

Indication	Imaging Study
Initial staging of all individuals	<p><u>ALL</u> of the following:</p> <ul style="list-style-type: none"> MRI without and with contrast of primary site <ul style="list-style-type: none"> CT with contrast may be substituted if contraindication to MRI CT Chest with contrast or without contrast <ul style="list-style-type: none"> Should be completed prior to anesthesia if possible For primary tumor of the chest wall, both MRI Chest wall without and with contrast (CPT® 71552) and CT Chest with contrast (CPT® 71260) or without contrast to assess for pulmonary metastatic disease (indicated simultaneously) PET/CT (CPT® 78815) <ul style="list-style-type: none"> Whole-body PET/CT (CPT® 78816) if there is clinical suspicion of skull or distal lower extremity involvement Nuclear bone scan (see: PEDONC-1.3 for coding) if PET is not available
<p><u>ANY</u> of the following:</p> <ul style="list-style-type: none"> Additional initial staging for individuals with disease in the abdomen, pelvis, or lower extremities Inconclusive findings in the abdomen on PET/CT 	<ul style="list-style-type: none"> CT Abdomen and Pelvis with contrast (CPT® 74177) if not already performed
Additional staging for individuals with primary site arising in the paraspinal or paravertebral region	<ul style="list-style-type: none"> MRI Brain (CPT® 70553) and Spine (Cervical-CPT® 72156, Thoracic-CPT® 72157, Lumbar-CPT® 72158) without and with contrast

Indication	Imaging Study
Further evaluation of ANY of the following: <ul style="list-style-type: none">PET or nuclear bone scan-avid lesions in skull, neck, or vertebrae seen on initial imagingNeurologic signs or symptoms raising suspicion of CNS metastases	<u>ALL of the following:</u> <ul style="list-style-type: none">MRI Brain (CPT® 70553)MRI Spine (Cervical-CPT® 72156, Thoracic-CPT® 72157, Lumbar-CPT® 72158)
Treatment response, every 2 cycles of treatment, prior to local control, and at the end of planned therapy	<u>Either of the following:</u> <ul style="list-style-type: none">CT Chest with (CPT® 71260) or CT Chest without contrast (CPT® 71250), andMRI without and with contrast of primary site<ul style="list-style-type: none">CT may be substituted if contraindication to MRIandImaging of all known metastatic sites using the same conventional imaging modality as per initial staging <p>OR</p> <ul style="list-style-type: none">PET/CT (CPT® 78815) if disease visible on initial staging PET but not on conventional imaging<ul style="list-style-type: none">Whole-body PET/CT (CPT® 78816) if there is clinical suspicion of skull or distal lower extremity involvement

Indication	Imaging Study
<p>ANY of the following, if PET positive at initial diagnosis:</p> <ul style="list-style-type: none"> Assessment prior to local control surgery or radiation therapy Evaluation of residual mass visible on conventional imaging as part of end of therapy evaluation Rare circumstances when PET results are likely to result in a treatment change for the individual, including a change from active treatment to surveillance 	<ul style="list-style-type: none"> PET/CT (CPT® 78815) <ul style="list-style-type: none"> Whole-body PET/CT (CPT® 78816) if there is clinical suspicion of skull or distal lower extremity involvement Once PET has been documented to be negative for a given individual's cancer or all PET-avid disease has been surgically resected, PET should not be used for continued disease monitoring or surveillance unless one of the exceptions in section <u>General Guidelines (PEDONC-1.0)</u> applies.
Restaging following local control surgery	<p><u>ALL of the following:</u></p> <ul style="list-style-type: none"> MRI without and with contrast of the primary site <ul style="list-style-type: none"> CT may be substituted if contraindication to MRI Imaging of all known metastatic sites using the same conventional imaging modality as per initial staging
Surveillance, localized NRSTS treated with resection (with or without radiation) or chemotherapy	<p><u>Every 3 months for the first 12 months, then every 4 months in years 2 and 3, and every 6 months in years 4 and 5 to complete 5 years surveillance after completion of therapy:</u></p> <ul style="list-style-type: none"> MRI without and with contrast of the primary site CT may be substituted if MRI contraindicated <p>AND</p> <p><u>Every 6 months for 3 years after completion of all therapy</u></p> <ul style="list-style-type: none"> CT Chest with (CPT® 71260) or CT Chest without contrast (CPT® 71250) <ul style="list-style-type: none"> CT Chest only supported for new symptoms or new findings on chest x-ray thereafter.

Indication	Imaging Study
Surveillance of metastatic NRSTS, and no prior history of disease in the chest	<p><u>Every 3 months for the first 12 months, then every 4 months in years 2 and 3, and every 6 months in years 4 and 5 to complete 5 years surveillance after completion of therapy:</u></p> <ul style="list-style-type: none"> MRI without and with contrast of the primary site <ul style="list-style-type: none"> CT may be substituted if MRI contraindicated Nuclear bone scan (see: PEDONC-1.3 for coding) for surveillance of known bony metastases <p>AND</p> <p><u>Every 6 months for 3 years:</u></p> <ul style="list-style-type: none"> CT Chest with (CPT® 71260) or CT Chest without contrast (CPT® 71250)
Surveillance of metastatic NRSTS, and known prior history of metastatic disease in the chest	<p><u>Every 3 months for the first 12 months, then every 4 months in years 2 and 3, and every 6 months in years 4 and 5 to complete 5 years surveillance after completion of therapy:</u></p> <ul style="list-style-type: none"> MRI without and with contrast of the primary site <ul style="list-style-type: none"> CT may be substituted if MRI contraindicated CT Chest with contrast (CPT® 71260) or CT Chest without contrast (CPT® 71250) Nuclear bone scan (see: PEDONC-1.3 for coding) for surveillance of known bony metastases
Surveillance, recurrent NRSTS	<p><u>ALL of the following after successful treatment for recurrent disease, every 3 months for 1 year:</u></p> <ul style="list-style-type: none"> CT Chest (CPT® 71260) with contrast CT with contrast or MRI without and with contrast of the primary site Surveillance in years 2 through 5 after completing therapy for recurrence should follow the standard timing listed in the appropriate surveillance section

Indication	Imaging Study
ANY of the following: <ul style="list-style-type: none">Conventional imaging (CT, MRI, US, plain film) during surveillance reveals findings that are inconclusive or suspicious for recurrence, and PET avidity will determine whether biopsy or continued observation is appropriateObvious clinical symptoms show strong evidence suggesting recurrent and PET would replace conventional imaging modalities	<ul style="list-style-type: none">PET/CT (CPT® 78815)<ul style="list-style-type: none">Whole-body PET/CT (CPT® 78816) if there is clinical suspicion of skull or distal lower extremity involvement

Background and Supporting Information

- All soft tissue sarcomas other than RMS fall into this category
- Because soft tissue sarcomas can arise from any soft tissue, the presenting symptoms and primary tumor sites vary widely and strongly influence the appropriate imaging decisions
- CT Abdomen and Pelvis with contrast (CPT® 74177) is not routinely indicated in the initial metastatic staging of pediatric NRSTS
- Many individuals with NRSTS will be treated with surgical resection alone, and these individuals enter immediately into surveillance
- PET imaging is not routinely utilized to assess treatment response in NRSTS
- PET imaging is generally not indicated during active treatment for recurrent pediatric cancer.
- Residual mass that has not changed in size since the last conventional imaging does not justify PET
- PET avidity in a residual mass at the end of planned therapy is not an indication for PET imaging during surveillance

ONCP.BT.0009.1.A

v2.0.2024

These guidelines include both benign and malignant lesions.

- Unless specified below, individuals who are <18 years old should be imaged according to this guideline section. Exceptions include:
 - Osteogenic sarcoma individuals of all ages should be imaged according to guidelines in **Osteogenic Sarcoma (OS) (PEDONC-9.3)**
 - Ewing Sarcoma and Primitive Neuroectodermal Tumor individuals of all ages should be imaged according to guidelines in **Ewing Sarcoma and Primitive Neuroectodermal Tumors (ESFT) (PEDONC-9.4)**
 - Chondrosarcoma individuals of all ages should be imaged according to guidelines in **Bone Sarcomas – Initial Work-up/Staging (ONC-12.6)**
 - Chordoma individuals of all ages should be imaged according to guidelines in **Bone Sarcomas – Initial Work-up/Staging (ONC-12.6)**
 - Giant cell tumor of bone and enchondroma individuals of all ages should be imaged according to guidelines in **Benign Bone Tumors – General Considerations (ONC-12.9)**
 - Other benign bone tumor individuals of all ages should be imaged according to guidelines in **Benign Bone Tumors (PEDONC-9.2)**
- Prosthetic devices for children after surgery for bony tumors are nearly all customized.
 - CT, contrast as requested in alignment with prosthetic manufacturer specifications, is appropriate when requested by the operating surgeon for planning for customized-to-individual joint replacement or prosthetic surgery
- All bone tumors should be evaluated by plain x-ray prior to any advanced imaging
- PET does not reliably distinguish between benign and malignant bone tumors and should not be performed prior to biopsy.
- Where indications for PET/CT are noted, please note that indications and coding for rare circumstances where PET/MRI may be approved are found in **PET Imaging in Pediatric Oncology (PEDONC-1.4)**
- CT Chest is superior to PET/CT for the detection of pulmonary metastases, and is indicated in the initial workup of all suspected malignant bone tumors.
 - CT Chest should be completed prior to anesthesia exposure, if possible.

Benign Bone Tumors (PEDONC-9.2)

ONCP.BT.0009.2.A
v2.0.2024

- Osteochondroma

Indication	Imaging Study
Preoperative planning	<ul style="list-style-type: none"> MRI without and with contrast can be approved after evaluation by the operating surgeon See: General Considerations (PEDONC-9.1) for requests related to prosthetic planning
<ul style="list-style-type: none"> ANY of the following: <ul style="list-style-type: none"> Concern for malignant transformation New or worsening pain/symptoms Change on a recent plain x-ray 	<ul style="list-style-type: none"> MRI without contrast or without and with contrast

- Osteoid osteoma

Indication	Imaging Study
Suspected, based on clinical history and plain film findings	<ul style="list-style-type: none"> CT without contrast
<ul style="list-style-type: none"> ANY of the following: <ul style="list-style-type: none"> CTs are not characteristic for diagnosis Individual has bone pain not localized to the area of findings on CT or x-ray 	<ul style="list-style-type: none"> ONE of the following: <ul style="list-style-type: none"> Triple phase bone scan (CPT® 78315) SPECT (CPT® 78803) Hybrid SPECT/CT (CPT® 78830)
<ul style="list-style-type: none"> Individuals with new pain who have been previously treated with radiofrequency ablation or curettage 	<ul style="list-style-type: none"> Bone scan (CPT® code 78830, 78315, or 78803 – as requested)

- Other benign tumors

- Refer to **Mass Involving Bone (Including suspected Lytic and Blastic Metastatic Disease) (PEDMS-3.4)**

Background and Supporting Information

- Plain x-ray appearance is diagnostic for many benign bone tumors, and advanced imaging is generally unnecessary except for preoperative planning
- Plain x-ray appearance is diagnostic for osteochondroma for the majority of individuals and advanced imaging is generally unnecessary

Osteogenic Sarcoma (OS) (PEDONC-9.3)

ONCP.BT.0009.3.A

v2.0.2024

Indication	Imaging Study
Suspected or Biopsy Proven Diagnosis	<ul style="list-style-type: none"> MRI without and with contrast of the primary site OR CT, contrast as request, of the primary site if there is a contraindication to MRI <p>AND</p> <ul style="list-style-type: none"> CT Chest with (CPT® 71260) or without contrast (CPT® 71250) <ul style="list-style-type: none"> CT Chest is indicated in initial workup of all suspected malignant bone tumors in children and should be completed prior to anesthesia exposure if possible These studies may be approved even when PET/CT has already been authorized or performed
Initial Staging of Biopsy Proven Disease	<ul style="list-style-type: none"> PET/CT whole-body (CPT® 78816) <ul style="list-style-type: none"> Nuclear bone scan (see: (PEDONC-1.3) for coding) may be substituted if PET not available PET/CT may be approved in addition to the conventional imaging listed in the suspected/diagnosis sections CT Abdomen and Pelvis with contrast (CPT® 74177) is not routinely indicated in the initial metastatic staging of pediatric OS but can be approved in the following situations: <ul style="list-style-type: none"> Evaluation of inconclusive PET findings Primary site of abdomen or pelvis
Suspected bony metastatic sites noted on PET or bone scan	<ul style="list-style-type: none"> MRI without and with contrast of the suspected metastatic site OR CT with contrast of the suspected metastatic site
Restaging after 10 to 12 weeks of neoadjuvant chemotherapy prior to local control surgery	<ul style="list-style-type: none"> MRI without and with contrast of primary site CT Chest with (CPT® 71260) or without contrast (CPT® 71250) PET/CT whole-body (CPT® 78816) or bone scan (see: (PEDONC-1.3) for coding)

Indication	Imaging Study
Individuals with metastatic disease undergoing current chemotherapy	<ul style="list-style-type: none"> CT Chest with (CPT®) or without contrast (CPT® 71250) can be performed every 2 cycles during treatment and at the end of planned chemotherapy MRI without and with contrast of primary site can be performed every 2 cycles during treatment and at the end of planned chemotherapy If previously positive for bony metastases, PET/CT whole body (CPT® 78816) or bone scan (see: (PEDONC-1.3) for coding) every 2 cycles during treatment and at the end of planned chemotherapy Imaging may be indicated more frequently around the time of surgical resection of primary or metastatic lesions to assess for resectability
Preoperative planning for local control surgery	<ul style="list-style-type: none"> CT, contrast as requested MRA and/or CTA may rarely be indicated for complicated surgical resections, and can be approved after evaluation by the operating surgeon to clarify inconclusive MRI findings for preoperative planning See: General Considerations (PEDONC-9.1) for advancing imaging requests related to prosthetic planning
Following local control surgery, until the end of planned adjuvant chemotherapy	<ul style="list-style-type: none"> MRI without and with contrast of primary site ~6 weeks after surgical procedure, and at the end of planned chemotherapy Plain x-rays of the primary site and chest immediately after local control and then every 2 months between the supported, listed advanced imaging studies. CT Chest with (CPT® 71260) or without contrast (CPT® 71250): <ul style="list-style-type: none"> Measurable pulmonary metastases: every 6 weeks, and at the end of planned chemotherapy No measurable pulmonary metastases: every 4 months, and at the end of planned chemotherapy Bone scan (see: (PEDONC-1.3) for coding) every 4 months, and at the end of planned chemotherapy <ul style="list-style-type: none"> PET/CT whole-body (CPT® 78816) can be used in place of bone scan, if positive for distant bone metastases at initial diagnosis

Indication	Imaging Study
Recurrent metastatic or recurrent unresectable disease on treatment	<ul style="list-style-type: none"> The following may be approved every 2 cycles of treatment, and at the end of planned chemotherapy: <ul style="list-style-type: none"> CT Chest with (CPT® 71260) or without contrast (CPT® 71250) MRI without and with contrast of primary site can be performed every 2 cycles during treatment and at the end of planned chemotherapy PET is generally not indicated during active treatment for recurrent pediatric cancer. In rare circumstances, PET/CT imaging with CPT® 78816 may be appropriate when results are likely to result in a treatment change for the patient, including a change from active treatment to surveillance.
Surveillance (all individuals regardless of primary site)	<ul style="list-style-type: none"> Any or all of the following every 3 months for year 1 and 2, then every 4 months in year 3, then every 6 months in year 4 and 5 after completion of all therapy <ul style="list-style-type: none"> CT or MRI of primary site as performed during suspected or initial disease workup (provided the individual does not have an endoprosthesis that will cause MRI or CT artifact): <ul style="list-style-type: none"> CT Chest with (CPT® 71260) or without contrast (CPT® 71250) Bone scan (see: (PEDONC-1.3) for coding) every 3 months for 1 year, then every 4 months for 1 year, then every 6 months for 1 year, then annually for 2 years after completion of all therapy

Indication	Imaging Study
Suspected recurrence	<ul style="list-style-type: none"> • MRI without and with contrast of the primary site and /or site of suspected recurrence based on symptoms or other imaging OR • CT, contrast as request, of the primary site and /or site of suspected recurrence based on symptoms or other imaging if there is a contraindication to MRI AND • CT Chest with (CPT® 71260) or without contrast (CPT® 71250) <ul style="list-style-type: none"> • CT Chest is indicated in initial workup of all suspected malignant bone tumors in children and should be completed prior to anesthesia exposure if possible • CT Abdomen and Pelvis with contrast (CPT® 74177) is not routinely indicated in the metastatic staging of pediatric OS, but can be approved in the following situations: <ul style="list-style-type: none"> • Evaluation of inconclusive PET findings • Primary site of abdomen or pelvis • These studies may be approved even when PET/CT has already been authorized or performed
<ul style="list-style-type: none"> • For suspected recurrence, ANY of the following: <ul style="list-style-type: none"> • Conventional imaging reveals findings that are inconclusive or suspicious for recurrence and PET avidity will determine whether biopsy or continued observation is appropriate • Rare circumstances where obvious clinical symptoms show strong evidence suggesting recurrence and PET would replace conventional imaging modalities 	<ul style="list-style-type: none"> • PET/CT <ul style="list-style-type: none"> • If PET is approved in osteosarcoma, it should be whole-body PET/CT (CPT® 78816)

Indication	Imaging Study
<ul style="list-style-type: none">Biopsy proven recurrence	<ul style="list-style-type: none">PET/CT whole-body (CPT® 78816) may be approved for biopsy proven recurrence<ul style="list-style-type: none">If disease is considered potentially resectable, follow osteosarcoma treatment response as previous

Ewing Sarcoma Family of Tumors (ESFT), Including Primitive Neuroectodermal Tumors (PNET) (PEDONC-9.4)

ONCP.BT.0009.4.A

v2.0.2024

Indication	Imaging Study
Suspected/Diagnosis – ill-defined or non-discrete soft tissue mass without bony involvement	<ul style="list-style-type: none"> US (CPT® 76881 or 76882) in addition to plain x-ray
Suspected or Biopsy Proven Diagnosis – Primary site	<ul style="list-style-type: none"> MRI without and with contrast <ul style="list-style-type: none"> CT, contrast as requested, if there is a contraindication to MRI MRA and/or CTA may rarely be indicated for complicated surgical resections, and can be approved after evaluation by the operating surgeon to clarify inconclusive MRI findings for preoperative planning CT Chest with (CPT® 71260) or without contrast (CPT® 71250) <ul style="list-style-type: none"> CT Chest is indicated in initial workup of all suspected or confirmed malignant bone tumors in children and should be completed prior to anesthesia exposure if possible These studies may be approved even when PET/CT has already been authorized or performed
Suspected or Biopsy Proven Diagnosis – Chest wall primary	<ul style="list-style-type: none"> MRI Chest without and with contrast AND CT Chest with (CPT® 71260) or without contrast (CPT® 71250) <ul style="list-style-type: none"> CT Chest is indicated in initial workup of all suspected or confirmed malignant bone tumors in children and should be completed prior to anesthesia exposure if possible These studies may be approved even when PET/CT has already been authorized or performed

Indication	Imaging Study
Initial Staging (additional imaging after biopsy confirmed disease)	<ul style="list-style-type: none"> PET/CT whole-body (CPT® 78816) <ul style="list-style-type: none"> Bone scan (see: (PEDONC-1.3) for coding) may be substituted for PET imaging if PET not available PET/CT may be approved in addition to the conventional imaging listed in the suspected/diagnosis sections
<ul style="list-style-type: none"> For ANY of the following: <ul style="list-style-type: none"> Evaluation of inconclusive PET findings Primary site involving the abdomen or pelvis 	<ul style="list-style-type: none"> CT Abdomen and Pelvis with contrast (CPT® 74177)
Restaging after 10 to 12 weeks of neoadjuvant chemotherapy prior to local control surgery	<p>Imaging modality should be the same as used for initial staging, any or all from the list below as described:</p> <ul style="list-style-type: none"> MRI without and with contrast of the primary site CT (contrast as requested) may be approved if requested per valuation by the operating surgeon for pre-operative planning <ul style="list-style-type: none"> See: General Considerations (PEDONC-9.1) for imaging requests related to prosthetic planning CT Chest with (CPT® 71260) or without contrast (CPT® 71250) ONE of the following: <ul style="list-style-type: none"> PET/CT whole-body (CPT® 78816) Whole-body bone scan (see: PEDONC-1.3 for coding) MRI bone marrow blood supply/diffusion-weighted MRI with ADC (CPT® 77084)

Indication	Imaging Study
Treatment response following local control surgery	<ul style="list-style-type: none"> MRI without and with contrast of primary site 3 months after surgical procedure and at the end of planned chemotherapy Plain x-rays of the primary site and chest immediately after local control then every 3 months CT Chest with (CPT® 71260) or without contrast (CPT® 71250): <ul style="list-style-type: none"> Measurable pulmonary metastases: every 6 weeks and at the end of planned chemotherapy No measurable pulmonary metastases: every 3 months and at the end of planned chemotherapy Whole-body bone scan (see: PEDONC-1.3 for coding) at the end of planned chemotherapy PET/CT whole-body (CPT® 78816) is supported for clinical or imaging findings suggestive of local recurrence
Individuals with metastatic disease undergoing current chemotherapy	<ul style="list-style-type: none"> CT Chest with (CPT® 71260) or without contrast (CPT® 71250) can be performed every 2 cycles during treatment and at the end of planned chemotherapy MRI without and with contrast of primary site can be performed every 2 cycles during treatment and at the end of planned chemotherapy If previously positive for bony metastases, PET/CT whole-body (CPT® 78816) or bone scan (see: (PEDONC-1.3) for coding) every 2 cycles during treatment and at the end of planned chemotherapy Imaging may be indicated more frequently around the time of surgical resection of primary or metastatic lesions to assess for resectability

Indication	Imaging Study
Recurrent metastatic or recurrent unresectable disease on treatment	<ul style="list-style-type: none"> The following may be approved every 2 cycles of treatment, and at the end of planned chemotherapy: <ul style="list-style-type: none"> CT Chest with (CPT® 71260) or without contrast (CPT® 71250) MRI without and with contrast of primary site can be performed every 2 cycles during treatment and at the end of planned chemotherapy PET is generally not indicated during active treatment for recurrent pediatric cancer. In rare circumstances, PET imaging may be appropriate when results are likely to result in a treatment change for the individual, including a change from active treatment to surveillance.
Surveillance for all disease other than low grade, stage I disease	<ul style="list-style-type: none"> Every 3 months for year 1 and 2, then every 4 months in year 3, then every 6 months in year 4 and 5, and annually for 5 years after completion of all therapy to complete 10 years of surveillance: <ul style="list-style-type: none"> CT or MRI of primary site as performed during suspected or initial disease workup (provided the individual does not have an endoprosthesis that will cause MRI or CT artifact): Bone scan (see: (PEDONC-1.3) for coding) Every 3 months for year 1 and 2, then every 4 months in year 3, then every 6 months in year 4 and 5: <ul style="list-style-type: none"> CT Chest with (CPT® 71260) or without contrast (CPT® 71250) After year 5, CXR should be used for surveillance

Indication	Imaging Study
Surveillance for low grade stage I disease only	<ul style="list-style-type: none"> • Every 3 months for year 1 and 2, then every 4 months in year 3, then every 6 months in year 4 and 5, and annually for 5 years after completion of all therapy to complete 10 years of surveillance: <ul style="list-style-type: none"> • CT or MRI of primary site as performed during suspected or initial disease workup (provided the individual does not have an endoprosthesis that will cause MRI or CT artifact) • Bone scan (see: PEDONC-1.3 for coding) • Every 3 months for year 1 and 2 <ul style="list-style-type: none"> • CT Chest with (CPT® 71260) or without contrast (CPT® 71250) • After 24 months off therapy, CXR should be used for surveillance with CT supported for new or inconclusive findings on CXR
Suspected Recurrence	<ul style="list-style-type: none"> • MRI without and with contrast of the primary site and/or site of suspected recurrence based on symptoms or other imaging, OR • CT, contrast as request, of the primary site and/or site of suspected recurrence based on symptoms or other imaging if there is a contraindication to MRI AND • CT Chest with (CPT® 71260) or without contrast (CPT® 71250) <ul style="list-style-type: none"> • CT Chest is indicated in initial workup of all suspected malignant bone tumors in children and should be completed prior to anesthesia exposure if possible • CT Abdomen and Pelvis with contrast (CPT® 74177) is not routinely indicated in the metastatic staging of pediatric EWS but can be approved in the following situations: <ul style="list-style-type: none"> • Evaluation of inconclusive PET findings • Primary site of abdomen or pelvis • These studies may be approved even when PET/CT has already been authorized or performed

Indication	Imaging Study
<ul style="list-style-type: none">For suspected recurrence, any of the following:<ul style="list-style-type: none">Conventional imaging reveals findings that are inconclusive or suspicious for recurrence and PET avidity will determine whether biopsy or continued observation is appropriateRare circumstances where obvious clinical symptoms show strong evidence suggesting recurrence and PET would replace conventional imaging modalities	PET/CT whole-body (CPT® 78816)
<ul style="list-style-type: none">Biopsy proven recurrence	<ul style="list-style-type: none">Refer to ESFT initial imaging for studies for suspected recurrence.PET/CT whole-body (CPT® 78816)If disease is considered potentially resectable, follow ESFT treatment response as previously noted

Background and Supporting Information

- Bone and bone marrow metastases can occur in ESFT, and cause a significant change in treatment approach.
- PET/CT can replace bone scan and bone marrow biopsy in ESFT individuals and is indicated in the initial staging of all ESFT individuals after histologic diagnosis is established

CT Abdomen and Pelvis with contrast (CPT® 74177) every 3 months for 1 year then every 6 months in year 2, then annually in years 3-5 year after completion of all therapy. MRI Abdomen and Pelvis without and with contrast (CPT® 74183 and CPT® 72197) may be substituted for surveillance for ovarian neoplasm if this modality was used for initial staging Individuals with brain or bone metastases should have surveillance imaging of those areas on the same schedule as the primary site imaging with the same modality used during initial staging
<ul style="list-style-type: none"> Suspected Recurrence: <ul style="list-style-type: none"> Any clinically significant rise in tumor markers Symptoms suggesting recurrent disease Abnormal chest x-ray 	<ul style="list-style-type: none"> CT Chest with contrast (CPT® 71260) and CT Abdomen and Pelvis with contrast (CPT® 74177) MRI Abdomen and Pelvis without and with contrast (CPT® 74183 and CPT® 72197) may be approved in lieu of CT for suspected recurrence of immature sacrococcygeal tumor or ovarian neoplasm Whole-body bone scan (CPT® 78306) for individuals with a history of bone involvement or with bone pain

Background and Supporting Information

General Considerations:

- Malignant pediatric germ cell tumors commonly include one of four histologic subtypes:
 - Yolk sac tumor
 - Choriocarcinoma
 - Embryonal carcinoma
 - Mixed histology (including immature sacrococcygeal teratoma)
- Tumors can occur in testicular, ovarian or extragonadal primary locations
- Sex cord stromal tumors (granulosa cell, theca, sertoli, and leydig tumors) are rare in pediatrics and should be imaged according to general guidelines in: **Testicular, Ovarian and Extragonadal Germ Cell Tumors (ONC-20)** in the Oncology Imaging Guidelines
- This section applies to primary germ cell tumors occurring outside the central nervous system in children who are ≤15 years old at the time of initial diagnosis.
 - For individuals who are >15 years old at diagnosis, the overall prognosis is inferior and these individuals should be imaged according to general guidelines in: **Testicular, Ovarian and Extragonadal Germ Cell Tumors (ONC-20)** in the Oncology Imaging Guidelines.
- For CNS germ cell tumors, use the imaging guidelines in: **CNS Germinomas and Non-Germinomatous Germ Cell Tumors (NGGCT) (PEDONC-4.7)**.

Treatment Considerations:

- Overall treatment strategies are similar for all malignant germ cell tumors.
- Individuals with localized GCT are often cured with surgery alone and do not receive adjuvant therapy.
 - These individuals should be imaged using surveillance guidelines after surgery is completed.
- Individuals receiving adjuvant chemotherapy are usually treated with 4 to 6 cycles of combination chemotherapy.

Imaging Modality Considerations:

- Initial evaluation of: Ovarian, testicular, and abdominal extragonadal suspected GCT should be completed by ultrasound and tumor markers (AFP, β-hCG)
 - Once a primary mass suspected to be GCT is discovered, initial staging is indicated prior to histologic confirmation

- The degree of abdominal exploration and node sampling necessary for adequate staging is determined in part by imaging findings and is required for preoperative planning
- The primary method of response assessment is by tumor marker decrease
- The primary method of surveillance in pediatric GCT is frequent assessment of serum tumor markers, unless tumor markers were not elevated at diagnosis
- Surveillance imaging of the chest in disease stages I-IV should generally be performed using chest x-ray
 - See surveillance indications for specific imaging recommendations
- There has been no published evidence to date supporting the routine use of PET/CT in the evaluation of pediatric GCT
 - Additionally, PET has been found to have similar efficacy to CT imaging in initial staging of adults with non-seminomatous GCT (the majority of pediatric GCT are non-seminomatous)
- PET as a marker of treatment response has been shown not to be predictive of individual outcomes in GCT and should not be approved
 - Suspicious lesions seen on conventional imaging should be biopsied to confirm active disease

Pediatric Liver and Pancreatic Tumors (PEDONC-11)

Guideline

Pediatric Liver Tumors – General Considerations (PEDONC-11.1)

Hepatoblastoma (PEDONC-11.2)

Pediatric Hepatocellular Carcinoma (HCC) (PEDONC-11.3)

Pediatric Pancreatic Carcinoma (PEDONC-11.4)

References (PEDONC-11)

Pediatric Liver Tumors – General Considerations (PEDONC-11.1)

ONCP.LT.0011.1.U
v2.0.2024

- Primary hepatic germ cell tumors should follow imaging guidelines in: **Pediatric Germ Cell Tumors (PEDONC-10)**.
- Primary hepatic sarcomas should follow imaging guidelines in: **Non-Rhabdomyosarcoma Soft Tissue Sarcomas (NRSTS) (PEDONC-8.3)**.
- Imaging requests relating to liver transplant surgery and surveillance should follow guidelines in section **Transplant (AB-42)** in the Abdomen Imaging Guidelines.

Hepatoblastoma (PEDONC-11.2)

ONCP.LT.0011.2.A
v2.0.2024

Hepatoblastoma Initial Staging:

- Ultrasound may be approved even after MRI or CT imaging in order to allow evaluation for tumor thrombus
- Once a primary liver mass is discovered, definitive imaging is indicated prior to histologic diagnosis, and may involve ANY of the following:
 - MRI Abdomen and Pelvis without and with contrast (CPT® 74183 and CPT® 72197) is preferred for evaluating tumor margins and vascular anatomy
 - Hepatobiliary-specific contrast agents (gadoxetate, gadobenate [MultiHance]) are preferred if available and should be approved if requested, whether or not a prior gadolinium-enhanced MRI has been previously performed
 - CT Abdomen and Pelvis with (CPT® 74177) is inferior to MRI for pediatric liver malignancies and should only be approved if MRI is not available, contraindicated, or sedation is required but not available, or to clarify specific inconclusive areas on MRI.
 - Noncontrast imaging is not indicated due to the increased radiation exposure and limited additive benefit
 - MRA Abdomen (CPT® 74185) or CTA Abdomen (CPT® 74175) to evaluate vascular invasion
- CT Chest with (CPT® 71260) **or** CT Chest without contrast (CPT® 71250) is indicated in the initial work-up of all pediatric liver tumors and should be completed prior to anesthesia exposure if possible
- Bone scan (See: **Modality General Considerations (PEDONC-1.3)**) for initial evaluation of bony metastases only with systemic symptoms or bone pain.
- MRI Brain without and with contrast (CPT® 70553) only for symptoms suggesting CNS metastases
- PET/CT only in very rare circumstances for preoperative planning when MRI and CT scans are insufficient for surgical decision-making.
 - Indications and coding for rare circumstances where PET/MRI may be approved are found in **PET Imaging in Pediatric Oncology (PEDONC-1.4)**

Hepatoblastoma Treatment Response:

- CT Chest with (CPT® 71260) **or** without contrast (CPT® 71250) every 2 cycles **and** at the end of planned therapy for individuals with incomplete resection at initial diagnosis
- MRI Abdomen and Pelvis without and with contrast (CPT® 74183 and CPT® 72197) every 2 cycles **and** at the end of planned therapy for individuals with incomplete resection at initial diagnosis

- CT Abdomen and Pelvis with contrast (CPT® 74177) or CT Abdomen and Pelvis with and without contrast (CPT® 74178) is inferior to MRI for pediatric liver malignancies and should only be approved if MRI is not available, contraindicated, or sedation is required but not available, or to clarify specific inconclusive areas on MRI.
 - Noncontrast imaging is not indicated due to the increased radiation exposure and limited additive benefit
- While the majority of individuals will require abdomen and pelvis imaging at all time points, the pelvis imaging may be omitted at the discretion of the ordering physician
- MRA Abdomen (CPT® 74185) or CTA Abdomen (CPT® 74175) to evaluate vascular invasion
- Imaging of any metastatic sites with the same modality used during initial staging every 2 cycles and at the end of planned therapy for individuals with incomplete resection at initial diagnosis
- Imaging more frequently to assess for surgical resectability in individuals who have received more than 4 cycles of chemotherapy.
- Abdominal ultrasound is indicated if tumor thrombus was detected at initial diagnosis
 - If no tumor thrombus was present, continued ultrasound evaluations are not indicated without a specific reason documented in the clinical records
- PET/CT should only be considered in very rare circumstances for preoperative planning when MRI and CT scans are insufficient for surgical decision making.

Hepatoblastoma Surveillance Imaging:

- For surveillance in individuals with an AFP of >100 ng/ml
 - CT Chest with contrast (CPT® 71260) and MRI Abdomen with and without contrast (CPT® 74183) for any clinically significant rise in tumor markers or symptoms suggesting recurrent disease
 - CT Abdomen and Pelvis with contrast (CPT® 74177) is inferior to MRI for pediatric liver malignancies and should only be approved if MRI is not available, contraindicated, or sedation is required but not available, or to clarify specific inconclusive areas on MRI.
 - Noncontrast imaging is not indicated due to the increased radiation exposure and limited additive benefit
- For individuals with AFP ≤100 ng/ml at diagnosis or recurrence, the following imaging is appropriate:
 - MRI Abdomen with and without contrast (CPT® 74183) every 3 months for 2 years, then every 4 months for 2 years after completion of all therapy
 - Chest x-ray or CT Chest with contrast (CPT® 71260) every 3 months for 2 years, then every 4 months for 2 years after completion of all therapy
 - Individuals with brain or bone metastases should have surveillance imaging on the same schedule as the primary site imaging with the same modality used during initial staging

Background and Supporting Information

- Pediatric liver tumors primarily include hepatoblastoma and hepatocellular carcinoma, but hepatic germ cell tumors and primary hepatic sarcomas occur with some frequency. Tumor markers are useful for initial evaluation as well as treatment response, particularly in hepatoblastoma. Early consideration of liver transplant may be undertaken in children and adolescents with unresectable localized disease, provided that the disease remains confined to the liver.
- Hepatoblastoma occurs most commonly in very young children (median diagnosis age of 19 months). Most cases of hepatoblastoma are sporadic, but some are associated with genetic abnormalities, including Beckwith-Wiedemann syndrome, familial adenomatous polyposis, and trisomy 18. Most suspected liver tumors will have ultrasound and tumor markers (AFP, β -HCG, CEA) as part of the initial evaluation.
- There has been no published evidence to date supporting the routine use of PET/CT imaging in the evaluation of pediatric Hepatoblastoma during initial imaging, treatment response, or surveillance.
- PET/CT should not be approved in lieu of biopsy of suspicious lesions
- Individuals with localized hepatoblastoma of pure fetal histology are often cured with surgery alone and do not receive adjuvant therapy. These individuals should be imaged using surveillance guidelines after surgery is completed.
- Individuals receiving adjuvant chemotherapy are usually treated with 2 to 8 cycles of combination chemotherapy. Tumor marker decrease is important in response assessment but does not eliminate the need for advanced imaging in individuals with unresected hepatoblastoma.
- The primary method of surveillance in hepatoblastoma is frequent assessment of serum tumor markers (primarily AFP).
- No specific imaging for surveillance in individuals with an AFP of >100 ng/mL at diagnosis or recurrence.

Pediatric Hepatocellular Carcinoma (HCC) (PEDONC-11.3)

ONCP.LT.0011.3.A

v2.0.2024

Pediatric HCC Initial Staging:

- Ultrasound may be approved even after MRI or CT imaging in order to allow evaluation for tumor thrombus
- Once a primary liver mass is discovered, definitive imaging prior to histologic diagnosis including ANY of the following:
 - MRI Abdomen and Pelvis without and with contrast (CPT® 74183 and CPT® 72197)
 - Hepatobiliary specific contrast agents (gadoxetate, gadobenate [MultiHance]) are preferred if available and should be approved if requested, whether or not a prior gadolinium-enhanced MRI has been previously performed
 - CT Abdomen and Pelvis with contrast (CPT® 74177) is inferior to MRI for pediatric liver malignancies and should only be approved if MRI is not available, contraindicated, or sedation is required but not available, or to clarify specific inconclusive areas on MRI.
 - Noncontrast imaging is not indicated due to the increased radiation exposure and limited additive benefit
 - MRA Abdomen (CPT® 74185) or CTA Abdomen (CPT® 74175) to evaluate vascular invasion
- CT Chest with (CPT® 71260) **or** without contrast (CPT® 71250) in the initial work-up of all pediatric liver tumors and should be completed prior to anesthesia exposure if possible
- MRI Brain without and with contrast (CPT® 70553) only for symptoms suggesting CNS metastases
- Nuclear bone scan (See **Modality General Considerations (PEDONC-1.3)**) should be used for initial evaluation of bony metastases only in individuals with systemic symptoms or bone pain
- PET/CT should only be considered in very rare circumstances for preoperative planning when MRI and CT are insufficient for surgical decision-making.
 - PET/CT should not be approved in lieu of biopsy of suspicious lesions
 - Indications and coding for rare circumstances where PET/MRI may be approved are found in **PET Imaging in Pediatric Oncology (PEDONC-1.4)**

Pediatric HCC Treatment Response:

- For individuals with disease not completely resected at initial diagnosis, the following every 2 cycles (~6 weeks) **and** at the end of planned therapy:

- CT Chest with (CPT® 71260) **or** CT Chest without contrast (CPT® 71250)
- MRI Abdomen and Pelvis without and with contrast (CPT® 74183 and CPT® 72197)
 - While the majority of individuals will require abdomen and pelvis imaging at all time points, the pelvis imaging may be omitted at the discretion of the ordering physician
 - CT Abdomen and Pelvis with contrast (CPT® 74177) is inferior to MRI for pediatric liver malignancies and should only be approved if MRI is not available, contraindicated, or sedation is required but not available, or to clarify specific inconclusive areas on MRI.
 - Noncontrast imaging is not indicated due to the increased radiation exposure and limited additive benefit
 - MRA Abdomen (CPT® 74185) or CTA Abdomen (CPT® 74175) to evaluate vascular invasion
- Imaging of any metastatic sites with the same modality used during initial staging
- Abdominal ultrasound if tumor thrombus was detected at initial diagnosis
 - If no tumor thrombus was present, continued ultrasound evaluations are not indicated without a specific reason documented in the clinical records
- PET/CT in very rare circumstances for preoperative planning when MRI and CT scans are insufficient for surgical decision-making.

Pediatric HCC Surveillance Imaging:

- MRI Abdomen and Pelvis without and with contrast (CPT® 74183 and CPT® 72197) every 3 months for 1 year, then every 6 months for 1 year, then annually for 3 years after completion of all therapy
- Chest x-ray or CT Chest with contrast (CPT® 71260) every 3 months for 1 year, then every 6 months for 1 year, then annually for 3 years after completion of all therapy

Background and Supporting Information

- Individuals with brain or bone metastases should have surveillance imaging on the same schedule as the primary site imaging with the same modality used during initial staging.
- HCC, including its rare histologically distinct variant fibrolamellar hepatocellular carcinoma (FL-HCC), occurs mostly in older children and adolescents. Despite recent advances in treatment, overall survival of pediatric HCC diagnosed in advanced stages remains exceedingly poor, with five-year survival of only 17% to 22% for all stages of pediatric HCC (and FL-HCC). Most suspected liver tumors will have ultrasound and tumor markers (AFP, β -HCG, CEA) as initial evaluation.
- PET/CT should not be approved in lieu of biopsy of suspicious lesions
- The majority of hepatocellular carcinoma individuals are treated with surgery alone and do not receive adjuvant therapy. Individuals with successful upfront gross total

resection should be imaged using surveillance guidelines after surgery is completed.

- PET/CT has no documented role in the surveillance evaluation of pediatric hepatocellular carcinoma.

Pediatric Pancreatic Carcinoma (PEDONC-11.4)

ONCP.LT.0011.4.A

v2.0.2024

- This guideline applies to suspected or diagnosed pancreatic neoplasms in children.
- Beckwith-Wiedemann syndrome increases pancreatoblastoma risk. MEN1, VHL, neurofibromatosis, and tuberous sclerosis are also risk factors for pancreatic endocrine neoplasms.
 - Screening studies in these conditions are found in **Screening Imaging in Cancer Predisposition Syndromes (PEDONC-2)**.

Indication	Imaging Study
Initial Staging	<ul style="list-style-type: none"> • CT Abdomen and Pelvis with or with and without contrast (CPT® 74177 or CPT® 74178) OR MRI Abdomen with and without contrast plus MRI Pelvis with and without contrast (CPT® 74183 and CPT® 72917) • CT Chest with (CPT® 71260) or without (CPT® 71250) contrast • ⁶⁸Ga-Dotatate PET/CT whole-body (CPT® 78816) <ul style="list-style-type: none"> • Exception: for pediatric pancreatic tumor of non neuroendocrine origin (SPN, pancreatoblastoma and other exocrine origin) with equivocal conventional imaging, FDG PET/CT whole-body or skull to thighs (CPT® 78816 or 78815)
Treatment response ~every 2 cycles during treatment and at the end of planned therapy	<ul style="list-style-type: none"> • CT or MRI as used at time of initial imaging
If conventional imaging for treatment response is equivocal	<ul style="list-style-type: none"> • Neuroendocrine tumors: ⁶⁸Ga Dotatate PET/CT skull to thighs or whole-body (CPT® 78815 or 78816) • Non-neuroendocrine tumors: FDG PET/CT skull to thighs or whole-body (CPT® 78815 or 78816)
Assess candidacy for PRRT therapy	<ul style="list-style-type: none"> • ⁶⁸Ga Dotatate PET/CT whole body CPT® 78816 may also be approved to assess candidacy for PRRT therapy
Surveillance	<ul style="list-style-type: none"> • MRI or CT, modality and contrast as used in initial imaging, every 3 months for 2 years, then every 4 months for 1 year, then every 6 months for 1 year, then in 12 months to complete 5 years surveillance.
Suspected recurrence	<ul style="list-style-type: none"> • Repeat all imaging as noted in initial staging section

Background and Supporting Information

- Pancreatic tumors in children are exceedingly rare. The most common are solid pseudopapillary neoplasm (SPN), a low-grade epithelial malignancy. Pancreatoblastoma is the second most common.

Retinoblastoma – Imaging (PEDONC-12.2)

References (PEDONC-12)

Retinoblastoma – General Considerations (PEDONC-12.1)

ONCP.EC.0012.1.A

v2.0.2024

- Retinoblastoma (RB) is primarily a disease of the infant and young child, and presents with leukocoria (loss of red reflex).
- About 75% of individuals are diagnosed before the age of two years (bilateral RB presents at 12 months of age).
- Retinoblastoma can occur as heritable (25% of cases) or nonheritable (75%) disease.
 - Heritable RB is associated with a germline mutation in the RB1 gene often resulting typically in bilateral disease.
 - Individuals who carry the RB1 mutation also have increased risk of developing other cancers, such as osteosarcoma, soft tissue sarcomas, or melanoma. For more information on heritable retinoblastoma, see: **Familial Retinoblastoma Syndrome (PEDONC-2.12)**.
 - Whole-body MRI has shown poor sensitivity and specificity in individuals with predisposition to systemic malignancy due to germline RB1 mutations, and is not supported.
- Detailed evaluation by a physician with significant training and/or experience in retinoblastoma (most commonly a pediatric ophthalmologist or pediatric oncologist) is indicated prior to considering advanced imaging.
- Retinoblastoma can be unilateral, bilateral, or trilateral (involving the pineal gland). Extraocular spread of retinoblastoma is rare and generally confined to the brain.

Retinoblastoma – Imaging (PEDONC-12.2)

ONCP.EC.0012.2.A

v2.0.2024

Retinoblastoma Initial Staging:

- Tumor biopsy is NOT required prior to imaging
- MRI Orbits (CPT® 70543) and Brain (CPT® 70553) without and with contrast in the initial work-up
 - Brain imaging may be omitted or deferred at the discretion of the treating ophthalmologist or oncologist
- MRI Spine without and with contrast (Cervical-CPT® 72156, Thoracic-CPT® 72157, Lumbar-CPT® 72158) if there is evidence of CNS metastasis on:
 - Ophthalmologic exam
 - MRI Brain
 - Lumbar CSF cytology
- CT Chest (CPT® 71260) and MRI Abdomen and Pelvis without and with contrast (CPT® 74183 and CPT® 72197) with clinical symptoms to suggest metastatic disease
- CT Orbital (contrast as requested) and orbital ultrasound can be approved if ordered by the treating ophthalmologist for a specified indication
- Nuclear bone scan (See: **Modality General Considerations (PEDONC-1.3)**) is the preferred imaging modality for individuals with systemic bone pain suggestive of bony metastases
- PET has no documented role in the evaluation of retinoblastoma

Retinoblastoma Treatment Response:

- MRI Orbits (CPT® 70543) and/or Brain (CPT® 70553) can be approved every 2 cycles (~ every 6 weeks) and at the end of planned therapy
- For individuals with metastatic disease, imaging of known positive areas using the same modality at initial staging can be approved every 2 cycles (~6 to 8 weeks) and at the end of planned therapy

Retinoblastoma Surveillance:

- Surveillance using advanced imaging for unilateral retinoblastoma after enucleation or exenteration only for evaluation of specific clinical concerns.
- MRI Orbits (CPT® 70543) and Brain (CPT® 70553) for individuals undergoing ocular salvage treatment approaches every 6 months for 2 years following completion of therapy
- MRI Brain without and with contrast (CPT® 70553) can be approved every 6 months for 5 years from the time of diagnosis with retinoblastoma

Background and Supporting Information

- CT should generally be avoided in retinoblastoma individuals under one year of age or with family history of retinoblastoma (heritable) due to substantially increased risks for secondary malignancy
- The primary method of surveillance in retinoblastoma is examination under anesthesia (EUA), although some older children can be sufficiently evaluated by exam without anesthesia (EWA).
- Surveillance using advanced imaging is generally not indicated for unilateral retinoblastoma after enucleation or exenteration but can be approved for evaluation of specific clinical concerns.
- Individuals with bilateral retinoblastoma or germline mutation in RB1 are at increased risk for subsequent pineoblastoma
- Routine MRI follow up for pineal disease is not currently supported by evidence in unilateral retinoblastoma individuals without germline RB1 mutations

Pediatric Nasopharyngeal Carcinoma (PEDONC-13)

Guideline

Pediatric Nasopharyngeal Carcinoma – General Considerations
(PEDONC-13.1)

Pediatric NPC – Imaging (PEDONC-13.2)

References (PEDONC-13)

Pediatric Nasopharyngeal Carcinoma – General Considerations (PEDONC- 13.1)

ONCP.NC.0013.1.A

v2.0.2024

- Pediatric nasopharyngeal carcinoma (NPC) is rare in comparison to adult NPC but is responsible for up to 50% of nasopharyngeal cancers in children and has higher rates of aggressive type III EBV-associated histology than adult NPC.
- Standard upfront treatment in pediatric NPC consists of 3 to 4 cycles of neoadjuvant chemotherapy followed by definitive chemoradiotherapy. Rare individuals with lower stage disease may be treated with radiotherapy alone.

Pediatric NPC – Imaging (PEDONC-13.2)

ONCP.NC.0013.2.A
v2.0.2024

Pediatric NPC Initial Staging:

- MRI Brain without and with contrast (CPT® 70553) **and** MRI Neck without and with contrast (CPT® 70543)
 - CT Head without and with contrast (CPT® 70470), CT Maxillofacial without and with contrast (CPT® 70488), **and/or** CT Neck with contrast (CPT® 70491) for individuals with documented contraindication to MRI imaging (avoidance of sedation should not be the sole reason)
- CT Chest with contrast (CPT® 71260) in initial staging
- Whole-body PET/CT (CPT® 78816) after histologic confirmation of NPC to evaluate for distant metastases
 - Bone scan when PET/CT is unavailable (See: **Modality General Considerations (PEDONC-1.3)**)
 - Indications and coding for rare circumstances where PET/MRI may be approved are found in **PET Imaging in Pediatric Oncology (PEDONC-1.4)**
 - CT Abdomen with contrast (CPT® 74160) for ANY of the following if PET/CT unavailable:
 - Initial EBV DNA load ≥ 4000 copies/mL
 - Signs and symptoms of liver disease (including abdominal pain and elevated LFTs)

Pediatric NPC Treatment Response:

- MRI Brain without and with contrast (CPT® 70553) **and** MRI Neck without and with contrast (CPT® 70543) for response assessment at the following time points:
 - Following completion of neoadjuvant chemotherapy
 - Following completion of chemoradiotherapy
- CT Chest with contrast (CPT® 71260) **and** Whole-Body PET/CT (CPT® 78816) **or** bone scan (See: **Modality General Considerations (PEDONC-1.3)**) at the following time points:
 - Following completion of neoadjuvant chemotherapy only if positive at initial diagnosis
 - Following completion of chemoradiotherapy
- PET during active treatment for recurrent pediatric cancer in rare circumstances when results are likely to result in a treatment change, including a change from active treatment to surveillance.

Pediatric NPC Surveillance:

- MRI Brain without and with contrast (CPT® 70553) **and** MRI Neck without and with contrast (CPT® 70543) every 3 months for 1 year, then every 6 months for 2 years after completion of all planned therapy
- CT Chest with contrast (CPT® 71260) is indicated every 3 months for 1 year, then every 6 months for 2 years after completion of all planned therapy

Pediatric NPC Suspected Recurrence:

- MRI Brain without and with contrast (CPT® 70553) and MRI Neck without and with contrast (CPT® 70543)
 - CT Head without and with contrast (CPT® 70470), CT Maxillofacial without and with contrast (CPT® 70488), and/or CT Neck with contrast (CPT® 70491) can be approved for individuals with documented contraindication to MRI imaging
- CT Chest with contrast (CPT® 71260)
- Whole-body PET/CT (CPT® 78816) or bone scan (See: **Modality General Considerations (PEDONC-1.3)**) for histologically confirmed recurrence of NPC. These studies may also be approved for:
 - Clarification of specified inconclusive findings seen on conventional imaging
 - Restaging to identify sites of disease when EBV PCR levels are abnormally high and conventional imaging is negative

Background and Supporting Information

- Metastasis frequently occurs in cervical lymph nodes and retropharyngeal space. Distal metastasis usually appears in bones, lungs, mediastinum, and rarely, in the liver. In many individuals, the initial presentation is a cervical adenopathy, and diagnosis is made with a lymph node biopsy.
- Quantitative EBV DNA PCR measured at initial diagnosis, as it can serve as an effective tumor marker if elevated at initial diagnosis.
- Skull base invasion is common in pediatric NPC and has a dramatic impact on prognosis, and is more easily recognized on MRI imaging
- PET is generally not indicated during active treatment for recurrent pediatric cancer
 - Whole-body PET/CT (CPT® 78816) or bone scan (See: **Modality General Considerations (PEDONC-1.3)**) are not indicated for routine surveillance in asymptomatic individuals

Pediatric Adrenocortical Carcinoma (PEDONC-14)

Guideline

Pediatric Adrenocortical Carcinoma – General Considerations
(PEDONC-14.1)

Pediatric ACC – Imaging (PEDONC-14.2)

References (PEDONC-14)

Pediatric Adrenocortical Carcinoma – General Considerations (PEDONC- 14.1)

ONCP.AC.0014.1.A

v2.0.2024

- Pediatric Adrenocortical Carcinoma (ACC) is a rare but aggressive tumor, with fewer than 25 cases diagnosed each year.
- Most individuals are diagnosed because of virilizing symptoms, Cushing syndrome, and rarely with feminization and hyperaldosteronism or detection on screening imaging recommended for specified cancer predisposition syndromes.
- See: **Li-Fraumeni Syndrome (LFS) (PEDONC-2.2)** and **Beckwith-Wiedemann Syndrome (BWS) (PEDONC-2.4)** for screening recommendations for individuals known to have these syndromes.

Pediatric ACC – Imaging (PEDONC-14.2)

ONCP.AC.0014.2.A

v2.0.2024

- CT Abdomen without and with contrast increases radiation exposure and should not be routinely performed in a child with an adrenal lesion as washout criteria have not been validated in children

Indication	Imaging Study
Initial staging	<ul style="list-style-type: none"> CT Chest without contrast (CPT® 71250) or with (CPT® 71260) contrast CT Abdomen with contrast (CPT® 74160) or MRI Abdomen without and with contrast (CPT® 74183) Nuclear bone scan (see: (PEDONC-1.3) for coding)
After complete resection, with no plans for chemotherapy or radiotherapy	<ul style="list-style-type: none"> See surveillance below
Restaging, for all unresected primary or metastatic disease on chemotherapy	<ul style="list-style-type: none"> Every 2 cycles (~6 weeks) during chemotherapy, and following completion of all planned chemotherapy: <ul style="list-style-type: none"> CT Chest without contrast (CPT® 71250) or with (CPT® 71260) contrast CT Abdomen with contrast (CPT® 74160) or MRI Abdomen without and with contrast (CPT® 74183) If positive for distant metastases at initial diagnosis: <ul style="list-style-type: none"> Nuclear bone scan (see: (PEDONC-1.3) for coding) every 2 cycles (~6 weeks) during chemotherapy and following completion of all planned chemotherapy
Response assessment at the completion of radiotherapy	<ul style="list-style-type: none"> CT Abdomen with contrast (CPT® 74160) or MRI Abdomen without and with contrast (CPT® 74183)

Indication	Imaging Study
Surveillance, individuals with only localized disease at diagnosis	<ul style="list-style-type: none"> Every 3 months for 2 years, then every 6 months for 3 years: <ul style="list-style-type: none"> CT Abdomen with contrast (CPT® 74160) or MRI Abdomen without and with contrast (CPT® 74183)
Surveillance, individuals with metastatic ACC	<ul style="list-style-type: none"> Every 3 months for 2 years, then every 6 months for 3 years: <ul style="list-style-type: none"> CT Chest without contrast (CPT® 71250) or with (CPT® 71260) contrast CT Abdomen with contrast (CPT® 74160) or MRI Abdomen without and with contrast (CPT® 74183)
Recurrence	<ul style="list-style-type: none"> CT Chest without contrast (CPT® 71250) or with (CPT® 71260) contrast CT Abdomen with contrast (CPT® 74160) or MRI Abdomen without and with contrast (CPT® 74183)
Suspected bone recurrence	<ul style="list-style-type: none"> Nuclear bone scan (see: (PEDONC-1.3) for coding)

Background and Supporting Information

- The mainstay of treatment is surgery.
 - Chemotherapy, adrenal suppression, and radiotherapy typically follow resection.
 - Many ACC individuals are treated with surgery alone and do not receive adjuvant therapy. These individuals should be imaged using surveillance guidelines after surgery is completed.

Pediatric Melanoma and Other Skin Cancers (PEDONC-15)

Guideline

Pediatric Melanoma and Other Skin Cancers (PEDONC-15)

References (PEDONC-15)

Pediatric Melanoma and Other Skin Cancers (PEDONC-15)

ONCP.SK.0015.A

v2.0.2024

- Pediatric melanoma is historically rare but has a steadily rising incidence, especially in adolescents and young adults (AYAs). Staging is assigned using the American Joint Committee on Cancer (AJCC) staging for adult melanoma. Most cases of melanoma arising in children and AYAs (~75%) are localized at diagnosis, and approximately 90% of individuals with pediatric melanoma are amenable to radical excision. The clinical management of adolescents and young adults with melanoma is still challenging and evolving because it is difficult to diagnose, and there is no standard treatment.
- Non-melanoma skin cancers (mostly basal cell carcinoma and squamous cell carcinoma) are extremely rare in pediatric individuals. In many cases, predisposing factors such as prolonged immunosuppression, radiation therapy, chemotherapy, voriconazole use, or a combination of the factors are present, and established age-specific guidelines for management of these skin tumors do not exist.
- Imaging guidelines and treatment approaches are consistent with those used for adults with melanoma and other skin cancers, and these individuals should follow the imaging guidelines in section **Melanomas and Other Skin Cancers (ONC-5)** in the Oncology Imaging Guidelines.

Pediatric Salivary Gland Tumors and Thyroid Tumors (PEDONC-16)

Guideline

Pediatric Salivary Gland Tumors and Thyroid Tumors (PEDONC-16)
References (PEDONC-16)

Pediatric Salivary Gland Tumors and Thyroid Tumors (PEDONC-16)

ONCO.ST.0016.A
v2.0.2024

Pediatric Salivary Gland Tumors

- The majority of pediatric salivary gland tumors arise in the parotid gland. Approximately 10% to 15% of tumors arise in the submandibular, sublingual, or minor salivary glands.
- Roughly 75% of pediatric salivary gland tumors are benign, most commonly pleomorphic adenoma.
- The most common malignant tumors occurring in the salivary glands are mucoepidermoid carcinoma, adenoid cystic carcinoma, acinic cell carcinoma, undifferentiated carcinoma, and rarely adenocarcinoma.
- American Joint Committee on Cancer (AJCC) staging is used for pediatric as well as adult salivary gland tumors.
- Imaging and treatment guidelines for malignant pediatric salivary gland tumors are consistent with those used for adults with salivary gland tumors, and these individuals should follow the imaging guidelines in section **Salivary Gland Cancers (ONC-4)** in the Oncology Imaging Guidelines.

Pediatric Thyroid Tumors

- Differentiated thyroid cancers (DTC): Papillary, Follicular and Hürthle Cell are the most common childhood thyroid malignancy. Standard treatment is thyroidectomy and radioactive iodine (RAI).
- Imaging and treatment guidelines for malignant pediatric thyroid tumors are consistent with those used for adults with thyroid tumors, and these individuals should follow the imaging guidelines in section **Thyroid Cancers (ONC-6)** in the Oncology Imaging Guidelines.

Pediatric Breast Masses (PEDONC-17)

Guideline

Pediatric Breast Masses (PEDONC-17)

References (PEDONC-17)

Pediatric Breast Masses (PEDONC-17)

ONCP.BC.0017.A

v2.0.2024

- Ultrasound (CPT® 76641 and CPT® 76642) is the primary and preferred modality used for evaluation of pediatric breast masses.
- MRI has very limited utility in evaluation of pediatric breast masses prior to biopsy but may be indicated in rare cases for surgical planning when ultrasound is non-diagnostic.
- Pediatric individuals with confirmed breast cancer should be imaged according to section **Breast Cancer (ONC-11)** in the Oncology Imaging Guidelines.

Background and Supporting Information

- Less than 1% of pediatric breast lesions are malignant, and advanced imaging is generally not recommended without histological confirmation of malignancy.
- Mammography has limited utility in pediatric breast mass evaluation due to the high mammographic breast density in this age group, and the risk of the radiation exposure outweighs the benefit of this modality. As a result, mammography is NOT recommended for evaluation of pediatric or adolescent breast masses.
 - BI-RADS classification may overstate the risk of malignancy or need for biopsy in pediatric individuals.

Histiocytic Disorders (PEDONC-18)

Guideline

Histiocytic Disorders – General Considerations (PEDONC-18.1)

Langerhans Cell Histiocytosis (LCH) (PEDONC-18.2)

Hemophagocytic Lymphohistiocytosis (HLH) (PEDONC-18.3)

Non-Langerhans Cell Histiocytoses (PEDONC-18.4)

References (PEDONC-18)

Histiocytic Disorders – General Considerations (PEDONC-18.1)

ONCP.HC.0018.1.A

v2.0.2024

- The majority of histiocytic disorders occurring in the pediatric population are either Langerhans Cell Histiocytosis (LCH) or Hemophagocytic Lymphohistiocytosis (HLH).
- The Non-Langerhans cell histiocytoses encompass a variety of diseases, and have limited imaging considerations except as specified later in this section.
- Where there are indications for PET/CT in these guidelines, please note that indications and coding for rare circumstances where PET/MRI may be approved are found in **PET Imaging in Pediatric Oncology (PEDONC-1.4)**
- PEDONC-18 applies to individuals of all ages.
- The use of PET in this guideline refers to Fluorodeoxyglucose (fluorine-18-2-fluoro-2-deoxy-D-glucose [FDG]) radiotracer only.

Langerhans Cell Histiocytosis (LCH) (PEDONC-18.2)

ONCP.HC.0018.2.A

v2.0.2024

LCH Initial Imaging Studies:

- Whole-body PET/CT (CPT® 78816)
 - Whole-body Tc-99m bone scan (CPT® 78306) can be approved in lieu of PET if PET is unavailable
- CT Chest with contrast (CPT® 71260) **or** high-resolution CT Chest without contrast (CPT® 71250) in addition to PET/CT for suspected pulmonary LCH based on ANY of the following:
 - Abnormal CXR
 - Symptoms of pulmonary involvement and normal CXR
 - Clarification of pulmonary findings on PET/CT
- MRI Brain without and with contrast (CPT® 70553) for ANY of the following:
 - Headaches or visual or neurologic disturbances
 - Polyuria/polydipsia or other endocrine abnormalities
 - Skull or craniofacial (including jaw) bone involvement
 - Otorrhea or hearing loss (CT Temporal Bone may be substituted if requested)
 - Other signs or symptoms suggesting intracranial involvement, including neurodegeneration syndrome
- CTA/MRA Head (CPT® 70496/70544) may be approved as part of operative planning or image guidance
- CT Abdomen and/or Pelvis with contrast (CPT® 74177, 74160, or 72193) for ANY of the following:
 - Abdominal and/or pelvic signs and symptoms **if PET/CT has not been performed** or to clarify abnormal abdominal/pelvic findings on PET/CT
 - Abdominal and/or pelvic findings on ultrasound if PET/CT has not been performed
- MRI Abdomen without and with contrast (CPT® 74183) for any of the following:
 - Elevated liver function tests (usually >5X upper limit of normal)
 - Abnormalities seen on abdominal ultrasound or CT
- MRI Spine without and with contrast (Cervical-CPT® 72156, Thoracic-CPT® 72157, Lumbar-CPT® 72158) for ANY of the following **if PET/CT has not been performed**:
 - Vertebral lesions seen on skeletal survey
 - Clinical symptoms (including back pain) suggesting spinal involvement and negative skeletal survey

LCH Treatment Response:

- Both PET/CT and CT with contrast or MRI without and with contrast **only** for simultaneous treatment response evaluation with specific documentation showing that both are necessary (i.e. not for purpose of acquiring a PET/MRI)
- CT and/or MRI and/or PET/CT (if modality showed disease at initial diagnosis):
 - After 2-3 cycles of treatment
 - At completion of therapy (approximately 12 weeks) for individuals with persistent disease on cycle 2-3 imaging
 - After surgical curettage (CT or MRI of involved area, not repeat PET)
 - After radiation therapy
- Following the initial phase, treatment response evaluation of **involved sites** with CT with contrast or MRI with and without contrast, every ~3 months while receiving active treatment and at completion of therapy.
 - PET/CT may be approved for inconclusive conventional imaging, if disease was previously only measured/measurable on PET/CT, or for change from active treatment to surveillance
 - Shorter interval imaging can be approved for documented signs or symptoms concerning for disease progression

LCH Surveillance Imaging:

- Surveillance imaging is determined by areas of disease involvement.
 - Bone involvement
 - Single site bone disease
 - CT or MRI contrast as requested of involved bony areas at 6 and 12 months after completion of therapy
 - Multifocal bone disease
 - CT or MRI contrast as requested of involved bony areas every 6 months for 2 years
 - PET/CT (CPT® 78815 or CPT® 78816) may be approved for CT or MRI inconclusive for recurrence or if disease was previously only measurable on PET.
 - Skull or craniofacial (including jaw) bone involvement should be imaged according to CNS involvement section below.
 - Pulmonary involvement
 - CT Chest with (CPT® 71260) **or** without contrast (CPT® 71250) every 6 months for the first 2 years post completion of therapy for any of the following:
 - Individuals with a history of pulmonary involvement
 - Individuals with new respiratory or chest symptoms
 - New findings on CXR

- CNS involvement
 - MRI Brain without and with contrast (CPT® 70553) at 6 weeks, and then every 6 months for 2 years after completion of all therapy for previously documented measurable intracranial lesions
 - If negative at that time, continued surveillance is indicated at 4, 7, and 10 years after completion of all planned therapy
 - If residual measurable intracranial lesions are present at 6 months, imaging can be repeated every 3 months until negative or unchanged on two consecutive studies, at which time the schedule in the previous bullet should begin
 - MRI Brain without and with contrast (CPT® 70553) for documented hypothalamic-pituitary dysfunction every 6 months for 2 years and at 4, 7, and 10 years after completion of all planned therapy
 - MRI at any time for worsening neurologic symptoms
 - Intraspinal lesions should be imaged according to the same guidelines as brain imaging using MRI without and with contrast of all involved spine levels
- Liver involvement
 - Individuals with a history of liver involvement may have ONE of the following every 6 months for 2 years after completion of all therapy:
 - Ultrasound Abdomen (CPT® 76700)
 - CT Abdomen with contrast (CPT® 74160)
 - MRI Abdomen with and without contrast (CPT® 74183)
- Suspected recurrence or inconclusive findings on any surveillance imaging
 - All imaging studies supported for initial workup may be approved, including whole-body PET/CT (CPT® 78816)

Background and Supporting Information

- This guideline may be used for all ages of individuals.
- LCH includes a heterogeneous group of disorders formerly known by other names, including histiocytosis X, eosinophilic granuloma, Letterer-Siwe Disease, Hand-Schuller-Christian Disease, and diffuse reticuloendotheliosis. LCH has a widely variable clinical presentation, ranging from single indolent lesions to disseminated multisystem disease.
- Most common sites of involvement are skin, bones, liver, lung, and pituitary, though other sites are possible.
- Individuals with localized or single site disease are often treated only with local therapies or observed, and should be imaged according to surveillance guidelines
- Individuals receiving systemic therapy will usually undergo treatment for ~12 months. Treatment response is assessed using any modalities showing disease at initial diagnosis after ~6 weeks of treatment.
- Skull or craniofacial (including jaw) bone involvement at diagnosis are at higher risk for CNS recurrence

- CNS LCH has a particularly high rate of refractory and recurrent disease, and requires longer imaging surveillance
- Liver involvement
 - Persistent liver involvement is rare, and imaging after completion of LCH therapy will be highly individualized depending on degree of liver dysfunction and plans for supportive therapy or liver transplant

Hemophagocytic Lymphohistiocytosis (HLH) (PEDONC-18.3)

ONCP.HC.0018.3.A

v2.0.2024

- As imaging for this condition is usually done on an urgent basis, ANY or ALL of the following may be approved for the initial evaluation of HLH include:
 - Ultrasound Abdomen (CPT® 76700)
 - CT Abdomen and/or Pelvis (contrast as requested)
 - MRI Abdomen (CPT® 74183) and/or Pelvis (CPT® 72197) without and with contrast
 - Chest x-ray
 - CT Chest with contrast (CPT® 71260)
 - MRI Brain without and with contrast (CPT® 70553)
 - CTA/MRA Head (CPT® 70496/CPT® 70544) may be approved as part of operative planning or image guidance
 - CT Sinus without or with contrast (CPT® 70486 or CPT® 70487) if clinical suspicion for sinus disease
- Whole-body PET/CT (CPT® 78816) for the purpose of identifying a site for tissue diagnosis of a primary source of infection or malignancy if conventional imaging has been completed and is unrevealing
 - If a malignancy is identified as the inciting factor for HLH, additional imaging decisions for that malignancy should be based on the appropriate diagnosis-specific guidelines

Background and Supporting Information

- There are no standard imaging studies required for the diagnosis and initial evaluation of HLH. Most cases are diagnosed with a combination of physical findings, laboratory testing, and bone marrow evaluation. Advanced imaging studies may be necessary to assess organ dysfunction as HLH commonly affects the liver, spleen, and bone marrow, and less commonly the kidneys, lungs, and brain
- It is NOT required to perform ultrasound or plain film in a stepwise fashion if CT or MRI is planned as individuals with HLH can deteriorate rapidly
- There is no established standard role for PET in the diagnosis or treatment response evaluation of HLH
 - Secondary HLH is very difficult to treat if the primary cause is not concurrently treated

Non-Langerhans Cell Histiocytoses (PEDONC-18.4)

ONCP.HC.0018.4.A

v2.0.2024

Juvenile Xanthogranuloma (JXG):

- Skin and/or cervical nodes:
 - CT with contrast of appropriate area
- Systemic JXG with multi-organ involvement:
 - MRI Brain (CPT® 70553) **and/or** Orbits (CPT® 70543) without and with contrast
 - CT Neck (CPT® 70491), Chest (CPT® 71260), **and/or** Abdomen (CPT® 74160) with contrast
 - CTA/MRA Head (CPT® 70496/CPT® 70544) may be approved as part of operative planning or image guidance
- There is no established role for PET in the diagnosis or treatment of JXG

Rosai-Dorfman Disease (RDD):

- RDD Initial Imaging Studies:
 - MRI Brain (CPT® 70553) and/or Orbits (CPT® 70543) without and with contrast
 - CTA/MRA Head (CPT® 70496/CPT® 70544) may be approved as part of operative planning or image guidance
 - CT Neck (CPT® 70491), Chest (CPT® 71260) and/or Abdomen/Pelvis (CPT® 74177) with contrast **if PET/CT not performed** or to follow up unclear findings in said body areas on PET/CT
 - CT Sinus without or with contrast (CPT® 70486 or CPT® 70487) if clinical suspicion for sinus disease and **PET/CT not performed** or to follow up unclear sinus findings on PET/CT
 - Whole-body PET/CT (CPT® 78816) after histologic confirmation of diagnosis
- RDD Treatment Response:
 - Treatment response imaging can be approved after 2-3 cycles of systemic therapy during active treatment using any modalities showing disease at diagnosis, including PET/CT.
 - Once PET/CT is negative, conventional imaging with other modalities that revealed disease at presentation may be approved for subsequent restaging at completion of chemotherapy and/or radiation and/or after surgical resection.
- RDD Surveillance Imaging:
 - PET/CT is indicated every 6 months until stabilization of disease (two PET/CT with stable disease status).

- Further surveillance imaging can be approved every 3 months for the first year after completion of treatment, then every 6 months using any modalities showing disease at initial diagnosis excluding PET-CT.
 - PET/CT is not supported for routine surveillance of RDD but can be approved if conventional imaging is inconclusive for suspected recurrence.

Erdheim-Chester Disease (ECD):

- ECD Initial Imaging Studies:
 - PET/CT Whole Body (CPT® 78816)
 - Nuclear bone scan (See: **PEDONC-1.3: Modality General Considerations**) may be approved in lieu of PET if requested
 - MRI Brain (CPT® 70553) **and/or** Orbits (CPT® 70543) without and with contrast is indicated for CNS symptoms, including diabetes insipidus
 - CTA/MRA Head (CPT® 70496/70544) may be approved as part of operative planning or image guidance
 - CT Neck (CPT® 70491), Chest (CPT® 71260) **and/or** Abdomen/Pelvis (CPT® 74177) with contrast **if PET/CT not performed** or if inconclusive findings in said body area on PET/CT
 - Cardiac MRI without and with contrast (CPT® 75561) for clinically suspected cardiac involvement
 - CT Sinus without or with contrast (CPT® 70486 or CPT® 70487) if clinical suspicion for sinus disease **if PET/CT not performed** or inconclusive sinus findings on PET/CT
- ECD Treatment Response:
 - Treatment response imaging every 3 months during active treatment using any modalities showing disease at initial diagnosis, including PET/CT
 - Once PET/CT shows no remaining FDG-avid lesions, additional PET imaging is only indicated when conventional imaging studies are inconclusive and acute treatment decisions will be made based on PET results.
- ECD Surveillance Imaging:
 - CT **and/or** MRI **and/or** Nuclear bone scan **and/or** CTA **and/or** MRA **and/or** Cardiac MRI (if modality showed disease at initial diagnosis) every 3 months until the first year after completion of treatment and then every 6 months
 - PET/CT if conventional imaging is inconclusive for suspected recurrence.

Background and Supporting Information

- Non-Langerhans Cell histiocytoses includes diagnoses such as juvenile xanthogranuloma (JXG), sinus histiocytosis with lymphadenopathy (Rosai-Dorfman Disease, RDD), and Erdheim-Chester Disease (ECD)
- In general, these are localized cutaneous or nodal disease without need for regular advanced imaging, but important exceptions are listed in this section.
- Juvenile Xanthogranuloma (JXG):

- Generally involves only skin or cervical nodes, and involutes spontaneously
- Rosai-Dorfman Disease (RDD):
 - Characterized by bulky adenopathy (usually cervical) with frequent systemic involvement
 - There is no established role for PET in the diagnosis or treatment of RDD
 - Because of the paucity of evidence for PET, PET/CT should not be used to replace tissue confirmation for any clinical scenario in RDD
 - There is no established role for routine surveillance imaging of asymptomatic individuals after treatment for RDD
- Erdheim-Chester Disease (ECD):
 - An aggressive histiocytic disorder with overall poor prognosis that is characterized by long bone involvement with frequent spread to multiple organs
 - Most individuals will receive systemic therapy
 - Once PET/CT shows no remaining FDG-avid lesions, additional PET imaging is not indicated unless conventional imaging studies are inconclusive and acute treatment decisions will be made based on PET results.

Long Term Pediatric Cancer Survivors – General Considerations
(PEDONC-19.1)

Cardiotoxicity and Echocardiography (PEDONC-19.2)

Second Malignant Neoplasms (SMN) (PEDONC-19.3)

Osteonecrosis in Long Term Cancer Survivors (PEDONC-19.4)

CNS vascular changes in pediatric cancer survivors following CNS
radiation (PEDONC-19.5)

References (PEDONC-19)

Long Term Pediatric Cancer Survivors – General Considerations (PEDONC-19.1)

ONCP.CS.0019.1.A
v2.0.2024

- This section applies to individuals who have passed the end of the surveillance imaging period for their specific cancer, or 5 years after completion of therapy, whichever occurs first
- As these are long-term survivors, many individuals falling under this guideline section will have reached adult age. However, these guidelines relate specifically to late effects of childhood cancer treatment and should be applied to all long term childhood cancer survivors regardless of current age
- The Children's Oncology Group has published comprehensive guidelines for the management of long-term childhood cancer survivors, and these are available at: <http://www.survivorshipguidelines.org>
- A summary of cancer treatment should be available for all individuals in this category and should generally include, at minimum:
 - Type of cancer and stage
 - Dates of diagnosis, recurrence, cancer-related surgeries, beginning and end dates of chemotherapy, radiotherapy, and/or stem cell transplant
 - Protocol number used for treatment and cumulative chemotherapy drug dose exposures
 - Cumulative radiation dose, fraction number, modality, and field exposure
- Annual detailed history and complete physical examination is a critical component of cancer survivorship care and along with laboratory testing serves as the primary method of screening for the majority of late effects
- Advanced imaging for asymptomatic screening is not routinely indicated except as specified in this section
- Imaging requests related to new clinical signs or symptoms in a long term cancer survivor not explicitly covered in this section should be reviewed according to the guideline for the individual's cancer type or the relevant non-malignant clinical problem

Cardiotoxicity and Echocardiography (PEDONC-19.2)

ONCP.CS.0019.2.A

v2.0.2024

- Screening echocardiography (CPT® 93306, CPT® 93307, or CPT® 93308) for life after exposure to anthracycline chemotherapy, cardiotoxic immunotherapy, or cardiac exposure to radiotherapy

SCREENING ECHOCARDIOGRAM INDICATIONS			
Age at time of Exposure	Cumulative Doxorubicin Equivalent Dose	Cumulative radiation dose to cardiac muscle	Echocardiogram frequency
All ages	None	None	None
0-0.99 years	≥250 mg/m2	None	Annual
	0-249 mg/m2	Any dose	Annual
	0-249 mg/m2	None	Every 2 years
1-4.99 years	≥250 mg/m2	Any dose	Annual
	0-249 mg/m2	15+ Gy	Annual
		0-14.99 Gy	Every 2 years
	None	35+ Gy	Annual
		15-34.99 Gy	Every 2 years
		0-14.99 Gy	Every 5 years
5+ years	≥250 mg/m2	Any dose	Every 2 years
	0-249 mg/m2	15+ Gy	Every 2 years
		0-14.99 Gy	Every 5 years
	None	35+ Gy	Every 2 years
		15-34.99 Gy	Every 5 years
		0-14.99 Gy	None
All ages with known ventricular dysfunction			Annual

- Stress echocardiography is not indicated as a screening study for anthracyclines cardiotoxicity in the absence of coronary artery disease symptoms. See: **Stress Testing with Imaging – Indications (CD-1.4)** for imaging guidelines.
- Female cancer survivors who are pregnant or planning to become pregnant:
 - If any of the following are present, echocardiogram is recommended as a baseline exam and in the 3rd trimester, and as clinically indicated for symptoms

(see: **Pregnancy – Maternal Imaging (CD-11.4)** in the Cardiology Imaging Guidelines) if ANY of the following are present:

- Anthracycline or cardiotoxic chemotherapy/immunotherapy exposure
- Chest radiotherapy

Background and Supporting Information

- Exposure to cardiotoxic anthracycline chemotherapy agents is common in pediatric oncology due to the high success rate of this drug class in the treatment of pediatric cancers.
- Cardiac risk is assessed based on the age of the individual at the time of treatment initiation, the cumulative drug exposure expressed as doxorubicin equivalent mg/m², and the presence or absence of radiotherapy exposure to cardiac muscle.

Second Malignant Neoplasms (SMN) (PEDONC-19.3)

ONCP.CS.0019.3.A

v2.0.2024

SMN—Breast Cancer

Clinical breast exam every 6 months supplemented with:

- MRI Breast (CPT® 77049) annually and annual mammogram beginning at age 25 or 8 years after completion of radiotherapy (whichever occurs later- screening breast MRI is not supported prior to age 25) for individuals who received therapeutic radiation exposure in the following fields while they were under 30 years of age:
 - Chest (thorax)
 - Whole lung
 - Mediastinal
 - Axilla
 - Mini-mantle, mantle, or extended mantle
 - Total (TLI) or subtotal (SLTI) lymphoid irradiation
 - Total body irradiation (TBI)

SMN – CNS Tumors

- Routine surveillance of asymptomatic individuals with normal neurologic exams is not supported by evidence, with the exception of NF1 and NF2 below:
 - MRI Brain without and with contrast (CPT® 70553) can be approved every 2 years after completion of radiotherapy for individuals with NF1 or NF2
- MRI Brain without and with contrast (CPT® 70553) for any individual with history of brain radiotherapy and new neurologic symptoms, including simple headache
- MRI Cervical (CPT® 72156), Thoracic (CPT® 72157), and Lumbar Spine (CPT® 72158) without and with contrast for any individual with history of spine radiotherapy and new neurologic symptoms including change in quality of pain
 - MRI Spine can be performed with contrast only (Cervical-CPT® 72142, Thoracic-CPT® 72147, Lumbar-CPT® 72149) if being performed immediately following a contrast-enhanced MRI Brain
- MRI Brain without and with contrast (CPT® 70553) annually for individuals with history of brain radiotherapy and persistent neurologic symptoms
- MRI Cervical (CPT® 72156), Thoracic (CPT® 72157), and Lumbar Spine (CPT® 72158) without and with contrast annually for individuals with history of spine radiotherapy and persistent neurologic symptoms
 - MRI Spine can be performed with contrast only (Cervical-CPT® 72142, Thoracic-CPT® 72147, Lumbar-CPT® 72149) if being performed immediately following a contrast-enhanced MRI Brain

SMN—Colorectal Cancer

- No advanced imaging is currently recommended. See: **Background and Supporting Information** section for recommended surveillance

Background and Supporting Information

- SMN—Breast Cancer:
 - Clinical breast exam every 6 months supplemented with advanced imaging
- SMN-CNS Tumors:
 - These are associated with radiation exposure to the brain and with neurofibromatosis
 - Routine surveillance of asymptomatic individuals with normal neurologic exams is not supported by evidence, with the exception of NF1 and NF2 listed above
- SMN—Colorectal Cancer:
 - Colonoscopy is recommended every 5 years beginning at age 30 or 5 years after radiation exposure (whichever is later) for individuals with ≥ 30 Gy radiation exposure to the following fields:
 - Thoracic, Lumbar, Sacral, or Whole Spine
 - Abdomen
 - Pelvis
 - Total body irradiation (TBI)
 - Colonoscopy is also recommended every 5 years beginning at age 30 or 5 years after radiation exposure (whichever is later) for individuals with:
 - Personal history of ulcerative colitis, GI malignancy, adenomatous polyps, or hepatoblastoma
 - Familial polyposis
 - Family history of colorectal cancer or polyps in a first degree (parent or sibling) relative
- While the American Cancer Society recently added computed tomographic colonography (CTC) (AKA “Virtual Colonoscopy”) as an acceptable option for colorectal cancer screening of average-risk adults, the National Comprehensive Cancer Network and United States Preventive Services Task Force concluded that data was too premature to warrant its use in screening. Colonoscopy remains the preferred screening modality for survivors at highest risk of colorectal cancer

Osteonecrosis in Long Term Cancer Survivors (PEDONC-19.4)

ONCP.CS.0019.4.A

v2.0.2024

Osteonecrosis is associated with corticosteroid, chemotherapy, and radiation exposure during treatment for ALL, NHL, and allogeneic HSCT in pediatrics. Osteonecrosis occurs primarily in hips, knees, and ankles and is frequently multifocal.

Osteoradionecrosis of the jaw can occur in individuals receiving radiotherapy to the mandible or maxilla; those receiving ≥ 40 Gy are at highest risk. Although unusual, it can also occur in any bone without symptoms. It is rare in other disease types.

- Plain films of symptomatic areas are indicated prior to advanced imaging.
- Routine bone density screening using DEXA or Quantitative CT screening has not been well normalized in the pediatric population, but imaging can be approved for those with symptoms to suggest bone density issues
 - DEXA or Quantitative CT screening is generally not recommended until age 18 unless a surgery, core decompression, or initiation of osteoporosis drugs will be planned based on the imaging results.
- Serial advanced imaging is not indicated in osteonecrosis without specific documentation regarding how the advanced imaging will change current individual management
 - When advanced imaging is necessary for acute management decisions, MRI without contrast of the affected area(s) can be approved.
 - Surveillance imaging of asymptomatic individuals to detect osteonecrosis has not been shown to impact individual outcomes, and it is not standard to alter treatment based on imaging findings alone without symptoms.
 - Follow up MRI of incidentally discovered osteonecrosis findings in asymptomatic individuals has not been shown to impact individual outcomes and is not necessary
 - For known osteonecrosis with articular collapse on other imaging, CT without contrast of area of interest is indicated for surgical planning
- See: **Acute Lymphoblastic Leukemia (ALL) (PEDONC-3.2)** for information on imaging osteonecrosis in ALL individuals during active treatment.

CNS vascular changes in pediatric cancer survivors following CNS radiation (PEDONC-19.5)

ONCP.CS.0019.5.A
v2.0.2024

Children receiving cranial radiation are at increased risk of cerebrovascular complications, including: hemorrhagic and ischemic stroke, moyamoya, occlusive vasculopathy, and cavernomas. These complications may occur months to years after radiation exposure.

- MRI Brain without and with contrast (CPT® 70553) and MRA Head (CPT® 70544, 70545, or 70546) for all individuals of any age with new neurologic symptoms or headache and a history of cranial irradiation.
- MRI Brain without and with contrast (CPT® 70553) and MRA Head (CPT® 70544, 70545, or 70546) may be approved annually for 10 years post treatment in individuals with a history of cranial irradiation and any of the following additional risk factors:
 - Down Syndrome, Sickle cell disease, or Neurofibromatosis 1 or 2
 - Parasellar or suprasellar tumors (i.e. craniopharyngioma)
 - Radiation dose >50 Gy
 - Radiation field involving Circle of Willis

Hematopoietic Stem Cell Transplantation (HSCT) (PEDONC-20)

Guideline

General Considerations (PEDONC-20.0)

Pre-Transplant Imaging (PEDONC-20.1)

Post-Transplant Imaging (PEDONC-20.2)

References (PEDONC-20)

General Considerations (PEDONC-20.0)

ONCP.HT.0020.0.A
v2.0.2024

Transplant Types:

- **Allogeneic (“allo”):** The donor and recipient are different people, and there are multiple types depending on the source of the stem cells and degree of match between donor and recipient. This is most commonly used in diseases originating in the hematopoietic system, such as leukemias and lymphomas, and bone marrow failure syndromes or metabolic disorders. **The goal is to replace the hematopoietic and immune system with healthy donor cells to treat the disease.** Common types are:
 - Matched sibling donor (MSD or MRD): Donor and recipient are full siblings and HLA-matched
 - Matched unrelated donor (MUD): Donor and recipient are HLA matched but not related to each other
 - Cord blood: Donor stem cells come from frozen umbilical cord blood not related to the recipient, sometimes from multiple different donors at once
 - Haploidentical transplant (haplo): Donor is a half-HLA match to the recipient, usually a parent
- **Autologous (“auto”):** The donor and recipient are the same person. The process involves delivery of high dose chemotherapy that is ablative to the bone marrow, followed by an infusion of one’s own harvested stem cells. This is primarily done in the context of solid tumors and the stem cells mainly rescue hematopoiesis to facilitate high-dose chemotherapy.
- **Allogeneic HSCT** results in a much greater degree of immunosuppression than autologous HSCT because of the need to allow the new immune system to chimerize with the recipient’s body. Immune reconstitution commonly takes more than a year for individuals who receive allogeneic HSCT, and individuals remain at high risk for invasive infections until that has occurred. In addition, patients may require prolonged immunosuppression for prevention and management of graft-vs-host disease.
- Recipients of autologous transplant are deeply immunosuppressed until complete count recovery, which may take several months. Graft-vs-host disease is not a consideration in auto transplants because the host is also the donor.

Pre-Transplant Imaging (PEDONC-20.1)

ONCP.HT.0020.1.A

v2.0.2024

- Disease status assessment may be approved per individual disease guidelines if it has been 6 weeks or more between end of treatment imaging and HSCT or if there are signs and symptoms of disease progression.

Indication	Imaging
Immediate pre-transplant period - screening for active or occult infection	<ul style="list-style-type: none"> CT Chest with or without contrast (CPT® 71250 or CPT® 71260) CT Abdomen with contrast (CPT® 74160) is supported for asymptomatic individuals if chest infection or disease is identified on CT Chest or for signs and symptoms of active abdominal infection including fever. CT Pelvis is not routinely recommended for screening asymptomatic individuals, but may be approved for pelvic signs and symptoms with CPT® 74177 or CPT® 72193 if abdominal imaging has already been performed. CT Sinus (CPT® 70486) is not recommended for screening prior to HSCT, but is indicated for signs or symptoms of infectious or disease involvement of the sinuses
Individuals at risk of developing VOD, for pre-transplant baseline	<ul style="list-style-type: none"> Abdominal ultrasound +/- Doppler (CPT® 76700 or 76705 +/- 93975)
Individuals with history of multiple blood transfusions at risk of iron overload, for iron quantification baseline	<ul style="list-style-type: none"> CPT® codes as listed in <u>Transfusion-Associated (Secondary) Hemochromatosis (PEDAB-18.2)</u> may be approved in the immediate pre-transplant period even if done in the previous 12 months.
Suspected renal tubular dysfunction	<ul style="list-style-type: none"> Nuclear renal imaging (CPT® 78700, CPT® 78701, CPT® 78707, CPT® 78708, CPT® 78709)

Background and Supporting Information

- CT Sinus screening is not routinely recommended as two studies showed no utility and no effect on surgical consults.
- Changes from baseline abdominal ultrasound with regard to veno-occlusive disease (VOD) are more predictive than absolute measurements and thus baseline imaging is supported.
- Pre-transplant liver and cardiac iron levels are associated with adverse transplant outcomes and a baseline is supported for further management.

Post-Transplant Imaging (PEDONC-20.2)

ONCP.HT.0020.2.A

v2.0.2024

Early post-transplant complication (<100 days post HSCT):

Indication	Imaging
For signs and symptoms of pulmonary infection or pulmonary edema or new CXR abnormalities	<ul style="list-style-type: none"> CT Chest without or with contrast (CPT® 71250 or CPT® 71260) PET/CT requests to clarify infection vs malignancy, see disease-specific guidelines for equivocal conventional imaging
Suspected impending lung necrosis on other imaging	<ul style="list-style-type: none"> MRI Chest with and without contrast (CPT® 71552)
<ul style="list-style-type: none"> EITHER of the following: <ul style="list-style-type: none"> Suspected graft vs. host disease (GVHD) of chest Bronchiolitis Obliterans (BOOP/BOS) 	<ul style="list-style-type: none"> High-resolution CT Chest without contrast (CPT® 71250)
<ul style="list-style-type: none"> ANY of the following: <ul style="list-style-type: none"> Suspected intra-abdominal and or pelvic infection (including cystitis or typhlitis) Suspected small bowel GVHD 	<ul style="list-style-type: none"> Abdominal Ultrasound (CPT® 76700 or CPT® 76705) +/- Pelvic Ultrasound (CPT® 76856 or CPT® 76857) CT Abdomen and Pelvis with contrast (CPT® 74177) may be approved for unclear findings on ultrasound
High clinical suspicion for intra-abdominal fungal infection	<ul style="list-style-type: none"> CT Abdomen and Pelvis with contrast (CPT® 74177)
Suspected hepatic veno-occlusive disease (VOD)	<ul style="list-style-type: none"> Ultrasound elastography (CPT® 91200) or Abdominal Ultrasound with Doppler (CPT® 76700 or CPT® 76705)

Indication	Imaging
Suspected CNS complication including infection, hemorrhage, thrombosis, or encephalopathy	<ul style="list-style-type: none"> MRI Brain without or with and without contrast (CPT® 70551 or CPT® 70553) CT Head without contrast (CPT® 70450) may be approved in the emergent setting or for suspected acute hemorrhage <ul style="list-style-type: none"> Acute CT should not preclude subsequent MRI imaging For additional imaging for suspected stroke, see: <u>Pediatric Stroke Initial Imaging (PEDHD-12.2)</u> in the Pediatric Head Imaging guidelines
Suspected musculoskeletal abscess or necrotizing fasciitis	<ul style="list-style-type: none"> See: <u>Pediatric Infection/Osteomyelitis (PEDMS-8)</u> in the Pediatric Musculoskeletal Imaging guidelines
Fever of unknown origin (8 or more days of temperature 38.0 C/100.4 F or higher)	<ul style="list-style-type: none"> PET/CT skull to thigh (CPT® 78815) is indicated if site-specific conventional imaging, microbiologic serologic studies, echocardiogram, urinalysis, and urine culture are all non-diagnostic

Late post-transplant complication imaging (100 or more days post HSCT):

Indication	Imaging
CNS complications	Same imaging as for early post-transplant
Chest complications	Same imaging as for early post-transplant
Hepatic VOD	Same imaging as for early post-transplant
Chronic GI GVHD	<ul style="list-style-type: none"> CT Abdomen and Pelvis (CPT® 74177) MR Enterography (CPT® 74183 and CPT® 72197) may be approved for suspected small bowel GVHD
Suspected renal tubular dysfunction	<ul style="list-style-type: none"> Nuclear renal imaging (CPT® 78700, CPT® 78701, CPT® 78707, CPT® 78708, CPT® 78709)

Indication	Imaging
Suspected poor bone mineral density or osteonecrosis	See: <u>Osteonecrosis in Long Term Cancer Survivors (PEDONC-19.4)</u>
Suspected PTLD	See: <u>Post-Transplant Lymphoproliferative Disorder (PTLD) (PEDONC 5.3)</u>

CT Guidance for and monitoring of Visceral Tissue Ablation	77013
CT Guidance for Placement of Radiation Therapy Fields	77014
Unlisted CT procedure (for radiation planning or surgical software)	76497

CTA	CPT®
CTA Abdomen and Pelvis	74174
CTA Pelvis	72191

Nuclear Medicine	CPT®
PET Imaging; limited area (this code not used in pediatrics)	78811
PET Imaging; skull base to mid-thigh (this code not used in pediatrics)	78812
PET Imaging; whole body (this code not used in pediatrics)	78813

Nuclear Medicine	CPT®
PET with concurrently acquired CT; limited area (this code rarely used in pediatrics)	78814
PET with concurrently acquired CT; skull base to mid-thigh	78815
PET with concurrently acquired CT; whole body	78816
Urinary Bladder Residual Study	78730
Ureteral Reflux Study (Radiopharmaceutical Voiding Cystogram)	78740
Testicular Scan – Vascular Flow and Delayed Images	78761
Radiopharmaceutical Imaging of Lymphatic System	78195
Radiopharmaceutical Localization Imaging Limited area	78800
Radiopharmaceutical Localization Imaging Whole Body	78802
Radiopharmaceutical Localization Imaging SPECT	78803

Ultrasound	CPT®
Ultrasound, pelvic (nonobstetric), complete	76856
Ultrasound, pelvic transvaginal	76830
Ultrasound, pelvic (nonobstetric), limited or follow-up	76857
Ultrasound, scrotum and contents	76870
Duplex scan of arterial inflow and venous outflow of abdominal, pelvic, scrotal contents and/or retroperitoneal organs; complete study	93975
Duplex scan of arterial inflow and venous outflow of abdominal, pelvic, scrotal contents and/or retroperitoneal organs; limited study	93976
Duplex scan of aorta, inferior vena cava, iliac vasculature, or bypass grafts; complete	93978
Duplex scan of aorta, inferior vena cava, iliac vasculature, or bypass grafts; limited	93979
Duplex scan of arterial inflow and venous outflow of penile vessels; complete	93980
Duplex scan of arterial inflow and venous outflow of penile vessels; limited study	93981

General Guidelines (PEDPV-1.0)

PVP.GG.0001.0.A

v1.0.2024

- A pertinent clinical evaluation since the onset or change in symptoms, including a detailed history, physical examination, appropriate laboratory studies, and basic imaging such as plain radiography or ultrasound should be performed prior to considering advanced imaging (CT, MRI, Nuclear Medicine), unless the individual is undergoing guideline-supported scheduled imaging evaluation. A meaningful technological contact (telehealth visit, telephone call, electronic mail or messaging) since the onset or change in symptoms can serve as a pertinent clinical evaluation.
- Unless otherwise stated in a specific guideline section, the use of advanced imaging to screen asymptomatic individuals for disorders involving the pelvis is not supported. Advanced imaging of the pelvis is only indicated in individuals who have documented active clinical signs or symptoms of disease involving the pelvis.
- Unless otherwise stated in a specific guideline section, repeat imaging studies of the pelvis are not necessary unless there is evidence for progression of disease, new onset of disease, and/or documentation of how repeat imaging will affect individual management or treatment decisions.
- Ultrasound
 - Ultrasound should be the initial imaging in most pelvic conditions to rule out those situations that do not require additional advanced imaging.
 - For those individuals who do require advanced imaging after ultrasound, ultrasound can be very beneficial in selecting the proper modality, body area, image sequences, and contrast level that will provide the most definitive information for the individual.
 - CPT® codes vary by body area and presence or absence of Doppler imaging and are included in the table at the beginning of this guideline.
 - Transabdominal ultrasound is appropriate in all pediatric individuals.
 - Transvaginal (TV) ultrasound is appropriate in pediatric individuals who are sexually active or use a tampon and consent to the study. Ultrasound (complete CPT® 76856 or, limited CPT® 76857) should substitute for TV in pediatric individuals or non-sexually active adult females

Pediatric Pelvis Imaging Age Considerations (PEDPV-1.1)

PVP.GG.0001.1.A**v1.0.2024**

Many conditions affecting the pelvis in the pediatric population are different diagnoses than those occurring in the adult population. For those diseases which occur in both pediatric and adult populations, minor differences may exist in management due to individual age, comorbidities, and differences in disease natural history between children and adults.

- Individuals who are 18 years old and younger⁹ should be imaged according to the Pediatric Pelvis Imaging Guidelines if discussed. Any conditions not specifically discussed in the Pediatric Pelvis Imaging Guidelines should be imaged according to the General Pelvis Imaging Guidelines. Individuals who are >18 years should be imaged according to the General Pelvis Imaging Guidelines, except where directed otherwise by a specific guideline section.

Pediatric Pelvis Imaging Modality General Considerations (PEDPV-1.3)

PVP.GG.0001.3.A

v1.0.2024

- Ultrasound
 - See **General Guidelines (PEDPV-1.0)**
- MRI
 - MRI Pelvis is generally performed without and with contrast (CPT® 72197) unless the individual has a documented contraindication to gadolinium or otherwise stated in a specific guideline section.
 - Due to the length of time required for MRI acquisition and the need to minimize individual movement, anesthesia is usually required for almost all infants (except neonates) and young children (age <7 years) as well as older children with delays in development or maturity. This anesthesia may be administered via oral or intravenous routes. In this individual population, MRI sessions should be planned with a goal of minimizing anesthesia exposure by adhering to the following considerations:
 - MRI procedures can be performed without and/or with contrast use as supported by these condition-based guidelines. If intravenous access will already be present for anesthesia administration and there is no contraindication for using contrast, imaging without and with contrast may be appropriate if requested. By doing so, the requesting provider may avoid repetitive anesthesia administration to perform an MRI with contrast if the initial study without contrast is inconclusive.
 - Recent evidence-based literature demonstrates the potential for gadolinium deposition in various organs including the brain, after the use of MRI contrast.
 - The U.S. Food and Drug Administration (FDA) has noted that there is currently no evidence to suggest that gadolinium retention in the brain is harmful and restricting gadolinium-based contrast agents (GBCAs) use is not warranted at this time. It has been recommended that GBCA use should be limited to circumstances in which additional information provided by the contrast agent is necessary and the necessity of repetitive MRIs with GBCAs should be assessed.
 - If multiple body areas are supported by eviCore guidelines for the clinical condition being evaluated, MRI of all necessary body areas should be obtained concurrently in the same anesthesia session.
 - The presence of surgical hardware or implanted devices may preclude MRI.
 - The selection of best examination may require coordination between the provider and the imaging service.

- CT
 - CT Pelvis typically extends from the iliac crest to the ischial tuberosities, and CT Abdomen and Pelvis extends from the dome of the diaphragm through the ischial tuberosities.
 - In general, CT Pelvis is appropriate when evaluating solid pelvic organs.
 - In general, CT Abdomen and Pelvis is appropriate when evaluating inflammatory or infections processes, hematuria, or conditions which appear to involve both the abdomen and the pelvis.
 - In some cases, especially in follow-up of a known finding, it may be appropriate to limit the exam to the region of concern to reduce radiation exposure.
 - The contrast level in pediatric CT imaging is specific to the clinical indication, as listed in the specific guideline sections.
 - CT Pelvis or Abdomen and Pelvis may be indicated for further evaluation of abnormalities suggested on prior US or MRI Procedures.
 - CT may be appropriate without prior MRI or US, as indicated in specific sections of these guidelines.
 - CT should not be used to replace MRI in an attempt to avoid sedation unless listed as a recommended study in a specific guideline section.
 - The selection of best examination may require coordination between the provider and the imaging service.
- Nuclear Medicine
 - Nuclear medicine studies are rarely used in imaging of the pediatric pelvis but are indicated in rare circumstances, including the following:
 - Lymph system mapping (CPT® 78195) is indicated for lower extremity lymphedema with recent negative Doppler ultrasound, or a history of Milroy's disease or prior pelvic lymph node dissection.
- 3D Rendering
 - 3D Rendering indications in pediatric pelvis imaging are identical to those in the general imaging guidelines. See **3D Rendering (Preface-4.1)** in the Preface Imaging Guidelines

The guidelines listed in this section for certain specific indications are not intended to be all-inclusive; clinical judgment remains paramount and variance from these guidelines may be appropriate and warranted for specific clinical situations.

Abnormal Uterine Bleeding (PEDPV-2)

Guideline

Abnormal Uterine Bleeding (PEDPV-2.1)

References (PEDPV-2)

Abnormal Uterine Bleeding (PEDPV-2.1)

PVP.UB.0002.1.A

v1.0.2024

- Abnormal uterine bleeding imaging indications in pediatric individuals are very similar to those for adult individuals. See **Abnormal Uterine Bleeding (AUB) (PV-2.1)** in the Pelvis Imaging Guidelines.
- The causes of vaginal bleeding in children differ from those in adolescents. Vaginal bleeding after the first week or so of life but before menarche is always abnormal and warrants evaluation. Common conditions before normal menarche include vaginal foreign bodies, infections, precocious puberty, and estrogen exposure. After menarche, pregnancy and excessive menstrual bleeding (dysfunction) must be considered.
- Pediatric-specific imaging considerations include the following:
 - Transabdominal ultrasound is appropriate in all pediatric individuals.
 - Transvaginal (TV) ultrasound is appropriate in pediatric individuals who are sexually active or use a tampon and consent to the study. Transvaginal ultrasound is generally not appropriate in pediatric individuals or in individuals who have never been sexually active.
 - MRI Pelvis without contrast or without and with contrast (CPT® 72195 or CPT® 72197) is indicated if ultrasound is inconclusive.

Guideline

Pelvic Inflammatory Disease (PID) (PEDPV-3.1)

References (PEDPV-3)

Pelvic Inflammatory Disease (PID) (PEDPV-3.1)

PVP.ID.0003.1.A

v1.0.2024

- Pelvic inflammatory disease imaging indications in pediatric individuals are very similar to those for adult individuals. See **Pelvic Inflammatory Disease (PV-7.1)** in the Pelvis Imaging Guidelines.
- Pediatric-specific imaging considerations include the following:
 - Transabdominal ultrasound is appropriate in all pediatric individuals.
 - Transvaginal (TV) ultrasound is appropriate in pediatric individuals who are sexually active or use a tampon and consent to the study. Transvaginal ultrasound is generally not appropriate in individuals who are pre-pubescent or victims of abuse.
 - MRI Pelvis without contrast (CPT® 72195) or without and with contrast (CPT® 72197) is indicated if ultrasound is inconclusive.
 - CT Pelvis with contrast (CPT® 72193) is indicated if MRI is not readily available.

Amenorrhea (PEDPV-4)

Guideline

Amenorrhea (PEDPV-4.1)

References (PEDPV-4)

Amenorrhea (PEDPV-4.1)

PVP.AA.0004.1.A

v1.0.2024

- Females with primary amenorrhea and any of the following should be evaluated initially with pelvic ultrasound (CPT® 76856 or CPT® 76857):
 - Amenorrhea is usually primary and refers to absence of menstrual periods by age 16.
 - Normal pubertal development and negative pregnancy test.
 - Transabdominal ultrasound is appropriate in all pediatric individuals.
 - Transvaginal (TV) ultrasound is appropriate in pediatric individuals who are sexually active or use a tampon and consent to the study. Transvaginal ultrasound (CPT® 76830) is indicated for better view of genitourinary anomalies in sexually active females.
 - Delayed puberty with follicle-stimulating hormone (FSH) or luteinizing hormone (LH) that is elevated for the individual's age and Tanner stage.
- MRI Pelvis without contrast or without and with contrast (CPT® 72195 or CPT® 72197) and/or MRI Abdomen without contrast or without and with contrast (CPT® 74181 or CPT® 74183) are indicated for congenital anomalies or for pre-operative planning.

Suspected Adnexal Mass (PEDPV-6)

Guideline

Suspected Adnexal Mass (PEDPV-6.1)

References (PEDPV-6)

Suspected Adnexal Mass (PEDPV-6.1)

PVP.AM.0006.1.A

v1.0.2024

- Suspected adnexal mass imaging indications in pediatric individuals are very similar to those for adult individuals. See **Adnexal Mass/Ovarian Cysts (PV-5)** in the Pelvis Imaging Guidelines. Ultrasound is the first study indicated for evaluation of a suspected adnexal mass.
- Pediatric-specific imaging considerations include the following:
 - Transabdominal ultrasound is appropriate in all pediatric individuals.
 - Transvaginal (TV) Ultrasound is appropriate in pediatric individuals who are sexually active or use a tampon and consent to the study. Transvaginal ultrasound is generally not appropriate in individuals who are pre-pubescent or have never been sexually active.
 - Adnexal masses with a solid component in individuals, age ≥ 15 years, should be imaged according to **Pediatric Germ Cell Tumors (PEDONC-10)** in the Pediatric Oncology Imaging Guidelines.

Pelvic Pain/Dyspareunia, and Ovarian Torsion (PEDPV-7)

Guideline

Pelvic Pain/Dyspareunia, and Ovarian Torsion (PEDPV-7.1)

References (PEDPV-7)

Pelvic Pain/Dyspareunia, and Ovarian Torsion (PEDPV-7.1)

PVP.PP.0007.1.A

v1.0.2024

- Pelvic Pain/Dyspareunia imaging indications in pediatric individuals are identical to those for adult individuals. See **Pelvic Pain/Dyspareunia, Female (PV-11.1)** in the Pelvis Imaging Guidelines.
- Ovarian torsion in children is typically associated with a normal ovary. Spontaneous torsion of a normal ovary is more common than torsion caused by a lead mass, such as a cyst or tumor. Torsion involves both the ovary and fallopian tube and typically presents with acute onset of lower abdominal pain, often associated with nausea or vomiting.
 - Transabdominal ultrasound (CPT® 76856) with Doppler (CPT® 93975) is appropriate in all pediatric individuals.
 - Transvaginal (TV) ultrasound (CPT® 76830) with Doppler (CPT® 93975) is appropriate in pediatric individuals who are sexually active or use a tampon and consent to the study. Transvaginal ultrasound is generally not appropriate in individuals who are pre-pubescent or have never been sexually active.

Guideline

Periurethral Cysts and Urethral Diverticula (PEDPV-9.1)

Periurethral Cysts and Urethral Diverticula (PEDPV-9.1)

PVP.CD.0009.1.A

v1.0.2024

- Periurethral cysts and urethral diverticula imaging indications in pediatric individuals are identical to those for adult individuals. See **Periurethral Cysts and Urethral Diverticula (PV-13)** in the Pelvis Imaging Guidelines.

Fetal MRI (PEDPV-10)

Guideline

Fetal MRI (PEDPV-10.1)

Fetal MRI (PEDPV-10.1)

PVP.MR.0010.1.A

v1.0.2024

- Fetal MRI indications in pediatric individuals are identical to those for adult individuals. See **Fetal MRI (PV-15.1)** in the Pelvis Imaging Guidelines.

Undescended Testis (PEDPV-11)

Guideline

Undescended Testis (PEDPV-11.1)

References (PEDPV-11)

Undescended Testis (PEDPV-11.1)

PVP.UT.0011.1.A

v1.0.2024

- Males with a history of cryptorchidism (undescended testis) have a several-fold risk increase of testicular cancer. It is important to diagnose and treat this condition either by bringing the undescended testis into the scrotum, or resecting the testis.
- Pediatric-specific imaging considerations include the following:
 - Suspected undescended testis is an indication for referral to a surgical subspecialist who should make the decision or be consulted on necessary imaging studies.
- After surgical evaluation or consultation, the following imaging is indicated for pre-operative evaluation⁸:
 - Scrotal ultrasound (CPT[®] 76870) if testis not palpable in the scrotal sac and there is concern for retractile or inguinal testis. In general CT and MRI are not indicated to localize non-palpable testes, as the findings would typically not alter the surgical procedure.
 - If after ultrasound there is concern for associated urogenital abnormalities, or the surgical consultant or any provider in consultation with the surgical consultant indicates that advanced imaging results would significantly alter the surgical procedure either of the studies below are indicated:
 - MRI Abdomen (CPT[®] 74183) and Pelvis (CPT[®] 72197) without and with contrast
 - CT Abdomen and Pelvis with contrast (CPT[®] 74177)

Scrotal Pathology (PEDPV-12)

Guideline

Scrotal Pathology (PEDPV-12.1)

References (PEDPV-12)

Scrotal Pathology (PEDPV-12.1)

PVP.SP.0012.1.A

v1.0.2024

- Scrotal pathology imaging indications in pediatric individuals are very similar to those for adult individuals. See **Scrotal Pathology (PV-20.1)** in the Pelvis Imaging Guidelines.
- Pediatric-specific imaging considerations include the following:
 - Scrotal US (CPT® 76870) with Doppler (CPT® 93975 or CPT® 93976) is indicated for concerns of testicular torsion.
 - MRI Pelvis without contrast (CPT® 72195) or without and with contrast (CPT® 72197) is indicated if torsion is unlikely on ultrasound and no surgical exploration is planned. MRI is not typically used for the acute scrotum due to the limited availability of equipment and the long examination time involved.
 - Since the acceptance of Doppler US as the primary imaging for evaluation of acute scrotum, scintigraphy is not indicated. The unavailability of nuclear medicine imaging in many practices and its use of ionizing radiation, its poor anatomical details, and the time required for imaging are other limiting factors.

Penis-Soft Tissue Mass (PEDPV-13)

Guideline

Penis-Soft Tissue Mass (PEDPV-13.1)

Penis-Soft Tissue Mass (PEDPV-13.1)

PVP.ST.0013.1.A

v1.0.2024

- Penile soft tissue masses are very rare in pediatric individuals, and imaging indications are identical to those for adult individuals. See **Penis-Soft Tissue Mass (PV-18.1)** in the Pelvis Imaging Guidelines.

Incontinence (PEDPV-14)

Guideline

Incontinence (PEDPV-14.1)

References (PEDPV-14)

Incontinence (PEDPV-14.1)

PVP.IN.0014.1.A

v1.0.2024

- Incontinence imaging indications in pediatric individuals are very similar to those for adult individuals. See **Urinary Incontinence/Pelvic Prolapse/Fecal Incontinence (PV-22)** in the Pelvis Imaging Guidelines.
- Most often incontinence in children is not due to a medical condition. Several uncommon disorders that can lead to urinary incontinence include a spinal cord defect such as spina bifida, ureteral duplication with ectopic insertion, and overactive bladder or dysfunctional voiding.
- No imaging is needed if primary enuresis is suspected; however, imaging evaluation may be warranted if ureteral duplication or overactive bladder or dysfunctional voiding is suspected. The physician should obtain a full medical history and urinalysis before imaging is done.
- Radiopharmaceutical urinary bladder residual study (CPT® 78730) is indicated for suspicion of urinary retention and a recent non-diagnostic ultrasound.
- Pediatric-specific imaging considerations include the following:
 - MRI Pelvis without and with contrast (CPT® 72197) is indicated if ultrasound is inconclusive or spinal abnormality is suspected.
 - CT Pelvis with contrast (CPT® 72193) is appropriate if MRI is not readily available.

Patent Urachus (PEDPV-15)

Guideline

Patent Urachus (PEDPV-15.1)

References (PEDPV-15)

Patent Urachus (PEDPV-15.1)

PVP.UR.0015.1.A

v1.0.2024

- Ultrasound pelvis (CPT® 76856) is indicated as the initial evaluation for patent urachus.
 - ANY of the following are indicated if the ultrasound is inconclusive or insufficient for preoperative planning:
 - MRI Pelvis without contrast (CPT® 72195)
 - MRI Pelvis without and with contrast (CPT® 72197)
 - CT Pelvis with contrast (CPT® 72193)
- Repeat imaging of asymptomatic individuals is not generally necessary, but is indicated for the following:
 - New or worsening symptoms
 - Preoperative planning

Background and Supporting Information

The urachus is a “tube” connecting the fetal bladder to the umbilical cord. It is usually obliterated during fetal growth, but if it remains patent, there can be a complete or partial connection between the bladder and the umbilicus.

Ultrasound has an accuracy greater than 90%.

General Guidelines (PEDPN-1.0)

PNP.GG.0001.0.A

v1.0.2024

- A pertinent clinical evaluation including a detailed history, physical examination since the onset or change in symptoms with a thorough neurologic examination, appropriate laboratory studies, and basic imaging such as plain radiography or ultrasound should be performed prior to considering advanced imaging (CT, MRI, Nuclear Medicine), unless the individual is undergoing guideline-supported scheduled imaging evaluation. A meaningful technological contact (telehealth visit, telephone call, electronic mail or messaging) since the onset or change in symptoms can serve as a pertinent clinical evaluation.
 - EMG may not be of clinical utility or obtainable in infants or individuals with severe developmental delay
 - EMG/NCS results may not be abnormal until 10 days after injury.
- Unless otherwise stated in a specific guideline section, the use of advanced imaging to screen asymptomatic individuals for disorders involving the peripheral nervous system is not supported. Advanced imaging of the peripheral nervous system is only appropriate in individuals who have documented active clinical signs or symptoms of disease involving the peripheral nervous system.
- Unless otherwise stated in a specific guideline section, repeat imaging studies of the peripheral nervous system are not necessary unless there is evidence for progression of disease, new onset of disease, and/or documentation of how repeat imaging will affect individual management or treatment decisions.

Age Considerations (PEDPN-1.1)

PNP.GG.0001.1.A

v1.0.2024

- Many conditions affecting the peripheral nervous system in the pediatric population are different diagnoses than those occurring in the adult population. For those diseases that occur in both pediatric and adult populations, minor differences may exist in management due to individual age, comorbidities, and differences in disease natural history between children and adults.
- Individuals who are 18 years old or younger¹¹ should be imaged according to the Pediatric Peripheral Nerve Disorders Imaging Guidelines if discussed. Any conditions not specifically discussed in the Pediatric Peripheral Nerve Disorder Imaging Guidelines should be imaged according to the General Peripheral Nerve Disorder Imaging Guidelines. Individuals who are >18 years old should be imaged according to the General Peripheral Nerve Disorders Imaging Guidelines, except where directed otherwise by a specific guideline section.

Modality General Considerations (PEDPN-1.3)

PNP.GG.0001.3.A

v1.0.2024

- MRI
 - MRI without and with contrast is the preferred modality for pediatric peripheral nerve imaging unless otherwise stated in a specific guideline section.
 - Due to the length of time required for MRI acquisition and the need to minimize individual movement, anesthesia is usually required for almost all infants (except neonates) and young children (age <7 years) as well as older children with delays in development or maturity. This anesthesia may be administered via oral or intravenous routes. In this individual population, MRI sessions should be planned with a goal of minimizing anesthesia exposure by adhering to the following considerations:
 - MRI procedures can be performed without and/or with contrast as supported by these condition-based guidelines. If intravenous access will already be present for anesthesia administration and there is no contraindication for using contrast, imaging without and with contrast may be appropriate if requested. By doing so, the requesting provider may avoid repetitive anesthesia administration to perform an MRI with contrast if the initial study without contrast is inconclusive.
 - Recent evidence based literature demonstrates the potential for gadolinium deposition in various organs including the brain after the use of MRI contrast.
 - The U.S. Food and Drug Administration (FDA) has noted that there is currently no evidence to suggest that gadolinium retention in the brain is harmful and restricting gadolinium-based contrast agents (GBCAs) use is not warranted at this time. It has been recommended that GBCA use should be limited to circumstances in which additional information provided by the contrast agent is necessary and the necessity of repetitive MRIs with GBCAs should be assessed.
 - If multiple body areas are supported by the guidelines for the clinical condition being evaluated, MRI of all necessary body areas should be obtained concurrently in the same anesthesia session.
- CT
 - CT is rarely used in the evaluation of pediatric peripheral nerve disorders. See specific guideline sections for indications.
- Ultrasound
 - Ultrasound is rarely used in the evaluation of pediatric peripheral nerve disorders. See specific guideline sections for indications.

- Nuclear Medicine
 - Nuclear medicine studies are generally not indicated in the evaluation of peripheral nerve disorders. See **Neurofibromatosis (PEDPN-2)** for specific imaging guidelines regarding PET/CT in evaluation of peripheral nerve tumors.
- 3D Rendering
 - 3D Rendering indications in pediatric PND imaging are identical to those in the general imaging guidelines. See **3D Rendering (Preface-4.1)** in the Preface Imaging Guidelines.
- The guidelines listed in this section for certain specific indications are not intended to be all-inclusive; clinical judgment remains paramount and variance from these guidelines may be appropriate and warranted for specific clinical situations

Neurofibromatosis – General Information (PEDPN-2.0)

Neurofibromatosis 1 (PEDPN-2.1)

Neurofibromatosis 2 (PEDPN-2.2)

Neurofibromatosis – General Information (PEDPN-2.0)

PNP.NF.0002.0.A

v1.0.2024

- This guideline section includes imaging indications for individuals with neurofibromatosis and known benign lesions.
- For cancer screening guidelines, see **Neurofibromatosis 1 and 2 (NF1 and NF2) (PEDONC-2.3)** in the Pediatric Oncology Imaging Guidelines.
- For Peripheral Nerve Sheath Tumors, see **Peripheral Nerve Sheath Tumors (PNST) (PND-9.1)** in the Peripheral Nerve Disorders (PND) Imaging Guidelines.
- For guidelines related to known malignancies in individuals with NF1, see the appropriate imaging guideline for the specific cancer type.

Neurofibromatosis 1 (PEDPN-2.1)

PNP.NF.0002.1.A

v1.0.2024

- See **Neurofibromatosis 1 and 2 (NF1 and NF2) (PEDONC-2.3)** in the Pediatric Oncology Imaging Guidelines.
- For Peripheral Nerve Sheath Tumors, see **Peripheral Nerve Sheath Tumors (PNST) (PND-9.1)** in the Peripheral Nerve Disorders (PND) Imaging Guidelines.
- For guidelines related to known malignancies in individuals with NF1, see the appropriate imaging guideline for the specific cancer type.

Neurofibromatosis 2 (PEDPN-2.2)

PNP.NF.0002.2.A

v1.0.2024

- See **Neurofibromatosis 1 and 2 (NF1 and NF2) (PEDONC-2.3)** in the Pediatric Oncology Imaging Guidelines.
- Individuals with NF2 and known meningioma should be imaged according to guidelines in **Meningiomas (Intracranial and Intraspinal) (ONC-2.8)** in the Oncology Imaging Guidelines.
- Individuals with NF2 and known ependymoma should be imaged according to guidelines in **Ependymoma (PEDONC-4.8)** in the Pediatric Oncology Imaging Guidelines.

Brachial Plexus (PEDPN-3)

Guideline

Brachial Plexus (PEDPN-3.1)

References (PEDPND-3)

Brachial Plexus (PEDPN-3.1)

PNP.BP.0003.1.A

v1.0.2024

Disorders of the brachial plexus can generally be identified and distinguished from lesions in other locations by clinical and electromyography/nerve conduction (EMG/NCV) examination. If the diagnosis remains unclear, advanced imaging can be helpful as a pre-operative study to evaluate the anatomy of brachial plexus lesions that should have already been defined by clinical examination.

- MRI is the preferred modality for imaging the brachial plexus. The goal of imaging is to visualize the entire course of the neural network from the preganglionic to the postganglionic segments.
 - CT is not often useful and should not be used as a substitute for MRI.
 - MRI Upper Extremity Other Than Joint without contrast (CPT® 73218) or without and with contrast (CPT® 73220) is indicated for unilateral brachial plexus.
 - MRI Chest without contrast (CPT® 71550) or without and with contrast (CPT® 71552) is indicated for bilateral brachial plexus studies. MRI Neck without contrast (CPT® 70540) is indicated for upper trunk lesions.
 - It is rare for more than one CPT® code to be necessary to adequately image the brachial plexus area of interest.
 - MRI Shoulder without contrast (CPT® 73221) or without and with contrast (CPT® 73223) is indicated in infants with brachial plexopathy due to birth trauma if requested for preoperative planning. These individuals often have glenohumeral dysplasia and require shoulder surgery.
 - Ultrasound also may be indicated in infants with brachial plexus injury to show the glenoid dysplasia and associated shoulder subluxation
 - MRI Cervical Spine without contrast (CPT® 72141) is indicated if there is clinical suspicion for cervical nerve root avulsion.
 - PET/CT skull base to mid-thigh (CPT® 78815) is appropriate if there is a contraindication to MRI in individuals with a known malignancy or post-treatment syndrome.

Ultrasound, abdominal, real time with image documentation; complete	76700
Duplex scan of extracranial arteries; complete bilateral study	93880
Duplex scan of extracranial arteries; unilateral or limited study	93882
Non-invasive physiologic studies of extracranial arteries, complete bilateral study	93875
Limited bilateral noninvasive physiologic studies of upper or lower extremity arteries	93922
Complete bilateral noninvasive physiologic studies of upper or lower extremity arteries	93923
Duplex scan of upper extremity arteries or arterial bypass grafts; complete bilateral	93930
Duplex scan of upper extremity arteries or arterial bypass grafts; unilateral or limited	93931
Non-invasive physiologic studies of extremity veins, complete bilateral study	93965
Duplex scan of extremity veins including responses to compression and other maneuvers; complete bilateral study	93970
Duplex scan of extremity veins including responses to compression and other maneuvers; unilateral or limited study	93971
Duplex scan of hemodialysis access (including arterial inflow, body of access, and venous outflow)	93990

General Guidelines (PEDPVD-1.0)

PVDP.GG.0001.0.A

v1.0.2024

- A pertinent clinical evaluation since the onset or change in symptoms including a detailed history, physical examination, appropriate laboratory studies and basic imaging such as plain radiography or ultrasound should be performed prior to considering advanced imaging (CT, MR, Nuclear Medicine), unless the individual is undergoing guideline-supported scheduled imaging evaluation. A meaningful technological contact (telehealth visit, telephone call, electronic mail or messaging) can serve as a pertinent clinical evaluation.
- Unless otherwise stated in a specific guideline section, the use of advanced imaging to screen asymptomatic individuals for disorders involving the peripheral vascular system is not supported. Advanced imaging of the peripheral vascular system should only be approved in individuals who have documented active clinical signs or symptoms of disease involving the peripheral vascular system.
- Unless otherwise stated in a specific guideline section, repeat imaging studies of the peripheral vascular system are not necessary unless there is evidence for progression of disease, new onset of disease, and/or documentation of how repeat imaging will affect the individual's management or treatment decisions.

Age Considerations (PEDPVD-1.1)

PVDP.GG.0001.1.A

v1.0.2024

Many conditions affecting the peripheral vascular system in the pediatric population are different diagnoses than those occurring in the adult population. For those diseases which occur in both pediatric and adult populations, differences may exist in management due to the individual's age, comorbidities, and differences in disease natural history between children and adults.

- Individuals who are 18 years old and younger¹⁴ should be imaged according to the Pediatric Peripheral Vascular Disease imaging guidelines if discussed. Any conditions not specifically discussed in the pediatric peripheral vascular disease imaging guidelines should be imaged according to the general peripheral vascular disease imaging guidelines. Individuals who are >18 years old should be imaged according to the general Peripheral Vascular Disease imaging guidelines, except where directed otherwise by a specific guideline section.

Modality General Considerations (PEDPVD-1.3)

PVDP.GG.0001.3.A

v1.0.2024

- MRI
 - MRI is generally performed without and with contrast unless the individual has a documented contraindication to gadolinium or otherwise stated in a specific guideline section.
 - Due to the length of time required for MRI acquisition and the need to minimize the individual's movement, anesthesia is usually required for almost all infants (except neonates) and young children (age <7 years), as well as older children with delays in development or maturity. This anesthesia may be administered via oral or intravenous routes. In this population, MRI sessions should be planned with a goal of minimizing anesthesia exposure adhering to the following considerations:
 - MRI procedures can be performed without and/or with contrast use as supported by these condition-based guidelines. If intravenous access will already be present for anesthesia administration and there is no contraindication for using contrast, imaging without and with contrast may be indicated if requested. By doing so, the requesting provider may avoid repetitive anesthesia administration to perform an MRI with contrast if the initial study without contrast is inconclusive.
 - Recent evidence-based literature demonstrates the potential for gadolinium deposition in various organs including the brain after the use of MRI contrast.
 - The U.S. Food and Drug Administration (FDA) has noted that there is currently no evidence to suggest that gadolinium retention in the brain is harmful and restricting gadolinium-based contrast agents (GBCAs) use is not warranted at this time. It has been recommended that GBCA use should be limited to circumstances in which additional information provided by the contrast agent is necessary and the necessity of repetitive MRIs with GBCAs should be assessed.
 - If multiple body areas are supported for the clinical condition being evaluated, MRI of all necessary body areas should be obtained concurrently in the same anesthesia session.
 - The presence of surgical hardware or implanted devices may preclude MRI.
 - The selection of best examination may require coordination between the provider and the imaging service.
- CT
 - CT or CTA may be indicated for further evaluation of abnormalities suggested on prior US or MRI Procedures.

- CT may be indicated without prior MR or US, especially in the following (non-exhaustive list of) settings:
 - Lymphatic malformations
 - Vascular abnormalities including vasculitis, thrombosis, narrowing, aneurysm, dissection, and varices.
 - For pre-operative planning or assessment of post-operative complications.
- In some cases, especially in follow-up of a known finding, it may be appropriate to limit the exam to the region of concern to reduce radiation exposure.
- CT should not be used to replace MRI in an attempt to avoid sedation unless listed as a recommended study in a specific guideline section.
- The selection of best examination may require coordination between the provider and the imaging service.
- Ultrasound
 - Ultrasound can be helpful in evaluating arterial, venous, and lymphatic malformations.
 - Ultrasound can be limited by the imaging window and the individual's body type.
 - CPT® codes vary by body area and presence or absence of Doppler imaging and are included in the table at the beginning of this guideline.
- 3D Rendering
 - 3D Rendering indications in pediatric imaging are identical to those in the general imaging guidelines. See **3D Rendering (Preface-4.1)** in the Preface Imaging Guidelines
- Nuclear Medicine
 - Nuclear medicine studies are rarely used in the evaluation of peripheral vascular disorders but are indicated in the following circumstances:
 - Lymphoscintigraphy (CPT® 78195) is indicated for evaluation of lower extremity lymphedema when a recent Doppler ultrasound is negative for valvular insufficiency.
 - Vascular flow imaging (CPT® 78445) is an obsolete study that has been replaced by MRA, CTA, or Duplex ultrasonography, and is not supported for any indication at this time.
 - Venous thrombosis imaging (CPT® 78456, CPT® 78457, and CPT® 78458) are obsolete studies that have been replaced by MRA, CTA, or Duplex ultrasonography, and are not supported for any indication at this time.
 - Radiopharmaceutical nuclear medicine studies (CPT® 78800, CPT® 78801, CPT® 78802 or CPT® 78803) can be approved for evaluation of the following:
 - Mycotic aneurysms
 - Vascular graft infection
 - Infection of central venous catheter or other indwelling device
- The guidelines listed in this section for certain specific indications are not intended to be all-inclusive; clinical judgment remains paramount and variance from these guidelines may be indicated and warranted for specific clinical situations.

Vascular Anomalies (PEDPVD-2)

Guideline

General Information (PEDPVD-2.1)

Lymphatic Malformations (PEDPVD-2.2)

Venous Malformations (PEDPVD-2.3)

Capillary Malformations (PEDPVD-2.4)

Arteriovenous Malformations (AVMs) and Fistulas (PEDPVD-2.5)

Vascular Tumors (PEDPVD-2.6)

References (PEDPVD-2)

General Information (PEDPVD-2.1)

PVDP.AN.0002.1.A

v1.0.2024

- Individuals with aggressive lesions being treated with systemic therapy can have imaging (see specific sections for details regarding modality and contrast level) approved for treatment response every 3 months during active treatment.
- Annual surveillance imaging of known vascular or lymphatic malformations can be approved for body areas where growth could cause significant organ dysfunction or functional impairment.

Background and Supporting Information

Vascular and lymphatic malformations encompass a broad variety of conditions and have very heterogeneous natural history and treatment approaches. Lesions can be divided into low flow lesions (lymphatic, capillary and venous malformations), and high-flow lesions (arteriovenous malformations and fistulas).

Lymphatic Malformations (PEDPVD-2.2)

PVDP.AN.0002.2.A

v1.0.2024

- Ultrasound is indicated as an initial examination for superficial lesions.¹⁸
 - Large lesion characterization may be limited by ultrasound imaging window.
 - Ultrasound is also limited in evaluating malformation relationship to airway or bony structures.
- MRI without contrast or without and with contrast of the affected body part is indicated for:
 - Lymphatic malformations involving deep tissues
 - Malformations too large to be completely imaged with ultrasound¹⁷
 - Inconclusive ultrasound findings
 - Preoperative planning
 - Post treatment evaluation¹⁸
- CT is of limited value in evaluating lymphatic malformations
 - CT with contrast of the affected body part is indicated for lesions with acute enlargement and concerns for compression when MRI is contraindicated.

Background and Supporting Information

Lymphatic malformations are composed of dilated lymphatic channels filled with proteinaceous fluid and do not connect to normal lymphatic channels. They are typically soft, non-pulsatile masses with normal overlying skin.

Venous Malformations (PEDPVD-2.3)

PVDP.AN.0002.3.A

v1.0.2024

- Ultrasound with Doppler is indicated as an initial examination for superficial lesions.
 - Large lesion characterization may be limited by ultrasound imaging window.
 - Ultrasound is also limited in evaluating malformation relationship to airway or bony structures.
- MRI without contrast or without and with contrast of the affected body part is indicated for venous malformations for preoperative assessment to evaluate the extent of malformation and their relationship to normal structures.
- MRA or CTA has a limited role in evaluating most venous malformations but may be indicated (contrast as requested of the affected body part) if MRI or CT is equivocal and the results will impact acute management decisions.
- CT can also be used to characterize venous malformations and their relationship to normal structures but is generally not as accurate as MRI.
 - CT with contrast of the affected body part is indicated when MRI is inconclusive or contraindicated
 - Both Klippel-Trénaunay syndrome and CLOVES syndrome have been found to have increased risk of venous thrombosis and pulmonary embolism, particularly after surgery or sclerotherapy. When pulmonary embolism is suspected in such individuals, CT Chest with contrast with PE protocol (CPT® 71260) or CTA Chest (CPT® 71275) is indicated.

Background and Supporting Information

Venous malformations are slow-flow lesions characterized by dilated venous spaces and a normal arterial component. They are soft, compressible, non-pulsatile lesions that are usually blue to deep purple in color. Lesions can range from very small to large infiltrating ones. Some may change size with Valsalva.

Venous malformations are usually isolated, but they may be seen in multiple syndromes including Klippel-Trenaunay (KT) syndrome, Blue Rubber Bleb Nevus syndrome (BRBN), Maffucci syndrome, Proteus syndrome, Bannayan-Riley-Ruvalcaba syndrome, Parkes-Weber syndrome and congenital lipomatous overgrowth, vascular malformations, epidermal nevi and scoliosis/skeletal/spinal anomalies (CLOVES) syndrome.

Capillary Malformations (PEDPVD-2.4)

PVDP.AN.0002.4.A

v1.0.2024

- MRI (without contrast or without and with contrast) is indicated to evaluate occult underlying neurologic structures associated with encephalocele, spinal dysraphism, or Sturge-Weber syndrome.

Background and Supporting Information

Capillary malformations also known as port wine stains are characterized by a collection of small vascular channels in the dermis and generally do not require advanced imaging because the diagnosis is made clinically.

Arteriovenous Malformations (AVMs) and Fistulas (PEDPVD-2.5)

PVDP.AN.0002.5.A

v1.0.2024

- Ultrasound with Doppler is indicated as an initial examination for superficial lesions
 - Large lesion characterization may be limited by ultrasound imaging window.
 - Ultrasound is also limited in evaluating AVM relationship to airway or bony structures.
- MRI without contrast or without and with contrast of the affected body part is also indicated for evaluation of AVMs, and is useful in evaluating the extent of AVMs and their relationship to normal structures.
- MRA (contrast as requested) of the affected body part is indicated for evaluation and surveillance of known AVMs.
- It is unusual for both MRI and MRA to be necessary for routine treatment response or surveillance imaging of AVMs, but both may be indicated for preoperative planning.
- CT and CTA can also be used to characterize AVMs and their relationship to normal structures but is generally not better than MRI and has associated radiation risks.
 - CT with contrast and/or CTA (contrast as requested) of the affected body part is indicated when MRI and/or MRA is inconclusive or contraindicated.

Background and Supporting Information

Arteriovenous malformations are characterized by a network of multiple abnormal vascular channels interposed between enlarged feeding arteries and draining veins. The arteriovenous fistula has a single communication interposed between a feeding artery and a draining vein. The normal capillary bed is absent in both lesions. Both lesions may have an aggressive clinical course and are characterized by a reddish pulsatile mass which has a thrill or bruit. Though often recognized at birth, these lesions may grow and present near adolescence.

Vascular Tumors (PEDPVD-2.6)

PVDP.AN.0002.6.A

v1.0.2024

- Ultrasound with Doppler is indicated as an initial examination for vascular tumors.
 - Large lesion characterization may be limited by ultrasound imaging window.
 - Ultrasound is also limited in evaluating malformation relationship to airway or bony structures.
- MRI without contrast or without and with contrast of the affected body part is also indicated for evaluation of vascular tumors, and is useful in evaluating the extent of arteriovenous malformations and their relationship to normal structures, as well as response to therapy.
- MRA (contrast as requested) of the affected body part is indicated for evaluation and surveillance of known vascular tumors.
- It is unusual for both MRI and MRA to be necessary for routine treatment response or surveillance imaging of vascular tumors, but both may be indicated for preoperative planning.
- CT and CTA can also be used to characterize vascular tumors and their relationship to normal structures but is generally not better than MRI and has associated radiation risks.
 - CT with contrast and/or CTA (contrast as requested) of the affected body part is indicated when MRI and/or MRA is inconclusive or contraindicated.

Background and Supporting Information

Vascular tumors include a variety of benign, borderline, and malignant tumors, which have variable clinical courses, including but not limited to Infantile Hemangiomas see **Infantile Hemangiomas (PEDPVD-5)**, Epithelioid hemangioma, Kaposiform hemangioendothelioma, Kaposi sarcoma, Epithelioid hemangioendothelioma, and Angiosarcoma of soft tissue.

Vasculitis (PEDPVD-3)

Guideline

General Information (PEDPVD-3.1)

Large Vessel Vasculitis (PEDPVD-3.2)

Medium Vessel Vasculitis (PEDPVD-3.3)

Small Vessel Vasculitis (PEDPVD-3.4)

References (PEDPVD-3)

General Information (PEDPVD-3.1)

PVDP.VI.0003.1.A

v1.0.2024

- PET/CT is **not** medically necessary for management of pediatric vasculitis at this time.
 - There are limited data suggesting PET may have similar accuracy to MRA in the initial diagnosis of Takayasu arteritis but is not helpful in assessing treatment response and has not been shown to improve individual outcomes to date.

Background and Supporting Information

Systemic vasculitis is much less common in children than in adults, although the diagnostic pathways and treatment options are similar.

Large Vessel Vasculitis (PEDPVD-3.2)

PVDP.VI.0003.2.A

v1.0.2024

- ANY of the following modalities may be indicated for evaluation of Takayasu arteritis:
 - MRA of the affected body area(s) (contrast as requested)
 - CTA of the affected body area(s) (contrast as requested)
 - Ultrasound with Doppler of the affected body area(s)
- Imaging is indicated at the following intervals:
 - Every 3 months for treatment response during active treatment in individuals being treated with systemic therapy.
 - See specific sections for details regarding modality and contrast level.
 - Annually for surveillance of known involved body areas to detect progressive vascular damage that may require intervention.

Background and Supporting Information

Takayasu arteritis is the predominant large vessel vasculitis occurring in children.

Medium Vessel Vasculitis (PEDPVD-3.3)

PVDP.VI.0003.3.A

v1.0.2024

- Some children who have had COVID 19 develop a severe inflammatory disease that can present in a similar way to Kawasaki disease or toxic shock syndrome. This syndrome has been defined by the US Centers for Disease Control and Prevention as multisystem inflammatory syndrome in children (MIS-C). See **Multisystem inflammatory syndrome in children (MIS-C) (PEDCD-12)** in the pediatric cardiac imaging guidelines.
- Imaging guidelines for Kawasaki Disease- see **Kawasaki Disease (PEDCD-6)** in the pediatric cardiac imaging guideline.
- For evaluation of polyarteritis nodosa:
 - ANY of the following modalities may be indicated:
 - MRA of the affected body area(s) (contrast as requested)
 - CTA of the affected body area(s) (contrast as requested)
 - Ultrasound with Doppler of the affected body area(s)
 - Imaging is indicated at the following intervals:
 - Every 3 months during active treatment with systemic therapy for treatment response.
 - For details regarding modality and contrast level see **Modality General Considerations (PEDPVD-1.3)**
 - Annually for surveillance of known involved body areas to detect progressive vascular damage that may require intervention.

Background and Supporting Information

Polyarteritis nodosa and Kawasaki Disease are the primary medium vessel vasculitides occurring in children.

Small Vessel Vasculitis (PEDPVD-3.4)

PVDP.VI.0003.4.A

v1.0.2024

- Advanced imaging is not sensitive enough to detect changes in small vessels, and is not indicated for primary assessment of any small vessel vasculitis.
- End-organ damage occurs with several of the small vessel vasculitides. Advanced imaging is indicated for the following:
 - Henoch-Schönlein Purpura (HSP) is the most common vasculitis of childhood, mainly involving small blood vessels. Ultrasound abdomen (CPT® 76700) is commonly used to evaluate possible gastrointestinal complications (including bowel wall edema and hemorrhage, and intussusception) in known or suspected HSP, and should be approved when requested for that indication.
 - Granulomatosis with polyangiitis (GPA, formerly known as Wegener's granulomatosis):
 - CT Sinuses (CPT® 70486) and/or CT Chest without contrast (CPT® 71250) or with contrast (CPT® 71260) is indicated in the following circumstances:
 - New or worsening clinical symptoms affecting the body area requested
 - To assess response to medical therapy when a change in treatment regimen is being considered
 - Annually-to evaluate the extent of disease
 - Eosinophilic granulomatosis with polyangiitis (EGPA, formerly known as Churg-Strauss Syndrome):
 - CT Chest without contrast (CPT® 71250) or with contrast (CPT® 71260) is indicated in the following circumstances:
 - New or worsening clinical symptoms affecting the body area requested
 - To assess response to medical therapy when a change in treatment regimen is being considered
 - Annually-to evaluate the extent of disease
 - Immune complex associated small-vessel vasculitis [immunoglobulin A–associated vasculitis (IgAV)]:
 - Doppler ultrasound of the affected body part (most commonly abdomen) is indicated in the following circumstances:
 - New or worsening clinical symptoms affecting the body area requested
 - To assess response to medical therapy when a change in treatment regimen is being considered
 - Annually-to evaluate the extent of disease

Disorders of the Aorta and Visceral Arteries (PEDPVD-4)

Guideline

Thoracic Aortic Disease (PEDPVD-4.1)

Aortic Congenital Vascular Malformations (PEDPVD-4.2)

Visceral Artery Aneurysms (PEDPVD-4.3)

References (PEDPVD-4)

Thoracic Aortic Disease (PEDPVD-4.1)

PVDP.AD.0004.1.A

v1.0.2024

Familial Aortopathies

- For Aortopathies such as the following:
 - Marfan
 - Ehlers-Danlos (EDS)- a genetic mutation known to predispose to aortic aneurysms/dissections (TGFB1, TGFB2, FBN1, ACTA2, or MYH11)
 - Loeys-Dietz
 - Familial thoracic aneurysm and dissections
- Screening: for Family history with first-degree relative of aortopathy
 - Asymptomatic Individuals with no signs or symptoms of disease, whose first-degree relative has no definitive gene defect, can have screening.
 - Echo (TTE) annually.
- Initial workup: Individuals with suspected aortopathies (gene positive, physical exam positive, or other findings) or definite disease associated with aortopathy
 - Echocardiogram (TTE) at the time of evaluation.
 - If the consideration is for Loeys-Dietz any of the following may be indicated in addition to the TTE at the time of work up:
 - MRA or CTA Head
 - MRA or CTA Neck
 - MRA or CTA Chest
 - MRA or CTA Abdomen and Pelvis
 - MRA or CTA of area of concern when there is an incidental finding on other imaging
- Surveillance: Suspected or known disease but **normal** aortic imaging:
 - Individuals with suspected genetic aortopathies but no disease can have an echocardiogram to assess for change:
 - At 6 months
 - Then annually
 - Individuals with Loeys-Dietz can be imaged with any of the following:
 - Echocardiogram
 - MRA or CTA of (any or all):
 - Head
 - Neck
 - Chest
 - Abdomen
 - Pelvis

- Individuals with Loyes-Dietz can be imaged with the above at the following intervals:
 - At 6 months
 - Then annually
- Surveillance: Suspected disease and **previous abnormal** imaging
 - Individuals with abnormal thoracic imaging can be imaged with (both):
 - Echocardiogram
 - CTA or MRA of (any):
 - Chest
 - Abdomen
 - Pelvis
 - Head (Loyes-Dietz)
 - Neck (Loyes-Dietz)
 - The above imaging is indicated as follows:
 - At the time of diagnosis
 - In 6 months after diagnosis (if older than 2 years)
 - Then as follows based on the individual's age:
 - Individual's age 0 to 2 years:
 - Every 3 months
 - Individual's age 3 to 12 years:
 - Every 6 months
 - Individual's age 13 years and older:
 - Every 12 months (if <4.5 or <0.5 cm growth per year)
 - Every 6 months if ≥ 4.5 or ≥ 0.5 cm growth per year, or any Loyes-Dietz patient)
 - If the diameter z score is increased, then a repeat study can be done prior to the next allowed study, to assess for rate of change
- If there are symptoms of dissection any or all of the following are indicated:
 - Echo
 - CTA or MRA of (any or all):
 - Chest
 - Abdomen
 - Pelvis
- For pediatric individual with dissection, imaging per vascular surgery and cardiology or any provider in consultation with vascular surgery at **any** interval.
- Miscellaneous syndromes with potential aortopathy as major feature of congenital heart disease
 - Individuals with Turner syndrome see section **Aortic disease in Turner Syndrome (CD-11.2.10)** in the Cardiac Imaging Guideline

- Williams syndrome See section **LVOT lesions (PEDCD-2.4.10)** in the Pediatric Cardiology Imaging Guideline
- Individuals with congenital heart disease would be managed based on **Imaging and Surveillance per Congenital lesion (PEDCD-2.4)** in the Pediatric Cardiology Imaging Guideline
- Miscellaneous disorders that can affect aorta, Osteogenesis imperfecta, Homocystinuria, polycystic kidney disease, Pseudo xanthoma elasticum, Hurler syndrome.
 - Screening echocardiogram yearly.
 - If positive findings, follow protocol for aortic root dilatation.
- Follow-up of thoracic aortic abnormalities for other conditions please see discussions indicated elsewhere in the guidelines:
 - Coarctation of the Aorta- See **Aortic Coarctation and IAA (interrupted aortic arch) (PEDCD-2.4.11)** in the Pediatric Cardiac Imaging Guidelines
 - Congenital rubella syndrome- See **Imaging and Surveillance per Congenital lesion (PEDCD-2.4)** in the Pediatric Cardiac Imaging Guidelines
 - Kawasaki Syndrome- See **Kawasaki Disease (PEDCD-6)**
 - Neurofibromatosis- See **General Guidelines (PEDCD-1.0)** in the Pediatric Cardiac Imaging Guidelines

Aortic Congenital Vascular Malformations (PEDPVD-4.2)

PVDP.PC.0004.2.A

v1.0.2024

- Cardiac MRI without contrast (CPT® 75557) or without and with contrast (CPT® 75561), MRA Chest (CPT® 71555), CT Chest with contrast (CPT® 71260), or CTA Chest (CPT® 71275) may be indicated for evaluation.
- Vascular rings may impact both the esophagus and trachea. See **Esophagus (PEDNECK-7)** and/or **Trachea (PEDNECK-8)** in the Pediatric Neck Imaging Guidelines for additional guidelines.

Visceral Artery Aneurysms (PEDPVD-4.3)

PVDP.AD.0004.3.A

v1.0.2024

- Visceral artery imaging indications in pediatric individuals are identical to those for adult individuals. See **Aortic Disorders and Renal Vascular Disorders and Visceral Artery Aneurysms (PVD-6)** in the Peripheral Vascular Disease Imaging Guidelines.

Infantile Hemangiomas – General Considerations (PEDPVD-5.1)

PVDP.IH.0005.1.A

v1.0.2024

Most infantile hemangiomas do not require any imaging. Ultrasound with Doppler can be used when the diagnosis is uncertain, or with high risk clinical considerations. Other general imaging considerations for other vascular neoplasms regarding MRI, MRA, CT, and CTA also apply to infantile hemangiomas. See **Vascular Tumors (PEDPVD-2.6)**.

- Multiple (5 or more) infantile hemangiomas can be associated with hepatic hemangiomas with risk potential for high-output cardiac failure and other risks see **Multiple Infantile Hemangiomas (PEDPVD 5.2)**.
- High-output cardiac failure can also be caused rarely by large cutaneous infantile hemangiomas. Affected infants may present with “failure-to-thrive”, a hyperdynamic precordium, tachycardia, bounding pulses with a widened pulse pressure, and a palpable thrill and/or audible bruit over the hemangioma. This is an indication for cardiac evaluation, including echocardiography (CPT® 93303 ordered with CPT® 93320 and CPT® 93325).
- Life threatening risk of airway obstruction is associated with infantile hemangiomas of the lower face (“beard distribution”), or of the anterior neck, or of the oral and/or pharyngeal mucosa.
- Location-associated functional impairment can be found with periocular infantile hemangiomas larger than 1 cm (impairing vision), or infantile hemangiomas involving lip(s) or oral cavity (impairing feeding)
- Ulceration can occur with profuse bleeding that can be life threatening.
- Disfigurement risk is increased with large (5 cm or larger) infantile hemangiomas, facial or scalp infantile hemangiomas, and breast infantile hemangiomas in female infants.
- An infantile hemangioma at least 2.5 cm in diameter overlying the lumbar spine or sacrum is an indication to do a spinal ultrasound (under 6 months of age) and/or MRI Lumbar Spine without contrast (CPT® 72148) or MRI Lumbar Spine without and with contrast (CPT® 72158).
- Infantile hemangiomas 5 cm or larger in size have an increased risk of extracutaneous structural abnormalities.
- Other high risk indications include Syndromes or Associations with extracutaneous structural changes: for “PHACE(S) syndrome” See **PHACE(S) Syndrome PEDPVD-5.3)**, and for “LUMBAR syndrome” See **LUMBAR Syndrome PEDPVD-5.4)**

Background and Supporting Information

Infantile Hemangiomas are the most common benign tumor of childhood, occurring in close to 5% of infants. Infantile Hemangiomas typically have a phase of rapid and significant growth between 1 month and 3 months of age; growth is usually completed by 5 months of age. Gradual involution then occurs, completed in 90% by age of 4 years but with residual skin changes frequently persisting. Though usually not needed for diagnosis, biopsy can be done when needed to identify unique markers not found on other vascular tumors.

When treatment is needed, imaging may be used to monitor response; consultation with a Hemangioma specialist may be useful in guiding evaluation, treatment, and follow up. The 2019 Clinical Practice Guideline of the American Academy of Pediatrics states "Unlike many diseases, management of IHs is not limited to 1 medical or surgical specialty. A hemangioma specialist may have expertise in dermatology, hematology-oncology, pediatrics, facial plastic and reconstructive surgery, ophthalmology, otolaryngology, pediatric surgery, and/or plastic surgery, and his or her practice is often focused primarily or exclusively on the pediatric age group."

Multiple Infantile Hemangiomas (PEDPVD-5.2)

PVDP.IH.0005.2.A

v1.0.2024

- Multiple (5 or more) hemangiomas is an indication for Ultrasound with Doppler exam of the liver (CPT® 76700):
 - Initial imaging to look for hepatic hemangiomas
 - Repeat doppler ultrasound abdomen:
 - Monitor hepatic hemangiomas for progression
 - Monitor response to treatment.

Background and Supporting Information

Multiple (5 or more) hemangiomas- though hepatic hemangiomas can be asymptomatic, they rarely can cause a high flow rate that can cause high-output cardiac failure and can be potentially fatal. "Diffuse" hepatic infantile hemangiomas are a rare subset of hepatic hemangiomas at high risk for morbidity and mortality; affected infants usually present before 4 months of age with severe hepatomegaly, which can lead to lethal abdominal compartment syndrome with compromised ventilation, renal failure caused by renal vein compression, or compromise of inferior vena cava blood flow to the heart. Hepatic hemangiomas can also inactivate (via deiodination) thyroid hormones, causing risk of severe hypothyroidism.

PHACE(S) Syndrome (PEDPVD-5.3)

PVDP.IH.0005.3.A

v1.0.2024

"PHACE" (Posterior fossa malformations, Hemangiomas, Arterial anomalies, Coarctation of the aorta and Cardiac defects, and Eye abnormalities) syndrome or association (or "PHACE(S)" syndrome when also associated with Sternal cleft and/or Supraumbilical raphe) is frequently suspected when an infant has a large (5 cm in diameter or larger) infantile hemangioma of the face, scalp, or neck (risk of PHACE(S) Syndrome is then approximately 30%).

In rare cases, the face or scalp is not involved, with a large infantile hemangioma located on the torso and/or upper extremity instead. Cerebrovascular anomalies, present in more than 90% of individuals with PHACE(S) syndrome, are the most common extracutaneous feature of the syndrome, followed by cardiac anomalies (67%) and structural brain anomalies (about 50%).

- Indications for imaging a young child for suspected PHACE(S) syndrome include the following:
 - Large (5 or more cm in diameter) infantile hemangioma of the face, scalp, and/or neck.
 - Infantile hemangioma on face, scalp, or neck that is smaller than 5 cm in diameter but with at least one major anomaly found in PHACE(S) syndrome, such as coarctation of the aorta or midline ventral defect.
 - Without any visible facial infantile hemangioma, PHACE(S) syndrome can also reasonably be suspected with the following:
 - Infantile hemangioma on upper chest or proximal upper extremity that is 5 cm or larger in size, with also major anomalies found in PHACE(S) syndrome
 - Large intraorbital infantile hemangioma.
- When PHACE(S) syndrome is reasonably suspected, initial imaging would include the following:
 - MRI Brain without contrast (CPT® 70551) or MRI Brain without and with contrast (CPT® 70553)
 - MRI Orbits without contrast (CPT® 70540) or MRI Orbits without and with contrast (CPT® 70543)
 - MRA Head without contrast (CPT® 70544) or MRA Head without and with contrast, (CPT® 70546)
 - MRA Neck may be done either without contrast (CPT® 70547), with contrast (CPT® 70548), or without and with contrast (CPT® 70549)
 - MRA Chest (CPT® 71555).
 - A screening transthoracic echocardiogram, CPT® 93303 (CPT® 93320 and CPT® 93325 are also indicated if ordered with CPT® 93303). If abnormalities are identified on echocardiogram, a cardiac MRI (CPT® 75557 or CPT® 75561) is then indicated.

- If other clinical information or imaging shows involvement of the aorta, then MRI Chest without contrast (CPT® 71550) or MRI Chest without and with contrast (CPT® 71552) is also indicated.
- Need for follow up or surveillance imaging is dictated by the results of the initial clinical and imaging assessment, and any subsequent clinical change. The most frequent follow up will be needed for those deemed at highest risk, including when the following has been found:
 - Evidence of past arterial stroke
 - Arterial stenosis or occlusions, with or without moyamoya-like vascular changes
 - Structural brain changes, with neurosurgical evaluation clarifying the need for follow up.
 - Changes in the aortic arch, coarctation of the aorta, and congenital cardiac anomalies, with pediatric cardiology evaluation clarifying the need for follow up see **Imaging and Surveillance per Congenital lesion (PEDCD-2.4)** in the Pediatric Cardiac Imaging Guidelines

LUMBAR Syndrome (PEDPVD-5.4)

PVDP.IH.0005.4.A

v1.0.2024

- “LUMBAR syndrome” is reasonably suspected in a child with a large (5 or more cm in diameter) infantile hemangioma of any lumbosacral or perineal region or lower extremity. The following imaging is then indicated:
 - Ultrasound spine (CPT® 76800) in infants up to 6 months of age, abdomen (CPT® 76700), and pelvis (CPT® 76856), with color Doppler.
 - MRI Lumbar Spine without contrast (CPT® 72148) or without and with contrast (CPT® 72158) at 3 to 6 months of age, or earlier when either findings on an Ultrasound exam are inadequate or when requested by a hemangioma specialist or any provider in consultation with a hemangioma specialist.
 - MRI of other relevant spinal level (relevance based on proximity of observed infantile hemangiomas larger than 5 cm) without contrast or MRI of the relevant spinal level without and with contrast.
 - When ultrasound findings are inadequate and/or when recommended by a hemangioma specialist or any provider in consultation with a hemangioma specialist:
 - MRI Pelvis without contrast (CPT® 72195) or without and with contrast (CPT® 72197) **and/or**
 - MRI Abdomen without contrast (CPT® 74181) or without and with contrast (CPT® 74183).
 - MRA Abdomen CPT® 74185 and/or Pelvis CPT® 72198, is indicated based on proximity of infantile hemangioma(s) at least 5 cm in diameter and/or other clinical evidence of vascular involvement, and/or when recommended by a hemangioma specialist or any provider in consultation with a hemangioma specialist.
 - Infantile hemangioma of the lower extremity that is at least 5 cm in diameter is an indication for MRI of the relevant portion of the lower extremity without contrast (CPT® 73718) or lower extremity without and with contrast (CPT® 73720) and/or lower extremity joint without contrast (CPT® 73721) or lower extremity joint without and with contrast (CPT® 73723).
 - When there is extensive lower extremity involvement with infantile hemangiomas the following are all indicated:
 - MRA (for both arterial and venous phase imaging) Abdomen
 - MRA Pelvis
 - MRA Lower extremities
 - Note: this should be reported as CPT® 74185 and CPT® 73725; the CPT® code for MRA Pelvis (CPT® 72198) should not be included in this circumstance.

Background and Supporting Information

The acronym "LUMBAR syndrome" refers to the association of Lower body infantile hemangiomas at least 5 cm in size (and other cutaneous defects), Urogenital anomalies and ulceration, "Myelopathy" (lipomyelocele/lipo-myelomeningocele and/or tethered spinal cord), Bony deformities, Anorectal malformations and Arterial anomalies, and Renal anomalies. Though not exclusively true, there is a general regional correlation between the location of the cutaneous large infantile hemangioma(s) with underlying structural anomalies.

Radiopharmaceutical localization of tumor, inflammatory process or distribution of radiopharmaceutical agent(s) (includes vascular flow and blood pool imaging, when performed); planar, single area (e.g., head, neck, chest, pelvis), single day imaging	78800

Procedure Codes Associated with Spine Imaging

Radiopharmaceutical localization of tumor, inflammatory process or distribution of radiopharmaceutical agent(s) (includes vascular flow and blood pool imaging, when performed); planar, 2 or more areas (e.g., abdomen and pelvis, head and chest), 1 or more days imaging or single area imaging over 2 or more days	78801
Radiopharmaceutical localization of tumor, inflammatory process or distribution of radiopharmaceutical agent(s) (includes vascular flow and blood pool imaging, when performed); planar, whole body, single day imaging	78802
Radiopharmaceutical localization of tumor, inflammatory process or distribution of radiopharmaceutical agent(s) (includes vascular flow and blood pool imaging, when performed); tomographic (SPECT), single area (e.g., head, neck, chest, pelvis), single day imaging	78803
Radiopharmaceutical localization of tumor, inflammatory process or distribution of radiopharmaceutical agent(s) (includes vascular flow and blood pool imaging, when performed); planar, whole body, requiring 2 or more days imaging	78804
Radiopharmaceutical localization of tumor, inflammatory process or distribution of radiopharmaceutical agent(s) (includes vascular flow and blood pool imaging, when performed); tomographic (SPECT) with concurrently acquired computed tomography (CT) transmission scan for anatomical review, localization and determination/detection of pathology, single area (e.g., head, neck, chest, pelvis), single day imaging	78830

Procedure Codes Associated with Spine Imaging	
Radiopharmaceutical localization of tumor, inflammatory process or distribution of radiopharmaceutical agent(s) (includes vascular flow and blood pool imaging, when performed); tomographic (SPECT), minimum 2 areas (e.g., pelvis and knees, abdomen and pelvis), single day imaging, or single area imaging over 2 or more days	78831
Radiopharmaceutical localization of tumor, inflammatory process or distribution of radiopharmaceutical agent(s) (includes vascular flow and blood pool imaging, when performed); tomographic (SPECT) with concurrently acquired computed tomography (CT) transmission scan for anatomical review, localization and determination/detection of pathology, minimum 2 areas (e.g., pelvis and knees, abdomen and pelvis), single day imaging, or single area imaging over 2 or more days	78832
Ultrasound	CPT[®]
Ultrasound, spinal canal and contents	76800

General Guidelines (PEDSP-1.0)

SPP.GG.0001.0.A**v1.0.2024**

- A pertinent clinical evaluation since the onset or change in symptoms, including a detailed history, physical examination with a thorough neurologic examination, appropriate laboratory studies and basic imaging such as plain radiography or ultrasound should be performed prior to considering advanced imaging (CT, MR, Nuclear Medicine), unless the individual is undergoing guideline-supported scheduled imaging evaluation. A meaningful technological contact (telehealth visit, telephone call, electronic mail or messaging) can serve as a pertinent clinical evaluation.
 - A thorough neurologic examination should include results of manual motor testing, specific dermatomal distribution of altered sensation, reflex examination, nerve root tension signs (e.g., straight leg raise test, slump test, femoral nerve tension test), and documentation of any specific radicular features.
- For those spinal conditions/disorders for which the Spine Imaging Guidelines require a plain x-ray of the spine prior to consideration of an advanced imaging study, the plain x-ray must be performed after the current episode of symptoms started or changed and results need to be available to the requesting provider of the advanced imaging study.
- Unless otherwise stated in a specific guideline section, the use of advanced imaging to screen asymptomatic individuals for disorders involving the spine is not supported. Advanced imaging of the spine should only be approved in individuals who have documented active clinical signs or symptoms of disease involving the spine.
- Unless otherwise stated in a specific guideline section, repeat imaging studies of the spine are not necessary unless there is evidence for progression of disease, new onset of disease, and/or documentation of how repeat imaging will affect patient management or treatment decisions.

Pediatric Spine Imaging Age Considerations (PEDSP-1.1)

SPP.GG.0001.1.A**v1.0.2024**

- Many conditions affecting the spine in the pediatric population are different diagnoses than those occurring in the adult population. For those diseases which occur in both pediatric and adult populations, minor differences may exist in management due to patient age, comorbidities, and differences in disease natural history between children and adults.
- Patients who are ≤ 18 years old or younger¹⁴ should be imaged according to the Pediatric Spine Imaging Guidelines if discussed. Any conditions not specifically discussed in the Pediatric Spine Imaging Guidelines should be imaged according to the General Spine Imaging Guidelines. Individuals who are >18 years old should be imaged according to the General Spine Imaging Guidelines, except where directed otherwise by a specific guideline section.

Pediatric Spine Imaging Appropriate Clinical Evaluation (PEDSP-1.2)

SPP.GG.0001.2.A
v1.0.2024

- See: **General Guidelines (PEDSP-1.0)**

Pediatric Spine Imaging Modality

General Considerations (PEDSP-1.3)

SPP.GG.0001.3.A

v1.0.2024

- MRI
 - MRI is the preferred modality for imaging the pediatric spine unless otherwise stated in a specific guideline section.
 - Due to the length of time required for MRI acquisition and the need to minimize individual movement, anesthesia is usually required for almost all infants (except neonates) and young children (age <7 years), as well as older children with delays in development or maturity. This anesthesia may be administered via oral or intravenous routes. In this individual population, MRI sessions should be planned with a goal of minimizing anesthesia exposure by adhering to the following considerations:
 - MRI procedures can be performed without and/or with contrast use as supported by these condition based guidelines. If intravenous access will already be present for anesthesia administration and there is no contraindication for using contrast, imaging without and with contrast may be appropriate if requested. By doing so, the requesting provider may avoid repetitive anesthesia administration to perform an MRI with contrast if the initial study without contrast is inconclusive.
 - Recent evidence based literature demonstrates the potential for gadolinium deposition in various organs including the brain, after the use of MRI contrast.
 - The U.S. Food and Drug Administration (FDA) has noted that there is currently no evidence to suggest that gadolinium retention in the brain is harmful and restricting gadolinium-based contrast agents (GBCAs) use is not warranted at this time. It has been recommended that GBCA use should be limited to circumstances in which additional information provided by the contrast agent is necessary and the necessity of repetitive MRIs with GBCAs should be assessed.
 - If multiple body areas are supported by eviCore guidelines for the clinical condition being evaluated, MRI of all necessary body areas should be obtained concurrently in the same anesthesia session.
- CT
 - CT is generally inferior to MRI for imaging the pediatric spine, but has specific indications in which it is the preferred modality listed in specific sections of these guidelines.
 - CT is the imaging study of choice in the setting of trauma
 - CT should not be used to replace MRI in an attempt to avoid sedation unless it is listed as a recommended study in a specific guideline section.

- Myelogram with post-myelogram CT imaging is rarely indicated in children except in certain limited indications (usually requested after specialist consultation), including:
 - Evaluation of spine in individuals with fixation hardware which limits utility of MRI.
 - Severe congenital scoliosis with inconclusive MRI.
 - Evaluation of nerve root avulsion in patients with a brachial plexus injury and inconclusive MRI.
 - Evaluation of paraspinal cyst to assess continuity with the subarachnoid space.
 - Coding note: CT of appropriate spinal level with or without contrast may be appropriate. If the radiologist performs the myelogram the exam should be coded with contrast. If a clinician performs the myelogram the exam should be coded without contrast.
- Ultrasound
 - Spinal canal ultrasound (CPT® 76800) describes the ultrasonic evaluation of the spinal cord (canal and contents) and should not be reported multiple times for imaging of different areas of the spinal canal.
 - Do not use CPT® 76800 for intraoperative spinal canal ultrasound as CPT® 76998 (intraoperative ultrasonic guidance) is the appropriate code in this circumstance.
 - Spinal canal ultrasound (CPT® 76800) is generally limited to infants up to 6 months of age because of the bone mass surrounding the spinal cord limits evaluation of the intraspinal contents in older infants.
 - **Exception:** the persisting acoustic window in children with posterior spinal defects of spinal dysraphism enables spinal canal ultrasound to be performed at any age (see: **Spinal Dysraphism (PEDSP-4)**).
 - In general, additional imaging studies of the spine are not indicated in asymptomatic individuals with normal spinal ultrasound findings.
- Nuclear Medicine
 - Nuclear medicine studies are rarely used in the evaluation of the spine, but are indicated in the following circumstances:
 - Evaluation of suspected loosening of orthopedic hardware when recent plain x-ray is nondiagnostic:
 - Bone scan (CPT® 78315) or
 - Distribution Of Radiopharmaceutical Agent SPECT (CPT® 78803, or 78831) or
 - SPECT/CT (CPT® 78830 or CPT® 78832)
 - For suspected spondylolysis, see **Spondylolysis (PEDSP-2.4)**
 - Evaluation of back pain when no cause is demonstrated on MRI, see **Back and Neck Pain in Children Age 5 and Under (PEDSP-2.2)** or **Back and Neck Pain in Children Age 6 and Older (PEDSP-2.3)**

- The guidelines listed in this section for certain specific indications are not intended to be all-inclusive; clinical judgment remains paramount and variance from these guidelines may be appropriate and warranted for specific clinical situations.

Pediatric Back and Neck Pain and Trauma (PEDSP-2)

Guideline

Introduction (PEDSP-2.1)

Back and Neck Pain in Children Age 5 and Under (PEDSP-2.2)

Back and Neck Pain in Children Age 6 and Older (PEDSP-2.3)

Spondylolysis (PEDSP-2.4)

Spine Pain Due to Infectious Causes (PEDSP-2.5)

Spine Pain Related to Trauma and Painless Spine Trauma (PEDSP-2.6)

References (PEDSP-2)

Introduction (PEDSP-2.1)

SPP.TR.0002.1.A

v1.0.2024

- Currently, only about 20% of back pain in children over age 5 is from a discoverable cause. Scoliosis, spondylitic disorders, Scheuermann disease, tumor, and trauma are the most common causes.
- Back pain in children under age 5 is uncommon and often reflects underlying serious disease when present.
- Disc herniations are rare in children, but become more frequent as activity increases during adolescence.

Back and Neck Pain in Children Age 5 and Under (PEDSP-2.2)

SPP.TR.0002.2.A

v1.0.2024

- A pertinent clinical evaluation including a detailed history, physical examination with thorough neurologic examination and documentation of any specific radicular features, and plain radiography should be performed prior to considering advanced imaging.
- Advanced imaging is appropriate in all individuals in this age group except those with mild and transient back pain.
 - MRI of the symptomatic spinal region should be approved
 - Individuals in this age group will require sedation to complete MRI imaging. See: **Pediatric Spine Imaging Modality General Considerations (PEDSP-1.3)** for contrast and body area considerations.
 - CT without contrast of the symptomatic spinal region when:
 - Plain x-rays suggest an isolated vertebral bone abnormality without any concern for spinal canal or cord abnormalities (which is rare in this age group).
 - A recent MRI does not provide sufficient detail of the bony anatomy to allow for acute patient care decision making.
 - Bone scan is indicated for evaluation of suspected spinal fracture when x-ray is negative using any of the following CPT® code combinations:
 - CPT® 78300, CPT® 78305, or CPT® 78306 as a single study
 - CPT® 78315 or CPT® 78803 can be approved as a single study when stress fracture is suspected.
 - Bone scan is indicated for evaluation of suspected spondylolysis, or if recent spine MRI is inconclusive using any of the following CPT code combinations: SPECT bone scans are especially sensitive for detecting spondylolysis, revealing areas of bone turnover; and the findings are generally positive for a prolonged period.
 - CPT® codes: CPT® 78300, CPT® 78305, CPT® 78306, CPT® 78315, or CPT® 78803 as a single study
 - CPT® 78305 and CPT® 78803 concurrently
 - CPT® 78306 and CPT® 78803 concurrently

Back and Neck Pain in Children Age 6 and Older (PEDSP-2.3)

SPP.TR.0002.3.A

v1.0.2024

Radicular back and neck pain is common in adult patients but is uncommon in adolescents and rare in children.

- A pertinent clinical evaluation including a detailed history, physical examination with thorough neurologic examination including results of manual motor testing, the specific dermatomal distribution of altered sensation, reflex examination, and nerve root tension signs (e.g., straight leg raise test, slump test, femoral nerve tension test) and documentation of any specific radicular features, should be performed prior to considering advanced imaging.
- X-rays, while not required prior to conservative treatment, must be obtained before advanced imaging can be approved.
 - The results of plain x-rays performed after the current episode of symptoms started or changed need to be available to the requesting provider of the advanced imaging study
- Advanced imaging should be approved following a recent x-ray when one or more of the following pediatric “red flags” are present:
 - Accompanying systemic symptoms (fever, weight loss, etc.)
 - Functional disability (daily limitation in normal activities because of pain)
 - Pain which is extremely severe or worse at night
 - Constant or radicular pain lasting ≥ 4 weeks
 - Pain which worsens despite an attempt at symptomatic treatment
 - Neurological symptoms or abnormal neurological examination findings
 - An established diagnosis of cancer other than leukemia
 - Abnormal x-rays
 - Spinal imaging for patients having undergone spinal surgery
 - Associated bowel or bladder dysfunction
- In the absence of any “red flags”, a recent (within 3 months) 4-week trial of provider-supervised conservative treatment should be attempted before advanced imaging can be approved.
 - It can be assumed that children who are being evaluated by a pediatric spine surgeon have failed a reasonable trial of conservative treatment under the care of the primary care provider, as this is by far the most common reason for such referrals.
- X-rays of the involved regions should be obtained prior to advanced imaging in patients with “red flag” findings, or who remain symptomatic after a 4 week trial of provider-supervised conservative treatment.

- The results of plain x-rays performed after the current episode of symptoms started or changed need to be available to the requesting provider of the advanced imaging study
- MRI without contrast of the symptomatic spinal region is the preferred study for the evaluation of pediatric spine pain, and should be approved unless one of the following conditions applies, in which case MRI without and with contrast should be approved:
 - Fever ($\geq 100^{\circ}$ F)
 - Clinical suspicion of infection (discitis, osteomyelitis, paraspinous or epidural abscess)
 - Physical examination or plain x-ray suggests a mass lesion
 - New or worsening pain in a patient with an established diagnosis of cancer
- CT without contrast of the symptomatic spinal region when:
 - The request is for re-evaluation of a known vertebral bony disorder.
 - Plain x-rays show spondylotic changes or suggest an isolated vertebral bone abnormality without any concern for spinal canal or cord abnormalities (which is rare in this age group).
 - A recent MRI does not provide sufficient detail of the bony anatomy to allow for acute individual care decision making.
- Bone scan is indicated for evaluation of suspected spinal fracture when x-ray is negative, or if recent MRI is inconclusive using any of the following CPT® code combinations:
 - CPT® codes: CPT® 78300, CPT® 78305, or CPT® 78306 as a single study
 - CPT® 78315 or CPT® 78803 can be approved as a single study when stress fracture is suspected.

Spondylolysis (PEDSP-2.4)

SPP.TR.0002.4.A

v1.0.2024

Most cases of childhood spondylolysis are believed to be caused by repeated microtrauma, resulting in stress fracture of the pars interarticularis. Heredity is also believed to be a factor in some cases. It is the most common cause of low back pain in children older than age 10.

- Activity modification, NSAID treatment, physical therapy, and/or immobilization with various braces are the initial treatments for symptomatic patients.
- Surgical treatment is only recommended for patients with disabling symptoms that have not responded to non-surgical care.
- A pertinent clinical evaluation including a detailed history, physical examination with thorough neurologic examination and documentation of any specific radicular features, and plain radiography should be performed prior to considering advanced imaging.
- Spondylolysis is screened with plain x-rays
 - MRI without contrast of the symptomatic spinal level is indicated to evaluate for stress reaction in bone and visualizing nerve roots if symptoms have continued despite a recent (within 3 months) provider-directed 4 week course of conservative care, or if there is a documented need for preoperative planning.
 - If additional imaging is needed because of radiological uncertainty or associated spondylolisthesis, SPECT Radiopharmaceutical Localization Imaging (CPT® 78803) or SPECT/CT (CPT® 78830) is indicated to identify stress reaction in spondylolysis cases which are radiographically occult. Bone scan has been demonstrated to be superior to MRI in detecting active spondylolysis.
 - SPECT bone scans are especially sensitive for detecting spondylolysis, revealing areas of bone turnover; and the findings are generally positive for a prolonged period. CT without contrast of the symptomatic spinal level is indicated to provide detailed evaluation of bony anatomy, if there is a documented need for preoperative planning. CT scans have been considered the criterion standard for characterizing fractures and for detailing bone morphology and anatomy.

Spine Pain Due to Infectious Causes (PEDSP-2.5)

SPP.TR.0002.5.A

v1.0.2024

- Entities including, but not limited to, discitis and vertebral osteomyelitis, typically present with sudden onset of back pain, fever, and elevated white blood cell count, occurring most commonly in prepubescent children.
- A detailed history and physical examination with thorough neurologic examination should be performed initially.

Initial Imaging Studies

- Plain x-rays should be performed initially.
 - The results of plain x-rays performed after the current episode of symptoms started or changed need to be available to the requesting provider of the advanced imaging study
- MRI without and with contrast of the symptomatic spinal level is very sensitive at detecting early changes and can be approved when discitis or osteomyelitis is clinically suspected.
- Nuclear medicine imaging also can be positive as soon as 1 to 2 days after the onset of symptoms. Any of the following studies are indicated for initial evaluation of suspected osteomyelitis:
 - Bone scan (one of CPT® codes: CPT® 78300, 78305, 78306, or 78315)
 - Nuclear Bone Marrow imaging (one of CPT® codes: CPT® 78102, 78103, or 78104)
 - Radiopharmaceutical inflammatory imaging (one of CPT® codes: CPT® 78800, 78801, 78802, 78803, or 78804)
 - SPECT (CPT® 78831)
 - SPECT/CT (CPT® 78830, or CPT® 78832)

Follow-Up Imaging Studies

- Follow-up plain x-rays may show disc space narrowing and bony changes of osteomyelitis.
- MRI without and with contrast of the symptomatic spinal level or CT with contrast (including myelography) may be useful in follow-up for evaluating bony changes of osteomyelitis or concern for epidural abscess.
- Any of the following studies are indicated for evaluation of response to treatment in established osteomyelitis:
 - Bone scan (one of CPT® codes: CPT® 78300, 78305, 78306, or 78315)
 - Nuclear Bone Marrow imaging (one of CPT® codes: CPT® 78102, 78103, or 78104)
 - Radiopharmaceutical localization imaging (one of CPT® codes: CPT® 78800, 78801, 78803, 78830, 78831, or 78832)

Spine Pain Related to Trauma and Painless Spine Trauma (PEDSP-2.6)

SPP.TR.0002.6.A

v1.0.2024

- Imaging evaluation of traumatic spine injury in children is generally directed based on clinical examination. 60% to 80% of all spinal injuries in children involve the cervical spine as opposed to the thoracic spine and lumbar spine.
- A pertinent clinical evaluation including a detailed history, physical examination with thorough neurologic examination and documentation of any specific radicular features, should be performed prior to considering advanced imaging.
- When advanced imaging is appropriate, MRI without contrast or CT without contrast of the involved level is indicated as discussed in **Pediatric Spine Imaging Modality General Considerations (PEDSP-1.3)**
 - If the initial CT or MRI study is considered inconclusive, an exam of the other modality may be approved if needed to direct clinical management.

Cervical Spine

- The results of plain x-rays performed after the current episode of symptoms started or changed need to be available to the requesting provider of the advanced imaging study
- Children under 3 years of age should be approved for advanced imaging of the cervical spine following a relevant recent x-ray when one or more of the following “red flags” are present:
 - Glasgow Coma Scale <14
 - Individual does not open eyes regardless of stimulus
 - Motor Vehicle Collision
- Children ≥ 3 years of age should be approved for advanced imaging of the cervical spine following a recent (within 60 days) x-ray when one or more of the following “red flags” are present:
 - Altered Mental Status
 - Focal Neurologic Findings
 - Neck pain
 - Torticollis not present prior to trauma
 - Substantial torso injury
 - Diving or head-first injury
 - High speed motor vehicle collision
 - Predisposing conditions, e.g. Down Syndrome
- Children older than 2 years of age SHOULD NOT be approved for advanced imaging of the cervical spine if they meet ALL of the following criteria:
 - Absence of posterior midline cervical pain

- Absence of focal neurologic deficit
- Normal level of alertness
- No evidence of intoxication
- Absence of other clinically apparent pain which could distract patient from the pain of a cervical injury

Thoracolumbar Spine

- Children should be approved for advanced imaging of the thoracolumbar spine following a recent x-ray when x-rays are inconclusive, or there is an abnormal neurological examination.

Suspected Physical Child Abuse

- In children with suspected physical child abuse and documented findings suggesting abuse (e.g., fractures on skeletal survey or other clinical indicators), MRI Cervical (CPT® 72141), Thoracic (CPT® 72146), and Lumbar (CPT® 72148) Spine without contrast are indicated to search for associated abnormalities.
 - If intravenous access will already be present for anesthesia administration and there is no contraindication for using contrast, imaging without and with contrast can be approved. See: **Pediatric Spine Imaging Modality General Considerations (PEDSP-1.3)**

Kyphosis and Scoliosis (PEDSP-3)

Guideline

Juvenile Thoracic Kyphosis (Scheuermann Disease) (PEDSP-3.1)

Scoliosis (PEDSP-3.2)

References (PEDSP-3)

Juvenile Thoracic Kyphosis (Scheuermann Disease) (PEDSP-3.1)

SPP.KS.0003.1.A

v1.0.2024

- This condition is also known as Scheuermann Kyphosis, and these individuals generally present with chronic and recurrent back pain.
- A pertinent clinical evaluation including a detailed history, physical examination with thorough neurologic examination and documentation of any specific radicular features, and plain radiography should be performed prior to considering advanced imaging.
- X-rays will typically show anterior wedging in three or more adjacent vertebral bodies.
 - Lower thoracic kyphosis from developmental vertebral wedging with thoracic kyphosis varying between 20° and 45° should be identified by plain x-rays before considering advanced imaging.
 - MRI is not an effective diagnostic modality for this condition since the incidence of false positive vertebral changes in normal individuals is high.
- MRI Thoracic Spine without contrast (CPT® 72146) preoperatively to rule out any associated spinal cord problems.
- MRI Lumbar Spine without contrast (CPT® 72148) preoperatively to rule out any associated spinal cord conditions when there is clinical or radiographic evidence of lumbar abnormalities.

Scoliosis (PEDSP-3.2)

SPP.KS.0003.2.A

v1.0.2024

- Scoliosis is an abnormal lateral curve of the thoracic or thoraco-lumbar spine in the frontal plane. A small lateral curve in a skeletally mature person is not uncommon and generally does not require further investigation.
- Using the Cobb technique for measuring these curves, a curve of under 10° is normal, a curve from 10 to 20° is mildly abnormal, a curve over 20° is significantly abnormal, and a curve > 40° is severely abnormal.
- Most patients with significant scoliosis have some element of kyphosis as well.
 - There are many ways of classifying scoliosis. These guidelines will classify scoliosis as congenital, idiopathic, and neuromuscular scoliosis.
- A pertinent clinical evaluation including a detailed history, physical examination with thorough neurologic examination and documentation of any specific radicular features, detailed examination of the spine in different body positions, and plain radiography should be performed prior to considering advanced imaging.
 - Standing posteroanterior (PA) and lateral x-rays of the spine are the initial imaging studies and are used for follow-up. If anteroposterior (AP) x-rays are to be performed, breast shields should be used to reduce breast radiation exposure.
 - Spine surgical specialists sometimes appropriately request both MRI and CT together for preoperative planning of scoliosis surgery.
 - In addition, MR and CT are useful to identify an underlying cause of scoliosis, such as congenital and developmental anomalies.
 - MR or CT Spine postoperative when recent postoperative x-rays are inconclusive for managing individual treatment.
 - Individuals with severe scoliosis may have compromised lung development. CT Chest with contrast (CPT® 71260) or without contrast (CPT® 71250) may be obtained in the perioperative period as well as 2 and 5 years post operatively to assess lung growth.

Congenital Scoliosis

Cases are recognized in infancy or early childhood. Most cases arise from anomalies of vertebral development, and many are associated with anomalies of the genitourinary system or of other organs.

- In infants, spinal ultrasound (CPT® 76800) can be approved after initial imaging with plain x-rays.
- MRI Cervical (CPT® 72141), Thoracic (CPT® 72146), and Lumbar (CPT® 72148) Spine without contrast are indicated to search for underlying anomalies.
 - If intravenous access will already be present for anesthesia administration and there is no contraindication for using contrast, imaging without and with contrast may, be approved. See: **Pediatric Spine Imaging Modality General Considerations (PEDSP-1.3)**

- MRI Brain without and with contrast if the clinical evaluation or preliminary imaging studies suggest an associated intracranial anomaly.
- Renal ultrasound (CPT® 76770 or CPT® 76775) should be performed, since nearly one-third of individuals also have genitourinary anomalies.
 - CT, MRI, or nuclear medicine studies of the genitourinary tract may be necessary if the ultrasound is abnormal.

Idiopathic Scoliosis

Idiopathic scoliosis is the most common form of pediatric scoliosis and is divided into infantile (0-3 years of age), juvenile (4-9 years of age), and adolescent (10-17 years of age). Idiopathic scoliosis is defined as having no underlying structural abnormality or accompanying syndrome.¹²

- The following clinical features are associated with an increased risk of underlying vertebral or spinal cord abnormality:
 - Associated back pain
 - Age younger than 10 years
 - Neurological abnormalities on examination or neurological symptoms
 - Left sided curve (concave to right)
 - Absence of apical segment lordosis/kyphosis
 - Rapid curve progression (>1 degree per month)
 - Pes Cavus (see: **Occult Spinal Dysraphism (PEDSP-4.3)**)
 - Double curves or high thoracic curves
 - Kyphosis
 - Spinal x-ray abnormalities other than the curve itself (widened spinal canal, dysplastic changes in spine or ribs, etc.)
 - Midline spinal cutaneous markers (esp. sacral) such as dermal tracts, tufts of hair, skin tags, etc.
 - Abnormal number or size of café au lait spots (neurofibromatosis)
- MRI Cervical (CPT® 72141), Thoracic (CPT® 72146), and Lumbar (CPT® 72148) Spine without contrast is the preferred study for the evaluation of scoliosis and should be approved when any of the above clinical features is present or if imaging is requested for individuals who are being actively evaluated for corrective surgery.

Neuromuscular Scoliosis

Scoliosis can result from many disorders of the nervous system. In some conditions, including (but not limited to) cerebral palsy, muscular dystrophy, and spinal muscular atrophy, associated scoliosis may develop over time.

The appropriate spinal level, modality, and contrast level of advanced imaging will depend on the nature of the underlying disease.

- MRI without contrast or without and with contrast or CT without contrast of the cervical, thoracic, and/or lumbar spine can be approved in these individuals with

painful neuromuscular scoliosis, or when they are actively being evaluated for spinal deformity corrective surgery.

- Bone scans (one of CPT® codes: CPT® 78300, CPT® 78305, CPT® 78306, or CPT® 78315) are useful to evaluate cases of painful scoliosis and to identify tumors or infections. They are more sensitive than plain radiography.

Spinal Dysraphism and Tethered Spinal Cord (PEDSP-4)

Guideline

Introduction (PEDSP-4.1)

Cutaneous Indications to Suspect Occult Spinal Dysraphism (PEDSP-4.2)

Non-Cutaneous Indications to Suspect Occult Spinal Dysraphism
(PEDSP-4.3)

Spinal Dysraphism (PEDSP-4.4)

References (PEDSP-4)

Introduction (PEDSP-4.1)

SPP.TC.0004.1.A

v1.0.2024

Spinal Dysraphism

- Spinal dysraphism includes a range of congenital and/or developmental anomalies of the spinal cord and associated spinal structures that can affect any level of the spine, but most commonly the lumbosacral region.
- Based on clinical classification, dysraphism is grouped into two categories:
 - Open dysraphism (spina bifida aperta) which are non-skin-covered, open neural tube defects (myelomeningocele)
 - Occult spinal dysraphism (also called closed spinal dysraphism), which includes skin-covered defects (either with or without an associated subcutaneous mass).

Normal position of spinal cord

- In newborns, the spinal cord should terminate (at the conus medullaris) at L2-3 or higher.
- By 3 months of age, the conus should lie at or above the L2 level.
- Afterwards, in normal infants and children, the conus medullaris should be positioned at L1-2.
- Of note, however, in premature infants, the conus medullaris may be located at the mid L3-level.
 - If such a finding on an initial spinal ultrasound results in uncertainty as to whether cord termination is low, repeat spinal ultrasound (CPT® 76800) can be performed in 4 to 6 weeks, since a normal cord will have “moved” higher within the spinal canal by this time.

Tethered cord

- Tethering is certain when the cord terminates at or below L4 and there is other supporting evidence of tethering such as limited spinal cord pulsatility, posterior positioning in the spinal canal, thick filum terminale, intraspinal mass, or lipoma.
- If the conus terminates at a normal position (at L2-3 under 3 months of age, at L2 by 3 months of age, at L1-2 in older infants and children), the cord may still be tethered by an abnormal structure. Such tethering of the spinal cord can be found in some (but not all) patients with Occult Spinal Dysraphism. Abnormalities can be found in both lumbosacral and thoracic regions and are often associated with spinal lipomas in either region.
- Open Spinal Dysraphism is frequently associated with tethering of the spinal cord; symptoms of or findings from that tethering may manifest initially or may increase after the newborn period and the initial imaging evaluation. See: **Open Dysraphism (PEDSP-4.4)**.

“Tethered cord Syndrome”

- “Tethered Cord Syndrome” refers to symptoms and abnormal physical findings (such as low back or leg pain, decreased or absent lower extremity reflexes, urinary

urgency, urinary incontinence, bowel incontinence, and constipation) that arise when a pathologic attachment causes abnormal spinal tension (increased by axial growth), with ensuing pathophysiologic effects. Some of these patients do have an abnormally low conus medullaris; other patients have other spinal abnormalities (such as spinal dysraphism) that causes the spinal cord to be abnormally tethered. Other patients with spinal dysraphism who may present with symptoms or findings suggestive of “Tethered Cord Syndrome” may have those clinical manifestations caused by primary dysplasia of neural tissue, instead of being caused by abnormal tethering. See: **Non-Cutaneous Indications to Suspect Occult Spinal**

Dysraphism (PEDSP-4.3).

- Not all anatomically tethered spinal cords result in symptoms of “Tethered Cord Syndrome”.

Imaging Studies to Evaluate Suspected Occult Spinal Dysraphism and/or Tethered Cord

- Plain x-rays are not indicated for suspected Occult Spinal Dysraphism and/or Tethered Cord.
- Spina Bifida Occulta, an incomplete fusion of the posterior lumbosacral bony elements (present in about 25% of people), is often discovered as an incidental finding on x-rays and other imaging exams. In asymptomatic individuals it is of no consequence, and is not an indication for further imaging.
- A plain spine x-ray finding suggesting an absent or distorted pedicle (the “winking owl sign”) can be indicative of Occult Spinal Dysraphism, for which an initial MRI without contrast or MRI without and with contrast of the appropriate spinal level can be approved.
- When indicated (See: **Cutaneous Indications to Suspect Occult Spinal Dysraphism (PEDSP-4.2)**, **Non-Cutaneous Indications to Suspect Occult Spinal Dysraphism (PEDSP-4.3)**, and **Open Dysraphism (PEDSP-4.4)** for indications), the following imaging may be approved:
 - Spinal ultrasound (CPT® 76800) for initial evaluation in infants up to 6 months of age, in premature infants whose “corrected age” (subtracting the number of weeks of prematurity from the infant’s actual age) is less than or equal to 6 months, or in older individuals with open spinal dysraphism (see: **Open Dysraphism (PEDSP-4.4)**).
 - In a term infant, the diagnosis of tethered cord is likely if the conus terminates below the L2-L3 disc space. Of note, however, in premature infants, the conus medullaris may be located at the mid L3-level; if there is uncertainty as to whether cord termination is low in a premature infant, repeat spinal ultrasound (CPT® 76800) can be performed in 4 to 6 weeks, since a normal cord will have “moved” higher within the spinal canal by this time.
 - MRI Cervical, Thoracic, and Lumbar spine without contrast (CPT® 72141, 72146, and 72148) or without and with contrast (CPT® 72156, 72157, and 72158) may be approved for initial evaluation in individuals older than 6 months of age.

- MRI can be approved at a younger age when there are symptoms or physical findings or concerning findings on ultrasound showing the need for more prompt MRI imaging, or when MRI imaging prior to 6 months of age has been ordered by (or in consultation with) an appropriate specialist for an indication from **Cutaneous Indications to Suspect Occult Spinal Dysraphism (PEDSP-4.2)**, **Non-Cutaneous Indications to Suspect Occult Spinal Dysraphism (PEDSP-4.3)**, or **Open Dysraphism (PEDSP-4.4)**.
 - The appropriate spinal level, modality, and contrast level of follow-up advanced imaging will depend on the nature of the underlying disease, usually ordered by (or after consultation with) an appropriate specialist.
 - Postoperative MRI is not done routinely, but may be indicated if there are recurrent symptoms or findings suggesting recurrent tethering or other deterioration. Contrast level per ordering specialist.
 - A complete abdominal ultrasound (CPT® 76700) or retroperitoneal ultrasound (CPT® 76770) can be approved as an initial evaluation for patients with newly diagnosed neurogenic bladder, myelomeningocele (open spinal dysraphism), or occult spinal dysraphism.
 - A complete retroperitoneal ultrasound (CPT® 76770) can be approved every 6 to 12 months for follow-up/surveillance for any of the above conditions.
 - CT of the effected spinal level can be approved for surgical planning when a complex bony deformity of the spine is present, or when the Guidelines support doing MRI of the spine in a patient for whom MRI is contraindicated.

Cutaneous Indications to Suspect Occult Spinal Dysraphism (PEDSP-4.2)

SPP.TC.0004.2.A

v1.0.2024

- More than 80% of individuals with Occult Spinal Dysraphism and/or Tethered Spinal Cord will have a cutaneous lesion overlying the lower spine.
- Spine imaging is NOT indicated in the following situations:
 - Pilonidal cysts below the level of the intergluteal fold.
 - For discussion of imaging in pilonidal cysts, see: **Pilonidal Cyst (PV-21.4)** in the Pelvis Imaging Guidelines
 - Non-specific darkened areas of skin over the sacrum (such as dermal melanosis) unless there are other associated midline cutaneous abnormalities
 - Occult bony dysraphism incidentally noted on x-ray
- Screening with advanced imaging IS recommended in the following clinical conditions which are associated with an increased risk of underlying spinal dysraphism:
 - Spinal dimples (midline soft tissue depression over the spine); or deviated or split (bifid) gluteal cleft
 - Spinal ultrasound (CPT® 76800) may be approved for initial evaluation in infants up to 6 months of age (or in premature infants with a “corrected” age up to 6 months of age). Follow-up of a normal screening spinal ultrasound with ultrasound is not appropriate.
 - MRI of the involved spinal level without contrast or without and with contrast may be approved for initial evaluation in individuals older than 6 months of age. MRI can be approved at a younger age when there are symptoms or physical findings or concerning findings on ultrasound showing the need for more prompt MRI imaging, or if ordered by (or in consultation with) an appropriate specialist.
 - A screening MRI can be approved after a normal screening spinal ultrasound exam. Follow-up of a normal screening MRI imaging study is not appropriate.
 - Dermal sinuses overlying the lumbar, thoracic, or cervical spine, and sacral dermal sinuses, whether manifested by a dermal sinus tract (a small opening in the skin, which leads into a narrow duct; it may be associated with protruding hairs) or a dermal cyst. They may be associated with an overlying or nearby hairy patch or vascular nevus
 - Spinal ultrasound (CPT® 76800) may be approved for initial evaluation in infants up to 6 months of age (or in premature infants with a “corrected” age up to 6 months of age). Follow-up of a normal screening spinal ultrasound is not appropriate.
 - MRI of the involved spinal level without contrast or without and with contrast should be approved if an ultrasound shows abnormalities other than a

- cutaneous dermal cleft, if ordered after 6 months of age, or at a younger age if ordered by (or in consultation with) an appropriate specialist.
- A screening MRI can be approved after a normal screening spinal ultrasound exam. Follow-up of a normal screening MRI imaging study is not appropriate.
 - Subcutaneous midline masses (including cysts and lipomas) at any level.
 - Plain x-rays are not required to approve other imaging for midline masses overlying the spine when occult spinal dysraphism and/or tethered cord is suspected.
 - Spinal ultrasound (CPT® 76800) may be approved for initial evaluation in infants up to 6 months of age (or in premature infants with a “corrected” age up to 6 months of age), but MRI of the involved spinal level without contrast or without and with contrast is the preferred initial imaging for midline masses overlying the spine. Repeat ultrasound follow-up of a normal screening spinal ultrasound is not appropriate.
 - MRI of the involved spinal level without contrast or without and with contrast may be approved for initial evaluation in patients older than 6 months of age. MRI can be approved at a younger age when there are symptoms or physical findings or concerning findings on ultrasound showing the need for more prompt MRI imaging, or if ordered by (or in consultation with) an appropriate specialist.
 - A screening MRI can be approved after a normal screening spinal ultrasound exam. Follow-up of a normal screening MRI imaging study is not appropriate.
 - Caudal extensions (including tail-like appendages), midline skin tags, abnormal patches of hair over the spine at any level, infantile hemangiomas overlying any spinal level, and complex midline birthmarks above the upper sacral region.
 - Spinal ultrasound (CPT® 76800) may be approved for initial evaluation in infants up to 6 months of age (or in premature infants with a “corrected” age up to 6 months of age). Repeat ultrasound follow-up of a normal screening spinal ultrasound is not appropriate.
 - MRI of the involved spinal level without contrast or without and with contrast may be approved for initial evaluation in individuals older than 6 months of age. MRI can be approved at a younger age when there are symptoms or physical findings or concerning findings on ultrasound showing the need for more prompt MRI imaging, or if ordered by (or in consultation with) an appropriate specialist.
 - A screening MRI can be approved after a normal screening spinal ultrasound exam. Follow-up of a normal screening MRI imaging study is not appropriate.
 - Café au lait spots are a marker for type 1 neurofibromatosis
 - See imaging indications in **Neurofibromatosis 1 and 2 (NF1 and NF2) (PEDONC-2.3)** and/or **Neurofibromatosis (PEDPN-2)**.

Non-Cutaneous Indications to Suspect Occult Spinal Dysraphism (PEDSP-4.3)

SPP.TC.0004.3.A

v1.0.2024

- Imperforate Anus, and other congenital anorectal abnormalities are often associated with dysraphism. Also associated with spinal dysraphism are VACTERL (Vertebral malformations, Anal atresia, Cardiac anomalies, Tracheo-Esophageal fistula, Renal abnormalities, and Limb defects) Syndrome, Currarino triad (sacral dysgenesis, presacral mass, anorectal malformation), OEIS (omphalocele, exstrophy, imperforate anus, spinal defects) syndrome, Caudal regression Syndrome, and Sacral Agenesis (when 2 or more of the sacral vertebral bodies are absent; physical exam will show buttock flattening, short gluteal cleft, and palpable absence of coccygeal vertebrae; about 20% of children with sacral agenesis are not detected prior to age of 3 years).
 - Spinal ultrasound (CPT® 76800) may be approved for initial evaluation in infants up to 6 months of age (or in premature infants with a “corrected” age up to 6 months of age). Repeat ultrasound follow-up of a normal screening spinal ultrasound is not appropriate.
 - The following should be approved when requested: MRI Lumbar Spine without contrast (CPT® 72148) or without and with contrast (CPT® 72158); and/or MRI Pelvis without contrast (CPT® 72195) or MRI Pelvis without and with contrast (CPT® 72197).
 - Appropriate MRI (or other modality) imaging (including contrast level) of any other spinal level will depend on the nature of the underlying disease, usually ordered by (or in consultation with) an appropriate specialist.
 - Follow-up of a normal screening MRI imaging study is not appropriate, but an initial MRI can be approved if the first screening study was an ultrasound.
 - Postoperative MRI is not done routinely, but may be indicated if there are recurrent symptoms or findings suggesting recurrent tethering. Contrast level per ordering specialist.
- Rubinstein-Taybi syndrome (gait abnormalities, short stature, short limbs, characteristic facies, developmental delay, tethered spinal cord)
 - Spinal ultrasound (CPT® 76800) may be approved for initial evaluation in infants up to 6 months of age (or in premature infants with a “corrected” age up to 6 months of age). Repeat ultrasound follow-up of a normal screening spinal ultrasound is not appropriate.
 - MRI Lumbar spine without contrast (CPT® 72148) or without and with contrast (CPT® 72158) should be approved.
 - Appropriate MRI (or other modality) imaging (including contrast level) of any other spinal level will depend on the nature of the underlying disease, usually ordered by (or in consultation with) an appropriate specialist.

- Follow-up of a normal screening MRI imaging study is not appropriate, but an initial MRI can be approved if the first screening study was an ultrasound.
- Individuals with known DiGeorge Syndrome (22q11.2 deletion syndrome), when tethered cord syndrome or occult spinal dysraphism is suspected.
 - Spinal ultrasound (CPT® 76800) may be approved for initial evaluation in infants up to 6 months of age.
 - The following should be approved when requested: MRI Lumbar Spine without contrast (CPT® 72148) or without and with contrast (CPT® 72158)
 - Appropriate MRI (or other modality) imaging (including contrast level) of any other spinal level will depend on the nature of the underlying disease, usually ordered by (or in consultation with) an appropriate specialist.
 - Follow-up of a normal screening MRI imaging study is not appropriate, but an initial MRI can be approved if the first screening study was an ultrasound.
- Neurologic Related Symptoms and Physical Exam Findings suggestive of Occult Spinal Dysraphism or Tethered Cord Syndrome and/or low lying conus medullaris (see: **Myelopathy (SP-7.1)** and **Myelopathy (PEDSP-6)**, and **Developmental Motor Delay (PEDHD-19.3)** for spinal cord involvement suspected in individuals with developmental motor delay) for which MRI of the involved spinal level without contrast or without and with contrast may be approved when any of the following are present:
 - Asymmetry of the feet, with one smaller foot, a high arch, and/or clawing of the toes. This is sometimes called the “neuroorthopedic syndrome”, and is associated with lack of an ipsilateral ankle jerk deep tendon reflex and calf atrophy
 - Cavus foot (also called pes cavus or pes cavovarus)
 - Toe walking, when associated with upper motor neuron signs including hyperreflexia, spasticity, and positive Babinski sign
 - Ataxia (see: **Ataxia (PEDHD-20)**)
 - Absent perineal sensation
 - Lower urinary tract dysfunction, including urinary urgency or urinary incontinence. Though not a requirement for advanced imaging, some of these patients will have had abnormal urodynamic studies (such as cystometrography and/or sphincter electromyography).
 - Constipation, especially if there are abnormal physical exam findings related to the spine (such as lower extremity weakness, decreased lower extremity tone, abnormal lower extremity reflexes, a tuft of hair over the spine or covering a pilonidal dimple, a sacral dimple, gluteal cleft deviation, or absent anal or cremasteric reflex), failure of maximal laxative therapy (see: **Constipation, Diarrhea, and Irritable Bowel Syndrome (PEDAB-12)**) and/or bowel incontinence, when Tethered Cord Syndrome or Occult Spinal Dysraphism is suspected as the cause
 - Back or leg pain when Tethered Cord Syndrome or Occult Spinal Dysraphism is suspected as the cause. In this setting, neither a plain x-ray of the spine nor a

recent period of provider directed conservative treatment is required to approve an MRI spine).

Spinal Dysraphism (PEDSP-4.4)

SPP.TC.0004.4.A

v1.0.2024

- Clinically significant dysraphism includes findings ranging from complex vertebral anomalies to myelomeningocele.
- Dysraphism is categorized into 2 major groups:²⁶
 - Open Dysraphism - lack of skin covering with exposed neural elements
 - Closed Dysraphism - skin covered
- It is rare to perform MRI in neonates with open dysraphism as the diagnosis is usually made with obstetric ultrasound and confirmed with visual inspection
 - MRI of the entire spine may be approved for preoperative planning if ordered by a specialist.
- MRI Brain without contrast (CPT® 70551) or with and without contrast (CPT® 70553) is indicated in all cases of open dysraphism as Chiari II malformation will be present²⁶
- Closed Dysraphism
 - MRI of the entire spine without contrast or without and with contrast is appropriate at the time of initial diagnosis.
 - MRI Brain without contrast (CPT® 70551) or without and with contrast (CPT® 70553) or CT without contrast of the brain (CPT® 70450) may be approved in cases with associated hydrocephalus, signs of cerebral involvement, or the presence of multiple hydromyelia (which suggests hydrocephalus).
 - MRI Pelvis without contrast (CPT® 72195) or without and with contrast (CPT® 72196) may be approved once if there are clinical signs of pelvic malformation or anorectal anomaly
 - MRI Cervical, Thoracic, and Lumbar spine without contrast (CPT® 72141, 72146, 72148) or without and with contrast (CPT® 72156, 72157, 72158) when ordered for preoperative planning.
 - Spinal canal ultrasound (CPT® 76800) may be approved as an alternative to MRI, if requested, in individuals with open dysraphism as the posterior bony defect provides an acoustic window for ultrasound.
 - MRI of the appropriate spinal level without contrast or without and with contrast may be approved when there are new and/or worsened neurologic symptoms and/or physical exam findings suggestive of new or worsened tethering of the spinal cord, such as any of the following:
 - New or worsened cavus foot
 - New or worsened toe walking and/or upper motor neuron signs (including hyperreflexia, spasticity, and positive Babinski sign)
 - New or worsened leg weakness or numbness or difficulty in ambulation
 - New or worsened loss of perineal sensation

- New or worsened lower urinary tract dysfunction (including urinary urgency or urinary incontinence, or new or worse changes on diagnostic urodynamic studies)
- New or worsened constipation
- New or worsened pain in the back or legs suspected to have been caused by tethering of the spinal cord.
 - MRI Brain without contrast (CPT® 70551) or without and with contrast (CPT® 70553) or CT without contrast of the brain (CPT® 70450) may be approved in cases with associated hydrocephalus, signs of cerebral involvement, or the presence of multiple hydromyelia (which suggests hydrocephalus).
 - MRI Pelvis without contrast (CPT® 72195) or without and with contrast (CPT® 72196) may be approved once if there are clinical signs of pelvic malformation or anorectal anomaly
- The appropriate spinal level, modality, and contrast level of follow-up advanced imaging will depend on the nature of the underlying disease, usually requested after specialist consultation.

SPP.CD.0007.1.A

v1.0.2024

- The diagnosis of achondroplasia is made clinically. Achondroplasia patients are at risk for hydrocephalus as well as myelopathy from spinal stenosis with increasing age.
- A pertinent clinical evaluation including a detailed history, physical examination with thorough neurologic examination and documentation of any specific radicular features, and plain radiography should be performed prior to considering advanced imaging.
- MRI without contrast or without and with of the symptomatic spinal region can be approved when new or worsening clinical symptoms suggest achondroplasia-related spinal stenosis.
- MRI Brain without contrast (CPT® 70551) or CT Head without contrast (CPT® 70450) can be approved when new or worsening clinical symptoms suggest hydrocephalus.

Inflammatory Spondylitis (PEDSP-7.2)

SPP.CD.0007.2.A

v1.0.2024

- Except as listed below, imaging considerations in pediatric and adult patients are identical for this condition, and these patients should be imaged according to **Inflammatory Spondylitis (SP-10.2)**.

For pediatric patients with juvenile idiopathic arthritis:

- MRI without and with contrast or without contrast of the involved levels is appropriate.
- An initial x-ray is not necessary prior to MRI in these patients.
- For evaluation of facet arthropathy in patients with ankylosing spondylitis, osteoarthritis, or rheumatoid arthritis:
 - Whole body radiopharmaceutical localization imaging (CPT® 78802) and SPECT (CPT® 78803) OR
 - SPECT/CT (CPT® 78830)

Atlantoaxial Instability in Trisomy 21 (Down Syndrome) (PEDSP-7.3)

SPP.CD.0007.3.A**v1.0.2024**

- The diagnosis of atlantoaxial instability is a recognized complication of trisomy 21, and patients are routinely screened with lateral x-rays of the cervical spine.
- MRI Cervical Spine without contrast (CPT® 72141) or without and with contrast (CPT® 72156) in individuals where the lateral cervical spine x-ray demonstrates an atlantodental (pre dens) interval of ≥ 4.5 mm, and/or a neural canal width of ≤ 14 mm.
- MRI Cervical Spine without contrast (CPT® 72141) or without and with contrast (CPT® 72156) when new or worsening clinical symptoms suggest myelopathy in a trisomy 21 individual.

Basilar Impression (PEDSP-7.4)

SPP.CD.0007.4.A

v1.0.2024

See: **Basilar Impression (PEDHD-9.4)** in the Pediatric Head Imaging Guidelines

Chiari Malformation (PEDSP-7.5)

SPP.CD.0007.5.A

v1.0.2024

See: **Chiari and Skull Base Malformations (PEDHD-9)** in the Pediatric Head Imaging Guidelines

Klippel-Feil Anomaly (Congenital Fusion of Cervical Vertebrae) (PEDSP-7.6)

SPP.CD.0007.6.A**v1.0.2024**

This is generally an incidental finding. A detailed history and physical examination with thorough neurologic examination, and plain x-rays should be performed initially. Klippel-Feil can occur in conjunction with platybasia and/or Chiari malformation.

- Plain x-rays of the cervical spine are sufficient to establish the diagnosis. Advanced imaging is indicated if there are acute or worsening neurologic symptoms (including pain), or if multiple levels are involved.
 - MRI Cervical Spine without contrast (CPT® 72141) or CT Cervical Spine without contrast (CPT® 72125) for these indications.

Marfan Syndrome (PEDSP-7.7)

SPP.CD.0007.7.A

v1.0.2024

Marfan syndrome patients are at risk for scoliosis (see **Scoliosis (PEDSP-3.2)**) and dural ectasias. Dural ectasias are usually asymptomatic but can be associated with other spinal lesions.

- A pertinent clinical evaluation including a detailed history, physical examination with thorough neurologic examination and documentation of any specific radicular features, and plain radiography should be performed prior to considering advanced imaging.
- MRI without contrast of the symptomatic spinal region can be approved when:
 - New or worsening clinical symptoms suggest a complicated dural ectasia
 - The individual is under active consideration for surgery

Neurofibromatosis (PEDSP-7.8)

SPP.CD.0007.8.A

v1.0.2024

- See: **Neurofibromatosis 1 and 2 (NF1 and NF2) (PEDONC-2.3)** in the Pediatric Oncology Imaging Guidelines for screening recommendations in neurofibromatosis.
- See: **Neurofibromatosis (PEDPN-2)** in the Pediatric Peripheral Nerve Disorders Imaging Guidelines for imaging considerations in neurofibromatosis individuals with known plexiform neurofibromas.
- See: **Non-Rhabdomyosarcoma Soft Tissue Sarcomas (PEDONC-8.3)** in the Pediatric Oncology Imaging Guidelines for imaging in individuals with neurofibromatosis and malignant peripheral nerve sheath tumors.

Von Hippel-Lindau Syndrome (VHL) (PEDSP-7.9)

SPP.CD.0007.9.A

v1.0.2024

- See: **Von Hippel-Lindau Syndrome (VHL) (PEDONC-2.10)** in the Pediatric Oncology Imaging Guidelines for screening recommendations in VHL patients.
- MRI without and with contrast of the affected spinal level can be approved for patients with known spinal hemangioblastomas in the following conditions:
 - Annually for asymptomatic patients with unresected spinal hemangioblastoma(s)
 - Preoperative planning for resection of a hemangioblastoma
 - New or worsening symptoms suggesting progression of a known hemangioblastoma
